CROWN AGENTS FOR OVERSEAS GOVERNMENTS
AND ADMINISTRATIONS

MILLBANK, LONDON, S.W.1

[Go to Family Keys >>>](#)

Gymnospermae

CYCADACEAE

Shrubs or small trees with thick, usually simple stems and a crown of pinnatisect leaves circinate in bud; leaflets often with spiny teeth. Cones dioecious. Males terminal or subterminal, composed of numerous leathery or fleshy flat or peltate scales bearing on the under-surface numerous pollen-sacs. Female cones similar, the scales bearing a pair of inverted nude ovules on the lower side. Seeds large, drupe-like, with copious endosperm; cotyledons 2.

Mainly found in [S. Africa](#), [Australia](#) and [Central America](#).

The most ancient of the families of Gymnosperms, only one species represented in our area.

ENCEPHALARTOS

Lehm.—F.T.A. 6, 2: 346. *APD acc*

- 1 Stem very short, ellipsoid; leaves pinnatisect, 1–2 m. long, up to about 25 cm. wide; segments up to about 80 pairs, linear-lanceolate, very acute, with a few spinulose teeth on the margin, and numerous close parallel nerves; male cones pedunculate, pale green, 30–40 cm. long including the stalk; female cones subsessile, up to 25 cm. long; seeds crimson when ripe[barteri](#)

Encephalartos barteri *Carruth.*—F.T.A. 6, 2: 348; Bot. Mag. t. 8232; Pilger in E. & P. Pflanzenfam. 13: 80 (1926); Chev. Fl. Viv. 1: 3. *APD acc*

Stem rarely over 1 ft. high and 9 in. across, covered with persistent leaf-bases clothed with cottony indumentum.

G. C.: Kwahu Chipp 624! Labolabo Anderson! Upper Volta Schonfeld! **Togo:** fide Pilger l.c. **Dah.:** Borgu Prov. Poisson. Savalou Chev. **N. Nig.:** rocky valley 3 miles S. of Jebba Barter 1692! N. of Ilorin by Jebba Road (fr. Dec.) Meikle 870!

PODOCARPACEAE

Trees, or shrubby in some species; leaves persistent, alternate or opposite, or absent and represented by phylloclades, very variable from acicular to broadly lanceolate. Plants dioecious or monoecious; male flowers in terminal or axillary strobili, the stamens usually many, the anthers 2-celled; female flower solitary or paired, axillary or terminal, or in strobili with megasporophylls 1-ovuled and bracteate; seed solitary, or paired; cotyledons 2.

A family of 7 genera, largely of the southern hemisphere.

PODOCARPUS

L'Hérit. ex Pers.—F.T.A. 6, 2: 339.

Dioecious, very rarely monoecious; leaves alternate (in our species); ovule adnate to the face of the fertile scale and usually much exceeding it, inverted, and enclosed in a false aril (epimatium) arising from the face of the scale and adnate to the single integument.

- 1 Receptacle well-developed, fleshy, finally bright red, obconical to subglobose, 15–18 mm. long, 15–20 mm. broad at the broadest point, with a pair of seeds (or sometimes only 1), at the distal end; seeds subglobose, 8–9 mm. diam.; leaves linear-lanceolate, 5–10 cm. long, 6–16 mm. broad, with stomata on one side of the leaf only[L. milanjanus](#)

Receptacle not large and fleshy; seeds solitary, pyriform, 2.5–3.8 cm. long; leaves linear, 6–16 cm. long, 4–11 mm. broad, with stomata on both surfaces[2. mannii](#)

1. **Podocarpus milanjianus** *Rendle*—F.T.A. 6, 2: 340; Pilger in E. & P. Pflanzenfam. 13: 247 (1926); Chalk, Burt Davy & Desch in For. Trees & Timbers Brit. Emp. 1: 24 (1932).

APD: Synonym of Podocarpus latifolius (Thunb.) R. Br. ex Mirb.

A shrub, or tree up to 100 ft. high; male cones flesh-pink about 1 in. long; seeds glaucous, on the large fleshy scarlet receptacle; indigenous.

Br. Cam.: Mamfe Div. (Jan.) Lobe Babute FHI 8797! Bali-Ngomba F.R. Ujor FHI 30326! L. Oku, Bamenda Johnstone 233/31!

Also in **French Cameroons**, and widespread on the mountains of eastern Africa.

2. **Podocarpus mannii** *Hook. f.*—F.T.A. 6, 2: 341; Pilger l.c. 13: 245, t. 132 (1926); Chalk, Burt Davy & Desch l.c. 1: 23 (1932); Dandy in Exell Cat. S. Tomé 99 (1944); Netta E. Gray in J. Arn. Arb. 34: 75 (1953).

APD: Synonym of Afrocarpus mannii (Hook. f.) C. N. Page

A tree 30–50 ft. high.

Introduced and widely planted in the Cameroons, rarely so in S. Nigeria. Endemic to S. Tomé.

Br. Cam.: Buea (fr. Dec., Jan.) Maitland 343! 345! Fairchild SPD 74656!

GNETACEAE

Erect or scandent shrubs, leaves opposite, simple. Flowers in catkin-like spikes, usually dioecious; spikes jointed, with the flowers in whorls. Male flowers with a tubular envelope of 2 connate scales; anthers 2 or 1, sessile on the summit of a central column. Female flowers with a close-fitting utricle resembling an ovary; ovule otherwise naked, integument produced into a straight micropylar tube exerted through the orifices of the aril and utricle, truncate, toothed or fimbriate. Seed with copious endosperm.

A small family of one genus, widely distributed in the tropics and warmer regions.

GNETUM

Linn.—F.T.A. 6, 2: 330.

- 1 Internode of male spike of the same diameter throughout its length, slender in dried (or old) specimens; staminal column exerted from the mouth of the envelope; leaves ovate-oblong or elliptic-oblong, more rarely lanceolate, attenuate at base, abruptly acuminate, 10–13 cm. long, 3.5–5 cm. broad[1. africanum](#)

Internode of male spike in the fresh condition much thicker at the base than higher up; staminal column hardly exerted from the mouth of the envelope; leaves ovate-elliptic or broadly elliptic, rounded or very slightly cuneate at base, abruptly acuminate, 9–14 cm. long, 4–7 cm. broad[2. buchholzianum](#)

1. **Gnetum africanum** *Welw.*—F.T.A. 6, 2: 330; Markgraf in E. & P. Pflanzenfam. 13: 440 (1926). *APD acc*

A dioecious liane; **in forest**.

Br. Cam.: Abonando, Mamfe (Apr.) Rudatis 42!

Also in **French Cameroons**, **Gabon**, **Belgian Congo** and **Angola**.

2. **Gnetum buchholzianum** *Engl.*—F.T.A. 6, 2: 331; Markgraf l.c. *APD acc*

A dioecious liane; **in forest**.

Br. Cam.: Victoria (Oct., Nov.) Maitland 749! 780! Johann-Albrectshöhe Staudt 543!

Also in **French Cameroons**.

Angiospermae

Dicotyledones

ANNONACEAE

Trees, shrubs or climbers, aromatic. Leaves alternate, entire, exstipulate. Flowers terminal, leaf-opposed or axillary, solitary or crowded, hermaphrodite or rarely unisexual, mostly trimerous. Sepals 3, rarely 2, separate or united into a 3-lobed calyx, valvate or rarely imbricate, persistent or deciduous. Petals generally 6, in two series, valvate or slightly imbricate, rarely in two series of 2, or the inner series absent. Stamens generally numerous, hypogynous; anther-cells adnate, with the connective often truncate. Carpels numerous or rarely few or solitary, free or very rarely united into a 1-celled ovary with parietal placentas; ovules 1 or more. Fruiting carpels sessile or stipitate, mostly indehiscent. Seed with or without an aril, with copious ruminant endosperm and minute embryo.

Mainly in tropical and subtropical regions.

Recognized by the alternate, exstipulate leaves, mostly trimerous flowers, numerous and often truncate free stamens, free carpels, and seeds with ruminant endosperm.

- 1 Carpels spirally arranged, free, or if united forming a many-celled syncarp; stigmas erect; petals free, or rarely slightly united at base:2
- Carpels in a single whorl, united into a 1-celled ovary with parietal placentas; stigmas radiating; petals more or less united into a tube: 23
- 2 Fruit apocarpous, of sessile or stipitate carpels always free at maturity (fruiting carpels contiguous and at the base included in the receptacle in *Pachypodanthium*):3
- Fruit syncarpous; carpels united into a fleshy mass in fruit: 22
- 3 Petals always in two series, both or only the inner series imbricate:4
- Petals all valvate, in two distinct series or in one series:6
- 4 Fruiting carpels stipitate or sessile, not included in the receptacle at base:5
- Fruiting carpels contiguous and included in the receptacle at base; ovules numerous; indumentum stellate3.
- [*Pachypodanthium*](#)
- 5 Inner and outer petals subequal, the inner ones at length spreading; ovules 6 or more; indumentum usually of stellate, or more rarely simple, hairs; shrubs or lianes1. [*Uvaria*](#)
- Inner petals much shorter than the outer and closely appressed over the stamens and carpels; ovules 1–2; leaves glabrous; trees2. [*Cleistopholis*](#)
- 6 Petals in two series, each of 3 petals:7
- Petals in a single series, 3–6: 17
- 7 Outer 3 petals much smaller than the inner ones and scarcely distinguishable from the sepals; inner petals elongated:8
- Outer 3 petals as large as, or larger than, the inner petals (but see *Xylopia rubescens*), distinct from the sepals: 9
- 8 Flowers in cymes or panicles; inner petals ovate-lanceolate4. [*Piptostigma*](#)
- Flowers in fascicles; inner petals linear 5. [*Brieya*](#)
- 9 Inflorescence borne on a recurved hook-like thickened peduncle, leaf-opposed6. [*Artabotrys*](#)
- Inflorescence not on hook-like peduncles: 10
- 10 Petals broadened and hollowed at base, usually with a more or less lanceolate blade (but see *Xylopia africana* and *X. staudtii*); anthers transversely septate; pollen grains large: 11
- Petals not broadened and hollowed at base; anthers not transversely septate: 12
- 11 Carpels with 2–12 ovules; fruiting carpels several-seeded, sessile or on a stout stipe; inner petals usually only a little shorter than the outer, rarely much shorter (in *X. rubescens*)7. [*Xylopia*](#)
- Carpels with 1 ovule; fruiting carpels 1-seeded, on slender stipe; inner petals much shorter than the outer8. [*Neostenanthera*](#)
- 12 Sepals relatively small and not covering the petals in bud (but see *Uvariadendron fuscum*): 13
- Sepals relatively large and entirely covering the petals in bud; often with the angles of the bud winged (but not in

- U. elliotianum) [14. Uvariastrum](#)
- 13** Flower buds oblong; petals subequal, linear to lanceolate; carpels with 1–3 ovules; fruiting carpels subglobose, stipitate [9. Polyalthia](#)
- Flower buds subglobose or ovoid-conical: **14**
- 14** Fruiting carpels stipitate, 1-seeded, or if several-seeded then narrowly constricted between the seeds: **15**
- Fruiting carpels sessile or subsessile, several-seeded but not narrowly constricted between the seeds: **16**
- 15** Inner and outer petals subequal, or somewhat dissimilar in size, but similar in shape and texture [10. Popowia](#)
- Inner and outer petals very unequal and dissimilar in shape and texture [11. Oxymitra](#)
- 16** Inner petals contiguous from base to apex in bud [12. Polyceratocarpus](#)
- Inner petals contiguous only at the top, narrowed at base leaving a gap between adjacent petals [13. Uvariadendron](#)
- 17** Petals 6: **158**
- Petals 3 or 4: **20**
- 18** Sepals completely covering the petals in bud; petals united into a short tube at base, transversely plicate in bud [15. Hexalobus](#)
- Sepals not covering the petals in bud: **19**
- 19** Petals equal, not covering each other in bud, free at base; stamens very numerous on an ellipsoid receptacle [16. Monocyclanthus](#)
- Petals with the 3 larger covering the 3 smaller ones in the upper part in bud, free or united at base; stamens 9–12 in a single whorl; leaves often glaucous beneath [17. Enneastemon](#)
- 20** Petals 4, sepals 2, flowers unisexual [18. Uvariopsis](#)
- Petals 3, sepals 3, flowers hermaphrodite: **21**
- 21** Ovules about 10 in each carpel; petals alternate with the sepals [19. Dennettia](#)
- Ovule solitary; petals opposite the sepals [20. Enantia](#)
- 22** Inner petals imbricate; flowers numerous in branched cymes on leafless branches below the foliage [21. Anonidium](#)
- Inner and outer petals valvate; flowers solitary, or 2–7 in fascicles, on usually leafy twigs [22. Annona](#)
- 23** Petals in a single series, corolla tube funnel-shaped, lobes all alike [23. Isolona](#)
- Petals in 2 series; the external petals shortly united at base, with larger lobes, often with wavy margins; internal petals smaller and entire or with lateral lobes [24. Monodora](#)

Cananga odorata (Lam.) Hook. f. & Thoms

From tropical Asia is often cultivated in our area.

1. UVARIA

Linn.-Engl. & Diels Monogr. Afr. Annonac. 7 (1901). APD acc

- 1** Calyx cupular in bud, splitting more or less irregularly into 3 lobes as the flowers open, or remaining scarcely lobed: **2**
- Calyx with the lobes distinct in bud, separating as the flowers open into regular sepals, free to the middle or to the base: **9**
- 2** Petals not exceeding 2 cm. long: **3**
- Petals up to 4 cm. long, 1.3 cm. broad, oblong-lanceolate, rather densely stellate-pubescent outside; leaves oblong, rounded or obtuse at apex, 6–9 cm. long, 4–5 cm. broad; rather densely stellate pubescent beneath; flowers few in a cluster; pedicels 7–8 mm. long, fruiting carpels densely warty, up to 4.5 cm. long and 2 cm. broad [7. sofa](#)
- 3** Fruiting carpels globose or subglobose, up to 1–2 cm. diam.: **4**
- Fruiting carpels cylindrical or ellipsoid, exceeding 1.2 cm. in length: **6**
- 4** Fruiting carpels smooth, sessile or shortly stipitate; stipe shorter than the carpel; leaves with up to 8 pairs of rather obscure lateral nerves: **5**
- Fruiting carpels verrucose, long-stipitate; stipe 2–3 cm. long; leaves oblong-lanceolate, 7–10 cm. long, 2.3–3.5 cm. broad, rounded at base, densely tomentellous with long and short stellate hairs beneath; 15–20 pairs of

- lateral nerves, impressed above and very prominent beneath; calyx about 1 cm. in diam. when expanded, scarcely lobed; petals suborbicular, concave, about 1 cm. in diam. [2. baumannii](#)
- 5 Leaves oblong-lanceolate, rounded to cordate at base, 4–8 cm. long, 1.5–2.5 cm. broad, midrib beneath densely clothed with long simple or fascicled hairs even at maturity; sepals about 5 mm. long, petals 6–8 mm. long in open flower [1. ovata subsp. ovata](#)
- Leaves ovate-elliptic, obtuse to cuneate at base, 4–8 cm. long, 1.5–3.5 cm. broad, midrib beneath very sparsely pubescent at maturity, with short hairs; flowers and fruits as above [1a. ovata subsp. afzeliana](#)
- 6 Mature leaves very sparsely pubescent with short stellate hairs: 7
- Mature leaves pubescent with long spreading simple and fasciculate hairs, sometimes with shorter stellate hairs as well: 8
- 7 Leaves oblong-elliptic to ovate-elliptic, obtuse to cuneate at base, shortly acuminate, 4.5–15 cm. long, 2.5–6.5 cm. broad, with 6–10 pairs of rather obscure lateral nerves, not impressed above; calyx about 5 mm. long; petals oblong, up to 14 mm. long and 8 mm. broad; fruiting carpels cylindrical, up to 3 cm. long, subsessile or with stipe up to 1 cm. long [3. chamae](#)
- Leaves oblong-ovate or broadly elliptic, rounded or subcordate at base, acutely acuminate, 10–25 cm. long, 5–13 cm. broad, with 10–15 pairs of lateral nerves impressed above and prominent beneath; calyx about 8 mm. long; petals broadly ovate about 16 mm. long and 15 mm. broad; fruiting carpels ellipsoid 2–3 cm. long, with stipe about 1.5 cm. long [4. anonoides](#)
- 8 Fruiting carpels smooth, cylindrical, up to 5 cm. long, stipe 10–15 mm. long; leaves oblong to oblong-obovate, rounded to subcordate at base, acute at apex, 7–17 cm. long, 3–9 cm. broad [5. angolensis subsp. guineensis](#)
- Fruiting carpels densely warty, ellipsoid, 2–2.5 cm. long, stipe 7–12 mm. long; leaves narrowly oblong-obovate, rounded at base, shortly acuminate, 7–12 cm. long, 2.5–6 cm. broad [6. doeringii](#)
- 9 Leaves quite glabrous, subcoriaceous, oblong, rounded to subcordate at base, acute at apex, 15–20 cm. long, 5.5–7 cm. broad, with a cartilaginous margin; sepals thick, broadly ovate, 9–10 mm. long; petals semiorbicular, 2–3 cm. long and almost as broad [8. obanensis](#)
- Leaves pubescent, without a cartilaginous margin: 10
- 10 Leaves obovate, narrowed to a subacute base, acutely acuminate, 6–15 cm. long, 2–5.5 cm. broad, softly stellate-pubescent beneath; lateral nerves 8–10 pairs; pedicels 1.5 cm. long, tomentellous; petals subequal, about 1 cm. long, tomentellous [9. dinklagei](#)
- Leaves rounded or cordate at base: 11
- 11 Leaves rounded and emarginate at apex, subcordate at base, shortly petiolate, elliptic, 4–6.5 cm. long, 2.5–4 cm. broad, finely pubescent beneath; lateral nerves about 5 pairs; sepals broadly triangular, about 4 mm. long, outer petals about 12 mm. long; young fruiting carpels stipitate, glabrous [10. farquharii](#)
- Leaves acute or acuminate; 12
- 12 Sepals not exceeding 1 cm. long: 13
- Sepals exceeding 1 cm. in length, ovate, acute or subacute; petals more or less ovate and flat, 1.8–3 cm. long: 14
- 13 Petals flat or nearly so, oblong or obovate, spreading, densely tomentose within, oblong, 1–1.4 cm. long; sepals broadly ovate, about 5 mm. long; flowers solitary, supra-axillary; leaves oblong-oblancoate, 10–13 cm. long, 3–4.5 cm. broad, rounded at base, long-acuminate, like the stems long bristly pilose beneath; fruit unknown [11. thomasi](#)
- Petals concave, connivent, broadly triangular-semiorbicular, thick, about 1.5 cm. diam. or more; sepals broadly ovate-triangular, 8–10 mm. long; leaves oblong-obovate, 15–35 cm. long, 5–15 cm. broad, rounded at base, acuminate, with 10–15 pairs of nerves prominent beneath, pubescent with rather long fascicled hairs beneath; fruit unknown [12. bipindensis](#)
- 14 Fruiting carpels long-stipitate; stipe attached to one side of carpel which is lobed on the other side; carpels densely covered with long hairs; leaves and branchlets with long hairs, upper surface of leaves not scabrid; leaves oblong, rounded at base, subacute or obtuse at apex, 7–25 cm. long, 3–7 cm. broad [13. afzelii](#)
- Fruiting carpels sessile; leaves and branchlets with short, mainly stellate hairs, upper surface of leaves scabrid with short simple hairs; leaves oblong, rounded at base, obtuse at apex, 10–18 cm. long, 3.5–6.5 cm. broad [14. scabrida](#)

1. *Uvaria ovata* (Dunal) A. DC. subsp. *ovata*—F.T.A. 1: 21; Engl. & Diels Monogr. Afr. Annonac. 29 (1901); Keay in Kew Bull. 1952: 543 (1953). *APD acc APD acc*

The typical species is in Belgian Congo, Uganda, Kenya, N. Rhodesia and Angola (see Boutique in Fl. Congo Belge 2: 295 (1951)).

6. *Uvaria doeringii* **Diels** in Engl. Bot. Jahrb. 53: 435 (1915). *APD acc*

Tree or scrambling shrub, to 20 ft. high; flowers brown.

G. C.: Achlmota-Aburi Road (fl. & fr. Apr., May) Irvine 698! Boughey 129! Abokobi (fl. & fr. Jan.) Irvine 1987! 2593! Abuantem (May) Andoh FH 5021! Agena (fr. June) Boughey 130! **Togo:** Atakpame (fr. May) Doering 259! **Dah.:** Poisson!

7. *Uvaria sofa* **Sc. Elliot** in J. Linn. Soc. 30: 69 (1895); Engl. & Diels Monogr. 27; Chev. Bot. 7. *APD acc*

A tree or scandent shrub, up to 20 ft. high.

Fr. G.: Farmar 337! Farana (Mar.) Sc. Elliot 5376! Macenta (Oct.) Baldwin 9815! Timbo (Mar.) Pobéguin 903! Labé (Mar.) Chev. 12400! Dalaba (fr. Apr.–Oct.) Chev. 18227! 18863!

8. *Uvaria obanensis* **Bak. f.** in Cat. Talb. 1 (1913). *APD acc*

Uvaria marginata **Diels** in Engl. Bot. Jahrb. 53: 437 (1915).

Scandent shrub, inner petals dull orange, outer apricot lined deep red.

S. Nig.: Oban Talbot 402! 432! 1579! 1603! **Br. Cam.:** Johann-Albrechtshöhe (Dec.) Busgen 191.

Also in [French Cameroons](#).

9. *Uvaria dinklagei* **Engl. & Diels** Monogr. 21 (1901). *APD acc*

A climbing shrub with yellowish-green flowers.

Lib.: Grand, Bassa in low bush near the seashore (fl. May, Aug., fr. Sept.) Dinklage 1794! 1822! 2061!

10. *Uvaria farquharii* **Hutch. & Dalz.** F.W.T.A., ed. 1, 1: 50 (1927); Kew Bull. 1927: 151. *APD acc*

Woody climber.

S. Nig.: Ukehe, Benin, (Sept.) Farquhar 73 (partly)!

11. *Uvaria thomasii* **Sprague & Hutch.** in Kew Bull. 1916; 158. *APD acc*

A twining shrub with spreadingly hispid branches.

S. L.: Sendugu (June) Thomas 569!

12. *Uvaria bipindensis* **Engl.** in Notizbl. Bot. Gart. Berl. 2: 292 (1899); Engl. & Diels Monogr. 12. *APD acc*

Extensive liane, in [forest](#); flowers on old wood, petals whitish, sepals pale green.

Br. Cam.: S. Bakundu F. R. (Mar.) Brenan 9445!

Also in [French Cameroons](#).

13. *Uvaria afzelii* **Sc. Elliot** in J. Linn. Soc. 30: 70 (1895); Engl. A Diels Monogr. 22; Chev. Bot. 5. *APD acc*

Small tree to 15 ft. high, or spreading shrub; flowers greenish-yellow or cream.

Fr. G.: Kindia Jac.-Fel. **S. L.:** Afzelius! Between Kahreni and Port Loko (Apr.) Sc. Elliot 5812! Mofari Sc. Elliot 4412! Njala (May-June) Deighton 2581! 2643! **Lib.:** Sinoe Basin Whyte! Gbanga (fr. Sept.) Linder 691! **Iv. C.:** Dabou Chev. 15564! 17218! Bingerville Jolly! Baoulé Pobéguin 272! **G. C.:** Axim (Apr.) Chipp 708! Kumasi (July) Vigne 3955! Atwabo (fr. Feb.) Irvine 2292! **S. Nig.:** Olokemeji (fr. June) Foster 308! Mamu Biver F. R., Onitsha (young fr. July) Latilo FHI 27628!

14. *Uvaria scabrida* Oliv. F.T.A. 1: 21 (1868); Engl. & Diels Monogr. 14. *APD acc*

Climbing shrub, or small tree, to 30 ft. high; petals yellowish-green.

Lib.: Grand Basaa (May) Dinklage 1936. **S. Nig.:** Calabar Thomson 98! Eket Talbot 3250! Degema Talbot 3668! **Br. Cam.:** Cameroons R. Mann 1433!

Extends to **Belgian Congo** and **Angola**.

Uvaria tortilis A. Chev. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 50 (1927); Chev. Bot. 8, name only.

Flowers unknown; genus uncertain.

Iv. C.: Bingerville Chev. 15563!

2. CLEISTOPHOLIS

Pierre—Engl. & Diels Monogr. Afr. Annonac. 33 (1901).

- 1 Leaves ovate-elliptic to lanceolate, coriaceous, shining above, midrib noticeably depressed, 12–25 cm. long, 3–5 cm. broad, glabrous, petioles up to 1 cm. long; pedicels 2–2.5 cm. long; sepals small; outer petals obovate to oblong, 7–10 mm. long, 3–4 mm. broad, inner petals about 2 mm. long and broad; fruiting carpels on thickened stipe, tuberculate, 2.5 cm. long, 1.5 cm. diam *l. patens*
- 1.2. Leaves obovate-elliptic to elliptic-lanceolate, coriaceous, 10–15 cm. long, 5–6 cm. broad, glabrous, petioles more than 1 cm. long; pedicels 1 cm. long; sepals triangular, small; outer petals almost linear, 8–10 mm. long, 2 mm. broad; fruits similar to above *2. staudtii*

1. *Cleistopholis patens* (Benth.) Engl. & Diels Monogr. Afr. Annonac. 35, t. 12 (1901). *APD acc*

Oxymitra patens Benth.—F.T.A. 1: 34.

Cleistopholis klaineana of F.W.T.A. ed. 1, 1: 51.

A tree up to 90 ft. high with horizontal branches; flowers greenish-yellow; young leaves often very long; bark pale grey, slash moist and fragrant; wood light, floats easily.

S. L.: Bagroo R. (Apr.) Mann 828! Falaba (Feb.) Aylmer 4! **Lib.:** Dukwia R. (fr. May) Cooper 430! **Iv. C.:** Faranou (fr. Aug.) Chev. 22379! **G. C.:** Kwahu Prasu (Feb.) Vigne 1616! **N. Nig.:** Lokoja (Mar.) Shaw 16! **S. Nig.:** Eppah Barter 3267! Old Calabar Thomson 5! **Br. Cam.:** Bibundi (Nov.) Mildbr. 10640!

Also in **French Cameroons** and **Gabon**.

2. *Cleistopholis staudtii* Engl. & Diels l.c. 35 (1901). *APD acc*

Medium-sized tree (fide Ross & Mildbraed) with horizontal branches and more or less distichously arranged shining leaves; ripe fruits purple.

S. Nig.: Shasha F. R. (fr. Apr.) Ross 247! **Br. Cam.:** Johann-Albrechtshöhe (Apr.) Staudt 957!

Also in **French Cameroons** and **Uganda**.

3. PACHYPODANTHIUM

Engl. & Diels in Notizbl. Bot. Gart. Berl. 3: 55 (1900).

- 1 Leaves elongate-oblong, shortly tapered at each end, 15–25 cm. long, 4–5 cm. broad, sparingly clothed with minute stellate hairs beneath; branchlets closely tomentellous; sepals densely tomentellous outside, glabrous inside; petals glabrous; fruiting carpels loosely united, ribbed *l. staudtii*

Leaves broadly elliptic-lanceolate, narrowed from near the middle to each end, 17–22 cm. long, 5–6.5 cm. broad, sparingly clothed with minute stellate hairs beneath; branchlets at first minutely puberulous, at length glabrous; flowers not seen; fruiting carpels compact[2. barteri](#)

1. **Pachypodanthium staudtii** Engl. & Diels Monogr. Afr. Annonac. 32, t. 11 (1901); Chev. Bot. 8.

APD: *Synonym of Duguetia staudtii* (Engl. & Diels) Chatrou

A large-boled forest tree, 60–90 ft. high, with grey, rough, odoriferous bark; timber hard; flowers pale yellow; mature fruit fleshy, reddish.

S. L.: Kambul Lane-Poole 197! Sawyerr FHN 13554! **Lib.:** Dukwia B. (Feb.) Cooper 296! **iv. C.:** Anvama (fr. Feb.) Cher. 16224! Abidjan (Nov.) Aubrév. 164! **G. C.:** Mampong Scarp (May) Vigne 1721! **S. Nig.:** Oban Talbot 1494!

Also in **French Camerouns.**

2. **Pachypodanthium barteri** (Benth.) Hutch. & Dalz. F.W.T.A., ed. 1, 1: 51 (1927); Kew Bull. 1927: 151.

APD: *Synonym of Duguetia barteri* (Benth.) Chatrou

Annona barteri Benth.—F.T.A. 1: 17.

Tree, 50 ft., leaves shining; fruit the size of a peach.

S. Nig.: Onitsha Barter 445! Koton Karifi Swamp F. R. Johnstone K. 14! Ibaji-Ojoku F. R., Kabba Prov. (fr. Mar.) Taylor 13!

4. PIPTOSTIGMA

Oliv.—F.T.A. 1: 18.

1 Inflorescence elongated, 15–35 cm. long; leaves abruptly acuminate, more or less obovate or broadly elliptic:..2

Inflorescence few-flowered, on the branches; leaves narrowly oblong-obovate, narrowed to a rounded base, gradually acuminate, or rounded at apex, 6–24 cm. long, 2–8 cm. broad, with 18–22 pairs of lateral nerves; sepals lanceolate, acute, 6–7 mm. long; outer petals lanceolate 9–10 mm. long; inner petals 3–3.5 cm. long, long pilose; fruiting carpels 2–4, sessile, ovoid, bluntly beaked, warted, about 18 mm. long[4. fugax](#)

2 Sepals linear-lanceolate, acuminate; leaves rounded at base, 20–30 cm. long, up to 15 cm. broad, with about 20 pairs of lateral nerves, weakly pilose beneath; inner petals longitudinally nerved, about 5–5 cm. long [1. pilosum](#)

Sepals ovate-triangular, short, scarcely acuminate:3

3 Leaves oblong or obovate-elliptic, distinctly narrowed to the base, up to about 20 cm. long and 9 cm. broad, with 20–30 pairs of lateral nerves; inner petals linear-lanceolate, about 4–5 cm. long, rather obscurely nerved[2. preussii](#)

Leaves broadly elliptic, rounded to the base, very large, up to 30–35 cm. long and 25 cm. broad, with about 30 pairs of lateral nerves; inner petals broadly lanceolate, about 5 cm. long, strongly nerved outside, softly tomentose; fruiting carpels stellate, sessile, bluntly beaked, ribbed, about 2–5 cm. long[3. giganteum](#)

1. **Piptostigma pilosum** Oliv.—F.T.A. 1: 18. APD acc

S. Nig.: Calabar Thomson 61! Oban Talbot 1290! 1420! Eket Talbot 3143!

2. **Piptostigma preussii** Engl. & Diels Monogr. Afr. Annonac. 54 (1901).

APD: *Synonym of Piptostigma glabrescens* Oliv. var. *glabrescens*

A tree, 30 ft.

Br. Cam.: Barombi Preuss 251!

Also in **French Camerouns.**

3. **Piptostigma giganteum** Hutch. & Dalz. F.W.T.A., ed. 1, 1: 52 (1927); Kew Bull. 1927: 151. APD acc

A tree.

S. Nig.: Oban Talbot 1336!

4. **Piptostigma fugax** *A. Chev. ex Hutch. & Dalz.* F.W.T.A., ed. 1,1: 52 (1927); Chev. Bot. 13, name only. *APD acc*

A shrub, up to 12 ft.; flowers red.

Lib.: Peahtah (fr. Oct.) Linder 962! **Iv. C.:** Mid. Sassandra to Mid. Cavally (June) Chev. 19193! Grabo (July) Chev. 19620!

5. BRIEYA

De Wild. in Fedde Rep. 13: 383 (1914).

- 1 A small tree; young branches shortly tomentose, at length glabrous; leaves oblong-obovate, 15–30 cm. long, 4–10 cm. broad, apex rounded to broadly acuminate, rounded and unequal at base, glabrous when mature; 15–20 pairs of ascending lateral nerves prominent beneath; flowers fasciculate on woody twigs; pedicels 1–1.5 cm. long; sepals broadly triangular, 2–3 mm. long; outer 3 petals short and similar to the sepals; inner 3 petals 6–8 cm. long, 5–9 mm. broad; sepals and petals finely pubescent; stamens 1.5–2 mm. long; carpels 2–5, pubescent, stigmas densely hairy; fruit of 2–4 ovoid carpels about 10 cm. long and 6 cm. broad *fasciculata*

Brieya fasciculata *De Wild.* in Fedde Rep. 13: 383 (1914).

APD: *Synonym of Piptostigma fasciculatum (De Wild.) Boutique ex R. E. Fr.*

Piptostigma aubrevillei *Ghesq. ex Aubrév.* Fl. For. C. Iv. 1: 98 (1936), French deser. only.

An understorey tree of forest.

Iv. C.: Agnéby (fl. & fr. Aug.) Aubrév. 2115! Agboville (Aug.) Aubrév. 1500! **G. C.:** Tafo (May) Darko 194! S. Fomang Su F. R. (June) Vigne 2057!

Also in **Congo** and **Angola**.

6. ARTABOTRYS

R. Br.—F.T.A. 1: 27. *APD acc*

Species 7–10 are very close and some may not prove to be distinct. I have not seen authentic material of *A. libericus* Diels and *A. dahomensis* Engl. & Diels.—R.W.J.K.

- 1 Outer petals in mature flowers exceeding 15 mm. long and 3 mm. broad:.....2
Outer petals in mature flowers up to 15 mm. long and not exceeding 3 mm. broad in the blade:6
- 2 Inflorescence many-flowered, dense:3
Inflorescence 1–3-flowered:4
- 3 Outer petals about 25 mm. long, constricted above the thickened base, with a blade about 8 mm. broad; leaves oblong-elliptic 15–21 cm. long, 7–9 cm. broad, rounded or cuneate at base, abruptly acuminate, closely and prominently reticulate, glabrous *1. jollyanus*
Outer petals 15–17 mm. long, 3 mm. broad, lanceolate, slightly constricted above the base; leaves oblong-elliptic, 10–15 cm. long, about 6 cm. broad, rounded at base, shortly acuminate, with 9–12 pairs of lateral nerves prominent beneath, pilose on nerves beneath, then glabrescent *2. thomsonii*
- 4 Petals with a broad thickened basal portion surrounding the stamens, and a blade contracted where it joins the basal part:5
Petals broadly lanceolate, not contracted above a thickened base; outer petals lanceolate, about 20 mm. long and 8 mm. broad, very shortly pubescent; leaves lanceolate, about 15 cm. long and 5 cm. broad, cuneate at base, acuminate, glabrous *5. oliganthus*
- 5 Outer petals at least 30 mm. long and 8 mm. broad, tomentellous outside, densely so at base; leaves oblong, 7–20 cm. long, 3–10 cm. broad, shortly cuneate, gradually acuminate; fruiting carpels obovoid, long-stipitate *3. insignis*

- Outer petals 18–20 mm. long, shortly pubescent; leaves oblong-elliptic, 5–13 cm. long, 2.5–4.5 cm. broad, cuneate at base, abruptly acuminate; fruiting carpels ovoid, beaked, sessile [4. *coccineus*](#)
- 6 Leaves large, 15–25 cm. long, 10–15 cm. broad, broadly elliptic or ovate-rotundate, rounded at base, rather abruptly and acutely acuminate, with 6–8 pairs of arcuate nerves prominent beneath, glabrous; inflorescences densely many-flowered; petals about 15 mm. long with broad base and short narrow blade, about twice as long as the sepals [6. *macrophyllus*](#)
- Leaves up to 15 cm. long and 6 cm. broad: 7
- 7 Outer petals linear or lanceolate, not subulate: 8
- 8 Outer petals 8–9 mm. long, densely ferruginous-pilose, gradually broadened to a 3–4 mm. broad base; inner petals rather thick and subterete, leaves oblong-elliptic to lanceolate, 7–12 cm. long, 3–4 cm. broad, cuneate at base, shortly acuminate, midrib and nerves appressed pilose beneath; branchlets pilose when young, becoming only sparsely so [7. *velutinus*](#)
- Outer petals 9–15 mm. long, with narrow blade broadened to a 1.5–2 mm. broad base; inner petals flat in section: 9
- 9 Mature branchlets and underside of leaves glabrous or very sparsely pubescent; leaves oblong-lanceolate, acute at base, long-acuminate, 6–10 cm. long, 2–3 cm. broad; inflorescence slender, many-flowered; outer petals about 13 mm. long (flowers very similar to *dahomensis*) [8. *libericus*](#)
- Mature branchlets and underside of leaves pubescent with spreading hairs: 10
- 10 Leaves ovate to suborbicular, 4–8 cm. long, 2.5–4 cm. broad, very obtusely and shortly acuminate, rounded at base; outer petals pilose, up to 12 mm. long, with blade 1.5 mm. broad [9. *dahomensis*](#)
- Leaves oblong-ovate to elliptic, 8–13 cm. long, 3–5.5 cm. broad, distinctly acuminate, cuneate to obtuse at base; outer petals rather shortly pubescent on the narrow blade, up to 15 mm. long [10. *stenopetalus*](#)
- Outer petals subulate, 15 mm. long, acute, subterete, with broadened thickened base; leaves oblong-lanceolate 5–10 cm. long, 2–4 cm. broad, rounded at base, obtusely acuminate, pilose on midrib beneath; branchlets very hispid with rust-coloured hairs [11. *hispidus*](#)

1. **Artabotrys jollyanus** *Pierre ex Engl. & Diels* Monogr. Afr. Annonac. 73 (1901). *APD acc*

IV. C.: Dabou (Nov.) Jolly 157!

Also in **French Cameroons**.

2. **Artabotrys thomsonii** *Oliv.* F.T.A. 1: 28 (1868). *APD acc*

Scandent shrub to 45 ft. high, flowers yellow.

S. Nig.: Calabar (Feb.) Thomson 25! 2310! Oban Talbot 1407! Eket Talbot 3228! 3230!

Also in **French Cameroons**, **Gabon** and **Upper Congo**.

3. **Artabotrys insignis** *Engl. & Diels* in Engl. Bot. Jahrb. 39: 483 (1907). *APD acc*

Artabotrys lucidus *A. Chev.* Bot. 9, name only.

Forest liane with large yellow flowers.

S. L.: Gegbwema (Apr.) Deighton 3662! **IV. C.:** fide Chev. l.c. **G. C.:** Atroni, W. Ashanti (Aug.) Vigne 2446! Owabi (fl. & fr. Dec.) Lyon FH 2661!

Also in **French Cameroons**, **Gabon** and **Belgian Congo**.

4. **Artabotrys coccineus** *Keay* in Kew Bull. 1952: 149 (1952). *APD acc*

Small liane, with yellowish-green flowers and brilliant scarlet fruits.

S. Nig.: Ibadan South F. R. (fl. Sept., fr. Jan.) Keay FHI 19799! 28041!

5. **Artabotrys oliganthus** *Engl. & Diels* Monogr. Afr. Annonac. 73 (1901). *APD acc*

Artabotrys rubicunda *A. Chev.* Bot. 9, name only

A climbing shrub, fruit red when ripe.

Lib.: Cook 102; 183. Grand Bassa, in wet patches of forest near seashore (Oct.) Dinklage 2083! **IV. C.:** Basin of the Haut-Nuon (fr. Apr.) Chev. 21297.

6. *Artabotrys macrophyllus* Hook. f.—F.T.A. 1: 28. *APD acc*

A small glabrous tree.

F. Po: T. Vogel 137!

7. *Artabotrys velutinus* Sc. Elliot in J. Linn. Soc. 30: 71 (1894). *APD acc*

Artabotrys nigericus Hutch. in Kew Bull. 1921: 356; F.W.T.A., ed. 1, 1: 54.

Artabotrys djalonis A. Chev. Bot. 8, name only.

Scandent shrub or liane, with yellowish flowers.

Fr. G.: Kouroussa (Nov.) Pobéguin 590! **S. L.:** Falaba (Mar.) Sc. Elliot 5137! Bumbuna (fr. Oct.) Thomas 3676! Musala (fr. Dec.) Deighton 4453! **G. C.:** Akumadan (Oct.) Vigne 2558! **N. Nig.:** Naraguta (Aug.) Lely 541!

8. *Artabotrys libericus* Diels in Engl. Bot. Jahrb. 53: 446 (1915). *APD acc*

Shrub, with weak trailing branches; flowers greenish-yellow.

Lib.: Cook 102; 183. Between Jenneh and Cabiola (Apr.) Dinklage 2567.

9. *Artabotrys dahomensis* Engl. & Diels in Notizbl. Bot. Gart. Berl. 2: 299 (1899); Chev. Bot. 8. *APD acc*

Also in **French Cameroons**, **Gabon** and **Belgian Congo**.

11. *Artabotrys hispidus* Sprague & Hutch. in Kew Bull. 1916: 149. *APD acc*

S. L.: Roruks (Nov.) Thomas 5770! Magbile (Dec.) Thomas 6154!

7. XYLOPIA

Linn.—F.T.A. 1: 29; Engl. & Diels Monogr. Afr. Annonac. 57 (1901).

- 1 Flower-buds ovoid or ovoid-globose; outer petals more or less ovate, almost as broad as long:2
 Flower-buds lanceolate to linear, more or less pointed; outer petals more or less linear:3
- 2 Buds rounded at apex; calyx spreading, with ovate-triangular lobes about 5 mm. long; pedicels about 1 cm. long; leaves obovate-elliptic, subcuneate at base, 9–16 cm. long, 4–7.5 cm. broad, strongly reticulate [1. africana](#)
 Buds subacute at apex; calyx small, very shallowly lobed, lobes about 2–3 mm. long; pedicels about 3–4 mm. long; leaves as above but smaller [2. staudtii](#)
- 3 Inner petals (about 6 mm. long) much shorter than the outer (about 35 mm. long); leaves coriaceous, ovate-elliptic, 9–24 cm. long, 4–9 cm. broad, very shortly puberulous beneath, finely reticulate, lateral nerves faint, about 10 pairs, often rust-coloured; carpels about 10, narrow, 6–10 cm. long [3. rubescens](#)
 Inner and outer petals subequal:4
- 4 Outer petals 1–1.7 cm. long; flowers clustered, often nodding or reflexed in bud; leaves cuneate at base, almost glabrous beneath, up to 13 cm. long and 6 cm. broad, obovate; carpels few, stipitate, about 5 cm. long and 1 cm. diam. [4. quintasii](#)
 Outer petals 2.5 cm. or more long; flowers clustered or solitary, usually erect:5
- 5 Branchlets and leaves densely pilose with spreading hairs; flowers shortly pedicellate:6
 Branchlets and leaves at the most thinly pilose or pubescent or appressed pilose when young, glabrescent; flowers with short or long pedicels:8
- 6 Leaves cuneate at base, ovate-lanceolate, 5–9 cm. long, 2–3 cm. broad; flowers solitary, pedicels about 5 mm. long; outer petals about 2.5 cm. long [5. elliotii](#)

- Leaves rounded or obtuse at base; pedicels very short:7
- 7 Flowers usually fasciculate, petals with appressed hairs; leaves oblong-lanceolate, rounded or obtuse at base, acute at apex, 6–13 cm. long, 2–4 cm. broad; carpels several, sessile, thick, about 6 cm. long and 2 cm. broad, velutinous [6. villosa](#)
- Flowers solitary, petals with long spreading hairs; leaves similar to above but thinner and with a long acumen (about 1 cm.) [7. talbotii](#)
- 8 Pedicels long and very slender, 1–1.5 cm. long, petals narrowly linear with broad base, outer ones 4–4.5 cm. long; carpels few, subsessile, short and thick, 3–4 cm. long and 1.2–1.5 cm. diam.; leaves ovate-elliptic, obtuse or slightly acuminate, rounded at base, 3–8.5 cm. long and 2–3.5 cm. broad, petiole about 6 mm. long [8. parviflora](#)
- Pedicels short, or if up to 1 cm. then rather stout and petals not very narrow:9
- 9 Carpels very numerous (25 or more), narrow, 5–6 cm. long and 4–6 cm. broad; leaves elliptic to oblong, gradually acuminate, obtuse or rounded at base, up to 15 cm. long and 6 cm. broad, appressed pilose beneath when young, becoming rather shining above and glaucous beneath, reticulate; outer petals about 5 cm. long, thick and gradually narrowed to the apex; pedicels stout, up to 1 cm. long [9. aethiopica](#)
- Carpels fewer (5–10), shorter and relatively stout, about 3 cm. long and 1 cm. diam.; leaves ovate-elliptic to lanceolate, obtusely acuminate, obtuse or rounded at base, 4.5–10 cm. long, 2–3.7 cm. broad, thinly pilose beneath, glabrescent, midrib above hirsute; outer petals about 4.5 cm. long; flowers solitary and sessile [10. acutiflora](#)

1. **Xylopia africana** (*Benth.*) *Oliv.*—F.T.A. 1: 30 (1868); *Engl. & Diels Monogr. Afr. Annonac.* 59, partly.

APD: *Synonym of Xylopia staudtii Engl. & Diels*

Melodorum africanum Benth. (1862).

A tree of **montane forest**, 30–40 ft. high, with dark crimson veins on the leaves beneath; olive-brown silky buds.

S. Nig.: Ikwette Plateau, Obudu (fl. & fr. Dec.) Keay & Savory FHI 25179! **Br. Cam.**: Buea, 3,000 ft. (fl. & fr. Jan.) Maitland 233! Cam. Mt., 4,000 ft. (Feb.) Mann 1193!

Also in **S. Tomé**.

2. **Xylopia staudtii** *Engl. & Diels* in *Notizbl. Bot. Gart. Berl.* 2: 298 (1899). *APD acc*

Forest tree to 150 ft. high, with buttresses and stilt roots.

S. L.: Kambui (Aug.) Aylmer 596! **Lib.**: Firestone Plantation No. 3 (fl. & fr. Aug.) Cooper 66! Dukwia R. (fr. Feb., Mar.) Cooper 60! 139! **G. C.**: Abosso (Aug.) Vigne 982! Achembrom, Prestea (July) Vigne 1268! **S. Nig.**: Calabar Prov. (Nov.) Rosevear C. 21! **Br. Cam.**: Johann-Albrechtshöhe Staudt 530!

Also in **French Cameroons**, **Gabon** and **Angola**.

3. **Xylopia rubescens** *Oliv.*—F.T.A. 1: 30 (1868); *Engl. & Diels Monogr.* 60. *APD acc*

Xylopia humilis Engl. & Diels (1901).

Xylopia zenkeri Engl. & Diels (1907).

A **forest** tree, up to 90 ft.; leaves coriaceous, drying reddish; fruit-carpels slender, stoutly stipitate, cylindric, slightly twisted, with shallow constrictions.

Lib.: Grand Bassa Dinklage, 2006! **iv. C.**: Sanvi, Assinie (Apr.) Chev. 16321! Banco Aubrév. 507! **S. Nig.**: Sapoba, Kennedy 205! 2821! Calabar Thomson 53!

4. **Xylopia quintasii** *Engl. & Diels* *Monogr.* 62 (1901). *APD acc*

Xylopia striata Engl. (1904).

Xylopia lane-poolei Sprague & Hutch. (1916).

Xylopia parviflora of Chev. *Bot.* 15, partly.

A **forest** tree, to 90 ft. high, with clean straight bole and easily stripped bark; flowers cream.

S. L.: Kessewe (Apr.) Lane-Poole 123! Heddles Farm (Apr.) Lane-Poole 210! Njala (Feb) Deighton 4153! **Lib.:** Dukwia R. Cooper 222! **Iv. C.:** Bouroukrou (Dec.–Jan.) Chev. 16118! Abidjan Aubrév 38! **G. C.:** Adeambra (May) Vigne 856! Tanosu (fr. Sept.) Brent 389! **S. Nig.:** Omo F.R. (Mar.) Jones & Onochie FHI 17012! Sapoba Kennedy 702! Oban Talbot 1302!

Also in **Cameroons** and **S. Tomé**.

5. *Xylopia elliotii* Engl. & Diels Monogr. 65 (1901); Aubréy. Fl. For. C. Iv. 1: 112. *APD acc*

A small forest tree, to 30 ft. high, with sweet-scented flowers.

Fr. G.: Niger bank Sc. Elliot 5325! **S. L.:** Falaba (Mar.) Sc. Elliot 5288! **Iv. C.:** Abidjan (Feb.) Aubrév.

6. *Xylopia villosa* Chipp in Kew Bull. 1923: 183. *APD acc*

Xylopia macrocarpa A. Chev. Bot. 15, name only.

A forest tree to 80 ft. high and 4 ft. girth.

Iv. C.: Etérokrou to Tchumkrou (fr. Dec.) Chev. 22516! Abidjan (Jan.) Aubrév. 198! **G. C.:** Dunkwa Vigne 81! Jimira F. R. (Oct.) Vigne 3113! **S. Nig.:** Ibadan F. R. (Nov.) Punch 119! Benin Dist Kennedy 415! 417! Sapoba (Nov.) A. F. Ross 236! Degema Talbot 3775!

7. *Xylopia talbotii* Exell in J. Bot. 69: 98 (1931). *APD acc*

Xylopia villosa of F.W.T.A., ed. 1, 1: 53, partly.

Forest tree or shrub.

S. Nig.: Eket Talbot 3209! Oban Talbot 1601!

8. *Xylopia parviflora* (A. Rich.) Benth. in Trans. Linn. Soc. 23: 479 (1862); F.T.A. 1: 31; Engl. & Diels Monogr. 64; not of Spruce (1861), name only.

APD: *Synonym of Xylopia longipetala De Wild. & T. Durand*

Uvaria parviflora A. Rich. in Guill. & Perr. Fl. Seneg. 9 (1831).

Xylopia vallonii Chipp ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 53 (1927); Kew Bull. 1927: 152; Exell in J. Bot. 64, Suppl. Polypet. 8 (1926), name only.

Small tree or shrub of forests, especially fringing forests; common throughout the area. Petals with crimson base and yellow green tails. Ripe carpels, green outside, dehiscent, bright pink within, seeds green.

Sen.: Casamance Perrottet 7! **S. L.:** Karene Dist. Sc. Elliot 5730! Njala (Feb.) Deighton 1081! **Lib.:** Peahtah (fl. & fr. Oct.) Linder 910! 1017! 1115! **Iv. C.:** Comoe (Jan.) Aubrév. 667! **G. C.:** Tano R. (Dec.) Talmie 84! **Togo:** Kete-Krachi (fl. & fr. June) Vigne 3883! **Dah.:** between Savé and Agouagon (fr. May) Chev. 23586! **N. Nig.:** Nupe Barter 1035! Lokoja Barter 426! Anara F. R., Zaria (Oct.) Keay FHI 20129! **S. Nig.:** Olokemeji (fl. & fr. Oct.) Foster 99! Keay FHI 28044!

Extending to A.–E. **Sudan**, **Uganda** and **Angola**.

9. *Xylopia aethiopica* (Dunal) A. Rich.—F.T.A. 1: 32; Engl. & Diels Monogr. 60. *APD acc*

Unona aethiopica Dunal (1817).

Xylopia eminii of Chev. Bot. 15, not of Engl.

A tree, up to 60 ft. high with greenish-white fragrant flowers; fruit a cluster of very numerous narrow dark brown carpels.

Sen.: Niayes (Dec.) Chev. 2545! **Gam.:** Ingram! **Fr. G.:** Rio Nunez Heudelot! Conakry Maclaud 189! **S. L.:** Sc. Elliot! Waterloo (June) Lane-Poole 319! **Lib.:** Grand Bassa Dinklage 2005! Dukwia R. (fr. Feb.) Cooper 174! **Iv. C.:** Bouaké Aubrév. 828! **G. C.:** Eady! **Togo:** Alavanyo (Nov.) St. Clair Thompson 3656! Kersting A. 181! **Dah.:** Adjara Chev. 22747! **S. Nig.:** Eppah Barter 3268! Nun R. Mann 485! Eket Talbot 3281! Calabar (Mar.) Holland 296!

Also in **Gabon** and **Principe**.

The closely related *X. eminii* Engl. is widespread in E. Africa.

10. *Xylopia acutiflora* (Dunal) A. Rich.—F.T.A. 1: 32; Engl. & Diels Monogr. 63. *APD acc*

Unona acutiflora Dunal (1817).

Xylopia oxypetala (DC.) Oliv. ex Engl. & Diels Monogr. l.c.

Xylopia thomsonii Olliv. F.T.A. 1: 31 (1868).

Xylopia dinklagei Engl. & Diels l.c.

A shrub or small tree of **forest**; fruits scarlet.

S. L.: Afzelius! Bagroo R. (Apr.) Mann 14! Kumrabai (Dec.) Thomas 6972! Near Dodo (Apr.) Deighton 3808! **Lib.:** Grand Bassa (May) Dinklage! **Iv. C.:** Ebrie Lagoon Aubrév. 1537! **G. C.:** Kumasi Cummins 117! **Togo:** Sihabola (Mar.) Kersting 67! **S. Nig.:** Lagos (Dec.) Dalz. 1144! Sapoba Kennedy 2276! Old Calabar Thomson 63! Cross R. (Mar.) Johnston! Oban Talbot 1353! **Br. Cam.:** Johann-Albrechtshöhe Staudt 504! Bamenda 3,000–3,500 ft. (May) Maitland 1731! Johnstone 70/31!

Also in **French Camerouns** and **Ubangi-Shari-Chad**.

Xylopia sp.

Forest tree "with red upper bark."

S. Nig.: Okwango, Ikom (fl. Nov., fr. Dec.) Catterall 51! 61!

Imperfectly known species.

8. NEOSTENANTHERA

Exell in J. Bot. 73, Suppl. Polypet. 5 (1935).

Stenanthera Engl. & Diels (1900), not of R. Br. (1810).

- 1 Leaves closely appressed puberulous and glaucous beneath; branchlets and pedicels sparingly pubescent, the latter only slightly thickened towards the apex; outer petals up to 3 cm. long:2
 Leaves more or less densely rusty pubescent with spreading hairs beneath, especially on midrib and nerves; branchlets and pedicels densely rusty tomentose, the latter markedly thickened towards the apex; leaves oblong-elliptic, 7–14 cm. long, 3–5 cm. broad, with 8–10 pairs of lateral nerves; outer petals up to 7 cm. long; fruiting carpels ellipsoid, rusty tomentose, up to 20 mm. long and 11 mm. broad, not ribbed, on stipes 1–8 cm. long[3. hamata](#)
- 2 Leaves rounded at base, elongate-oblong to broadly oblanceolate, 15–30 cm. long, 5–10 cm. broad, with about 15 pairs of lateral nerves; outer petals up to 2.5 cm. long; fruiting carpels very numerous, ovoid, about 6 mm. long (? mature), not ribbed, on stipes about 5 mm. long[1. myristicifolia](#)
 Leaves cuneate to obtuse at base, oblong-obovate, 9–16 cm. long, 3–6 cm. broad, with 7–12 pairs of lateral nerves; outer petals up to 3 cm. long; fruiting carpels ellipsoid, up to 25 mm. long and 5 mm. broad, longitudinally ribbed, on stipes 5–15 mm. long[2. gabonensis](#)

1. *Neostenanthera myristicifolia* (Oliv.) *Exell* in J. Bot. 73, Suppl. Polypet. 6 (1935). *APD acc*

Oxymitra myristicifolia Oliv. F.T.A. 1: 33.

Stenanthera myristicifolia (Oliv.) Engl. & Diels Monogr. Afr. Annonac. 67; F.W.T.A., ed. 1, 1: 56.

Slender-stemmed **forest** tree, to 15 ft. high; flowers green at first, yellow when mature; fruits green.

S. Nig.: Newi (fr. Jan.) Kitson! Okomu F. R. (fl. & fr. Feb.) Brenan 9015! 9015a! Sapoba (May) Ainslie 308! Calabar Thomson 134!

Also in **French Camerouns**.

2. *Neostenanthera gabonensis* (Engl. & Diels) *Exell* l.c. 6 (1935). *APD acc*

Oxymitra gabonensis Engl. & Diels in Notizbl. Bot. Gart. Berl. 2: 297 (1899).

Stenanthera gabonensis (Engl. & Diels) Engl. & Diels Monogr. 68, t. 24a.

Stenanthera bakuana A. Chev. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 56 (1927); Chev. Bot. 15, name only; Aubrév. Fl. For. C. Iv. 1: 118, t. 40b.

Neostenanthera bakuana (A. Chev. ex Hutch. & Dalz.) *Exell* l.c.

Shrub or small tree to 25 ft. high in **forest**.

Lib.: Dukwia R. (Mar., May) Cooper 306! 416! Gbanga (fr. Sept.) Linder 560! **Iv. C.:** Banco (Jan.) Aubrév. 884! 1936! Bingerville Chev. 15429! **G. C.:** Ankasa, W. P. (fr. Dec.) Vigne 3173! Aguna (Aug.) Vigne 1308! Dunkwa, W. P. (fr. Oct.) Akpabla 870!

Also in **Gabon**.

3. *Neostenanthera hamata* (Benth.) Exell l.c. 6 (1935). *APD acc*

Oxymitra hamata Benth.—F.T.A. 1: 33.

Stenanthera hamata (Benth.) Engl. & Diels Monogr. 68, t. 24b; F.W.T.A., ed. 1, 1: 56; Aubrév. l.c. 1: 116, t. 40a.

Neostenanthera yalensis Hutch. & Dalz. ex Cooper & Record in Yale Univ. For. Bull. 31: 17 (1931); F.W.T.A., ed. 1, 2: 605 (1936).

Tree to 50 ft. high, in **forest**.

S. L.: Bagroo R. (Apr.) Mann 876! Sherbro Sc. Elliot 5861! Port Loko (Dec.) Thomas 6677! Kambui (fr. Aug.) Edwardson 144! **Lib.:** Dukwia R. (fl. & young fr. Apr.) Cooper 371! **Iv. (Jan.) Andoh F H 5458! **S. Nig.:** Calabar Thomson 109! Arochuku Akpata FHI 3933!

Also in **French Cameroons** and **Gabon**.

2. *Polyalthia sauveolens* Engl. & Diels l.c. 42 (1901); Kennedy For. Fl. S.Nig. 11. *APD acc*

Forest tree with straight bole, to 65 ft. high.

S. Nig.: Sapoba (Aug.–Oct.) Kennedy 1544! 1617! Okomu F. R. (fr. Feb.) Brenan 9112! Afi River F. R. Keay!

Extends to **Belgian Congo** and **Angola**.

10. POPOWIA

Endl.—Engl. & Diels Monogr. Afr. Annonac. 43 (1901).

Note-species 8 and 9 differ somewhat from the other species of *Popowia* and may perhaps represent distinct genera.

- 1** Flowers unisexual; male borne on leafy shoots in cymes 2–3 cm. diam.; female in dense many-flowered cymes 7–15 cm. diam., on leafless branches of several season's growth; leaves oblong-elliptic to oblong-obovate, 7–23 cm. long, 3.5–8 cm. broad; fruiting carpels torulose with 1–6 ellipsoid seeds: **2**

Flowers hermaphrodite; flowers solitary, paired, or in few-flowered cymes or lax racemes, usually on leafy branches: **3**

- 2** Stem and under surface of leaves densely hirsute; male flowers in slender cymes; male buds 2–3 mm. diam. .. *1. declina*

- Stem puberulous or tomentellous; leaves puberulous or glabrous beneath; male flowers in robust cymes; male buds 3·5–4 mm. diam [2. cauliflora](#)
- 3 Bracteole large, foliaceous, suborbicular, amplexicaul, 8–13 mm. diam.; flowers solitary, extra-axillary, pedicel 2·5–4 cm. long; leaves oblong-elliptic, rounded to subcordate at base, obtuse at apex, 3·5–10 cm. long, 1·5–4·5 cm. broad [3. littoralis](#)
- Bracteole small, less than 5 mm. long: [4](#)
- 4 Sepals much shorter than the petals, more or less triangular, not more than 3 mm. long; buds globose: [5](#)
- Sepals at least 5 mm. long, more than half as long as the petals, lanceolate or ovate-lanceolate; buds ovoid: [8](#)
- 5 Flowers in few-flowered cyme on woody branches below the leaves; inflorescence, sepals and petals rusty tomentellous; leaves subelliptic, rounded at base, obtuse at apex, 10–16 cm. long, 4·5–6·5 cm. broad, sparsely puberulous and greyish beneath; carpels with 2 ovules [4. whytei](#)
- Flowers solitary, mainly among the leaves on the current season's growth: [6](#)
- 6 Segments of the fruiting carpels cylindrical, 1·5–2·5 cm. long; leaves elliptic to obovate-elliptic, rounded to subcordate at base, obtuse or shortly acuminate at apex, 4·5–17 cm. long, 2·5–6·5 cm. broad; pedicel 5–7 mm. long [5. congensis](#)
- Segments of the fruiting carpels globose to shortly ellipsoid, 5–10 mm. long; leaves up to 7·5 cm. long and 3 cm. broad: [7](#)
- 7 Pedicel 12–25 mm. long, borne about 1 mm. above the axil on the same side of the stem as the leaf; leaves oblong, rounded at base, acute to obtuse at apex, 5–7·5 cm. long, 2–3 cm. broad; fruiting carpels 1-seeded .. [6. nimbana](#)
- Pedicel 2·5–5 mm. long, borne more or less at the node on the side of the stem opposite to the leaf; leaves oblanceolate to oblong-elliptic, rounded to subcordate at base, obtuse to rounded and slightly emarginate at apex, 2·5–7·5 cm. long, 1·5–3·5 cm. broad; fruiting carpels 1–5-seeded [7. oliveriana](#)
- 8 Stem and leaves sparingly puberulous; leaves broadly oblanceolate, obtuse at base, acutely and rather broadly acuminate, 5–13 cm. long, 2–4 cm. broad; flowers axillary, solitary, pedicels about 1·5 cm. long; sepals and outer petals about 5 mm. long [8. stenosepala](#)
- Stem and leaves densely long-hirsute; leaves oblong to oblong-elliptic, cordate or subcordate at base, obtuse or shortly acuminate at apex, 11–19 cm. long, 4·5–7·5 cm. broad; flowers in axillary few-flowered lax racemes, with rhachis up to 13 cm. long, rarely solitary or paired; sepals 5–10 mm. long, outer petals 8–15 mm. long [9. filamentosa](#)

1. **Popowia declina** *Sprague*—Chipp in Kew Bull. 1923;. 182; Sprague in Kew Bull. 1908: 53, partly; Boutique in Fl. Congo Beige 2: 343 (1951).

APD: *Synonym of Monanthotaxis diclina (Sprague) Verdc.*

APD: *Synonym of Monanthotaxis cauliflora (Chipp) Verdc.*

ClathrospERMUM mannii *Oliv.* F.T.A. 1: 25, partly (male spec.).

Popowia mannii of Engl. & Diels Monogr. Afr. Annonac. 45, partly, not of Baill.

Popowia ferruginea of Cooper & Record in Yale Univ. For. Bull. 31: 17 (1931), not of Engl. Liane.

Lib.: Dukwia R. Cooper 199!

Also in **French Camerouns**, **Gabon** and **Belgian Congo**.

2. **Popowia cauliflora** *Chipp* l.c. (1923); Boutique l.c. 2: 344.

APD: *Synonym of Monanthotaxis cauliflora (Chipp) Verdc.*

ClathrospERMUM mannii *Oliv.* F.T.A. 1: 25, partly (female spec.).

Popowia mannii of Engl. & Diels l.c., partly, not of Baill.

Popowia declina *Sprague* in Kew Bull. 1908: 53, partly.

A lotty-climbing shrub.

S. Nig.: Calabar Thomson! & Oban Talbot!

Also in **French Camerouns**, **Gabon** and **Belgian Congo**.

3. **Popowia littoralis** *Bagshawe & Bak. f.* in J. Bot. 46: 221 (1908); Boutique l.c. 2: 347 (1961).

APD: *Synonym of Monanthotaxis littoralis (Bagsh. & Baker f.) Verdc.*

Shrub or small tree.

Br. Cam.: Bambui, Bamenda (June) Maitland 1618!

Also in **Gabon**, **Belgian Congo** and **Uganda**.

4. **Popowia whytei** *Stapf* in Johnston Lib. 2: 575 (1906).

APD: Synonym of Monanthotaxis whytei (Stapf) Verdc.

Popowia prehensilis A. Chev. Bot. 11, name only.

A shrub, erect or climbing; flowers yellowish; fruit yellow.

Lib.: Sinoe Basin Whyte! **iv. C.:** Bingerville (young fr. Dec.) Chev. 16048. Guébo to Mbago (fr. Feb.) Chev. 17077. Byanouan Soubiré (Mar.) Chev. 17701.

5. **Popowia congensis** (*Engl. & Diels*) *Engl. & Diels* l.c. 44 (1901); Boutique in Fl. Congo Belge 2: 362 (1951).

APD: Synonym of Monanthotaxis laurentii (De Wild.) Verdc.

Annona congensis *Engl. & Diels* (1899).

Popowia heudelotii of F.W.T.A., ed. 1, 1: 55 and of *Engl. & Diels Monogr. Afr. Annonac.* 51, partly, not of Baill.

A scandent shrub, up to 6 ft.; fault yellow, orange or red.

S. L.: Ronietta (fr. Aug.) Thomas 1642! Jigaya (fr. Sept.) Thomas 2705! **Lib.:** Zigida (Mar.) Bequaert 140! **iv. C.:** Guidéko (fr. June) Chev. 19490! **S. Nig.:** Gambari F. R., Ibadan (fr. Aug.) Onochie FHI 19139! Onitsha (fr. May) Barter 1335! Unwin 49! Degema Talbot 3726! 3727!

Also in **Ubangi** and **Belgian Congo**.

6. **Popowia nimbana** *Schnell* in Bull. Inst. Fr. Afr. Noire 15: 93, t. 1 (1953).

APD: Synonym of Monanthotaxis nimbana (Schnell) Verdc.

Slender scandent shrub; leaves glaucous beneath; in montane forest.

Fr. G.: Mt. Nimba, 4,000–5,100 ft. (fl. Apr., fr. Feb., Sept.) Schnell 3516! 5202! 4399. Mt. Ziama, 4,200 ft. (fl. May, fr. Feb.) Schnell 2636! 4541.

7. **Popowia oliveriana** *Exell & Mendonça* in Consp. Fl. Ang. 1: 24 (1937); Boutique l.c. 2: 353.

Unona parvifolia *Oliv.* F.T.A. 1: 36.

Popowia parvifolia (*Oliv.*) *Engl. & Diels* l.c. 46 (1901), not of Kurz (1875).

Fr. Sud.: R. Niger, Bamako Chev. 26908! **Fr. G.:** Kouroussa Pobéguin 823!

Also in **Ubangi**, **Belgian Congo**, **N. Rhodesia** and **Angola**.

8. **Popowia stenosepala** *Engl. & Diels* *Monogr. Afr. Annonac.* 49 (1901).

APD: Synonym of Monanthotaxis stenosepala (Engl. & Diels) Verdc.

Shrub; fruiting carpels 1–2-seeded.

S. L.: Madina, Limba (Apr.) Sc. Elliot 5564! Port Loko (Apr.) Sc. Elliot 5882! Mayosso (fr. Aug.) Thomas 1446!

9. **Popowia filamentosa** *Diels* in *Engl. Bot. Jahrb.* 39: 478 (1907); Boutique l.c. 2: 356.

APD: Synonym of Monanthotaxis filamentosa (Diels) Verdc.

Liane with golden-brown hair on shoots; leaves metallic grey beneath; calyx green, outer petals pale brown, inner petals rich pink.

S. Nig.: Aboabam (Dec.) Keay FHI 28187! **Br. Cam.:** Bulifambo, Buea (Mar.) Maitland 566!

Also in **French Cameroons**, **Ubangi** and **Belgian Congo**.

Popowia lucidula (*Oliv.*) *Engl. & Diels* (see *Boutique* l.c. 351)

Talbot 41 from Oban, S. Nigeria recorded as *Popowia vogelii* (Hook. f.) Baill. in Ed. 1, is possibly *P. lucida*, but there can be no certainty as the specimen lacks flowers and the species is not otherwise known from our area. Imperfectly known species.

11. OXYMITRA

Hook. f. & Thoms.—*Sprague & Hutch.* in *Kew Bull.* 1916: 153.

- 1 Pedicels slender, about 2 cm. long or more; branchlets more or less glabrous:2
 Pedicels short and stoutish, about 1 cm. long or less; branchlets more or less hirsute:5
- 2 Leaves shortly acuminate, acumen not much more than 1 cm. long:3
 Leaves acutely long-acuminate, acumen about 2 cm. long; blade obovate-oblong, 7–14 cm. long, 2.5–4.5 cm. broad, more or less glaucous and minutely pubescent beneath; outer petals lanceolate, 2 cm. long, puberulous, the inner connivent, less than half as long as the outer[4. rosea](#)
- 3 Flowers in fascicles of about 3; pedicels about 3 cm. long; leaves subacute at base, oblong, 7–15 cm. long, 3–5 cm. broad, pale glaucous-green beneath, glabrous; petals minutely pubescent, the outer 7–8 mm. long, triangular; fruit ribbed, about 2 cm. long, glabrous[1. longipedicellata](#)
 Flowers solitary; pedicels about 2 cm. long:4
- 4 Leaves obovate, rounded or obtuse at base, 7–11 cm. long, 2.5–3.5 cm. broad, slightly hairy and more or less glaucous beneath; outer petals ovate, 1.2 cm. long, minutely pubescent; inner petals connivent, about half as long as the outer; fruiting carpels stipitate, 1–4-seeded, moniliform[2. gracilis](#)
 Leaves elliptic, rounded at base, 6–12 cm. long, 3–5 cm. broad, glabrous and glaucous beneath; flowers small (seen only in the young stage)[3. gracilipes](#)
- 5 Leaves glabrous, very glaucous beneath; oblong or oblong-elliptic, acutely long-acuminate, slightly cordate at base, 12–25 cm. long, 4–7 cm. broad, with numerous slender tertiary nerves; inner petals glabrous; fruiting carpels shortly stipitate, 1–2.5 cm. long, tomentellous[5. glaucifolia](#)
 Leaves pubescent or pilose on the nerves and veins beneath:6
- 6 Leaves narrowed towards the base, oblong or oblong-oblancheolate, up to 6.5 cm. broad:.....7
 Leaves broadly elliptic, rounded to a shortly cordate base, 8–12 cm. long, 3.5–8 cm. broad, acuminate to rounded or emarginate at apex, pilose on the nerves beneath; outer petals ovate, acute, 1.7 cm. long, silky and strongly nerved; fruiting carpels oblong, stipitate, 3.5 cm. long, hirsute[8. hirsuta](#)
- 7 Branchlets shortly and densely tomentose; leaves oblong-elliptic to oblong-oblancheolate, shortly and obtusely acuminate, subcordate at base, 9–18 cm. long; outer petals ovate-lanceolate, 1–1.3 cm. long, 5–6 mm. broad, tomentellous outside; inner petals about half as long[6. velutina](#)
 Branchlets loosely bristly pilose; leaves subsessile, 10–14 cm. long, slightly glaucous and laxly pilose on the nerves beneath; sepals broadly ovate, about 0.5 cm. long; outer petals ovate, 1.5 cm. long, nervose; inner petals glabrous[7. obanensis](#)

1. Oxymitra longipedicellata (*Bak. f.*) *Sprague & Hutch.* in *Kew Bull.* 1916: 154.

APD: Synonym of Friesodielsia gracilipes (*Benth.*) *Steenis*

Oxymitra albida var. *longipedicellata* *Bak. f.* in *Cat. Talb.* 3 (1913).

A climbing shrub; petals yellowish, mauve inside at the base; fruits scarlet.

S. Nig.: Oban Talbot 1559! 1677! Afi River F. R. (fr. May) Jones & Onochie FHI 18634! **Br. Cam.:** Bulifambo, Buea, 2,500 ft. (Mar.) Maitland 536!

2. Oxymitra gracilis (*Hook. f.*) *Sprague & Hutch.* l.c. (1916).

APD: Synonym of Friesodielsia gracilis (*Hook. f.*) *Steenis*

Uvaria gracilis *Hook. f.* in *Fl. Nigrit.* 210 (1849); *F.T.A.* 1: 22; *Engl. & Diels Monogr. Afr. Annonac.* 22.

Oxymitra platypetala *Benth.*—*F.T.A.* 1: 33.

Cleistopholis platypetala (*Benth.*) *Engl. & Diels.*

Unona millenii Engl. & Diels; Chev. Bot. 10.

Small liane with flattened stems, leaves metallic grey beneath; flowers dull greenish-purple.

S. L.: Bagroo R. (Apr.) Mann 857! Kambia (Jan.) Sc. Elliot 4382! **Lib.:** Banga (fr. Oct.) Linder 1212! **Iv. C.:** Bingerville Chev. 15433! **S. Nig.:** Lagos (fl. & fr. Mar.) Millen 149! Dalz. 1096! Akure F. R. (Nov.) Keay FHI 25599! Eket Talbot 3381!

3. **Oxymitra gracilipes** Benth.—F.T.A. 1: 33.

APD: Synonym of Friesodielsia gracilipes (Benth.) Steenis

A shrub, up to 25 ft. high with greenish-white petals.

F. Po: on the beach Mann 251!

Probably very close to *O. albida* (Engl.) Sprague & Hutch.

4. **Oxymitra rosea** Sprague & Hutch. l.c. (1916).

APD: Synonym of Friesodielsia rosea (Sprague & Hutch.) Steenis

A shrub with flexuous grey branches covered with lenticels; flowers pendulous, bright pink.

S. Nig.: Oban Talbot 199!

5. **Oxymitra glaucifolia** Hutch. & Dalz. F.W.T.A., ed. 1, 1: 57 (1927); Kew Bull. 1927: 153.

APD: Synonym of Friesodielsia glaucifolia (Hutch. & Dalziel) Steenis

A shrub.

S. Nig.: Oban Talbot 403! 1255!

6. **Oxymitra velutina** Sprague & Hutch. l.c. 156 (1916).

APD: Synonym of Friesodielsia velutina (Sprague & Hutch.) Steenis

Forest liane with flexuous rusty branches and red fruits.

S. L.: Yonibana (fl. & fr. Nov.) Thomas 4701! 5005! Makump (fr. July) Thomas 968! Near Roruks (fl. & fr. July) Deighton 2498!

7. **Oxymitra obanensis** (Bak. f.) Sprague & Hutch. l.c. (1916).

APD: Synonym of Friesodielsia enghiana (Diels) Verdc.

Unona obanensis Bak. f. in Cat. Talb. 1 (1913).

Shrub; inflorescence with a broad hairy bract at the base of the peduncle; outer petals apricot red, inner dull-orange.

S. Nig.: Oban Talbot 1246! 1323!

8. **Oxymitra hirsuta** (Benth.) Sprague & Butch. l.c. 155 (1916).

APD: Synonym of Friesodielsia hirsuta (Benth.) Steenis

Unona hirsuta Benth.—F.T.A. 1: 35; Chev. Bot. 10.

Uvaria caillei A. Chev. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 50; Chev. Bot. 5.

Small **forest** liane, to 20 ft. high, outer petals green, inner brownish; vegetatively very like *Popowia filamentosa* Diels.

Fr. G.: Mamou (Nov.) Chev. 14817! Dalaba to Mamou (Jan.) Chev. 20341! **S. L.:** Talla Hills (fr. Feb.) Sc. Elliot 4854! **Iv. C.:** Bingerville Chev. 15428! Guidéko (May) Chev. 15408! **Br. Cam.:** Likomba (Dec.) Mildbr. 10777! **F. Po:** (Nov.) Mann 559!

12. POLYCERATOCARPUS

Engl. & Diels Monogr. Afr. Annonac. 67 (1901).

Alphonseopsis Bak. f. in Cat. Talb. 3 (1913).

- 1 Leaves oblong to elliptic, glabrous above, glaucous beneath, apex acuminate, 18–23 cm. long, 4–7 cm. broad, main lateral nerves 9–11 pairs; pedicels up to 6 mm. long; bracteoles several; petals yellow, the outer up to 9 mm. long, the inner slightly smaller [parviflorus](#)

Polyceratocarpus parviflorus (*Bak. f.*) *Ghesq.* in Rev. Zool. & Bot. Afr. 32: 140 (1939); Pellegr. in Bull. Soc. Bot. Fr. Mém. 1949: 68 (1950). *APD acc*

Alphonseopsis parviflora Bak. f. in Cat. Talb. 3, t. 1 (1913); F.W.T.A., ed. 1, 1: 52.

Uvaria microtricha of Chev. Bot. 7.

Uvaria scabrada of F.W.T.A., ed. 1, 1: 50, partly.

Small tree or shrub, to 20 ft. high; flowers creamy-white; leaves pale duck's egg blue beneath.

Iv. C.: Dyolas (fr. Apr.) Chev. 21343! Guidéko (fl. & fr. May, fr. June) Chev. 16423! 19032! **G. C.:** Atromi, W. Ashanti (Aug.) Vigne 2473! Nkinkaso (fr. Oct.) Vigne 2544! **S. Nig.:** Sapoba Kennedy 260! 772! 1980! Oban Talbot 1607!

Also in **Gabon**.

13. UVARIODENDRON

(*Engl. & Diels*) *R. E. Fries* in Act. Hort. Berg. 10: 51 (1931). *APD acc*

- 1 Flowers axillary, solitary among the leaves on relatively young shoots; leaves up to 40 cm. long and 7–12 cm. broad, elongate-obovate, rounded to slightly cuneate at base, abruptly acuminate, quite glabrous, usually with at least 20 pairs of lateral nerves, petiole 4–10 mm. long, stout; pedicel about 1.5 cm. long; sepals broadly ovate, about 1 cm. long, shortly tomentellous outside; outer petals broadly ovate, 2.6–2.8 cm. long, 2 cm. broad, shortly tomentellous; fruiting carpels glabrous, ellipsoid, about 4 cm. long, and 3 cm. broad [1. connivens](#)

Flowers on older branches or trunk, well below the leafy shoots; fruiting carpels (where known) pubescent: **2**

- 2 Branchlets, petioles and midrib and nerves on lower surface of mature leaves glabrous, or sparsely appressed pubescent: **3**

Branchlets, petioles and midrib and nerves on lower surface of leaves densely tomentose even when mature; leaves 40–60 cm. long, 12–20 cm. broad, oblanceolate, rounded at base, broadly rounded to almost truncate at apex but with abrupt acumen about 2 cm. long; flowers about 4 cm. diam., fruiting carpels velvety brown ... [2. calophyllum](#)

- 3 Mature leaves up to 20 cm. long, with 8–16 pairs of lateral nerves, broadest at about the middle: **4**

Mature leaves exceeding 20 cm. long, with more than 15 pairs of lateral nerves, broadest rather above the middle: **5**

- 4 Leaves cuneate at base, 10–18 cm. long, 3–7 cm. broad, narrowly elliptic to lanceolate, gradually acuminate, with 8–11 pairs of lateral nerves rather obscure beneath; leaf-buds densely silky but leaves very soon glabrous; outer petals oblong-ovate, 2–2.5 cm. long, 1.2–1.4 cm. broad, densely silky outside; fruits not known [2. angustifolium](#)

Leaves rounded at base, 12–20 cm. long, 3.5–6.5 cm. broad, elongate-elliptic, shortly and obtusely acuminate, with 14–16 pairs of lateral nerves prominent beneath; outer petals ovate, 1.5–1.7 cm. long, 1–1.2 cm. broad; fruit not known [3. letestui](#)

- 5 Mature leaves up to 50 cm. long and 13 cm. broad, with 15–20 pairs of lateral nerves, obtuse to cuneate at base: **6**

Mature leaves 40–60 cm. long, 10–20 cm. broad, with 25–30 pairs of lateral nerves, rounded at base, oblong-oblanceolate, shortly acuminate; flowers 7–8 cm. diam. [6. giganteum](#)

- 6 Outer petals 2.5–3.5 cm. long, appressed pubescent outside, broadly ovate, 2–2.5 cm. broad; calyx with short triangular lobes leaving the petals almost completely exposed even in early bud stages; leaves 15–30 cm. long, 2.5–9 cm. broad, broadly oblong-oblanceolate, abruptly acuminate, lateral nerves prominent beneath and

impressed above; leaf-buds densely pubescent, leaves appressed pubescent beneath, becoming glabrous when old; fruiting carpels cylindrical with transverse grooves, closely grey pubescent, about 4 cm. long and 1·8 cm. diam., stipes about 1 cm. long [4. *mirabile*](#)

Outer petals 1·5–2·5 cm. long, long silky-pilose outside, suborbicular, 1·5–2 cm. broad; calyx cupular at first in bud and covering a large part of the corolla up to a late stage; leaves 20–50 cm. long, 5–13 cm. broad, oblong-oblancoate, obtuse acuminate, lateral nerves not impressed above, leaf-buds densely pubescent, leaves soon glabrous except for appressed hairs on and by the midrib; fruit not known [5. *fuscum*](#)

1. **Uvariodendron connivens** (*Benth.*) *R. E. Fries* in Act. Hort. Berg. 10: 55 (1931). *APD acc*

Uvaria connivens *Benth.* in Trans. Linn. Soc. 23: 465 (1862); F.T.A. 1: 20; F.W.T.A., ed. 1, 1: 50.

Understorey tree in [forest](#), to 40 ft. high, sepals green, petals purple.

S. Nig.: Oban Talbot 62! 404! 1254! Aboabam, Ikom (Dec.) Keay FHI. 28191! **Br. Cam.:** Buea (Mar.) Maitland 537! Buea to Mayuko (fr. Feb.) Dalz. 8243! Amba Bay (Feb.) Mann 763! **F. Po:** Mann 1159!

14. UVARIASTRUM

Engl.—Engl. & Diels Monogr. Afr. Annonac 31 (1901); Sprague & Hutch, in Kew Bull. 1916: 159.

- 1 Sepals broadly triangular; buds acutely angled and winged towards the apex:2
 Sepals ovate-lanceolate rounded at apex, early caducous; buds not sharply angled and not winged; flowers usually several together on short slender lateral branches, or more rarely solitary, supra-axillary:4
- 2 Sepals sparsely pubescent or glabrescent outside, 17–25 mm. long, 8–19 mm. broad; outer petals 15–35 mm. long; pedicels 1.5–3 cm. long; leaves oblong-ob lanceolate, 9–20 cm. long, 3–6 cm. broad, cuneate, acuminate, glabrous, with 10–15 pairs of lateral nerves prominent beneath, not impressed above; flowers on old twigs or trunk, solitary or several in a fascicle [1. zenkeri](#)
 Sepals densely pilose:3
- 3 Sepals 18–30 mm. long, 10–20 mm. broad, shortly pilose; buds acute and markedly winged at apex; outer petals 23–42 mm. long, pedicels 1.5–7 cm. long; leaves oblanceolate to obovate-elliptic, 5.5–16 cm. long, 3–5 cm. broad, cuneate at base, long-acuminate, sparsely pubescent, with 9–12 pairs of lateral nerves not impressed above; flowers on old twigs, solitary or several together; fruiting carpels oblong, up to 7 cm. long, 3 cm. broad and 2 cm. thick, densely tomentose, smooth [2. pierreanum](#)
 Sepals 10–18 mm. long, up to 10 mm. broad, densely long ferruginous pilose; buds obtuse and only slightly winged at apex; outer petals 1.5–2.5 cm. long, pedicels up to 1.5 cm. long; leaves oblong-ob lanceolate, 8–15 cm. long, 3–4.5 cm. broad, rounded at base, long-acuminate, pubescent on midrib beneath, with 8–12 pairs of lateral nerves, impressed above and prominent beneath; flowers solitary, axillary, on leafy twigs and just below; fruiting carpels cylindrical up to 9 cm. long and 2 cm. diam., acute at the apex, longitudinally ridged, pilose [3. insculptum](#)
- 4 Leaves more or less coriaceous, pubescent on the midrib above; pedicels and sepals densely pilose:5
 Leaves chartaceous, almost glabrous from youth, midrib above glabrous; pedicels and sepals thinly pubescent; otherwise as var. *elliotianum* [4b. elliotianum var. glabrum](#)
- 5 Leaves very thick, densely brown-sericeous when young, lanceolate-elliptic, gradually long-acuminate, 12–24 cm. long, 4–7 cm. broad; petals 18 mm. long [4a. elliotianum var. sericeum](#)
 Leaves somewhat thinner, and less densely hairy, obovate-elliptic rather abruptly acuminate, 8–20 cm. long, 2.5–6 cm. broad; petals 14–16 mm. long [4. elliotianum var. elliotianum](#)

1. *Uvariastrum zenkeri* Engl. & Diels in Engl. Bot. Jahrb. 39: 473 (1907). *APD acc*

2a. *Hexalobus monopetalus* var. *parvifolius* Bak. f. in Cat. Talb. 5 (1913).

APD: Synonym of *Hexalobus monopetalus* (A. Rich.) Engl. & Diels var. *monopetalus*

Hexalobus glabrescens Hutch. & Dalz. in Kew Bull. 1927: 152; F.W.T.A., ed. 1, 1: 52.

A small tree or shrub of savannah; flowers yellow; fruiting carpels irregularly ovoid, or cylindrical, orange yellow.

G. C.: Pabarabo Hill (fr. May) Kitson 1110! Aframso (Oct.) Vigne 4030! **N. Nig.:** Lere to Ham Talbot 531! Yola (Oct.) Shaw 103! Song (fr. May) Rosevear FHI 26603!

Extends to east and south tropical Africa.

16. MONOCYCLANTHUS

Keay in Kew Bull. 1953: 69.

- 1 Branchlets and leaves glabrous; leaves oblong-elliptic, cuneate at base, gradually acuminate, 13–25 cm. long, 5–7.5 cm. broad, with a swollen sulcate petiole, 5–7 mm. long, lamina minutely and densely gland-dotted; inflorescence on stem and older branches, fasciculate, few-flowered; petals 6, valvate in a single whorl, triangular-lanceolate, 14–16 mm. long, up to 4–6 mm. broad, exposed in bud; receptacle ellipsoid with very numerous linear stamens; carpels free, about 7, densely pilose; fruits not known [vignei](#)

Monocyclanthus vignei Keay in Kew Bull. 1953: 69. *APD acc*

A forest tree, to 20 ft. high; cauliflorous; petals yellow.

G. C.: Benso (Sept.) Vigne 4744! Ankasa F. R. (Dec.) Viyne 3175!

17. ENNEASTEMON

Exell in J. Bot. 70 Suppl. 1: 209 (1932).

ClathrospERMum Planch. ex Benth. & Hook. f. Gen. Pl. 1: 29 (1862).

- 1 Flowers solitary or paired: 2

- Flowers in cymes of more than 2 flowers; flower-buds depressed-subglobose; pedicels, sepals and petals densely rusty tomentellous outside; leaves without marginal glands at the base:.....**5**
- 2** Flower-buds ovoid just before opening; pedicels, sepals and petals puberulous outside; leaves without marginal glands at the base:**3**
- Flower-buds depressed-subglobose before opening; pedicels, sepals and petals densely rusty tomentellous outside; leaves with a pair of marginal glands at the base; fruiting carpels, 2–4-seeded, brown tomentose:.....**4**
- 3** Leaves oblong-obovate, rounded to subcordate at the broad base, 8–15 cm. long, 3.5–6.5 cm. broad; lateral nerves 6–10 pairs; fruiting carpels 1– (rarely 2–) seeded, puberulous, cylindrical, about 1 cm. long and 4 mm. diam. [1. vogelii](#)
- Leaves oblanceolate, rounded at the narrow base, 6–14 cm. long, 2–4.5 cm. broad; lateral nerves 5–7 pairs; fruits not known [2. angustifolius](#)
- 4** Fruiting carpels verrucose, not torulose, 1–3.2 cm. long, 7–8 mm. diam.; leaves oblong-elliptic to obovate-elliptic, 8–17 cm. long, 3.5–7.5 cm. broad [3. capea](#)
- Fruiting carpels smooth, torulose, 2–4.5 cm. long, 6–8 mm. broad; leaves oblong-elliptic to obovate-elliptic, 4.5–14 cm. long, 1.5–4.5 cm. broad [4. barteri](#)
- 5** Flowers in numerous, lax, branched, 4–12-flowered cyme, often crowded towards the ends of the branches above the leaves; pedicels more than 5 mm. long; flowers more than 5 mm. diam.; leaves oblong-elliptic, 8–18 cm. long, 3.5–7.5 cm. broad, densely brown silky pilose beneath when young [5. foliosus](#)
- Flowers in 3–6-flowered, axillary, fasciculate cymes; pedicels less than 5 mm.; flowers less than 5 mm. diam.; leaves oblong-elliptic, 3.5–11 cm. long, 1.5–4.5 cm. broad, sparingly puberulous beneath when young, becoming markedly glaucous beneath [6. mannii](#)

1. Enneastemon vogelii (Hook. f.) Keay in Kew Bull. 1953: 72. APD acc

Uvaria? *vogelii* Hook. f. in Fl. Nigrit. 208, t. 17 (1849).

Clathropermum vogelii (Hook. f.) Planch.—F.T.A. 1: 25, partly (T. Vogel 203).

18. UVARIOPSIS

Engl. & Diels—*Robyns & Ghesq.* in Ann. Soc. Sci. Brux. 53: 312 (1933).

- 1 Flower buds elongate, tetragonal in section; petals 1.5–3 cm. long, linear-lanceolate, strigose pubescent outside; flowers solitary or in few-flowered fascicles on the bole; leaves elongate or oblanceolate, rounded and slightly subcordate at base, rather long-acuminate, 15–20 cm. long, 4–9 cm. broad, glabrous except for the midrib beneath, laxly reticulate; fruiting carpels lobulate, 5.5 cm. long, 2 cm. broad [1. bakeriana](#)
- Flower buds globose or ovoid-conical; petals suborbicular to ovate: **2**
- 2 Flowers solitary, or up to 3 together, axillary on leafy shoots; buds globose; petals suborbicular, 9–12 mm. diam.; fruiting carpels shortly stipitate, subcylindrical to obovoid, 2–4 cm. long, 1.2–1.7 cm. broad, constricted between the seeds; leaves oblong to oblong-ob lanceolate, rounded or obtuse at base, gradually acuminate, 12–23 cm. long, 3.5–8.5 cm. broad, with 9–14 pairs of looping lateral nerves [2. globiflora](#)
- Flowers in fascicles on the bole: **3**
- 3 Flower buds depressed globose; petals of male flower ovate-triangular, 18–20 mm. long, 14–17 mm. broad, very fleshy and up to 6 mm. thick, connate for 5–7 mm. at base; female flowers not known; fruiting carpels sessile, up to 4.5 cm. long, constricted between the seeds, fruiting pedicels up to 6.5 cm. long; leaves very similar to above, 15–25 cm. long, 5–9 cm. broad, with about 10 pairs of lateral nerves looped well within the margin [3. guineensis](#)
- Flower buds ovoid-conical; petals ovate, female up to 25 mm. long and 15 mm. broad, male 8–13 mm. long, 5–7 mm. broad, up to 2 mm. thick; pedicels variable in length, up to 18 cm. long in female flower; fruiting carpels almost sessile, subglobose to cylindrical, about 5 cm. long and 3 cm. broad, not constricted between the seeds; leaves oblong, obovate or oblanceolate, 12–20 cm. long, 4–8 cm. broad, very similar to above [4. dioica](#)

1. **Uvariopsis bakeriana** (*Hutch. & Dalz.*) *Robyns & Ghesq.* in Ann. Soc. Sci. Brux. 53: 9 (1933); Keay

in Kew Bull. 1952: 153. *APD acc*

Tetrastemma bakerianum Hutch. & Dalz. F.W.T.A., ed. 1, 1: 57 (1927); Kew Bull. 1927: 153.

Shrub or small tree to 20 ft., in [marshy forest](#); petals pinkish-brown outside, carmine within. Monoecious, female flowers with about 12 carpels, male flowers with numerous whitish stamens, fruiting carpels bright red.

S. Nig.: Mbarakpa-Obutong Road, Oban (Dec.) Talbot 1517! Between Obutong and Mfamoseng (fr. Mar.) McElderry FHI 7737! **Br. Cam.:** S. Bakundu F. R. (fl. & fr. Mar.) Brenan 9305! 9409!

4. **Annona glabra Linn. Sp. Pl. 537 (1753); Robyns & Ghesq. l.c. 49. APD acc**

Annona palustris Linn. (1762)—F.T.A. 1: 16; F.W.T.A., ed. 1, 1: 57.

A small tree or shrub of coastal marshes; flower white; fruits smooth, yellowish when ripe.

Sen.: Cayor Perrottet. **Gam.:** Albreda Perrottet 5! **S. L.:** Bawbaw (May) Deighton 2740! Luti (young fr. July) Jordan 279! **Lib.:** Grand Bassa (July) T. Vogel 100! **Iv. C.:** mouth of R. Cavally (Aug.) Chev. 19907. **S. Nig.:** Lagos (Feb.–Apr.) Dalz. 1097!

Also in **French Camerouns**, **S. Tome**, **Congo** and in **tropical America**.

Robyns & Ghesquiere (l.c.) also record from our area *A. chrysophylla* Boj. on a single specimen (Lely P. 391b from the Bauchi Plateau). This species is widespread in tropical Africa east of the Camerouns, but I am not sufficiently convinced of the identity of Lely P. 391b to include *A. chrysophylla* Boj. in our key. This species is close to *A. senegalensis* Pers. var. *senegalensis* but, according to Robyns & Ghesquiere, differs in its thicker and rather larger leaves, irregularly spaced curved lateral nerves and ferruginous indumentum.—R.W.J.K.

Annona muricata Linn.

Several species have been introduced and are cultivated for their fruit; they may be naturalized in places. Introduced species include the sour-sop.

Annona reticulata Linn.

Several species have been introduced and are cultivated for their fruit; they may be naturalized in places. Introduced species include the custard apple, or bullock's heart.

Annona squamosa Linn.

Several species have been introduced and are cultivated for their fruit; they may be naturalized in places. Introduced species include the sweet-sop.

Annona cherimola Mill.

Several species have been introduced and are cultivated for their fruit; they may be naturalized in places. Introduced species include the cherimola.

23. ISOLONA

Engl.—*Engl. & Diels Monogr. Afr. Annonac.* 82 (1901).

- 1 Young shoots and leaves glabrous:2
 Young shoots and leaves pubescent or densely hirsute:5
- 2 Corolla lobes up to 10 mm. long, less than twice as long as the tube:3
 Corolla lobes 12–25 mm. long, more than twice as long as the tube:4
- 3 Corolla lobes narrowly triangular, up to 3.5 mm. broad at base, acute or obtuse at apex, 7–10 mm. long; tube expanded at base, about 4–5 mm. long; leaves oblong or oblong-lanceolate, obtusely long-acuminate, narrowly cuneate at base, 8–15 cm. long, 2–5 cm. broad, with 8–10 pairs of lateral nerves prominent beneath and markedly looped about 5 mm. from the margin; fruit narrowly ovoid, lobulate, not ridged, 4–5 cm. long, 2–3 cm. broad [1. *campanulata*](#)
 Corolla lobes oblong, 3–5 mm. broad at base, rounded at apex, 5–10 mm. long; tube expanded at base, about 10 mm. long; leaves oblong-oblong-lanceolate gradually acuminate, broadly cuneate to obtuse at base, 8–15 cm. long, 2–4.5 cm. broad, with 9–13 pairs of lateral nerves prominent above and beneath, extending almost to the margin without looping; fruit subovoid to depressed subglobose, lobulate, with irregular transverse ridges, 8–10 cm. long, 7–8 cm. broad [2. *pleurocarpa* subsp. *nigerica*](#)
- 4 Corolla lobes oblong, 3.5–4.5 mm. broad, tube 5–7 mm. long; leaves oblong-obovate, 20–27 cm. long, 7–10 cm. broad, obtuse to rounded at base, acuminate, with 9–12 pairs of lateral nerves prominent beneath [3. *cooperi*](#)
 Corolla lobes lanceolate, acute, up to 3.5 mm. broad, tube 3–5 mm. long; leaves oblong-elliptic, 8–25 cm. long, 2.5–8.5 cm. broad, obtuse to cuneate at base, rather abruptly acuminate, with 10–13 pairs of lateral nerves [4. *thonneri*](#)
- 5 Leaves beneath, especially the midrib and nerves, and the shoots densely hirsute to maturity; leaves 12–18 cm. long and 3.5–6 cm. broad, elongate obovate to lanceolate, with 8–10 pairs of lateral nerves, base cuneate, apex long-acuminate; lower part of corolla tube 5 mm. long, upper expanded part 7 mm. long; lobes 13 mm. long triangular, spreading; sepals 14 mm. long by 9 mm. broad; fruit, flattened, ellipsoid, 6 cm. long, 4 cm. broad and 1.8 cm. thick [5. *deightonii*](#)
 Leaves and shoots finely pubescent when young, only very sparsely so when mature; leaves 13–19 cm. long and 3.5–5 cm. broad, with 13–18 pairs of lateral nerves, cuneate at base, gradually long-acuminate; lower part of corolla tube 4 mm. long, upper expanded part 5 mm. long; lobes about 13 mm. long, triangular; sepals 2 mm. long [6. *maitlandii*](#)

1. *Isolona campanulata* *Engl. & Diels* in *Monogr. Afr. Annonac.* 83 (1901); Aubrév. *Fl. For. C. Iv.* 1: 22, t. 41, 6–9. *APD acc*

APD: *Synonym of Isolona congolana (De Wild. & T. Durand) Engl. & Diels*

Isolona leonensis *Sprague & Hutch.* in *Kew Bull.* 1916: 151; F.W.T.A., ed. 1, 1: 58.

Isolona soubreana *A. Chev. ex Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 58.

Forest tree, 12–50 ft. high; corolla green, turning yellow; fruit yellow when ripe.

S. L.: Sendugu (June) Thomas 687! Yonibana (fl. & fr. Oct.) Thomas 4230! 4259! 4690! Mamaha (fl. & fr. Nov.) Thomas 4593! 4648! Kongohun (Apr.) Deighton 3676! Jau (fr. Oct.) Deighton 5238! **Iv. C.:** San Pedro Thoiré! Soubre (June) Chev. 19088! 19138! Rasso (fl. & fr. Dec.) Aubrév. 570! **G. C.:** Bonsa-Ben F. R. (Dec.) Vigne 4753! Subiri F. R. (Feb.) Vigne 4757! **S. Nig.:** Oban Talbot 3261!

Also in **French Cameroons** and **Gabon**.

2. *Isolona pleurocarpa* subsp. *nigerica* *Keay* in *Kew Bull.* 1952: 157.

APD: *Synonym of Isolona hexaloba (Pierre) Engl. & Diels*

Isolona leonensis of Kennedy *For. Fl. S. Nig.* 14, not of *Sprague & Hutch.*

Forest tree, to 60 ft. high; corolla green with carmine centre; fruit dark brown.

S. Nig.: Sapoba (Sept.) Kennedy 1568! Shasha F. R. (Apr.) Richards 3343!

The typical plant, which has longer corolla lobes, occurs in French Cameroons.

3. *Isolona cooperi* Hutch. & Dalz. ex Cooper & Record in Yale Univ. For. Bull. 31: 15 (1931). *APD acc*

Tree or shrub to 12 ft. high. in [forest](#); corolla yellow.

Lib.: Dukwia R. (May) Cooper 417! **G. C.:** Sefwi-Bekwai (Aug.) Vigne 1337!

[Possibly not distinct from *I. zenkeri* Engl.]

4. *Isolona thonneri* (De Wild. & Th. Dur.) Engl. & Diels l.c. 83 (1901). *APD acc*

Monodora thonneri De Wild. & Th. Dur. (1899).

Tree to 35 ft. high, in [forest](#); corolla green at first, then yellow.

S. Nig.: Ohosu F. R. (Dec.) Hide 1/38!

Also in [Belgian Congo](#).

[Ejiofor FHI 29302 from Kumba, British Cameroons, is very close to this species, but has narrower corolla lobes and longer sepals. The specimen recorded by Aubréville (l.c. 1: 122) is inadequate for certain identification but does not appear to be this species.]

5. *Isolona deightonii* Keay in Kew Bull. 1952: 156. *APD acc*

Tree 15 ft. high, in [forest](#); flowers green, fruit yellowish, edible.

S. L.: Jama (fr. Sept.) Deighton 3072! Kongohun (Apr.) Deighton 3675! Daru, Tunkia (Mar.) Deighton 4112!

6. *Isolona maitlandii* Keay l.c. 155 (1952).

APD: *Synonym of Isolona congolana* (De Wild. & T. Durand) Engl. & Diels

A [forest](#) tree.

Br. Cam.: Ngong, Bamenda, 3,000 ft. (June) Maitland 1555! Wae, Bamenda, 3,500 ft. (Apr.) Maitland 1596!

24. MONODORA

Dunal—F.T.A. 1: 37.

- 1 Inner petals as long as or longer than the outer crispate petals, shortly clawed, broadly obovate, about 2·5 cm. long, pilose-setose near the middle of the margin; leaves oblong-ob lanceolate, rounded at base, obtuse at apex, 6–12 cm. long, 3–4·5 cm. broad, somewhat glaucous beneath; lateral nerves about 15 pairs; pedicels about 5 cm. long [1. unwinii](#)
- Inner petals much shorter than the outer crispate ones: **2**
- 2 Inner petals very narrow, with a pair of lateral hairy appendages about the middle; leaves obovate-oblong, 15–20 cm. long, 4–5·5 cm. broad; flowers borne on the previous season's growth; sepals ovate-lanceolate, up to 5 cm. long and 3 cm. broad; fruit ovoid, not ribbed, about 10 cm. long and 8·5 cm. broad [2. tenuifolia](#)
- Inner petals very broad and obovate or clawed and spatulate, not appendaged, or the appendages near the base: **3**
- 3 Inner petals with a long claw almost as long as the limb, spatulate; pedicels very slender, 3 cm. long, with a lanceolate acute bract about the middle; sepals, lanceolate, crispate on the margin; leaves obovate to oblong, acuminate, rounded at base, 6–8 cm. long, 2·5–4 cm. broad [3. crispata](#)
- Inner petals shortly clawed, broadly ovate: **4**
- 4 Sepals lanceolate, up to 3·5 cm. long, with wavy crispate margins; leaves elliptic to obovate-elliptic, rounded at base, acuminate, 15–45 cm. long, 5–20 cm. broad; flowers large on long pedicels; outer petals up to 10 cm. long; fruit 10–15 cm. diam. [4. myristica](#)
- Sepals orbicular, 1 cm. long, not crispate on the margins; leaves obovate to oblong, obtuse at base, shortly acuminate, 15–30 cm. long, 7–12 cm. broad; outer petals up to 4·5 cm. long; fruit ribbed, globose, 7·5 cm. diam. [5. brevipes](#)

1. *Monodora unwinii* Hutch. & Dalz. F.W.T.A., ed. 1, 1: 59 (1927); Kew Bull. 1927: 153.

APD: Synonym of Monodora myristica (Gaertn.) Dunal

A tree.

S. Nig.: Benin Unwin 45!

2. **Monodora tenuifolia Benth.**—F.T.A. 1: 38; Chev. Bot. 12. *APD acc*

Small tree, up to 40 ft. high; flowers appearing before the leaves, sepals green, petals white at base, yellow at the tips, with reddish spots.

Fr. G.: Timba to Frigniagbe (Mar.) Pobéguin 134! Near Mamou (Mar.) Dalz. 8395! **S. L.:** near Ninia, Talla Hills (Feb.) Sc. Elliot 4814! Kalangba (Feb.) Glanville 177! **Iv. C.:** Aubrév. 13! **G. Po:** Mann 164 (partly)!

Also in **French Cameroons** and **Principe**.

MONIMIACEAE

Trees or shrubs, rarely climbers, usually fragrant, with opposite, or rarely alternate, entire or serrate, coriaceous leaves with pellucid dots; stipules absent. Flowers actinomorphic, rarely oblique, hermaphrodite, polygamous or unisexual, cymose or racemose, rarely solitary, small or medium-sized; inflorescence axillary or rarely terminal. Perianth inferior, with 4 to many often connivent teeth or lobes in 2 to many series and imbricate, equal, or the outer sepaloid and the inner petaloid, rarely obsolete. Disk adnate to the perianth-tube. Stamens numerous or few in 1–2 series; filaments very

short, often flattened, with or without glands at the base; anthers erect, 2-celled, opening by a longitudinal slit or by valves from the base upwards. Female fl.: staminodes present or none; carpels several or rarely solitary, 1-celled; style short or elongated; stigma terminal; ovule solitary, erect or pendulous. Carpels separate in fruit, enclosed by the perianth or the latter deciduous, indehiscent, often drupaceous. Seed erect or pendulous; testa membranous; endosperm fleshy; embryo small to half as large as the endosperm; cotyledons erect or spreading.

Distributed in tropical and subtropical regions mainly of the Southern Hemisphere, absent from India (except Ceylon and Burma), and very rare in Africa.

Recognized by the gland-dotted exstipulate leaves, apetalous flowers with the staminal disk adnate to the perianth-tube, 2-celled anthers opening by either slits or flaps (as in Lauraceae), the carpels separate in fruit, the endospermic seeds, and usually small embryo.

Plagiostyles Baill., formerly included in Monimiaceae, is now placed in Euphorbiaceae.

- 1 Perianth oblique with one lobe produced on one side into a tongue-like process, the other lobes small and deltoid; flowers dioecious, few in axillary fascicles, pedicellate; leaves subopposite, markedly anisophyllous, the reduced leaf filiform, early caducous, often leaving a scar, so that leaves on a mature shoot appear alternate [1. *Glossocalyx*](#)

Perianth symmetrical, lobes all deltoid; flowers dioecious in axillary racemes; leaves nearly opposite, both leaves of each pair well-developed, coriaceous; leaf-margins coarsely and irregularly serrate, more rarely entire [2. *Xymalos*](#)

1. GLOSSOCALYX

Benth.—F.T.A. 6, 1: 167.

- 1 Leaves equal-sided and narrowed at base, with scattered stellate hairs beneath; petiole 0.5–1 cm. long; perianth-limb linear-lanceolate, up to 2.5 cm. long [1. *longicuspis*](#)
 Leaves rounded or slightly cordate and unequal at base, sparingly strigose beneath with often bifurcate hairs; petiole up to 5 mm. long: [2](#)
- 2 Perianth-limb narrowed from near the base, more or less linear, up to 1 cm. long; pedicels up to 7 mm. long [2. *staudtii*](#)
 Perianth-limb triangular, up to 5 mm. long; pedicels up to 4 mm. long [3. *brevipes*](#)

1. **Glossocalyx longicuspis** *Benth.*—F.T.A. 6, 1: 167; Perkins & Gilg in Engl. Pflanzenr. Monim. 116, t. 28; Thonner Fl. Pl. Afr. t. 50; Chev. Fl. Viv. 1: 31. *APD acc*

A tree, 30–40 ft. high; young branches furnished with very short hairs.

F. Po: Mann 1428!

Also in **French Cameroons** and **Spanish Guinea**.

2. **Glossocalyx staudtii** *Engl.*—F.T.A. 6, 1: 168; Perkins & Gilg l.c. 117.

APD: Synonym of Glossocalyx brevipes var. letouzeyi Foulloy

A shrub, up to 24 ft. high; branches slightly flexuous, pithy; flowers with an odour of nutmeg.

S. Nig.: Oban Talbot 84! **Br. Cam.:** Johann-Albrechtshöhe (Jan.) Staudt 808!

Also in **French Cameroons**.

3. **Glossocalyx brevipes** *Benth.*—F.T.A. 6, 1: 168; Perkins & Gilg l.c. 116. *APD acc*

A shrub, 10 ft. high; flowers green.

Br. Cam.: Cameroons R. (Jan.) Mann 722! 2196!

2. XYMALOS

Baill.—F.T.A. 6, 1: 167.

- 1 A shrub or medium-sized tree; branches and leaves glabrous; leaves obovate to narrowly elliptic, cuneate at base, 7–20 cm. long, 2·5–10 cm. broad, 6–8 pairs of main lateral nerves, prominent beneath, looping well within margin; fruit ovoid, 1–1·5 cm. long, fleshy, crowned by persistent stigma, one-seeded [monospora](#)

Xylosma monospora (Harv.) Baill. ex Warb.—F.T.A. 6, 1: 169. *APD acc*

Xylosma monospora Harv.

Evergreen tree or shrub, leaves smelling of lemon; fruit orange-coloured.

Br. Cam.: Bambulue Hill, Bamenda, 5,000–7,000 ft. (Jan., Oct.) Johnstone 211/31! 274/32! Lakom, Bamenda (May) Maitland 1372! **F. Po:** above Musola Mildbr. 7114. Moka, 3,800–5,700 ft. Mildbr. 7044.

Widespread on mountains in central, east and south Africa.

LAURACEAE

Trees or shrubs, very rarely twining parasitic herbs, all parts with aromatic oil-glands. Leaves alternate, rarely opposite or subopposite, coriaceous and evergreen, variously nerved; stipules absent. Flowers small, greenish or yellowish, usually cymose or racemose, hermaphrodite, polygamous or dioecious, actinomorphic. Calyx usually inferior; tube sometimes enlarging in fruit; lobes usually 6, imbricate. Petals absent. Stamens typically in 4 whorls, often the fourth row suppressed or reduced to staminodes; filaments sometimes glandular at the base, very rarely the glands fused into a disk; anthers continuous with the filament, 2- or 4-valved, cells superposed or more or less collateral, opening from the base upwards by flaps, introrse or sometimes the third whorl extrorse. Ovary superior, rarely inferior, 1-celled; style terminal, simple; stigma small. Ovule solitary, pendulous. Fruit baccate or drupaceous. Seed pendulous, without endosperm; testa membranous; embryo straight; cotyledons thick, fleshy; radicle superior.

Generally distributed in tropical and subtropical regions, but comparatively rare in Africa.

Readily recognized by the simple aromatic evergreen leaves without stipules, the absence of petals, the characteristic dehiscence of the anthers, and the seed without endosperm.

- 1 Trees and shrubs with normal foliage: 2
 Leafless slender parasitic climbers; stems filiform, glabrous to tomentose; flowers small, spicate, with green receptacle and white calyx [3. Cassytha](#)
 2 Anthers 2-valved; fruit superior; flowers hermaphrodite [1. Beilschmiedia](#)
 Anthers 4-valved, the valves collateral; fruit inferior; flowers dioecious [2. Hypodaphnis](#)

Persea americana Mill.

P. gratissima Gaertn. f.

The Avocado Pear, a native of tropical America, a dessert or salad fruit is cultivated in our area.

Cinnamomum camphora Nees & Eberm.

The Camphor tree. A native of the Far East, it is cultivated in our area.

C. zeylanicum Nees

The Cinnamon tree. A native of the Far East, it is cultivated in our area.

C. cassia Lour.

A native of the Far East, it is cultivated in our area.

1. BEILSCHMIEDIA

Nees—Robyns & Wilczek in Bull. Jard. Bot. Brux. 19: 459 (1949).

Tylostemon Engl.—F.T.A. 6, 1: 173; F.W.T.A., ed. 1, 1: 61.

- 1 Stamens of the third whorl perfect (i.e. total of 9 fertile stamens): 2

- Stamens of the third whorl barren (i.e. total of 6 fertile stamens):9
- 2 Filaments of the outer two whorls of stamens elongated, generally narrow, considerably longer than the anthers:3
Filaments of the outer two whorls of stamens short and broad, scarcely as long as the anthers:8
- 3 Perianth outside and pedicels glabrous, except for the often ciliate margins of the perianth lobes:4
Perianth outside and pedicels more or less densely puberulous, or tomentellous:6
- 4 Perianth, including the lobes, 1.5 mm. long; leaves about 25 cm. and up to 11 cm. broad [1. hutchinsoniana](#)
Perianth, including the lobes, 2–3 mm. long when mature:5
- 5 Bracts early caducous, stamens of the third whorl with much narrower filaments than those of the outer two whorls; petioles 6–15 mm. long; leaves 10–22 cm. long, 4–10 cm. broad, often subopposite [2. mannii](#)
Bracts persistent, stamens of the third whorl subequal to those of the outer whorl; petiole 4 mm. long; leaves 8–12 cm. long, 3.5–5 cm. broad [3. myriciifolia](#)
- 6 Perianth, including the lobes, about 1 mm. long, densely tomentellous outside; ovary hairy; leaves lanceolate, long-acuminate, up to 25 cm. long and 7 cm. broad [4. preussii](#)
Perianth, including the lobes, 2–3 mm. long, evenly pubescent outside, but with the surface clearly visible between the hairs; ovary glabrous:7
- 7 Bracts early caducous, perianth lobes densely pilose at the tips; leaves 10–22 cm. long, 4–9 cm. broad, acutely acuminate [5. chevalieri](#)
Bracts persistent, perianth lobes sparingly but evenly puberulous; leaves 15–20 cm. long, 6–8 cm. broad, acuminate [6. staudtii](#)
- 8 Inflorescence lax, up to 18 cm. long and broad; perianth densely rusty-puberulous; leaves 12–20 cm. long, 4–7 cm. broad, drying brown [7. talbotiae](#)
Inflorescence short, up to 3 cm. long and 4 cm. broad; perianth sparsely and minutely puberulous; leaves 12–18 cm. long, 3–4 cm. broad, drying dark olive-green [8. foliosa](#)
- 9 Perianth, including the lobes, about 2 mm. long, tomentellous; inflorescence up to 12 cm. long; leaves acute or obtuse at base, shortly acuminate, 8–23 cm. long, 2.5–7.5 cm. broad, obscurely reticulate above [9. gaboonensis](#)
Perianth, including the lobes, 3–4 mm. long, densely tomentellous; inflorescence 10–18 cm. long; leaves rounded at base, long-acuminate, 17–25 cm. long, 5–9 cm. broad, prominently reticulate on both surfaces . [10. caudata](#)

Beilschmiedia euryneura (Stapf) Robyns & Wilczek l.c. 495.

Forest tree or shrub.

Lib.: Sinoe Basin Whyte (3 sheets)!

[As 4 out of the 7 specimens cited by Chevalier in Fl. Viv. 1: 36 are incorrectly identified, I hesitate, without seeing the specimens, to accept as this species the remaining records from Ivory Coast and Gold Coast.—R.W.J.K.]

1. *Tylostemon crassifolius* Engl.—F.T.A. 6, 1: 185.

A tree 60-120 ft. high; flowers not known. .

Br. Cam.: Johann-Albrechtshöhe (Dec.) Staudt 505!

Possibly a *Beilschmiedia*. Imperfectly known species.

2. *Beilschmiedia djalensis* A. Chev. Fl. Viv. 1: 40 (1938), French descr. only. *Tylostemon* sp. 1 of Aubrév. Fl. For. C. Iv. 1: 130. *APD acc*

Tall forest tree, to 120 ft. high; leaves very thick. Androecium not described.

Fr. G.: Dalaba Chev. 18135; 18888; 34574. **Iv. C.:** Malamosso Chev. 16248. Tabou (fr. Apr.) Aubrév. 1315! 1664!

Considerably more good specimens and accurate field observations are needed before the W. African species of this difficult genus can be adequately understood. Specimens lacking mature flowers are useless, but systematic collections from marked trees to show young and mature flowers, fruits, and the range of leaf-shape would be of great value. The important revision by Robyns and Wilczek is valuable in distinguishing the sections and the Belgian Congo species, but does not enable one to distinguish the other species many of which are very doubtfully distinct.—R.W.J.K.

2. HYPODAPHNIS

Stapf—F.T.A. 6, 1: 185.

- 1 A tree; young parts rusty-pubescent; leaves elliptic to obovate, acutely acuminate, shortly acute at base, 12–25 cm. long, up to 10 cm. broad, slightly puberulous on the nerves; lateral nerves 4–5 on each side of midrib, ascending; tertiary nerves subparallel, at length conspicuous; petiole up to 3–5 cm. long; panicle subcorymbose, 3–5–8 cm. long, many-flowered, finely rusty-pubescent all over [zenkeri](#)

Hypodaphnis zenkeri (Engl.) Stapf in F.T.A. 6, 1: 185 (1909); Hook. Ic. Pl. t. 2938; Chev. Fl. Viv. 1: 44. *APD acc*

Lower storey tree of forest, to 50 ft. high; bark smooth, grey; slash cream darkening to dirty brown, with black edge; leaves deep green; seeds ovoid with flattened sides, about 4–5 cm. long and 3 cm. broad.

S. Nig.: Okomu F. R. (Feb.) Brenan 9058! Sapoba (Apr.) Kennedy 779! **Br. Cam.:** Johann-Albrechtshöhe Staudt 961!

Also in **French Cameroons**.

3. CASSYTHA

Linn.—F.T.A. 6, 1: 188.

- 1 Twining parasitic herbs, with the leaves reduced to minute scales, adhering to the host by means of haustoria;

flowers white, small, loosely spicate, often rusty-pubescent; bracteoles ciliolate; outer perianth-segments similar to the bracteoles, the inner broadly ovate-oblong, longer than the outer; fruits crowned with the persistent perianth-limb, 4–6 mm. in diam. [filiformis](#)

Cassytha filiformis Linn.—F.T.A. 6,1: 188; Chev. Fl. Viv. 1: 45. *APD acc*

Cassytha senegalensis A. Chev. l.c. 1: 46 (1938), French descr. only.

Sen.: Roger! **S. L.:** Sc. Elliot 4177! 5875! Freetown (Feb.) Johnston 71! **Lib.:** Monrovia (Nov.) Linder 1415! **G. C.:** Aburi (June) Johnson 970! Very common throughout the area and in the tropics generally.

HERNANDIACEAE

Trees or shrubs, sometimes scandent, with alternate, simple or digitately compound leaves; stipules absent. Flowers hermaphrodite, or monoecious or polygamous by abortion, actinomorphic, arranged in axillary corymbose or paniculate cymes, bracteate or not. Calyx with 3–5 valvate subequal segments in two whorls or rarely 4–8 in one whorl. Stamens 3–5 in a single whorl, when the perianth is double opposite the outer segments, often 4; anthers 2-celled, opening introrsely or laterally by 2 valves; staminodes gland-like, in one or two whorls outside the stamens, or absent, those of the outer whorl in pairs at the base of the filaments, those of the inner whorl alternate with the stamens. Ovary single, inferior, 1-celled; ovule solitary, pendulous. Fruit dry, more or less ribbed, either with 2–4 wings on the body or with two terminal wings formed by enlarged perianth-segments, or wingless but enclosed in the inflated receptacle. Seed solitary, without endosperm; testa leathery; embryo straight; cotyledons large, plano-convex or flat and twisted around the radicle.

Distributed in the tropics of both hemispheres, mainly near the coasts, and especially on oceanic islands.

- 1 Leaves simple; sometimes peltate; fruits surrounded by the inflated calyx; flowers monoecious; calyx-lobes 6–8; petals absent; stamens 3–4 [1. Hernandia](#)
- Leaves digitately compound; fruits with 2–4 broad lateral wings; flowers hermaphrodite; calyx-lobes 5; petals 5; stamens 5 [2. Illigera](#)
- Leaves simple broadly ovate, often deeply 3–5-lobed; fruits with two long terminal wings; flowers male and hermaphrodite; calyx-lobes 4–7; petals absent; stamens 4 alternating with the staminodes **3. Gyrocarpus**

1. HERNANDIA

Linn.—F.T.A. 6, 1: 191.

- 1 Tree; branchlets stout, minutely puberulous; leaves ovate, rounded or very slightly cuneate at base, up to 22 cm. long and 13 cm. broad, firmly papery, glabrous, 5-nerved at the base; petiole up to 12 cm. in fruiting specimens; corymbs many-flowered, on stout peduncles; fruits broadly ellipsoid, ribbed, 2–5 cm. long, the calyx up to about 4 cm. long [beninensis](#)

Hernandia beninensis Welw. ex Henriq.—F.T.A. 6, 1: 192; Exell Cat. S. Tomé 280. *APD acc*

A tree 30–40 ft. high.

F. Po: Mann 1418!

Also in **S. Tomé**.

2. ILLIGERA

Blume—F.T.A. 6: 192.

- 1 Leaves normally 5-foliolate, but sometimes 3-foliolate in the inflorescence; leaflets ovate, oblong-elliptic to ovate-lanceolate, acuminate, acumen itself obtuse, obtuse, rounded or subcordate at base, with 2 (rarely 3) strong lateral nerves on each side of midrib, 5–8 cm. long, 3.5–6 cm. broad; midrib, lateral nerves and veins

sparingly hirsute beneath; petiole often tendriform, up to 10 cm. long, petiolules about 2 cm. long, hirsute when young; cymes panicate, axillary, shortly tomentose, the flowers merely puberulous or nearly glabrous; fruits 2.5 cm. long, about 10 cm. from tip to tip of the wings, finely puberulous [1. *pentaphylla*](#)

Leaves 3-foliolate; leaflets obovate, rounded or obtuse at apex, obtuse to cuneate at base, with 1 (rarely 2) strong lateral nerves on each side of midrib; midrib sparsely hirsute beneath near base only, leaves otherwise glabrous, rather smaller than in the above species [2. *vespertilio*](#)

1. *Illigera pentaphylla* Welw.—F.T.A. 6,1: 192; Chev. Fl. Viv. 1: 49; Keay in Kew Bull. 1952: 157, 158.

APD acc

Stout forest liane.

2. *Illigera vespertilio* (Benth.) Bak. f. in J. Bot. 63: 174 (1925) (excl. syn. *I. pentaphylla* Welw.); F.W.T.A., ed. 1, 2: 382, 605 (excl. syn. *I. pentaphylla* Welw.); Keay l.c. *APD acc*

***Discorea vespertilio* Benth.** in Hook. Fl. Nigrit. 638 (1849).

Liane, like the last, with white flowers.

S. L.: Don! **Lib.:** Gbanga (Sept.) Linder 381!

Also in **French Cameroons**.

3. GYROCARPUS

Jacq.—F.T.A. 6, 1: 189.

- 1** A tree; leaves crowded towards the ends of the branches; petioles 2.5–17 cm. long, blade broadly ovate, acuminate, sometimes deeply 3– (rarely 5–) lobed, averaging about 12 cm. diam., but reaching 25 cm., pubescent; flowers in ample terminal cymes up to about 12 cm. long, pubescent; flowers either all male in a cyme, or the terminal ones hermaphrodite, 1–2 mm. long; fruit ovoid, velvety, about 1–2 cm. long, with a pair of elongate spatulate wings 5–10 cm. long [americanus](#)

***Gyrocarpus americanus* Jacq.**—Chev. Fl. Viv. 1: 47. *APD acc*

***Gyrocarpus asiaticus* Willd.**—F.T.A. 6, 1: 190.

Tree, 25–50 ft. high; flowers greenish-yellow or cream.

Fr. Sud.: rocky hills between Diré and Bandiagra Rogeon & Leclercq 306 bis. Kita (fr. July) Jaeger 15!

Also in other parts of tropical and south Africa, and in tropical Asia, Polynesia and South America.

MYRISTICACEAE

Trees, often large and frequently aromatic. Leaves alternate, entire, penninerved, often with pellucid dots; stipules absent. Flowers small, dioecious, apetalous, fascicled, racemose, umbellate or capitate. Calyx 3- (rarely 2–5–) lobed, funnel-shaped to globose or saucer-shaped, lobes valvate. Male flower: stamens 2–30; filaments united into a column; anthers 2-celled, free or united in a mass, dehiscing longitudinally; rudimentary ovary absent. Female flower: staminodes absent; ovary superior, sessile, 1-celled; stigma subsessile; ovule 1, almost basal. Fruit fleshy, usually dehiscing by two valves. Seeds erect, with a thin or fleshy, sometimes lacinate, often coloured aril; endosperm copious, replete with fat and often starch, mostly ruminant; embryo small; cotyledons ascending or spreading, sometimes connate.

Generally distributed in the tropics, comparatively rare in Africa, abundant in Tropical Asia and America.

Recognized by habit and aromatic leaves, small dioecious flowers, the seeds often rich in fat and conspicuously arillate.

- 1 Lateral nerves of the leaves prominent, often numerous; endosperm ruminant:2
 Lateral nerves faint, rather few; endosperm not ruminant; flower-heads almost sessile in the leaf-axils, solitary or in small clusters; aril entire4. [Staudtia](#)
- 2 Leaves with 15–60 usually very marked lateral nerves on each side of the midrib; male flower-heads paniculate or in umbels without a common involucre; seeds solid in the middle:3
 Leaves with 7–10 slender curved lateral nerves on each side of the midrib; male flower-heads at first enclosed in a common involucre which falls away except the persistent disk-like base; seed with a longitudinal cavity in the middle3. [Coelocaryon](#)
- 3 Male flowers sessile in small heads arranged in a divaricate panicle; anthers 2–4; fruit oblong, 3–4 cm. long; aril of seed lacinate1. [Pycnanthus](#)
 Male flowers pedicellate, in small head-like umbels, the umbels solitary or crowded in reduced panicles; anthers 6–10; fruit depressed; aril entire2. [Scyphocephalum](#)

***Myristica fragrans* Houtt.**

The Nutmeg has been introduced in various parts of our area.

1. PYCNANTHUS

Warb.—F.T.A. 6, 1: 157.

- 1 Leaves cordate at base, with 20–35 prominent lateral nerves on each side; indumentum of the leaves rusty, composed of branched hairs; male flower-heads about 5 mm. in diam., crowded1. [angolensis](#)
 Leaves cordate at base, with 40–60 prominent lateral nerves on each side; indumentum of leaves of minute papillous stellate hairs; male flower-heads about 3 mm. in diam., laxly arranged 2. [microcephalus](#)2. [microcephalus](#)
 Leaves shortly cuneate at base, with 15–18 rather obscure lateral nerves on each side; indumentum merely papillous below; male flower-heads about 3 mm. in diam., laxly arranged3. [dinklagei](#)

1. *Pycnanthus angolensis* (Welw.) Warb. in Notizbl. Bot. Gart. Berl. 1: 100 (1895). *APD acc*

Myristica angolensis Welw. (1862).

M. kombo Baill. (1868).

Pycnanthus kombo (Baill.) Warb.—F.T.A. 6, 1: 158; F.W.T.A., ed. 1, 1: 64; Chev. Fl. Viv. 1: 51; Thonner Fl. Pl. Afr. t. 49.

A forest tree up to 120 ft. high, with long straight bole up to 15 ft. in girth: crown of horizontal, whorled branches; bark exuding red sticky juice when cut; fruit dehiscent with single seed covered by bright red lacinate aril.

2. *Staudtia kamerunensis* Warb. in Nov. Act. Nat. Cur. 68: 241 (1897); F.T.A. 6, 1: 165. *APD acc*

Tree like the last, but with considerably larger traits.

Br. Cam.: Victoria Bot. Gardens Winkler 1090; 1335.

Also in **French Cameroons**.

RANUNCULACEAE

Perennial (rarely annual) herbs with alternate leaves, or rarely shrubs or climbers with opposite leaves; stipules absent. Indumentum of simple hairs. Flowers hermaphrodite, hypogynous, usually actinomorphic. Perianth usually double, of calyx and corolla, or rarely the calyx petaloid and the petals absent. Sepals imbricate or valvate. Petals when present often with a nectariferous claw. Stamens numerous, free from one another; anthers dehiscing longitudinally. Carpels numerous, free or rarely partially connate, with a slightly bifid style or subsessile stigma. Ovules numerous or solitary. Fruit a bunch of follicles, rarely baccate, or of dry achenes with often persistent and elongated styles. Seeds small, usually smooth; embryo very small, at the base of horny or fleshy endosperm.

Abundant in temperate and cold regions of the Northern, comparatively rare in the Southern Hemisphere, and very rare in the tropics; poorly represented in our area, but interesting isolated species of northern genera are found at high altitudes in the mountains of East and South Africa.

Clematopsis is endemic to Africa and Madagascar, and the African species of *Thalictrum*, with their long, thread-like pedicels, differ markedly from most of the species from the Northern Hemisphere.

- 1** Flowers regular: **2**
 Flowers irregular; sepals petaloid, posterior sepal spurred; petals present; flowers bright blue; fruit of 3 follicles [5. *Delphinium*](#)
- 2** Petals present, yellow, with nectaries; sepals not petaloid; fruit of numerous glabrous achenes, without long hairy tails [1. *Ranunculus*](#)
 Petals absent: **3**
- 3** Sepals green, small, imbricate; stamens few, with glabrous filaments; leaves alternate, compound, with small and maidenhair-fern-like leaflets; pedicels very slender and much elongated in fruit; achenes solitary, ribbed, not hairy [2. *Thalictrum*](#)
 Sepals petaloid, large, induplicate-valvate or partly imbricate; stamens numerous, with hairy filaments; leaves opposite, simple or compound; pedicels not elongate; achenes in a cluster, hairy and with long hairy tails: **4**
- 4** Low anemone-like herbaceous savannah plants arising from woody rhizomes; sepals partly imbricate and partly valvate; flowers mostly solitary [3. *Clematopsis*](#)
 Tall climbing plants; sepals induplicate-valvate; flowers often paniculate [4. *Clematis*](#)

***Nigella sativa* Linn.**

Chevalier (Fl. Viv. 1: 81) records that this is cultivated in gardens at Timbuktu.

1. RANUNCULUS*Linn.*—F.T.A. 1: 8.

- 1** Lowest leaflets of radical leaves ovate to lanceolate, irregularly lobed and toothed, with petiolules longer than the leaflets; stems creeping, rooting at the nodes; fruit with up to about 15 achenes; sepals green, deciduous, petals up to 7 mm. long [1. *extensus*](#)
- Lowest leaflets of radical leaves linear, irregularly lobed and toothed, with petiolules shorter than the leaflets; stems usually erect; fruit with numerous achenes, at least 20; flowers as above [2. *multifidus*](#)

5. DELPHINIUM

Linn.—F.T.A. 1: 11.

- 1 Erect herb, shortly pilose with spreading hairs, sometimes glabrescent below, with few long-petiolate leaves; radical leaves deeply 5-lobed, lobes irregularly incised, 5–12 cm. in diam., petiole up to 23 cm. long; cauline leaves deeply 5-partite, segments irregularly lobed and incised; racemes up to 7 cm. long, flowers about 1.5 cm. in diam., posterior sepal with a spur 4–5 mm. long containing the spurs of the two posterior petals; fruit of 3 follicles, 12–14 mm. long[*dasycaulon*](#)

Delphinium dasycaulon Fres.—F.T.A. 1: 11; Turrill & Milne-Redhead F.T.E.A. Ranunc. 22. *APD acc*

Erect herb, rather lax, to 4 ft. high. in **grassland**; flowers bright blue.

S. Nig.: Mt. Koloishe, Obudu, 5,000–5,400 ft. (Dec.) Keay & Savory FHI 25081! **Br. Cam.:** above Bamenda, 8,000 ft. (Dec.–Jan.) Migeod 344! Keay FHI 28398!

Widespread in central, east and south tropical Africa.

CERATOPHYLLACEAE

Aquatic submerged herbs with leafy floating branches. Leaves verticillate, variously divided with thread-like or linear segments. Flowers monoecious, solitary in the whorls, the males and females at separate nodes, sessile. Calyx thinly herbaceous, many-parted into narrow subvalvate segments often dentate or lacerate at the apex. Male flowers: stamens 10–22, crowded on a flat torus; anthers almost sessile, erect, linear-oblong, 2-celled, cells parallel, opening lengthwise; connective produced beyond the cells, thick and often coloured. Female flowers: staminodes 0; ovary sessile, ovoid, 1-celled; style continuous with the ovary. Ovule 1, pendulous. Fruit a nut, ovoid or ellipsoid. Seed pendulous; endosperm 0; embryo straight; cotyledons oblong, equal; radicle very short, the plumule already well developed and showing several leaves in the seed.

A well-marked family found in nearly all parts of the world.

CERATOPHYLLUM

Linn.—F.T.A. 6, 2: 326.

Characters of the family.

- 1 A glabrous perennial aquatic herb; branches elongated, floating; leaves in whorls of 5–12, more or less deeply divided into linear or filiform segments; flowers small, axillary, sessile; calyx-segments oblong; fruit broadly ellipsoid, strongly warted and armed with 3 horns, about 5 mm. long without the horns[demersum](#)

Ceratophyllum demersum Linn.—F.T.A. 6, 2: 326; Chev. Fl. Viv. 1: 86, t. 17. *APD acc*

Sen.: Perrottet! And various localities fide Chev. l.c. **Fr. Sud.:** fide Chev. l.c. **S. L.:** Mattru to Gbangbema Deighton 2339! **Dah.:** fide Chev. l.c. **S. Nig.:** Cradu L., Lagos Barter 3242! Okomu F.R. (fr. Dec., Jan.) Brenan 8498! 8769!.

Almost cosmopolitan.

Only a few fruiting specimens of this genus have been collected in West Africa, but when more adequate material is available it is possible that one or two additional species or varieties may be recognizable. The Perrottet specimen cited above is evidently an isotype of *C. cristatum* Guill. & Perr. (Fl. Seneg. 296), a species reduced to synonymy in the F.T.A. and by Chevalier (Fl. Viv. 1: 86), but which may well prove distinct. A sterile specimen, collected by T. Vogel from the R. Niger in Nigeria, is possibly *C. submersum* Linn., a species not yet definitely recorded from tropical Africa.

NYMPHAEACEAE

Aquatic herbs with peltate or cordate leaves arising from a submerged prostrate rhizome. Flowers solitary, large and showy, often sweet-scented. Sepals 4–6, free or adherent to the receptacle. Petals numerous, imbricate, sometimes gradually passing into stamens. Anthers introrse, often flattened or petaloid, opening by a longitudinal slit. Carpels 8 or more, free and immersed in the receptacle or more or less united into an ovary of as many cells, inferior or semi-inferior. Receptacle large, fleshy, surrounding the ovary and with the petals and stamens inserted on its side. Ovules numerous, attached to the sides of the dissepiments. Fruit many-celled, indehiscent, fleshy. Seeds often arillate; endosperm copious; embryo minute, with thick cotyledons.

A small family found in both temperate and tropical regions of both hemispheres.

Water-lilies, easily recognized by their aquatic habit, floating leaves, showy flowers, several petals sometimes passing gradually into the numerous stamens, the numerous carpels, and endospermous seeds with minute embryo.

NYMPHAEAE

Linn.—F.T.A. 1: 52; Gilg in Engl. Bot. Jahrb. 41: 351 (1908).

Rhizome perennial. Leaves deeply cordate with numerous radiating nerves. Sepals 4. Petals indefinite in 2 or more series. Stamens numerous, inserted with the petals on the side of the receptacle. Ovary many-celled, with radiating sessile stigmas. Seeds numerous, immersed in pulp.

- 1 Leaves with entire or slightly undulate margins, glabrous or nearly so beneath; anther connective usually tapered at apex:**2**
 Leaves sharply toothed, with many strong nerves and usually hairy beneath; lamina up to 30 cm. diam.; anther-connective blunt and very shortly produced; flowers up to 20 cm. diam.[4. lotus](#)
- 2 Leaves bearing a cluster of bulbils, arising at the top of the petiole from a hairy umbo; lamina 10–17 cm. long, 8–12 cm. broad; flowers about 10–12 cm. diam. when spread out; young plants with smaller leaves and flowers; connective of anther shortly produced, conical, terete[1. micrantha](#)
- Leaves not bearing bulbils; hairy umbo absent:**3**
- 3 Sepals up to 1 cm. broad and 4 cm. long; petals about 5–10; flowers 3–8 cm. diam.; leaves up to about 15 cm. long and 11 cm. broad; nerves only slightly prominent beneath; undersurface of leaves only slightly spotted [2. maculata](#)
- Sepals 1–2 cm. broad, 4–6 cm. long; petals about 10–20; flowers 7–13 cm. diam.; leaves up to about 22 cm. long and 19 cm. broad; nerves rather prominent beneath; undersurface of leaves usually rather heavily blotched and often reddish or purplish[3. rufescens](#)

MENISPERMACEAE

Twining, or rarely erect shrubs or small trees, with the wood in cross-section showing broad medullary rays. Leaves petiolate, sometimes peltate, alternate, exstipulate, usually simple, rarely trifoliate, or palmately lobed and nerved. Inflorescences cymose, paniculate, racemose, capitulate, fasciculate, or rarely the flowers solitary or geminate, axillary or borne on the leafless wood. Flowers small, inconspicuously coloured, unisexual, dioecious, actinomorphic, rarely slightly zygomorphic. Male flowers: sepals 3–12 or more, rarely 1, generally in series, or slightly connate, imbricate or rarely valvate, the outer smaller; petals 1–6, usually in series, minute or absent, free, or rarely connate, usually imbricate; stamens 3–6 or indefinite, rarely 2, when few opposite the sepals, free or variously united; anthers short. Female flowers: sepals and petals as in male flowers; staminodes present or absent; carpels 3–6 or more, rarely 1, free, sessile or stipitate; styles terminal or subterminal, rarely recurved;

stigma terminal, entire or lobed; ovules 2, soon reduced to 1 by abortion, attached to the ventral suture. Fruiting carpels drupaceous, with the scar of the style subterminal or near the base by excentric growth, sessile or stipitate; exocarp membranous or subcoriaceous, mesocarp more or less pulpy, endocarp often chartaceous or bony, rugose, tuberculate or ribbed; seed often curved in the form of a horseshoe, with uniform or ruminant endosperm or without endosperm; embryo often curved, with a small radicle and flat or semi-terete cotyledons.

Generally distributed throughout the tropics, with a few species in warm temperate regions, in tropical Africa mainly occurring in evergreen forest areas.

Easily recognized by the structure of the wood, the usually twining habit, the alternate and exstipulate leaves, the unisexual small flowers often 3-merous, the stamens generally opposite the petals, the free carpels, and the often peculiar horseshoe-shaped fruit.

 - Staminal nodes present: 14
- 14 Leaves deeply lobed, hirsute; fruit bristly hirsute outside [10. Jateorhiza](#)
 - Leaves entire or angular, pubescent, tomentellous or glabrescent; outside of fruit pubescent or glabrescent: ... 15
- 15 Petioles up to 3–8 cm. long; leaves 5–8 cm. long and broad, glabrescent or hispidulous on the nerves; racemes 5–10 cm. long [11. Tinospora](#)
 - Petioles 5–12 cm. long; leaves 8–20 cm. long and broad, tomentellous or pubescent; racemes 10–30 cm. long [12. Chasmanthera](#)
- 16 Bracts minute, not enlarged in fruit; sepals 3–6; petals 2–4, free [13. Stephania](#)
 - Bracts conspicuous, membranous or leafy in fruit; sepals 1; petals 1–3, united into a cup [14. Cissampelos](#)
- 17 Leaves heteromorphous, often pinnately lobed; carpels several (up to 20?) [16. Sphenocentrum](#)
 - Leaves not lobed; carpels 3 [17. Penianthus](#)

Key to plants with male flowers

1	Twiningers:	2
	Erect shrubs or small trees:	19
2	Leaves not peltate:	3
	Leaves peltate; stamens united:	18
3	Inner sepals connate:	4
	Inner sepals free:	5
4	Stamens 6–9, united only at the base	1. Synclisia
	Stamens 20–30 united in an elongated synandrium	2. Epinetrum
5	Stamens free, or united only at the base:	6
	Stamens united:	10
6	Leaves membranous; petioles twisted at the base:	7
	Leaves not membranous; petioles not twisted at the base:	8
7	Racemes up to 10 cm. long, composed of solitary flowers or few-flowered cymules	11. Tinospora
	Panicles elongated and very slender, up to 40 cm. long	6. Kolobopetalum
8	Inner sepals imbricate; flowers in axillary cymes; sepals 6; petals 6; leaves up to 3 cm. long and 1.5 cm. broad	15. Cocculus
	Inner sepals valvate; inflorescences axillary or borne on the older wood; sepals 6–18; petals 3–9, or absent:	9
9	Petals well developed; sepals glabrous or nearly so	4. Tiliacora
	Petals minute or absent; sepals hairy	5. Triclisia
10	Inner sepals valvate:	11
	Inner sepals imbricate:	12
11	Inflorescence a fascicle of solitary flowers or of long-pedunculate 2–3-flowered congested cymules; flowers subglobose, sepals hairy	3. Syrrheonema
	Inflorescence a panicle of cymules; flowers oblong; sepals glabrous	4. Tiliacora
12	Petals absent; flowers solitary on the axis of the raceme; stamens united in an hemispherical synandrium	8. Dioscoreophyllum
	Petals 3–6; flowers not solitary on the axis of the inflorescence:	13
13	Flowers sessile; leaves deeply lobed and hispid	10. Jateorhiza
	Flowers pedicellate:	14
14	Leaves glabrous:	15
	Leaves pubescent:	17
15	Petals 3; leaves trifoliolate or simple, lobed or entire	9. Syntriandrium
	Petals 6:	16
16	Anthers opening by a semi-orbicular slit; flowers in elongate very slender panicles up to 60 cm. long	6. Kolobopetalum
	Anthers opening by a transverse slit; flowers in short panicles up to 20 cm. or in racemes	7. Rhigiocarya
17	Petals 6, free; sepals 6; petioles 8–12 cm. long; racemes pendulous, elongated	12. Chasmanthera
	Petals 1–3, united into a cup; sepals 4; petioles up to 3 cm. long; cymes crowded in fascicles or glomerules	14. Cissampelos
18	Sepals 6–8; petals 6, free	13. Stephania
	Sepals 4; petals 1–3, united into a cup	14. Cissampelos
19	Leaves heteromorphous, often pinnately lobed; sepals 6; petals 9; stamens 18–22	16. Sphenocentrum
	Leaves not lobed; sepals 6–10; petals 5–6; stamens 5–9	17. Penianthus

1. SYNCLISIA

Benth.—F.T.A. 1: 49.

- 1 Liane with slender stems and leaves clothed with long, stiff, spreading hairs; lower leaves sublanceolate, up to 20 cm. long; upper leaves ovate-cordate, acuminate, 5–12 cm. long, 4–9 cm. broad; petiole slender, 2–5 cm. long; male flowers axillary, solitary or paired, on slender pedicels 8–25 mm. long; female flowers unknown; fruits

ellipsoid, 12–17 mm. long, in dense clusters [scabrida](#)

Synclisia scabrida Miers—F.T.A. 1: 49; Diels in Engl. Pflanzenr. Menisp. 87 (excl. spec. Sc. Elliot 5751); Chev. Fl. Viv. 1: 100; Troupin in Fl. Congo Belge 2: 219 (1951). *APD acc*

A slender liane of [forest and regrowth](#); flowers yellow.

S. Nig.: Eket Talbot 3332! **Br. Cam.:** Missellele, Tiko (Jan.) Box 3558!

Also in [French Cameroons](#), [Gabon](#), [Belgian Congo](#) and [Angola](#).

2. EPINETRUM

Hiern in Cat. Welw. 1: 21 (1896).

- 1 Stem and leaves quite glabrous; leaves ovate-elliptic, cuneate to decurrent at base, obtusely long-acuminate, mucronate, 4·5–9 cm. long, 2–4·5 cm. broad, petiole 6–11 mm. long; male flowers sessile in 1–3-flowered cymules subsessile in the axils of leaves; inner united sepals glabrous outside, 6 mm. long; female flowers and fruits unknown [1. cuneatum](#)
Stem and leaves pilose or pubescent: **2**
- 2 Petioles up to 4 cm. long: **3**
Petioles 5–8 cm. long, leaves ovate to ovate-lanceolate, distinctly cordate at base, acute at apex, 8–15 cm. long, 5–8 cm. broad; female flowers 1–2 in subsessile axillary cymules; male flowers distinctly pedicellate, 2–5 together in lax axillary cymes [5. cordifolium](#)
- 3 Inner united sepals glabrous outside; male and female inflorescences in few-flowered axillary subsessile glomerules; leaves obovate to ovate-elliptic or suborbicular, rounded at base, obtuse and mucronate or emarginate at apex, 2·5–8 cm. long, 1·5–4 cm. broad; petiole up to 1 cm. long [2. undulatum](#)
Inner united sepals setose-pubescent: **4**
- 4 Leaves oblong-lanceolate to oblong-elliptic, not bullate, lamina more or less glabrous beneath except for the midrib which is hirsute with forward-spreading hairs, rounded to subcordate at base, obtuse to acute at apex, mucronate, 5–16 cm. long, 2·5–5·5 cm. broad; petiole 1–2 cm. long [3. scandens](#)
Leaves ovate-lanceolate, bullate, lamina densely hirsute beneath, the midrib densely hirsute with laterally spreading hairs, deeply cordate at base, gradually acuminate, 9–18 cm. long, 3–7 cm. broad, petiole 1–4 cm. long [4. ferrugineum](#)

1. Epinetrum cuneatum Keay in Kew Bull. 1953: 73.

APD: Synonym of Albertisia cuneata (Keay) Forman

Climbing among trees and undershrubs in xerophytic woods on hills near the coast.

G. C.: Yamoransa, Cape Coast (Mar., May) Box 2588! 2588a!

2. Epinetrum undulatum Hiern in Cat. Welw. 1: 21 (1896); Diels in Engl. Pflanzenr. Menisp. 95, t. 34; Mangenot & Miège in Rev. Gen. Bot. 58: 446 (1951).

APD: Synonym of Albertisia undulata (Hiern) Forman

Low climber, flowers yellow.

Iv. C.: Sangouine forest, 20 miles W. of Man Mangenot.

Also in [Angola](#), [Belgian Congo \(?\)](#) and [Uganda](#).

3. Epinetrum scandens Mangenot & Miège l.c. 442, t. 2 (1951).

APD: Synonym of Albertisia scandens (Mangenot & J. Miège) Forman

Synclisia ferruginea of Chev. Fl. Viv. 1: 100, partly (Pobéguin 198).

A climber of [forest](#) regrowth; flowers pale yellow; fruits with silvery hairs.

IV. C.: Adiopodoumé (fl. Mar., Sept., fr. July) Favarger; Mangenot! Grand Bassam (Jan.) Pobéguin 198! Mid. Sassandra (fr. June) Chev. 19052! **G. C.:** Atabadi, Elmina (Feb.) Box 2441! 2442!

4. *Epinetrum ferrugineum* (Diels) Keay l.c. 73 (1953).

APD: *Synonym of Albertisia ferruginea (Diels) Forman*

Anisocycla ferruginea Diels l.c. 92 (1910).

Synclisia ferruginea (Diels) Hutch. & Dalz. F.W.T.A., ed. 1, 1: 70 (1927), partly (excl. Chev. 20989 & 21157); Kew Bull. 1927: 154; Chev. Fl. Viv. 1: 100, partly (excl. Chev. 20989 & 21157 which are *Chlamydocarya capitata* Baill.; excl. Pobéguin 198 which is *E. scandens* Mangenot & Miège; excl. Chev. 21134 which is sterile but clearly not Menispermaceae).

Synclisia scabrida of Diels l.c. 87, partly, not of Miers.

Liane.

S. L.: Sc. Elliot 5751! Njala (fl. Oct., Jan., fr. Mar.) Deighton 3120! 3231! 3231a! Kenema (Jan.) Thomas 7630! 7685! **Lib.:** Grand Bassa (fr. Aug.) Dinklage 1686. Bushrod Isl. (Aug.) Dinklage 2844!

5. *Epinetrum cordifolium* Mangenot & Miège l.c. 443, t. 1 (1951).

APD: *Synonym of Albertisia cordifolia (Mangenot & J. Miège) Forman*

Shrub, then climber; common in forests and regrowth.

IV. C.: Adiopodoumé (Sept.) Mangenot.

3. SYRRHEONEMA

Miers—F.T.A. 1: 50.

- 1** Petals absent; male flowers with 3 stamens; female flowers with 3 or 0 staminodes; branches tomentose; leaves rounded-ovate, slightly cordate or rounded at base, acutely acuminate, 7–11 cm. long, 7–9 cm. broad, softly tomentose beneath with simple and stellate hairs, becoming almost glabrous [1. fasciculatum](#)

Petals 6; male flowers with 6 stamens; female flowers with 6 staminodes; branches puberulous, then glabrescent; leaves elliptic, rounded to subacute at base, obliquely acute or acuminate at apex, 9–18 cm. long, 4.5–10 cm. broad, sparsely puberulous beneath [2. hexastamineum](#)

1. *Syrrheonema fasciculatum* Miers—F.T.A. 1: 50; Diels in Engl. Pflanzenr. Menisp. 91; Troupin in Fl. Congo Belge 2: 219 (1951). *APD acc*

Climbing shrub, branches to 30 ft.; flowers whitish.

F. Po: (Jan.) Mann 192!

Also in **French Cameroons**, **Gabon** and **Belgian Congo**.

2. *Syrrheonema hexastamineum* Keay in Kew Bull. 1953: 75, t. 2. *APD acc*

Slender woody climber of **secondary forest growth**; flowers white, fruits deep red.

S. L.: Dodo (Apr.) Deighton 3909! **G. C.:** Asuansi (fl. Feb., Mar., July, fr. July) Box

4. TILIACORA

Colebr.—F.T.A. 1: 43.

- 1** Stamens free or connate only at the base: **2**
 Stamens united at least to the middle; male inflorescence paniculate with pedunculate several-flowered cymes: **5**
- 2** Stamens included, shorter than the inner larger whorl of petal-like sepals; male inflorescence a narrow raceme with 1–2-flowered shortly pedunculate cymes: **3**

Stamens exserted; male inflorescence paniculate, composed of pedunculate congested, several-flowered cymes:

- **4**
- 3** Male flowers up to 2.5 mm. long; inflorescence densely pubescent; leaves elliptic, acutely long-acuminate, 7–18 cm. long, 3–6 cm. broad, 3–5-nerved at base [1. dinklagei](#)
- Male flowers 5–8 mm. long; inflorescence glabrous or sparsely pubescent, on leafy shoots and cauliflorous; female flowers in short few-flowered racemes; carpels about 30; fruiting carpels obovoid, 8–12 mm. long, with stipes up to 7 mm. long; leaves oblong-elliptic, long-acuminate, 8–12 cm. long, 3–5.5 cm. broad, 3-nerved at base [2. ? odorata](#)
- 4** Leaves ovate, rounded to cordate at base, 4–8 cm. long, up to 6 cm. broad; petioles about 2 cm. long; male flowers about 4 mm. long; fruits globose, 1–1.5 cm. in diam., obliquely stalked [3. warneckeii](#)
- Leaves oblong-elliptic to ovate-elliptic, rounded at base, not cordate, 10–17 cm. long, 5–8.5 cm. broad; petioles 1–2 cm. long; male flowers about 5 mm. long; fruits obovoid, about 1 cm. long, oblique and beaked at base [4. johannis](#)
- 5** Leaves cuneate at base, long-acuminate, acumen obtuse, oblong-elliptic to oblanceolate, 9–15 cm. long, 3–6 cm. broad, stamens 6–9; male inflorescence cauliflorous; fruit unknown [5. leonensis](#)
- Leaves obtuse or rounded at base; stamens 6; male flowers about 4 mm. long: **6**
- 6** Petiole 2–2.5 cm. long, leaves ovate to ovate-oblong, 8–13 cm. long, 4–6 cm. broad, gradually acuminate; inflorescences cauliflorous; fruit obovoid about 7 mm. long [6. lehmbachii](#)
- Petiole up to 1.5 cm. long, leaves oblong, shortly acute, 9–20 cm. long, 4–7.5 cm. broad, 5-nerved at base, main nerves sculptured above; inflorescences on leafy-shoots or cauliflorous; female flowers and fruits unknown [7. dielsiana](#)

- 1. *Tiliacora dinklagei* Engl. Bot. Jahrb. 26: 402 (1899); Diels in Engl. Pflanzenr. Menisp. 60 (excl. spec. Whyte ex Monrovia); Chev. Fl. Viv. 1: 113.**

APD: Synonym of Tiliacora leonensis (Scott-Elliot) Diels

Glossopholis dinklagei (Engl.) Stapf in Johnston Lib. 576 (excl. spec. Whyte).

Forest liane.

Lib.: Grand Bassa (fl. & fr. Apr.) Dinklage 1646! 1803! 2123! **IV. C.:** fide Chev. l.c.

- 2. *Tiliacora ? odorata* Engl. l.c. 400 (1899); Diels l.c. 67. *APD acc***

APD: Synonym of Tiliacora louisii Troupin

Climbing shrub in [regrowth forest](#); flowers yellow or green; fruits golden-yellow.

S. L.: near Regent (fr. Dec.) Sc. Elliot 4017! Njala (fl. & fr. Oct.–Jan.) Deighton 2529! 2574! 2943! 3241! 4905! 5347! Rokupr (fl. & fr. Oct.) Jordan 140! 356! 366! Njama (fr. Mar.) Deighton 5363! **G. C.:** Asuansi (Feb., Apr.) Box 2411! 2674! Near Jukwa (fr. Mar.) Box 2577!

[*T. odorata* Engl. is based on a single gathering from the French Cameroons which has somewhat smaller flowers than the material from our area.]

- 3. *Tiliacora warneckeii* Engl. ex Diels l.c. 64 (1910); Chev. Fl. Viv. 1: 111.**

APD: Synonym of Tiliacora funifera (Miers) Oliv.

Stout climbing or trailing liane; sepals mauvish-brown; ripe fruits orange, [in coastal thickets](#).

G. C.: Anamabu (Jan.–May) Box 2216! 2698! 2699! Elmina (fr. Mar.) Box 2595! Achimota (Apr.) Milne-Redhead 5062! 5063! **Togo:** Lome (Aug.) Warnecke 221! (Nov.) Mildbr. 7505!

- 4. *Tiliacora johannis* Exell in J. Bot. 73, Suppl. Polypet. 7 (1935).**

APD: Synonym of Tiliacora funifera (Miers) Oliv.

Large [forest](#) liane, cauliflorous, with flowers low down; sepals cream.

S. Nig.: Olokemeji F.R. (July, Nov.) Keay FHI 14186! 22415! Shasha F.R. (fr. Jan.) Tamajong FHI 21051!

Also in [Cabinda](#).

5. *Tiliacora leonensis* (*Sc. Elliot*) *Diels* l.c. 67 (1910); Chev. Fl. Viv. 1: 112. *APD acc*

Synclisia leonensis *Sc. Elliot* (1894).

Forest liane, flowers yellow.

S. L.: Aylmer 591! Kafogo, Limba Sc. Elliot 5537! Karene (Apr.) Sc. Elliot 5627! Between Bumban and Falaba (Apr.) Sc. Elliot 5670! **Iv. C.:** fide Chev. l.c.

6. *Tiliacora lehmbachii* *Engl.* l.c. 401 (1899); Diels l.c. 68; Troupin in Fl. Congo Belge 2: 210 (1951). *APD acc*

Forest liane with rather thick branches.

Br. Cam.: Buea, over 3,000 ft. (Nov.) Lehmbach 90! (fr. Jan.) Maitland 313!

Also in **Belgian Congo** (?).

7. *Tiliacora dielsiana* *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 71 (1927); Kew Bull. 1927; 155.

APD: *Synonym of Tiliacora leonensis (Scott-Elliot) Diels*

Tiliacora dinklagei *Engl. ex Diels* l.c. 60, partly (Whyte s.n.).

Glossopholis dinklagei (*Engl.*) *Stapf* l.c. 576, partly (Whyte s.n.).

Stout forest liane; flowers yellow.

S. L.: Thomas 9899! Kuntara (June) Thomas 465! Njala (May) Deigliton 5051! **Lib.:** Monrovia Whyte! **G. C.:** Amentia (Apr.) Vigne 2891! Asuansi (Mar.) Box 2554! Asenanyo River F.R. (Feb.) Andoh FH 4309!

***Tiliacora* sp.**

Liane, flowers cream on leafless part of stem; male flowers with 3 free stamens and 3 united stamens; female flowers unknown; leaves known only by fragment.

S. Nig.: Akure F.R. (Oct.) Keay FHI 25493!

Imperfectly known species.

***Tiliacora trichantha* *Diels* l.c. 63.**

Included in F.W.T.A., ed. 1, 1: 71, but the only specimen cited is from the French Cameroons.

Excluded species.

5. TRICLISIA

Benth.—F.T.A. 1: 48.

- 1 Inflorescence of male flowers laxly cymose, or fasciculate; male flowers with 0–3 petals; inner sepals in both sexes oblong to oblanceolate; leaves usually much exceeding 10 cm. long, glabrous beneath except for midrib and main laterals, but sometimes shortly and sparsely pubescent when young:2
- Inflorescence of male flowers congested, subsessile, or capitate on a short peduncle; male flowers congested, subsessile, or capitate on a short peduncle; male flowers with 6 petals; inner sepals in both sexes suborbicular; leaves seldom exceeding 10 cm. long, pilose beneath, densely so when young:4
- 2 Leaves deeply and widely cordate at base, ovate-oblong to suborbicular, rather abruptly acuminate, with on each side of midrib 2–3 main basal nerves and 2–3 other nerves:3
- Leaves shortly cuneate to subcordate at base, ovate to ovate-elliptic, triangular-acuminate, 10–18 cm. long, 6–12 cm. broad, with 3–4 main lateral nerves on each side of midrib; petiole, midrib and main nerves beneath densely and shortly pubescent; petals 0–3 in male flower *3. patens*
- 3 Petiole, midrib and main nerves beneath densely pubescent; leaves 20–25 cm. long, 10–18 cm. broad; petals absent from male flower *1. macrophylla*
- Petiole, midrib and main nerves beneath very shortly puberulous to almost glabrous; leaves up to 36 cm. long and broad; petals 3 in male flower; fruits ellipsoid, 4–5 cm. long, 3–5 cm. broad, in many bunches forming a very large infructescence *2. gillettii*

- 4 Flowers with 9 small bract-like sepals, and 3 inner sepals 4–5 mm. diam.; leaves stiffly papery, very variable in shape, suborbicular, oblong or ovate, rounded to deeply cordate at base [4. subcordata](#)
 Flowers with 15 small bract-like sepals, and 3 inner sepals about 2 mm. diam.; leaves leathery, suborbicular .. [5. coriacea](#)

1. **Triclisia macrophylla** *Oliv.* F.T.A. 1: 48 (1868); Diels in Engl. Pflanzenr. Menisp. 70 (1910). *APD acc*

Climbing shrub, stems to 30 ft. long; calyx and corolla of male flower green.

F. Po: (Jan.) Mann 197!

2. **Triclisia gillettii** (*De Wild.*) *Staner* in Inst. Roy. Col. Belge Bull. 4: 430 (1933); Troupin in Fl. Congo Belge 2: 215 (1951).

APD: Synonym of Triclisia dictyophylla Diels

Tiliacora gillettii *De Wild.* (1911).

Triclisia macrophylla of Chev. Bot. 19 and of Fl. Viv. 1: 115, not of Oliv.; F.W.T.A., ed. 1, 1: 72, partly.

Massive liane, to 60 ft. high; flowers mostly on old wood below the leaves; male flowers pale brown, in lax cymes; female flowers dull orange in congested cymes; ripe fruits bright orange in an enormous bunch.

IV. C.: Grabo (fr. July) Chev. 19684. **G. C.:** Pra R., Ntronang (fr. Sept.) Box 2842! Pra-Anum F. R. (Jan.) Box 3108! **S. Nig.:** Omo F.R. (fr. Apr.) Tamajong FHI 16923! Okomu F.R. (Dec.–Feb.) 5. **Triclisia coriacea** *Oliv.* F.T.A. 1: 49 (1868); Diels l.c. 71. *APD acc*

Woody climber, 10–15 ft. long.

F. Po: Mann 174!

Triclisia sp.

Slender woody twiner; carpels numerous; male flowers unknown.

S. Nig.: R. Oni, Omo F.R. (Feb.) Jones FHI 17554!

Imperfectly known species.

6. KOLOBOPETALUM*Engl. Bot. Jahrb.* 26: 410 (1899). *APD acc*

- 1 Leaves cordate at base: **2**
 Leaves rounded at base, not cordate; ovate or ovate-elliptic, long-acuminate, 7–10 cm. long, 4–5.5 cm. broad, petioles 3–7 cm. long; axis of inflorescence elongated, lower branches simple: **3**
- 2 Axis of male inflorescence elongated, to 60 cm. long, with relatively short lateral branches of which the lower ones are compound; stamens 3–6; leaves elliptic to ovate, acutely or obtusely auriculate to rather widely cordate at base, caudate-acuminate, often remotely repand-dentate, 5–15 cm. long, 3.5–9 cm. broad, petioles 2–9 cm. long [1. auriculatum](#)
 Axis of inflorescence (male and female) abbreviated, much shorter than the lower branches, which are simple and up to 20 cm. long; leaves elliptic, closely cordate at base, caudate-acuminate, 11–17 cm. long, 7–9 cm. broad, petioles 4–10 cm. long [2. leonense](#)
- 3 Stamens free, 1.5 mm. long; inner sepals about 2.5 mm. long; petals about 1 mm. long [3. Chevalieri](#)
 Stamens connate, 1 mm. long; inner sepals about 1.5 mm. long; petals about 0.6 mm. long [4. ovatum](#)

1. Kolobopetalum auriculatum *Engl. Bot. Jahrb.* 26: 410 (1899); Diels in *Engl. Pflanzenr. Menisp.* 165, t. 56, 57. *APD acc*

Kolobopetalum exauriculatum *H. Winkl.* (1908).*Kolobopetalum veitchianum* *Diels* l.c. 164 (1910); F.W.T.A., ed. 1, 1: 73; Chev. Fl. Viv. 1: 117.

Lofty climber, petioles twining; male flowers yellowish; female flowers green.

G. C.: Asuansi (Apr.) Box 2650! Kakum F.R. (Apr.) Box 2631! **S. Nig.:** Ibadan (Mar.) Keay FHI 25695a! Oban Talbot! **Br. Cam.:** Victoria (Jan.–May) Kalbreyer 19! Preuss 1118! Winkler 525! Missellele, Tiko (Jan.) Box 3557!Also in **French Cameroons** and **Gabon**.

Yola (June) Dalz. 79! **S. Nig.:** Lagos Rowland! Dalz. 1137! Ibadan South F.R. (fl. Apr., fr. June) Keay FHI 22843!

Extends to Abyssinia and **Kenya**.

13. STEPHANIA*Lour.*—F.T.A. 1: 46.

- 1 Inflorescences 4–7 cm. in diam., composed of pseudo-umbels on a single peduncle up to 10 cm. long, solitary or fasciculate in the axils of leaves; leaves ovate to orbicular-ovate, acute, 5–10 cm. long, 4–13 cm. broad, entire, petiole 4–12 cm. long: **2**
- Inflorescences elongated, up to 50 cm. long with a single main axis which bears numerous lateral racemes or pseudo-umbels, in leaf axils or on older leafless branches: **3**
- 2 Plant glabrous [l. abyssinica var. abyssinica](#)

Plant densely pubescent [1a. abyssinica var. tomentella](#)

- 3 Plant hispid, with long stiff brown hairs; inflorescence up to 50 cm. long, usually axillary, with shortly stalked lateral branches diminishing in size from base to apex, clothed with short appressed curly white hairs as well as sparse brown setae; leaves broadly ovate or orbicular, 12–25 cm. long, 10–20 cm. broad, mucronate, margin crenulate, ciliate, petiole 8–15 cm. long [2. laetificata](#)

Plant glabrous; inflorescence up to 50 cm. long, usually on older wood, main axis with long-stalked lateral branches bearing pseudo-umbels, upper branches as long as lower; leaves ovate to suborbicular, 7–15 cm. in diam., acute, margin undulate, petiole 6–12 cm. long [3. dinklagei](#)

1. **Stephania abyssinica (Dill. & Rich.) Walp. var. abyssinica**—F.T.A. 1: 47; Diels in Engl. Pflanzenr. Menisp. 268; Chev. Fl. Viv. 1: 125. *APD acc*

Clypea abyssinica Dill. & Rich. (1840).

Slender liane, to 30 ft. high, leaves dark green above, glaucous beneath, flowers green or purple.

Fr. G.: Labé (Apr.) Chev. 12300! Ladedeperre (Apr.) Chev. 12335. **Br. Cam.:** Cam. Mt., 4,400–7,800 ft. (Dec.–Apr.) Mann 1242! 2169! Maitland 1112! Hutch. & Metcalfe 19! Brenan 9526! **F. Po:** Moka, crater lake, 6,000 ft. (Jan.) Exell 816!

Widely spread in tropical Africa.

1a. **Stephania abyssinica var. tomentella (Oliv.) Diels** l.c. 270 (1910). *APD acc*

Stephania hernandifolia var. *tomentella* Oliv. in Trans. Linn. Soc. 2: 328 (1887).

As above, but densely pubescent.

Br. Cam.: Bali-Ngemba F.R., Bamenda (May) Ujor FHI 30322!

Widespread in central and east Africa.

2. **Stephania laetificata (Miers) Benth.** in Benth. & Hook. f. Gen. Pl. 1: 962 (1867); F.T.A. 1: 47; Diels l.c. 262; Chev. Fl. Viv. 1: 124.

APD: *Synonym of Perichasma laetificata Miers var. laetificata*

Perichasma laetificata Miers (1866).

Slender liane, to 30 ft. high, calyx green, corolla white.

S. Nig.: Owena, Ondo Box 3522! Sapoba Kennedy 2179! Calabar Robb! Oban Talbot 594! s.n.! **Br. Cam.:** Victoria (Jan.) Deistel 142. R. Mungo, Missellele (Jan.) Box 3577! Buea (Mar.–May) Lehmbach 54; 118. Barombi (Apr.) Preuss 275.

Extends southwards to [Angola](#).

3. **Stephania dinklagei (Engl.) Diels** l.c. 265 (1910); Chev. Fl. Viv. 1: 126. *APD acc*

Cissampelos dinklagei Engl. (1899).

Liane, to 60 ft. high, with warty rope-like stems; leaves dark glossy green above, glaucous beneath with purplish veins; flowers greenish; peduncle and pedicels in fruit brilliant scarlet, fruits green, yellowish when ripe, seed black.

Fr. G.: Kindia (Mar.) Chev. 13075. **S. L.:** Tassin, R. Scarcies (Jan.) Sc. Elliot 4495! Kamalu (May) Thomas 324! Njala (fl. Apr., fr. June) Deighton 2602! 2905! 3732! **Lib.:** Bonuta (Oct.) 17. PENIANTHUS

Miers—F.T.A. 1: 50.

- 1** Lateral nerves raised on upper surface; male flowers cymose, pedicellate; leaves generally obovate-oblongate, long-cuneate to obtuse at base [1. zenkeri](#)
 Lateral nerves impressed on upper surface; male flowers glomerate, subsessile; leaves variable in shape, cuneate to subrotundate at base [2. longifolius](#)

1. Penianthus zenkeri (*Engl.*) *Diels* in Engl. Pflanzenr. Menisp. 101, t. 37, A–K (1910). *APD acc*

APD: Synonym of Penianthus patulinervis Hutch. & Dalziel

Heptacyclum zenkeri *Engl.* (1899).

Penianthus patulinervis *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 74 (1927); Kew Bull. 1927: 156; Dinklage in Fedde Rep. 41: 249 (1937); Chev. Fl. Viv. 1: 122.

A small tree or shrub, to 20 ft. high, in **forest**; male flowers pale yellowish, female greenish; fruit orange.

S. L.: Kememe (fr. Jan.) Thomas 7650a! 7991! Heirakohun Smythe 100! **Lib.:** Peahtah (fr. Oct.) Linder 1067! **IV. C.:** frequent between Cavally and G.C. border (fl. & fr. Also in **French Cameroons.**

2. Penianthus longifolius *Miers*—F.T.A. 1: 60; Diels l.c. 101, t. 37, L–P; Chev. Fl. Viv. 1: 123; Troupin in Fl. Congo Belge 2: 253 (1951). *APD acc*

Penianthus fruticosus *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 74 (1927); Kew Bull. 1927: 157.

A small tree or shrub, to 15 ft. high, in **forest**; male flowers cream, female brown-red; fruit red.

S. Nig.: Oban Talbot 1444! **Br. Cam.:** Cam. Mt., 500 ft. (Jan.) Mann 1205! S. Bakundu F.R. (fr. Mar.) Brenan 9482! Kumba (fr. Sept.) Rosevear 99/37! R. Metschum falls, Bamenda (Jan.) Keay FHI 28530! **F. Po.:** (fl. Jan., fr. June) Mann 194! Barter!

Also in **French Cameroons, Ubangi, Spanish Guinea, Gabon** and **Belgian Congo.**

ARISTOLOCHIACEAE

Climbing shrubs, or rarely dwarf and erect; stems of the woody species in cross-section showing broad medullary rays; roots often medicinal. Leaves petiolate, alternate, exstipulate, simple, mostly entire. Flowers solitary or racemose, axillary or in clusters on the older wood, pedicellate, hermaphrodite, zygomorphic or rarely actinomorphic. Perianth single, often enlarged and petaloid, variously produced above the ovary, often tubular, the limb either symmetrically 3-lobed, or unilateral and entire or lobed,

usually highly coloured and foetid. Stamens 6-∞, in 1-2 series around the apex of the ovary or stylar column; filaments short, thick, free or scarcely distinguishable from the column; anthers free or adnate, with 2 parallel cells, extrorse, opening longitudinally. Ovary inferior or rarely semi-superior, 4-6-celled or imperfectly celled; styles thick, short, united into a column, divided into 3-8 stigmatic lobes; ovules numerous in each cell. Fruit capsular or rarely indehiscent, sometimes dehiscing from the base upwards and hanging like an inverted parachute. Seeds numerous, often immersed in the pulpy endocarp, 3-sided or flattened, raphe sometimes thickened or winged; endosperm copious, fleshy; embryo small.

Generally distributed throughout the tropics and warm temperate regions, with a few species in the cooler parts of the North Temperate Zone especially.

Easily recognized by the structure of the wood, the usually climbing habit, the hermaphrodite flowers with often (*Aristolochia*) enlarged and petaloid single perianth, and usually capsular fruit with triquetrous or flattened seeds.

- 1 Fruit indehiscent, elongated, strongly ribbed, cucumber-like; perianth regular, 3-lobed, or zygomorphic with 3 or 1 long tails dependent from the mouth of the limb; 6-12 stigmatic lobes; 6-24 anthers; flowers mostly on old woody stems below the leaves [1. *Pararistolochia*](#)
- Fruit dehiscent, short, basket-like; perianth irregular, oblique with a single lobe or bilabiate with a broad standard and long keel; stigmatic lobes 6 or less, anthers 6 or less; flowers on leafy shoots [2. *Aristolochia*](#)

1. PARARISTOLOCHIA

Hutch. & Dalz. F.W.T.A., ed. 1, 1: 75 (1927); Kew Bull. 1928: 22; Keay in Kew Bull. 1952: 159.

- 1 Perianth lobes with intermediate very small lobes; leaves not known [1. *ju-ju*](#)
Perianth without intermediate lobes: **2**
- 2 Perianth regularly 3-lobed: **3**
Perianth irregularly lobed: **9**
- 3 Leaves cuneate, rounded or very slightly cordate at base, not lobed and not deeply cordate: **4**
Leaves deeply cordate at base: **8**
- 4 Perianth tube about 2 cm. long, only slightly pouched at base; lobes triangular, hardly 1 cm. long, almost forming a triangle in open flower; flowers on leafy shoots; leaves ovate, acuminate, 8-11 cm. long, 4-7 cm. broad, very laxly veined [2. *leonensis*](#)
Perianth tube at least 4 cm. long, flowers on older wood: **5**
- 5 Perianth lobes triangular to lanceolate without long slender tails: **6**
Perianth lobes triangular about 1.2 cm. long and broad, with slender tails up to 4 cm. long; pouch about 2 cm. long and 1-5 cm. diam.; tube curved, about 3.5 cm. long; leaves oblong-elliptic, cuneate, abruptly acuminate, 11-16 cm. long, 4.5-8 cm. broad [6. *preussii*](#)
- 6 Perianth lobes ovate-lanceolate to lanceolate, at least 4 cm. long and twice as long as broad, tapering to a fine point: **7**
Perianth lobes triangular, 2-2.5 cm. long, 1.2-2 cm. broad, reflexed; lower swollen part of tube 2.5-3 cm. long, 1.5-1.8 cm. broad, upper part about 3.5 cm. long; leaves oblong-elliptic, abruptly acuminate, 7-11 cm. long, 5-6.5 cm. broad; fruit 15 cm. or more long, 3 cm. broad, 6-grooved with rounded ridges [5. *zenkeri*](#)
- 7 Perianth tube about 4 cm. long, only slightly pouched at base, more or less straight; lobes lanceolate, about 4 cm. long; leaves oblong-ovate, 15 cm. long, 9 cm. broad [3. *tribrachiatata*](#)
Perianth tube 5-8 cm. long, conspicuously pouched at base and curved; lobes ovate-lanceolate, 2-3.5 cm. broad, 5-8 cm. long; leaves ovate-elliptic, 7-14 cm. long, 6-9.5 cm. broad; fruits to 60 cm. long and 3 cm. diam., hexagonal in section [4. *flos-avis*](#)
- 8 Leaves not lobed, broadly rounded-ovate, abruptly acuminate, up to about 15 cm. long and broad; perianth limb very large and spreading with 3 linear tails; basal portion of tube about 18 cm. long and 4-5 cm. wide, with well-marked ribs [7. *goldieana*](#)
Leaves shallowly 3-lobed, deeply cordate-auriculate, 12-15 cm. long, 9-12 cm. broad; perianth tube about 8 cm. long with large pouch at base; fruit about 25 cm. long, 3-4 cm. diam., with 6 angular ridges [8. *triactina*](#)
- 9 Perianth with short rounded lobes, two of the lobes being longer than the third thus making the mouth of the tube 2-lipped; pouch about 2.5 cm. long and 1.5 cm. broad; slightly oblique limb about 6 cm. long; leaves 3-5-lobed closely and deeply cordate at base, auricles sometimes overlapping, glabrous [9. *mannii*](#)
Perianth with 1-3 long tails arising from one side of the mouth of the tube: **10**

- 10** Perianth gradually tapered into 3 long tails (to 45 cm.); perianth tube at maturity 8–11 cm. long; leaves oblong-elliptic acuminate, chartaceous when mature, 8–13 cm. long, 3·5–5·5 cm. broad, 3-nerved at base [10. *promissa*](#)
- Perianth abruptly narrowed into the long tails; perianth tube up to 8 cm. long at maturity; leaves not known: . **11**
- 11** Flower with a single tail about 10 cm. long; perianth tube 4·5–5 cm. long, about 1 cm. broad in the middle when flattened out; pedicels about 3 cm. long [11. *talbotii*](#)
- Flower with 3 thread-like tails about 20 cm. long; perianth tube 8 cm. long, about 1·5 cm. broad in the middle when flattened out [12. *tenuicauda*](#)

1. *Pararistolochia ju-ju* (*S. Moore*) *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 77 (1927); Kew Bull. 1928: 23.

APD: Synonym of Pararistolochia mannii (*Hook. f.*) *Keay*

Aristolochia ju-ju *S. Moore* in *J. Bot.* 58: 269 (1920).

A twiner; bark rugose with lenticels; flowers rather large, inflated part of perianth 3 cm. long, 2–2·5 cm. diam., tube 7 cm. long.

S. Nig.: Degema Talbot 3766!

2. *Pararistolochia leonensis* (*Mast.*) *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 77 (1927); Kew Bull. 1928: 24.

APD acc

Aristolochia leonensis *Mast.* in *J. Linn. Soc.* 30: 95 (1894).

A stout twiner, often with warty bark; flowers comparatively small; petioles twisted and twining.

S. L.: near Kassa, 3,600 ft. (Mar.) *Sc. Elliot* 5062! Falaba (Mar.) *Sc. Elliot* 5401!

3. *Pararistolochia tribrachiata* (*S. Moore*) *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 77 (1927); Kew Bull. 1928: 24.

APD: Synonym of Pararistolochia macrocarpa (*Duch.*) *Poncy*

Aristolochia tribrachiata *S. Moore* in *Cat. Talb.* 92 (1913).

Stem twining, stout, assured; inflorescence with a thickly wooded base; flowers yellowish-white, lobes reddish-purple with white streaks.

S. Nig.: Oban Talbot 213! 1542!

4. *Pararistolochia flos-avis* (*A. Chev.*) *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 77 (1927); Kew Bull. 1928: 24; Chev. *Fl. Viv.* 1: 132.

APD: Synonym of Pararistolochia macrocarpa (*Duch.*) *Poncy*

Aristolochia flos-avis *A. Chev.* in *Journ. de Bot.* 1909: 129.

A. tessmannii *Engl. Bot. Jahrb.* 46: 413 (1911).

A stout forest liane, to 100 ft. high, with rough channelled bark, and twining petioles; perianth tube greenish to yellowish-white outside with very numerous purple spots, lobes deep purple.

S. L.: Commendi-Gengaru Road (Nov.) *Aylmer* 622! **Iv. C.:** Guidéko (May) Chev. 17786! 16434. Between Sampleu and Ganhoue (Apr.) Chev. 21145. **G. C.:** Gould! Pamu Berebun F.R. (fl. & fr. Sept.) Vigne 2492! **S. Nig.:** Omo F.R. (fl. & fr. Feb., Apr.) Ross 40! Jones & Onochie FHI 17301! Richards 3125! Oban Talbot 213! **Br. Cam.:** Kumba (fl. & fr. Nov.) Dundas FHI 8498!

Also in **French Cameroons** and **Spanish Guinea**.

5. *Pararistolochia zenkeri* (*Engl.*) *Hutch. & Dalz.* in Kew Bull. 1928: 24. *APD acc*

Aristolochia zenkeri *Engl. Bot. Jahrb.* 24: 490 (1898).

Forest liane, to 30 ft. high, stems rough; perianth tube pale brown outside, lobes deep purple-brown with many small white spots, and white hairs; white within with long hairs; fruit green.

S. Nig.: Okomu F.R. (Dec.) *Brenan* 8467!

Also in **French Camerouns**.

6. **Pararistolochla preussii** (Engl.) Hutch. & Dalz. in Kew Bull. 1928: 24. *APD acc*

Aristolochia preussii Engl. l.c. 492 (1898).

Forest liane, to 30 ft. high, outside of perianth tube and lobes pale dull brown with dull purple markings, throat deep purple.

Br. Cam.: Barombi, between the station and Kumba (Apr.) Preuss 108. **S. Bakundu F.R.** (Mar.) Brenan 9484!

[Preuss 108, the type was a poor leafless specimen and was presumably destroyed at Berlin in the war; Brenan's excellent specimen collected in the same district agrees well with Engler's description, except for the pedunculate flowers and longer internodes in the well-developed cymes of Brenan 9484.]

7. **Pararistolochla goldieana** (Hook. f.) Hutch. & Dalz. F.W.T.A., ed. 1, 1: 77 (1927); Kew Bull. 1928: 25; Chev. Fl. Viv. 1: 135. *APD acc*

Aristolochia goldieana Hook. f.—F.T.A. 6, 1: 142; Bot. Mag. t. 5672.

A climber, 20 ft. long with very large reddish-purple flowers up to 18 in. long; fruits several inches long with six well-marked ribs.

S. L.: Port Loko (Apr.) Sc. Elliot 5747! Pendembu Sc. Elliot 5682! Njala (July) Deighton 2907! **G. C.:** near Kibbi (Mar.) Vigne 4374! **N. Nig.:** forests near Lokoja Elliot 250! **S. Also in **French Camerouns**.

8. **Pararistolochla triactina** (Hook. f.) Hutch. & Dalz. F.W.T.A., ed. 1, 1: 77 (1927); Kew Bull. 1928: 24; Chev. Fl. Viv. 1: 134. *APD acc*

Aristolochia triactina Hook. f.—F.T.A. 6, 1: 140.

A. schweinfurthii Engl. Bot. Jahrb. 24: 492 (1898).

A woody climber, 25 ft. or more long, with pendulous cucumber-like fruits; perianth-lobes red-purple, tube paler.

Dah.: Zagnanado Chev. 23296. Tori-Avamé (July) Poisson. **S. Nig.:** Lagos (Mar.) Moloney 18! Dalz. 1076! Itu (Mar.) Holland 26!

Also in **Gabon, A.-E. Sudan, Uganda** and **Angola**.

9. **Pararistolochla mannii** (Hook. f.) Keay in Kew Bull. 1952: 159. *APD acc*

Aristolochia mannii Hook. f.—F.T.A. 6, 1: 140; F.W.T.A., ed. 1, 1: 77.

Woody climber 10–15 ft. long; flowers dark violet with yellowish spots; fruit long, 6-ridged.

Iv. C.: Adiopodoumé Favarger. **S. Nig.:** Old Calabar (Feb.) Mann 2323! Thomson 69! Bonny (fl. & fr. Feb.) Kalbreyer 62!

10. **Pararistolochla promissa** (Mast.) Keay l.c. 160, t. 1 (1952). *APD acc*

Aristolochia promissa Mast.—F.T.A. 6, 1: 142; F.W.T.A., ed. 1, 1: 78.

A. flagellata Stapf—F.T.A. 6, 1: 141; F.W.T.A., ed. 1, 1: 77.

A. talbotii var. *longissima* S. Moore in Cat. Talb. 94 (1913).

A. congolana Hauman in Fl. Congo Belge 1: 384 (1948), French descr. only.

Woody climber, flowers on old stems freely almost from ground to the top; to 30 ft. high, in **forest**. Outside of flower dirty yellow to greenish-white with purplish brown blotches; inside yellow, brown-spotted, with white hairs; fruit with 6 rounded ridges, to 6 in. long.

G. C.: Aburi Hills (Oct.) Johnson 487! Aburi Gardens (Nov.) Johnson 1060! Kwahu Prasu (Feb.) Vigne 1606! 1607! Bunsu, Akim (Mar.) Irvine 1806! **S. Nig.:** Oban Talbot 1642! **Br. Cam.:** Victoria (Jan.) Kalbreyer 7! Barombi (Mar.) Preuss 45!

Also in **French Camerouns** and **Belgian Congo**.

11. **Pararistolochla talbotii** (S. Moore) Keay l.c. 161 (1952).

APD: Synonym of Pararistolochia promissa (Mast.) Keay

Aristolochia talbotii S. Moore in Cat. Talb. 93, t. 11 (1913) (excl. var. longissima); F.W.T.A., ed. 1, 1: 78.

Perianth pale-yellowish-green with black-bulbous-based hairs within.

S. Nig.: Oban Talbot 128! 2310!

12. *Pararistolochia tenuicauda* (S. Moore) Keay l.c. 160 (1952).

APD: Synonym of Pararistolochia promissa (Mast.) Keay

Aristolochia tenuicauda S. Moore l.c. 94; F.W.T.A., ed. 1, 1: 78.

Colour of outside of perianth not recorded; inside with white hairs.

S. Nig.: Oban Talbot 2318!

2. ARISTOLOCHIA

Linn.—F.T.A. 6, 1: 135. APD acc

- 1 Perianth lobes not forming a keel-like lip and broad standard; flowers subtended by a leafy bract:2
Perianth lobes consisting of a keel-like lip up to 17 cm. long and a standard about 4 cm. diam. on a claw about 3.5 cm. long; tube consisting of an asymmetrical pouch about 5 cm. long and 4 cm. broad; leaves orbicular, deeply cordate, 8–12 cm. diam. (naturalized alien)[3. ringens](#)
- 2 Perennial herb, stems flexuous; flowers solitary in the leaf axils; older leaves not very reticulate; fruits about 2.5 cm. long[1. bracteolata](#)
Shrubby climber; stems twining; flowers racemose; older leaves markedly reticulate; fruits about 5–6 cm. long [2. albida](#)

1. *Aristolochia bracteolata* Lam. Encyl. 1: 258 (1783). *APD acc*

Aristolochia bracteata Retz.—F.T.A. 6, 1: 136; F.W.T.A., ed. 1, 1: 77; Chev. Fl. Viv. 1: 130.

A small glabrous shrub, stems flexuous from a woody base; flowers yellow-brown with a purple lip.

Fr. Sud.: L. Tacadji (Aug.) Chev. 3460! **Fr. Nig.:** fide Chev. l.c. **N. Nig.:** Bornu (Feb.) E. Vogel 45!

Also in **tropical E. Africa**, **S. Arabia** and **India**.

2. *Aristolochia albida* Duchartre—F.T.A. 6, 1: 137; Chev. Fl. Viv. 1: 131. *APD acc*

Aristolochia ledermannii Engl. (1911).

Stems glabrous, twining on other plants; flowers blackish-purple.

Sen.: Bondou Heudelot 173. **Fr. Sud.:** fide Chev. l.c. **S. Nig.:** Nupe Barter 1531! Katagum Dalz. 87! **S. Nig.:** Lagos Dawodu 206!

Also in **Shari-Chad** and **Angola**.

3. *Aristolochia ringens* Vahl Symb. Bot. 3: 99 (1794). *APD acc*

A glabrous climber, with pale glaucescent leaves; perianth pale green with dense dark violet network all over, especially dense on lobes; fruit-baskets about 7 cm. long.

S. Nig.: Ibadan Fuel Plantation (Feb.) Brenan & Keay 8981! Onitsha (Oct.) Dundas!

Native of tropical America; naturalized in several parts of Nigeria; cultivated in Gold Coast.

Aristolochia ridicula N.E.Br.

Grown in the Aburi Botanic Gardens, Gold Coast. Native of tropical America.

This species has been introduced into gardens, and may have become naturalized.

Aristolochia elegans Mast.

From Njala in Sierra Leone, Aburi, Kumasi and Abetifi Kwahu in Gold Coast, and Ibadan and Brass in Nigeria. Native of tropical America.

This species has been introduced into gardens, and may have become naturalized.

***Aristolochia gibbosa* Duchartre**

From Njala, Aburi and Kumasi. Native of tropical America.

This species has been introduced into gardens, and may have become naturalized.

***Aristolochia brasiliensis* Mast. & Zucc.**

From Njala. Native of tropical America.

This species has been introduced into gardens, and may have become naturalized.

***Aristolochia ringens* Vahl**

Naturalized in several parts of Nigeria and is included in the above key. Native of tropical America.

PIPERACEAE

Herbs or shrubs, erect or scandent; vascular bundles more or less scattered, as in Monocotyledones. Leaves usually alternate, entire, rarely opposite or whorled, petiolate, stipules adnate to the petiole or absent. Flowers minute, hermaphrodite or unisexual, usually densely spicate or spikes umbellate. Perianth absent. Stamens 2–6, hypogynous; filaments usually free; anthers 2-celled, distinct or confluent. Ovary superior, 1-celled, 1-ovuled; stigmas 1–5, short; ovule erect. Fruit baccate, small, with a succulent, thin or dry pericarp. Seeds small, with small endosperm and copious mealy perisperm; embryo very small.

Throughout the warmer regions of the world, comparatively rare in Africa, very abundant in tropical America.

Readily recognized by the structure of the stem, the minute spicate flowers entirely devoid of perianth, the definite number of stamens, the 1-celled and 1-ovuled ovary, the baccate fruit, and minute embryo of the seed.

- 1 Herbs; stamens 2, with confluent anther-cells; stigma single, sessile, penicillate or undivided; stipules absent; leaves sometimes opposite or whorled [1. *Peperomia*](#)
- Shrubs; stamens 2–6, usually with distinct anther-cells; stigmas 2–5; stipules adnate to the petiole; leaves alternate [2. *Piper*](#)

1. PEPEROMIA

Ruiz & Pav.—F.T.A. 6, 1: 147

- 1 Leaves alternate: **2**
 - Leaves opposite or whorled, spikes axillary or terminal: **11**
- 2 Lateral inflorescences leaf-opposed, or inflorescence terminal: **3**
 - Lateral inflorescences axillary: **5**
- 3 Leaves cordate or rounded-cordate at base, with 5–7 nerves, very thin; inflorescences very slender, with scattered flowers [1. *pellucida*](#)
 - Leaves rounded or cuneate at base, 3–5-nerved, moderately firm or rather thick: **4**
- 4 Leaves rounded and 5-nerved at base; plant not very fleshy; spikes slender [2. *molleri*](#)
 - Leaves cuneate and 3-nerved at base; plant fleshy, stems becoming almost angular when dry; spikes rather stout [3. *vulcanica*](#)
- 5 Leaves over 1 cm. long, not, or not entirely, orbicular, midrib distinct: **6**
 - Leaves less than 1 cm. diam., thick and fleshy, orbicular, veins all hidden; stems creeping and rooting nearly to the tip [10. *rotundifolia*](#)
- 6 Leaves acutely acuminate, more or less ovate or lanceolate, 3–6 cm. long, 1·5–3 cm. broad; inflorescences often paired; stems creeping and rooting at the base, then ascending [4. *fernandopoiana*](#)
 - Leaves obtuse, rounded or notched at apex; inflorescences solitary: **7**
- 7 Leaves entire at apex: **8**

- Leaves notched at apex: 10
- 8 Petioles less than 1/3 length of lamina; stems ascending from decumbent base: 9
- Petioles more than 1/3 length of lamina; stems trailing and rooting nearly to the tip; leaves elliptic-rhomboid to orbicular, up to about 1·8 cm. long and 1·4 cm. broad [7. mannii](#)
- 9 Leaves broadly to narrowly rhomboid, obtuse at apex, 3–5 cm. long, 0·8–2 cm. broad [5.? stuhlmannii](#)
- Leaves ovate to orbicular, up to about 15 mm. long and 8 mm. broad; ascending branches several together in a bunch [6. retusa](#)
- 10 Spike 3–6 cm. long, 1 mm. broad; leaves obovate to broadly oblanceolate, 2–3·5 cm. long, 1–1·5 cm. broad, long-petiolate; stems ascending from decumbent base, ascending portions to about 15 cm. long [8. vacciniifolia](#)
- Spike 5–10 cm. long, 2–3 mm. broad; leaves rhomboid-obovate, 2–5·3 cm. long, 1·5–4 cm. broad, petiole above 8 mm. long; stems rather stout, decumbent below, ascending to about 30 cm. above [9. hygrophila](#)
- 11 Stems and leaves densely pubescent: 12
- Stems and leaves glabrous; branching dichotomous; leaves in fours, broadly obovate-elliptic, about 1·5 cm. long, shortly petiolate [13. reflexa](#)
- 12 Undersurface of leaves showing only midrib, laterals very faint; lamina elliptic-obovate, 1–2·5 cm. long and 1–1·8 cm. broad; young shoots with brownish spreading pubescence [11. kamerunana](#)
- Undersurface of leaves with distinct main laterals; lamina obovate-cuneate, 6–11 mm. long and 4–8 mm. broad; young shoots with greyish-spreading pubescence [12. dusenii](#)

1. **Peperomia pellucida** (Linn.) H.B. & K.—F.T.A. 6, 1: 149; Chev. Fl. Viv. 1: 142. *APD acc*

Piper pellucidum Linn. (1753).

A herb, usually erect and often terrestrial, with delicate leaves; a common weed in moist situations.

Sen.: Perrottet! Dakar Chev. 34002. **Fr. G.:** Farana (Feb.) Chev. 20634. **S. L.:** Lester Peak (Dec.) Sc. Elliot 3885! Kumrabai-Mamila (Nov.) Deighton 4943! **Lib.:** Monrovia (Nov.) Cosmopolitan in tropics.

2. **Peperomia molleri** C. DC. in Henriq. Bol. Soc. Brot. 10: 154 (1893); Exell Cat. S. Tomé 277; F.T.A. 6, 1: 150. *APD acc*

Peperomia fernandopoiana var. *subopacifolia* C. DC. (1869).

Peperomia zenkeri C. DC. (1894)—F.W.T.A., ed. 1, 1: 79; Chev. Fl. Viv. 1: 143.

Peperomia holstii C. DC. (1894)—F.T.A. 6, 1: 151.

Peperomia baumannii C. DC. (1899)—F.T.A. 6, 1: 149.

A delicate herb, more or less erect; epiphytic.

G. C.: Obosomase (Aug.) Johnson 176! **Togo:** Misahöhe (July) Baumann 205. **S. Nig.:** Akure F.R. (Nov.) Keay FHI 25563! **Br. Cam.:** Buea, 3,000 ft. (Oct.) Preuss 1060! **F. Po.:** (Jan.) Guinea 1844!

Widespread in tropical Africa.

3. **Peperomia vulcanica** Baker & C. H. Wright in F.T.A. 6, 1: 151 (1913). *APD acc*

Stout fleshy herb with erect stems, in mist forest and on lava.

Br. Cam.: Cam. Mt., 8,000 ft. (Jan.) Mann 1305! Mann's Spring 7,000 ft. (Mar.) Brenan 9373!

4. **Peperomia fernandopoiana** C. DC. in Seem. Journ. Bot. 1866: 134 (excl. var. *subopacifolia* C. DC.); F.T.A. 6, 1: 154. *APD acc*

Peperomia preussii C. DC. (1894)—F.T.A. 6, 1: 150; F.W.T.A., ed. 1, 1: 78.

Peperomia staudtii Engl. (1899)—F.W.T.A., ed. 1, 1: 79; Chev. Fl. Viv. 1: 143.

Perennial herb, stems trailing and rooting, stems and undersides of leaves purplish; usually epiphytic.

Fr. G.: & **Iv. C.:** fide Chev. l.c. **S. Nig.:** Oban Talbot 2324! Koloishe, Obudu, 4,000 ft. (Dec.) Keay & Savory FHI 25040! **Br. Cam.:** Buea, 4,000 ft. (Feb.) Deistel 587! Maitland 419! Cam. Mt., 3,500–5,700 ft. (Feb.–Apr.) Dais. 8340! Hutch. & Metcalfe 35! Brenan 9342! L. Bambulue. Bamenda, 7,200 ft. (Jan.) Migeod 373! **F. Po.:** Mann 394! Moka (Jan.) Guinea 2101!

Also in **French Camerouns**.

5. *Peperomia stuhlmannii* C. DC.—F.T.A. 6, 1: 152.

APD: Synonym of Peperomia abyssinica Miq.

Peperomia vacciniifolia of F.T.A. 6, 1: 152, partly (Sierra Leone spec.), not of C. DC.

Epiphytic herb.

S. L.: Sugar Loaf Mt. (Apr., May) Sc. Elliot 5755! Barter! Kamadugu to Bandakarafaia, 1,500 ft. (Nov.) Glanville! Sankon Biriwa, 4,000 ft. (Feb.) Deighton 3509! Simbaru (Jan.) Deighton 4583! Yifin (Apr.) Deighton 5100! **Lib.:** R. Mao, Nyandamolahun (Feb.) Bequaert 76! **G. C.:** Irvine 11781! **Br. Cam.:** Tombel (Nov.) Thorold 76!

[Very close to Uganda specimens of *P. stuhlmannii* C. DC., but type (Stuhlmann 2485 from Ruwenzori) not seen.]

6. *Peperomia retusa* (Linn. f.) A. Dietr.—Fl. Capensis 5, 1: 491. *APD acc*

Piper retusum Linn. f. (1781).

Peperomia ulugurensis Engl.—F.T.A. 6, 1: 151.

Small epiphyte with erect branches.

S. Nig.: Oban Talbot 657! **Br. Cam.:** L. Oku, Bamenda (Jan.) Keay FHI 28532!

Also on highlands of tropical E. Africa, and in **S. Africa**.

7. *Peperomia mannii* Hook. f. ex C. DC.—F.T.A. 6, 1: 153 (incl. var. fernandopoana C. DC.).

APD: Synonym of Peperomia retusa (L. f.) A. Dietr. var. *retusa*

Peperomia bueana C. DC.—F.W.T.A., ed. 1, 1: 80.

Epiphyte with slender trailing stems.

S. Nig.: Shasha F.R. (May) Richards 3317! 3477! Okomu F.R. (Dec., Feb.) Brenan 8484! 9009! **Br. Cam.:** Cam. Mt., 4,000–7,000 ft. (Dec.–Apr.) Mann 2016! Preuss 663! Dunlap 3! 48! Hutch. & Metcalfe 4! Brenan 9372! **F. Po:** Mann 291! Balacha to Ureka (Feb.) Guinea 2304! 2306!

8. *Peperomia vacciniifolia* C. DC.—F.T.A. 6, 1: 152 (excl. Sierra Leone spec.).

APD: Synonym of Peperomia thomeana C. DC.

Herb with trailing stems, on ground and epiphytic.

Br. Cam.: Cam. Mt., 5,000–6,000 ft. (Nov.) Preuss 875a! Migeod 141! Cam. Mt., Mimbria, 4,400 ft. (Nov.) Brenan 9364! **F. Po:** Moka (Jan.) Guinea 2223!

9. *Peperomia hygrophila* Engl. in Mildbr. Wiss. Ergebn. Deutsch. Zentr.-Afr. Exped. 1907–08, 2: 177 (1911).

APD: Synonym of Peperomia vulcanica Baker & C.H. Wright

Stems prostrate below, ascending above, leaves succulent, spike stout; **in caves**.

Br. Cam.: Cam. Mt., 8,000–8,300 ft. (June) Mildbr. 3400. Between Buea and Mann's Spring (May) Preuss 805!

Also in **S. Tomé**.

10. *Peperomia rotundifolia* (Linn.) H.B. & K. Nov. Gen. & Sp. 1: 65 (1815).

APD: Synonym of Peperomia bangroana C. DC.

Piper rotundifolium Linn. (1753).

Peperomia bagroana C.DC.—F.T.A. 6, 1: 154; F.W.T.A., ed. 1, 1: 80; Chev. Fl. Viv. 1: 142.

Annual with filiform creeping stem and orbicular leaves.

S. L.: Bagroo R. (Apr.) Mann 905! Melekuri (Mar.) Glanville 430! Mendekiam, Gaura (Nov.) Deighton 5031! **Lib.:** Shew (Nov.) Linder 13921 **iv. C.:** fide Chev. l.c. **G. C.:** Kibbi (Dec.) Johnson 273! Effiduase Cox 118! Begoro, Akim (Jan.) Irvine 1162! **Togo:** Büttner! **Br. Cam.:** Tombel (Nov.) Thorold 75!

Widespread in tropical Africa and in Madagascar and tropical America.

11. **Peperomia kamerunana** *C. DC.*—F.T.A. 6, 1: 154. *APD acc*

Epiphyte with fleshy, creeping stems, hairy.

Br. Cam.: Preuss 918! Cam. Mt., 6,700 ft. (Mar., Apr., Nov.) Brenan 9371! Migeod 84! Maitland 1174! **F. Po:** Finca de Puente (Jan.) Guinea 1674! 1820!

12. **Peperomia dusenii** *C. DC.*—F.T.A. 6, 1: 155. *APD acc*

Apparently creeping at the base, with dwarf erect shoots to 4 in. high.

Br. Cam.: Dusen 436!

13. **Peperomia reflexa** (*Linn. f.*) *A. Dietr.*—F.T.A. 6, 1: 155; Chev. Fl. Viv. 1: 143.

APD: *Synonym of Peperomia tetraphylla (G. Forst.) Hook. & Arn.*

Piper reflexum *Linn. f.* (1781).

Stems tufted, creeping; leaves shining.

Fr. G.: Dalaba, 3,500 ft. (Dec.) Chev. 20288. Diaguissa, 3,000–4,000 ft. (Apr.) Chev. 13456. **S. L.:** Bintumane Peak, 5,400 ft. (Jan.) T. S. Jones 65! **Br. Cam.:** Cam. Mt., 4,000–7,000 ft. (Jan.) Dunlap 5! 223! L. Bambulue, Bamenda, 6,700 ft. (Jan.) Keay FHI 28360!

Widespread throughout the tropics.

2. PIPER

Linn.—F.T.A. 6, 1 : 144

- 1 Inflorescence solitary, leaf-opposed or terminal; leaves rounded or slightly cordate at base:2

Inflorescences from 2 to several in a pedunculate axillary umbel; peduncle shorter than the flowering axis; stigmas 3; leaves deeply cordate and many-nerved at base 3. *umbellatum*

- 2 Fruits spicate; peduncle as long as or longer than the flowering axis; stigmas 2; leaf-base 7-nerved ... 1. *capense*

Fruits racemose; pedicels up to 5 mm. long; peduncle usually shorter than the flowering axis; stigmas 3; leaf-base at most 5-nerved 2. *guineense*

1. **Piper capense** *Linn. f.*—F.T.A. 6, 1: 146 (incl. var. *magnifolium* *C. DC.*); Chev. Fl. Viv. 1: 138. *APD acc*

Piper bisexuale *C. DC.* (1914).

A shrub, erect or more or less scandent.

Fr. G.: Dalaba-Diaguissa Plateau, 3,000–4,000 ft. Chev. 18748. **S. Nig.:** Ijua, Obudu, 3,000 ft. (Dec.) Keay & Savory FHI 25027! **Br. Cam.:** Cam. Mt., 4,000–8,000 ft. (Nov.–Apr.) Mann 2015! Preuss 615! Maitland 1283! Brenan 9353! Above Bamenda, 6,500–7,000 ft. (Feb.) Migeod 471! 485! **F. Po:** 1,300 ft. Mann 299!

Also in **French Camerouns** and in **East** and **South Africa**.

[The specimens in our area have mostly glabrescent leaves, and the peduncles are often longer than the flowering axis; the reverse is the case in the S. African material.]

2. **Piper guineense** *Schum. & Thonn.*—F.T.A. 6, 1: 145; Chev. Fl. Viv. 1: 139. *APD acc*

Piper leonense *C. DC.* (1866)-Chev. Fl. Viv. 1: 140.

Piper famechonii *C. DC.* (1914).

A climber, 30–40 ft. long, on trees; fruit red or red-brown when ripe, black when dry.

Port. G.: Viegas 189! **Fr. G.:** Kafogo (fr. Apr.) Sc. Elliot 4003! Kissidougou (Feb.) Chev. 20719. **S. L.:** Don! Dunnia Talla (fr. Feb.) Sc. Elliot 4875! Yonibana (Nov.) Piper betle Linn. (Holl. 4: 552).

Cultivated in gardens

Piper cubeba Linn. f. (Holl. 4: 552).

Cultivated in gardens

Piper nigrum Linn. (Holl. 4: 552).

Cultivated in gardens

PAPAVERACEAE

Annual, biennial, or perennial herbs with coloured juice, often glaucescent and prickly, or rarely shrubs or small trees; root usually a rhizome or tuber. Leaves exstipulate, alternate, rarely the floral leaves opposite or whorled, much divided, rarely entire. Flowers hermaphrodite, actinomorphic, hypogynous or rarely perigynous, mostly solitary, fugacious and visited by pollen-eating insects. Perianth of calyx and corolla, or rarely the latter absent. Sepals 2, rarely 3, green, falling off separately on the opening of the flower or united into a deciduous calyptra. Petals showy, 4 or 6, rarely 8 or 12, free, imbricate and often crumpled in the bud, deciduous. Stamens numerous, rarely few, free, with filiform filaments; anthers mostly nearly as long as the filaments, 2-celled, dehiscing by longitudinal slits. Ovary free, of 2 or more united carpels, 1-celled with parietal placentas, or several-celled by the placentas reaching to the middle. Ovules numerous, rarely solitary. Fruit a capsule, opening by valves or pores. Seeds small, with minute embryo in fleshy or oily endosperm.

Mainly natives of the North Temperate Zone, rare in the tropics; represented in our area by a single introduced species.

ARGEMONE

Linn.—F.T.A. 1: 54. *APD acc*

Sepals 2–3. Petals 4–6, yellow. Stamens numerous. Ovary with 4–7 placentas; stigmas radiating. Capsule opening by valves at the top. Seeds pitted.

Argemone mexicana Linn.—F.T.A. 1: 54; Chev. Fl. Viv. 1: 145. *APD acc*

A prickly glaucous erect herb, with yellow juice; leaves semi-amplexicaul, pinnately lobed; flowers bright yellow; capsule smooth or setose, 3–4 cm. long; seeds pitted-reticulate.

Sen.: Roger 70! Dakar (Dec.) Debeaux! **Fr. G.:** Kouroussa (Oct.) Pobéguin 562! Farana (Mar.) Sc. Elliot 5323! **S. L.:** Deighton 2009! **Lib.:** (May) Willmott! **G. C.:** Tamale (Apr.) Nig.:** Oshogobo (Apr.) Moloney! Lanlate (July) Foster 113! **Br. Cam.:** Talbot 1411!

Mexican Poppy, introduced from America and found in waste dry places and roadsides throughout the area and in other parts of Africa.

TURNERACEAE

Herbs or undershrubs with entire or lobed alternate leaves; stipules absent. Flowers hermaphrodite, actinomorphic, yellowish. Calyx tubular, 5-toothed, teeth imbricate. Petals 5, inserted on the calyx-tube, free, clawed, contorted. Stamens 5, from the base of the calyx-tube; filaments free; anthers 2-celled, opening lengthwise. Ovary superior, 1-celled with 3 parietal placentas; styles 3, terminal, slender; stigmas fringed; ovules numerous. Fruit a capsule, opening loculicidally by 3 valves with the placenta in the middle of each. Seeds arillate, pitted; endosperm horny or fleshy; embryo straight, large.

Tropics and subtropics.

Mostly herbaceous and resembling Cruciferae or Capparidaceae. Recognized by the tubular calyx and 1-celled ovary with parietal placentas.

Turnera ulmifolia Linn. (incl. var. *elegans* Urb., and var. *angustifolia* Urb.)

A native of tropical America, is cultivated in Sierra Leone (Njala) and Gold Coast (Aburi).

WORMSKIOLDIA

Thonn.—F.T.A. 2: 501.

Herbs. Calyx tubular, 5-toothed. Petals 5, clawed, with a scale at their base. Stamens 5, arising from the base of the calyx-tube. Ovary 1-celled; styles 3, slender; stigmas fringed. Capsule linear, opening loculicidally by 3 valves with the placenta in the middle of each; seeds conspicuously pitted.

- 1 A branched herb about 1 ft. high; stems finely pubescent and with numerous purple bristles; leaves linear or linear-lanceolate, entire, denticulate or pinnatifid, up to 18 cm. long and 1 cm. broad, glabrous or shortly bristly beneath; flowers much resembling a Crucifer, racemose; calyx long-tubular, narrow, 1 cm. long, shortly 5-lobed, more or less bristly outside; petals exceeding the calyx; pod slender, slightly torulose, about 5 cm. long, shortly stipitate, beaked; seeds about 20, about 3 mm. long, straw-coloured, conspicuously pitted *pilosa*

Wormskioldia pilosa (Willd.) Schweinf. ex Urb. in Jahrb. Kgl. Bot. Gart. Berl. 2: 54 (1883); Chev. Fl. Viv. 1: 148.

APD: Synonym of Tricliceras pilosum (Willd.) R. Fern.

Rapanus pilosus Willd. (1801).

Wormskioldia heterophylla Schum. & Thonn. (1827); Guill. & Perr. Fl. Seneg. t. 11; F.T.A. 2: 503.

Annual herb, flowers bright yellow.

Sen.: St. Louis Leprieur; Perrottet. **Gam.:** Kuntaur (July, Aug.) Ruxton 68! 138! **Fr. Sud.:** Gourma (July) Chev. 24494. **Port. G.:** Catió, Granja (July) Esp. Santo 2129! **G. C.:** Hb. Vahl! Also in **Ubangi-Shari**, **French Cameroons**, **A.-E. Sudan**, **Uganda**, **Kenya** and **Tanganyika**.

CAPPARIDACEAE

Herbs, shrubs or trees, sometimes scandent. Leaves alternate or rarely opposite, simple or digitately 3–7-foliolate; stipules when present minute or spiny. Flowers mostly hermaphrodite, actinomorphic or rarely zygomorphic, hypogynous, axillary or terminal, variously arranged. Perianth of calyx and corolla, or the latter absent. Sepals free or partially united, imbricate or valvate, usually 4. Petals 4 to many or absent. Torus elongated or short, rarely with an appendix. Stamens few to many, sometimes some of them without anthers; filaments sometimes partially adnate to the torus; anthers 2-celled, longitudinally dehiscent. Ovary sessile or more usually supported on a long or short gynophore, 1-

celled with parietal placentas or divided into 2 or more cells by spurious dissepiments; ovules few to many. Fruit a capsule or berry, sometimes the latter elongate or torulose. Seeds usually reniform or angular; endosperm none or scanty; embryo arcuate or incurved.

Tropics and subtropics of both hemispheres, very numerous in East Africa and South America.

Recognized by the usually showy flowers, clawed petals, mostly stipitate ovary, parietal placentas and curved embryo with scanty or no endosperm.

- 1 Fruit a capsule, splitting its full length into two valves; mostly herbaceous annuals:2
Fruit a berry or drupe, often torulose; shrubs or trees or rarely suffrutescent with woody rhizomes and annual shoots:3
- 2 Torus short, not adnate to the free filaments; stamens 4 to many1. [Cleome](#)
Torus elongated into a gynophore bearing the filaments; stamens usually 62. [Gynandropsis](#)
- 3 Petals present:.....4
Petals absent; leaves simple:8
- 4 Sepals connate into a tube at the base, valvate in a single series; fruits generally torulose; leaves simple3. [Maerua](#)
Sepals free to the base or nearly to the base; imbricate or if in 2 series only the outer ones coherent and valvate; or valvate in a single series:5
- 5 Sepals in 2 series; leaves simple:.....6
Sepals imbricate in a single series; leaves trifoliolate; stamens 8–20; fruits not torulose6. [Crateva](#)
Sepals valvate in a single series; leaves trifoliolate or up to 5-foliolate, rarely 1-foliolate:.....7
- 6 Stamens numerous; fruits not torulose4. [Capparis](#)
Stamens 4–8; fruits often subtorulose5. [Cadaba](#)
- 7 Petals equal; torus without an appendage at the base; stamens 12 to many7. [Ritchiea](#)
Petals unequal, 2 much larger than the other 2; torus with a linear appendage of united staminodes between the two larger petals; stamens 5–78. [Euadenia](#)
- 8 Calyx imbricate:9
Calyx valvate in a single series:10
- 9 Small shrubs, with small leaves; flowers more or less shortly corymbose; stamens 4–5; fruit torulose or small and elliptic5. [Cadaba](#)
Trees; leaves large; flowers in rather long lax racemes; stamens indefinite; fruits large, ellipsoid ..9. [Buchholzia](#)
- 10 Fruit torulose; seeds numerous; calyx tubular at the base3. [Maerua](#)
Fruit entire, globose or ellipsoid; seeds few:11
- 11 Flowers racemose or subpaniculate; ovary 1-celled; fruit globose10. [Boscia](#)
Flowers axillary, solitary; ovary 2–3-celled; fruit ellipsoid11. [Courbonia](#)

1. CLEOME

Linn.—F.T.A. 1: 74.

- 1 Leaves simple:.....2
Leaves digitately compound:.....3
- 2 Leaves ovate to orbicular, 1–2 cm. long, setose-pilose, the marginal hairs gland-tipped; fruits falcate, slightly recurved, about 2.5 cm. long, slightly muricate1. [scaposa](#)
Leaves lanceolate or linear-lanceolate, up to 6 cm. long, setulose on the nerves beneath; fruits nearly straight, ascending, about 6 cm. long, strigose-pubescent2. [monophylla](#)
- 3 Leaflets filiform or linear:4
Leaflets lanceolate to obovate:6
- 4 Branches and leaflets filiform; fruits not stipitate, 3.5–4 cm. long, 2 mm. broad; flowers small, about 4 mm. long3. [tenella](#)
Branches not filiform; leaflets linear:5
- 5 Fruits 3–6 cm. long, stipitate, 2 mm. broad; flowers 8–10 mm. long4. [polyanthera](#)

- Fruits about 12 cm. long, stipitate; flowers large, 3 cm. long [5. *paradoxa*](#)
- 6** Stems with prickles at the base of the leaves and sometimes prickles also on the petioles: **7**
 Stems not prickly: **8**
- 7** Flowers in a dense corymbose raceme; lower leaves long-petiolate; leaflets often 5–7, oblanceolate, acutely acuminate, up to 10 cm. long; the upper leaves gradually reduced to leafy subsessile bracts; fruits long-stipitate, 4–6.5 cm. long, 6–9 mm. diam. [6. *spinosa*](#)
 Flowers in few-flowered racemes; lower leaves long-petiolate; leaflets 3, rhomboid to obovate, up to 3 cm. long; the upper leaves gradually reduced to subsessile ovate bracts; fruits shortly stipitate, about 4 cm. long and 2–3 mm. diam. [7. *aculeata*](#)
- 8** Fruits not stipitate; plants glandular-pubescent: **9**
 Fruits stipitate; plants not glandular; leaflets mostly 3: **10**
- 9** Leaflets 3–6, often 5, about 3 cm. long; pedicels up to 6.5 cm. long; fruits about 9 cm. long [8. *viscosa*](#)
 Leaflets 3, mostly small, up to 1.5 cm. long; pedicels slender, up to 1 cm. in fruit, the latter 1–1.25 cm. long, capped by the long slender style [9. *brachycarpa*](#)
- 10** Perennial with woody stock; leaflets oblong, rounded at apex, 6–15 mm. long, 3–4 mm. broad, petiole 5–10 mm. long; scape with very small 1–3-foliate leaves; petals 6–8 mm. long; fruit 3–4 cm. long [10. *montana*](#)
 Annual herb; leaflets ovate-lanceolate, acute at apex, 1–4.5 cm. long, 8–18 mm. broad, petiole 1–5.5 cm. long; petals 8–10 mm. long; fruit 2.5–6 cm. long [11. *ciliata*](#)

1. *Cleome scaposa* DC.—Gilg & Benedict in Engl. Bot. Jahrb. 53: 153; Chev. Fl. Viv. 1: 152. *APD acc*

Erect slender-branched herb, roughly setose, flowers yellow.

Fr. Sud.: Amongo (Sept.) Hagerup 379! Also various localities fide Chev. l.c. **N. Nig.:** Sokoto (Dec.) Moiser 188!

Also in **Mauritania**, **Tibesti**, **Eastern Sudan**, **Abyssinia**, **Somaliland** and **Arabia**.

2. *Cleome monophylla* Linn.—*F.T.A.* 1: 76; Chev. Fl. Viv. 1: 153. *APD acc*

Erect herb branching, up to 2 ft.; flowers white to pink.

Sen.: Galam Heudelot 425! **Fr. Sud.:** Kangara (May) Chev. 853. Diaguara (June) Chev. 1018. **G. C.:** Williams 544! **Fr. Nig.:** Kokoro Rogeon 507. **N. Nig.:** Nupe Barter 796! Katagum Dalz. 135! Sokoto (July) Dalz. 382! Bauchi Plateau (Jan., June) Lely 273! P. 94! Dent Young 5!

Also throughout tropical Africa and sub-tropical S. Africa.

3. *Cleome tenella* Linn. f.—*F.T.A.* 1: 78; Chev. Fl. Viv. 1: 153. *APD acc*

Erect shrub, 1–2 ft. high, glabrous, glaucescent, with abundantly forked branching; flowers white.

Sen.: Walo Heudelot 429! Hussenot! **Fr. Sud.:** Ile de Bourem (July) Chev. 1289.

Extends to Eastern **Sudan**, Zanzibar, Madagascar, Socotra and India.

4. *Cleome polyanthera* Schweinf. & Gilg—Gilg & Benedict l.c. 165; Chev. Fl. Viv. 1: 154. *APD acc*

Erect herb, 1–2 ft. high, somewhat glandular; flowers white or purplish.

N. Nig.: Yola (July) Dalz. 179!

Extends Into Eastern **Sudan**.

5. *Cleome paradoxa* R. Br. ex DC.—*F.T.A.* 1: 78; Chev. Fl. Viv. 1: 155. *APD acc*

Shrubby, 2–3 ft. high; leaves 3–6-foliate; flowers conspicuous, in terminal racemes.

Fr. Sud.: Goundam (Aug.) Chev. 2490!

Also in **Mauritania**, **Nubia**, **Abyssinia** and **Arabia**.

6. *Cleome spinosa* Jacq.—*F.T.A.* 1: 78; Chev. Fl. Viv. 1: 155. *APD acc*

APD: *Synonym of Cleome afrospina* Ittis

APD: Synonym of Cleome hassleriana Chodat

Much-branched erect herb, up to 3–5 ft.; flowers white to pink.

N. Nig.: Abinsi (July) Dalz. 742! **S. Nig.:** Oshogbo (Apr.) Millson 5! Lagos (Aug.) Phillips 21! Omo F.R. (Feb.) Jones FHI 16825! FHI 17247! Calabar Thomson 118! Williams 1! **Br. Cam.:** Moliko, 2,000 ft. (Apr.) Hutch. & Metcalfe 87!

Also in **French Cameroons** and **Congo region**; a native of tropical S. America.

7. **Cleome aculeata** Linn. Syst. ed. 12, 3; 232 (1768). *APD acc*

Much-branched herb, to 2 ft. high, flowers white.

Fr. G.: Farmoréah Jac.-Fel. 1720! **S. L.:** Port Loko (Dec.) Thomas 5826! Yungeru (Jan.) Thomas 7250! 7392! Freetown (Dec.) Deighton 475! Kambia (Dec.) Deighton 898! Mano (Nov., May) Deighton 1433! 1735! Bonthe (Nov.) Deighton 2266! **Lib.:** Monrovia (July, Nov.) Linder 16! 1563!

A native of tropical S. America, naturalized in many localities in Sierra Leone and in **Belgian Congo**.

8. **Cleome viscosa** Linn.—F.T.A. 1: 80; Chev. Fl. Viv. 1: 156. *APD acc*

Cleome foliosa of Chev. Bot. 25; of F.W.T.A., ed. 1, 1: 84; of Chev. Fl. Viv. 1: 159; not of Hook. f.

Erect herb, to 2 ft. high, very sticky, flowers yellow.

Sen.: Kouma Heudelot 426! **Fr. Sud.:** Goundam (Aug.) Chev. 2491! Bamako Waterlot 1112! **Fr. G.:** Kindia Jac.-Fel. 38! **S. L.:** Freetown (Dec.) Deighton 473! **Fr. Nig.:** Tlemcés Le Rumeur 83. **Dah.:** Atacora Mts. (June) Chev. 23965! **N. Nig.:** Sokoto (July) Dalz. 380! Mokwa (Apr.) Keay FHI 25713! Yola (July) Dalz. 57! **S. Nig.:** Lagos (Mar.) Dalz. 1392! Ibadan (Apr.) Jones FHI 14103!

Also in **Cape Verde Islands**, **Mauritania**, Cameroons to Eastern **Sudan**, S. **Arabia** and Socotra.

9. **Cleome brachycarpa** Vahl ex DC.—F.T.A. 1: 77; Chev. Fl. Viv. 1: 157. *APD acc*

A low diffuse herb, with numerous branches from a woody rhizome.

Fr. Sud.: Goundam (Aug.) Chev. 2493.

Also in Mauritania, Eastern **Sudan**, Abyssinia, and on the coasts of the Red Sea to **Arabia** and India.

10. **Cleome montana** A. Chev. ex Keay in Kew Bull. 1953: 287; Chev. Fl. Viv. 1: 159 (1938), French descr. only.

APD: Synonym of Cleome iberidella Welw. ex Oliv.

Perennial herb with woody stock, erect stems to 18 in. high.

Fr. G.: Mali, Fouta Djallon, 4,500 ft. Chev. 34461!

11. **Cleome ciliata** Schum. & Thonn.—F.T.A. 1: 78; Chev. Fl. Viv. 1: 158.

APD: Synonym of Cleome rutidosperma DC.

Annual weed of waste places and fields, 2–3 ft. high; flowers white, lilac or pink.

Fr. G.: Heudelot 625! **S. L.:** Sherbro Garrett 5849! Freetown (Dec.) Deighton 498! Hagerup 767a! Gbinti (Sept.) Deighton 4847! **Lib.:** Grand Bassa T. Vogel 34! Sinoe Basin Whyte! **Iv. C.:** several localities fide Chev. l.c. **G. C.:** Aburi (June) Brown 319! Cape Coast T. Vogel! Akim Irvine 562! **Togo:** Lome Warnecke 313! **N. Nig.:** R. Niger, Stirling (Sept.) T. Vogel 131! 152! Abinsi (July) Dalz. 741! **S. Nig.:** Lagos Dawodu 29! Idanre (Jan.) Brenan & Jones 8720! **Br. Cam.:** Mamfe (Dec.) Migeod 263! **F. Po.:** (Nov.) Mann 560!

Also in **Principe**, **Cameroons** and Congo to **Angola**.

2. GYNANDROPSIS

APD: Synonym of Cleome L.

DC.—F.T.A. 1: 81.

- 1 Leaves digitately 5-foliolate, long-petiolate; leaflets obovate to oblanceolate, up to 5 cm. long, acute or obtuse, slightly pubescent or glabrous; bracts foliaceous, the lower trifoliate, the uppermost becoming simple, subsessile; inflorescence racemose, the lower flowers often already in fruit before the uppermost have opened; petals 1–1.5 cm. long; fruits long-stipitate, the stipe composed of the gynophore and the slender base of the fruit, fruit-body about 6–7 cm. long, reticulate [gynandra](#)

Gynandropsis gynandra (Linn.) Briq. in Ann. Conserv. Jard. Bot. Genève. 17: 382 (1914); Chev. Fl. Viv. 1: 162.

APD: *Synonym of Cleome gynandra* L.

Cleome gynandra Linn. (1753).

Cleome pentaphylla Linn. (1763).

Gynandropsis pentaphylla DC.—F.T.A. 1: 82; F.W.T.A., ed. 1, 1: 84.

Herb, about 2 ft. high, flowers white to purplish; weed of waste places and fields.

Sen.: Perrottet! **Fr. Sud.:** Timbuktu (fl. July, fr. Sept.) Hagerup 154a! Chudeau! **Fr. G.:** Kouroussa (May) Pobéguin 259! **S. L.:** (June) T. Vogel 21! **G. C.:** Afram Plains (May) Kitson 1088! Ashanti Irvine 538! **Togo:** Lome Warnecke 291! **N. Nig.:** Kukawa (Feb.) E. Vogel 57! Sokoto (Nov.) Moiser 24! **S. Nig.:** Lagos (Aug.) Phillips 24! Olokemeji (Apr.) Foster 286! **Br. Cam.:** Victoria (Apr.) Ejiofor FHI 29333!

All over north and tropical Africa and India, occurring also in America.

Gynandropsis speciosa DC.

The flowers and leaves are larger than in *G. gynandra* and the plant is almost glabrous.

A native of central and S. America, has been introduced into gardens (e.g. Sierra Leone, Njala Deighton 1904! Nigeria, Sapoba Kennedy 427!).

3. MAERUA

Forsk.—F.T.A. 1: 83; Gilg & Benedict in Engl. Bot Jahrb. 53: 232 (1915).

- 1 Leaves small or rather small, with the flowers borne on very short arrested lateral branchlets; sepals broadly oblong-elliptic, rounded at apex; petals none or minute; fruits torulose, few-seeded:..... **2**
 Leaves larger, borne on elongated shoots:..... **3**
- 2 Leaves, pedicels and calyces pubescent; fruit softly pubescent; sepals 5–7 mm. long [1. crassifolia](#)
 Leaves, pedicels and calyces quite glabrous, except for the tomentose margins of the calyx-lobes; sepals 10–11 mm. long [2. de-waillyi](#)
- 3 Leaves elliptic or ovate-lanceolate, mucronate, 4–6.5 cm. long, 2–3 cm. broad, long-petiolate; sepals oblong, rounded at apex, 1.25 cm. long; fruits elongated, torulose, with 20 or more seeds [3. angolensis](#)
 Leaves oblong-lanceolate to linear, the lower oblong, about 7.5–9 cm. long and 2 cm. broad, the upper narrower, up to about 16 cm. long and 1.5 cm. broad; fruits short, about 4-seeded [4. oblongifolia](#)

1. **Maerua crassifolia** Forsk.—Gilg & Benedict in Engl. Bot. Jahrb. 53: 250 (1915); Chev. Fl. Viv. 1: 164; Aubrév. Fl. For. Soud.-Guin. 53. *APD acc*

Maerua rigida R.Br.—F.T.A. 1: 86; Gilg & Benedict l.c. 251.

Maerua senegalensis R.Br. ex A. Rich. in Guill. & Perr. Fl. Seneg. 28, t. 7; Chev. l.c. 165 (excl. spec. De Wailly).

Maerua trichocarpa Gilg & Benedict l.c. 256.

Tree, 20–30 ft. high, often with twisted branches and smooth bark; **in the drier savannahs and Sahara; flowers white, sweet-scented.**

Sen.: Richard Tol (Feb.) Roger 9! **Fr. Sud.:** Timbuktu (July) Chev. 1211! **Fr. Nig.:** various localities fide Chev. l.c. **N. Nig.:** Sokoto (Feb.) Lely 807! Hadeija (Mar.) Dalz. 141! Kukawa (Feb.) E. Vogel 63!

Also in **Mauritania** and **Central Sahara**, and extends to Eastern **Sudan**, **Egypt** and **Arabia**. (See Appendix, P. 22.)

2. **Maerua de-waillyi** *Aubrév. & Pellegr.* in Notulae Syst. 14: 59 (1950); Aubrév. Fl. For. Soud.-Guln. 53. *APD acc*

Tree, similar to above.

Fr. Sud.: Islands of R. Niger rapids between Gao and Ansongo (Mar.) De Wailly 5374!

3. **Maerua angolensis** *DC.*—F.T.A. 1: 86; Gilg & Benedict l.c. 257; Chev. Fl. Viv. 1: 165; Aubrév. l.c. 55. *APD acc*

Shrub, or tree to 30 ft. high or more, in *savannah*; flowers white.

Sen.: L. Guier (Panie-Foul) Roger 85! Walo Heudelot! L. Cayor Perrottet! **Gam.:** north bank of R. Gambia (July) Ozanne 26! Kudary (Jan.) Dalz. 8122! **Fr. Sud.:** Bamako (May) Hagerup 64! And several other localities fide Chev. l.c. **G. C.:** Wiasi, N.T. (Mar.) Vigne 4486! Nangodi (fr. July) Vigne 3298! **N. Nig.:** Nupe Barter 1703! Katagum (Jan.) Dalz. 142! Sokoto Lely 841!

Widely dispersed in tropical Africa.

4. **Maerua oblongifolia** (*Forsk.*) *A. Rich.*—F.T.A. 1: 85; Gilg & Benedict l.c. 260; Chev. Fl. Viv. 1: 166. *APD acc*

Capparis oblongifolia *Forsk.* (1775).

Maerua angustifolia *A. Rich.* in Guill. & Perr. Fl. Seneg. 29, t. 8 (1830); Gilg & Benedict l.c. 259; F.W.T.A., ed. 1, 1: 84; Chev. l.c. 1: 166; Aubrév. Fl. For. Soud.-Guin. 55.

Maerua dasyura *Gilg & Benedict* l.c. 259.

Maerua rogeani *A. Chev.* in Bull. Mus. Hist. Nat. 4: 584 (1932).

Low shrub, to 3 ft. high with thick rootstock, stiff branches and rather thick leaves; flowers white, fragrant.

Sen.: Lelievre! Carrey 48! **Fr. Sud.:** Gourma (July) Chev. 24365! Timbuktu (fl. & fr. Apr.) Chudeau! San to Donua (Mar.) Chev. 43970! Ségou Rogeon! **G. C.:** Amansare, Ashanti (July) Chipp 519! Bunsuru, N.T. (May) Vigne 3847! Tamale (Apr.) Williams 121! **N. Nig.:** Katagum Dalz. 138! Kukawa E. Vogel 68! Yauwa (Apr.) Daggash FHI 24951! Abinsi (Apr.) Dalz. 740!

Also in *Eastern Sudan* to *Red Sea* and *Arabia*.

4. CAPPARIS

Linn.—F.T.A. 1: 94; Gilg & Benedict in Engl. Bot. Jahrb. 53: 184 (1915).

- | | | |
|---|---|-----------------------------------|
| 1 | Leafless at time of flowering | <i>1. decidua</i> |
| | Leafy at time of flowering: | 2 |
| 2 | Branches and leaves glabrous, or the former slightly pubescent: | 3 |
| | Branches and leaves more or less tomentose: | 6 |
| 3 | Flowers solitary or paired in the axils of the leaves, or few and clustered at the end of a leafy shoot; sepals and petals over 5 mm. long: | 4 |
| | Flowers in lax axillary simple or slightly branched racemes; sepals and petals 2.5–3.5 mm. long; leaves lanceolate-elliptic, emarginate or mucronate, 3–6 cm. long, 2–2.5 cm. broad, sometimes rather densely pubescent beneath | <i>5. thonningii</i> |
| 4 | Petals 15–30 mm. long; flowers on stout pedicels (2–2.5 cm. long) clustered at the end of a leafy shoot; spines 4 mm. long, recurved: | 5 |
| | Petals 6–7 mm. long; flowers on slender pedicels (3 cm. long) in leaf-axils along the shoot; spines 3–4 mm. long, recurved; leaves ovate, rounded at base, 4–9 cm. long, 2–4.5 cm. broad | <i>4. viminea</i> |
| 5 | Ovary ribbed; petals at most emarginate; leaves very variable in shape, from obovate through elliptic to ovate and lanceolate, base cuneate to rounded, apex sharply acuminate to obtuse, 3–14 cm. long, 1.5–5 cm. broad | 2.
<i>erythrocarpos</i> |
| | Ovary not ribbed; petals bilobed; leaves broadly elliptic, rounded at each end, emarginate, 4.5–6 cm. long, 2.5–3.5 cm. broad | <i>3. biloba</i> |
| 6 | Flowers rather small; petals up to about 1 cm., sepals 5 mm. or less long: | 7 |

- Flowers larger; sepals 8–10 mm. long, petals about 3 cm. long:9
- 7 Calyx glabrous:8
- Calyx pubescent to densely tomentose, more or less thin; flowers 4–12 in short axillary cymes, sometimes appearing subfasciculate, pedicels 4–13 mm. long; leaves oblong or oblong-lanceolate, rounded at each end, emarginate or apiculate, 2–4 cm. long, densely tomentose when young, glabrescent7. *rothii*
- 8 Flowers in lax axillary simple or slightly branched racemes; sepals 2.5–3.5 mm. long; see above ..5. *thonningii*
- Flowers clustered in corymbs at the ends of short shoots; sepals about 5 mm. long, coriaceous; pedicels 1–1.5 cm. long; leaves tomentose on both surfaces, oblong or oblong-lanceolate, 2–4 cm. long, obtuse or emarginate6. *corymbosa*
- 9 Pedicels and sepals very shortly grey-tomentellous; flowers axillary along the shoots, sometimes also clustered towards the ends of the shoots; leaves oblong-elliptic to oblong-obovate, 2–5 cm. long, 1–3 cm. broad, nerves rather obscure beneath8. *tomentosa*
- Pedicels and sepals densely yellow-brown-pubescent; flowers corymbose at the ends of the shoots; leaves very variable in shape, 4–7.5 cm. long, 2–4.5 cm. broad, nerves obvious and often raised beneath ...9. *polymorpha*
1. **Capparis decidua** (Forsk.) Edgew. in J. Linn. Soc. 6: 184 (1862); Gilg & Benedict in Engl. Bot. Jahrb. 53: 203 (1915); Chev. Fl. Viv. 1: 171. *APD acc*
- Sodada decidua* Forsk. (1775).
Capparis aphylla Hayne ex Both—F.T.A. 1: 95.
- A shrub or small tree of desert regions, much branched, glabrous, with stipular spines, often leafless except on young shoots and barren branchlets.
- Sen.: Salde Heudelot 243. Fr. Nig.: fide Chev. l.c. N. Nig.: near L. Chad Denham & Clapperton.
- Also in Mauritania and extending to Eastern Sudan, Arabia and India.
2. **Capparis erythrocarpos** Isert—F.T.A. 1: 98; Gilg & Benedict. l.c. 200; Chev. Fl. Viv. 1: 172; Milne-Redhead in Kew Bull. 1950: 261. *APD acc*
- Capparis afzelii* DC., not of Pax.
Capparis warneckei Gilg & Benedict l.c. 201; F.W.T.A., ed. 1, 1: 85.
- A shrub, usually scandent; common in thickets of coastal scrub and inland; flowers white, often pink at the base of the stamens; fruit scarlet, ribbed, 2 in. long.
- Fr. G.: Boké (June) Chillou! S. L.: Afzelius! Ninia, Talla Hills Sc. Elliot 4917! Falaba (fr. Apr.) Sc. Elliot 5439! Mesima (fr. Apr.) Deighton 3701! Iv. C.: fide Chev. l.c. G. C.: Accra Plains (Apr.–July) T. Vogel! Moloney! Dalz. 129! Milne-Redhead 5087! Aburi Road (Feb.) Dalz. 8266! Prampram (Aug.) Vigne 4250! Togo: Lome (Sept.) Warnecke 258! Dah.: fide Chev. l.c. S. Nig.: Ilaro (Oct.) Onochie FHI 13544!
- Extends to Congo, Angola, A.–E. Sudan, Uganda and E. Africa.
3. **Capparis biloba** Hutch. & Dalz. F.W.T.A., ed. 1, 1: 85 (1927); Kew Bull. 1928: 25; Chev. Fl. Viv. 1: 173.
- APD: Synonym of Capparis tomentosa Lam.*
- A prickly woody climber; flowers conspicuous, pink and white.
- Iv. C.: Cavally Basin, Beriby, near sea (Aug.) Chev. 20026. G. C.: Assuantsi (Sept.) Dalz. 160!
4. **Capparis viminea** Hook. f. & Thoms. ex Oliv. F.T.A. 1: 97 (1868), excl. distrib. Asiat.; Exell & Mendonca in Consp. Fl. Ang. 1: 63. [Not C. viminea Hook. f. & Thoms. in Fl. Brit. India 1: 179 (1872).] *APD acc*
- Capparis welwitschii* Pax & Gilg in Engl. Bot. Jahrb. 33: 214 (1903); F.W.T.A., ed. 1, 1: 85; Chev. Fl. Viv. 1: 174.
Capparis holliensis A. Chev. in Bull. Soc. Bot. Fr. Mém. 8: 137 (1912), partly.
- Scrambling prickly shrub; flowers white.
- Dah.: Abbo, Hollis country (Feb.) Chev. 22959! N. Nig.: Abinsi (Mar.) Dalz. 769! S. Nig.: Onitsha (Feb.) Jones FHI 5036!
- Also in Belgian Congo and Angola.

5. *Capparis thonningii* Schum.—F.T.A. 1: 97; Gilg & Benedict l.c. 190; Chev. Fl. Viv. 1: 173.

APD: *Synonym of Capparis brassii* DC.

Capparis holliensis A. Chev. in Bull. Soc. Bot. Fr. Mém. 8: 137 (1912), partly.

A prickly scrambling or climbing shrub, with dark-green leaves and white fragrant flowers; fruit orange or red, globose or shortly cylindrical, 1/2–3/4 in. diam.

S. L.: Forbes! **G. C.:** Accra (May) Dalz. 131! Milne-Redhead 5161! **Togo:** Lome (Nov.) Mildbr. 7499! Warnecke 60! 384! Sokode-Basari Kersting A. 728. **Dah.:** Hollis country, Pobe and Abomey (Feb.) Chev. 22943; 23160! **S. Nig.:** Abeokuta (Feb.) Irving 66! Ijaye to Oyo Barter 3326! Olokemeji (Mar.) Meikle 1298!

6. *Capparis corymbosa* Lam.—F.T.A. 1: 96; Chev. Fl. Viv. 1: 174.

APD: *Synonym of Capparis sepiaria* var. *fischeri* (Pax) DeWolf

Scrambling prickly shrub of **savannah**; flowers white, fruits spherical yellow.

Sen.: Roger! Perrottet! **Fr. Sud.:** & **Fr. Nig.:** very common fide Chev. l.c. **G. C.:** Lawra Seth Smith 8! **N. Nig.:** Kukawa (Apr.) E. Vogel 90! Dumbum (Mar.) Foster 30! Samae (Mar.) Foster 23! Zurmi (Apr.) Keay FHI 15848!

Extends to Eastern **Sudan** and E. Africa.

7. *Capparis rothii* Oliv. F.T.A. 1: 97; Chev. Fl. Viv. 1: 175.

APD: *Synonym of Capparis fascicularis* DC. var. *fascicularis*

? *C. oliveriana* Gilg in Engl. Bot. Jahrb. 33: 216 (from Gilg's description this does not appear to be distinct from *C. rothii* Oliv., but I have not seen Gilg's type—R.W.J.K.); F.W.T.A., ed. 1, 1: 185.

Scrambling shrub, to 20 ft. high, similar to the preceding, but calyx silky pubescent; petals and filaments white.

Gam.: Macarthy Isl. (Jan.) Dalz. 8123! **Fr. Sud.:** Ansongo, Gao (Mar.) De Wailly 5363! **S. L.:** Afzelius. **Fr. Nig.:** Zinder (Sept.) Hagerup 607! **N. Nig.:** Hadeija (Mar.) Dalz. 139! Katsina town (Apr.) Meikle 1366!

Extends to Abyssinia and E. Africa.

8. *Capparis tomentosa* Lam.-Guill. & Perr. Fl. Seneg. 23; F.T.A. 1: 96, partly (var. α); Gilg & Benedict l.c. 189, partly; Chev. Fl. Viv. 1: 175, partly. APD *acc*

Capparis puberula DC. (1824).

A thorny climbing shrub; flowers sweet-scented, petals white, stamens pink; fruit orange-yellow.

Sen.: Perrottet s.n.! 20! 21! 30! Sieber 32! Richard Tol Leprieur! Walo Heudelot! Dakar (Apr.) Hagerup 7! Thies (Feb.) De Wailly 4449! Berhaut 221! **Fr. Sud.:** R. Niger Monod 762! **G. C.:** Cape Coast Brass! Accra Don! **N. Nig.:** Hadeija (Mar.) Dalz. 137! Kukawa E. Vogel 22! L. Chad Talbot 509! 1238!

Widespread in dry regions of Africa.

9. *Capparis polymorpha* Guill. & Perr. Fl. Seneg. 24, t. 5 (1831).

APD: *Synonym of Capparis tomentosa* Lam.

Capparis tomentosa of F.T.A. 1: 96, partly (var. β); Gilg & Benedict l.c. 189, partly; F.W.T.A., ed. 1, 1: 85, partly; Chev. Fl. Viv. 1: 175, partly.

Sen.: M'boro Perrottet! Brunner 91! Cape Verde Perrottet 19! Ngazobil (May) Berhaut 1904! Casamance (Jan.) Chev. 2513! **Gam.:** Don! Albreda (Mar.) Perrottet 21! R. Gambia Heudelot 370! On the beach, Sukoko (Jan.) Dalz. 8124! Genieri (Feb.) Fox 29! **G. C.:** Namvilli to Pala, N.T. (Mar.) Kitson 967! **N. Nig.:** Plateau Prov. Kennedy FHI 8063! **Br. Cam.:** Buea (Jan.) Maitland 241!

Widespread in tropical Africa.

Forsk.—F.T.A. 1: 88; Gilg & Benedict in Engl. Bot. Jahrb. 53: 222 (1915).

- 1 Leaves more or less orbicular, 1–3 cm. in diam., like the branchlets glandular-setose, distinctly petiolate; petal 1, unguiculate, oblong, about 2 cm. long [1. glandulosa](#)
 Leaves oblong or elliptic, up to 2.5 cm. long and 1 cm. broad, like the branchlets mealy-puberulous, very shortly petiolate; petals 4, linear or narrowly oval, clawed [2. farinosa](#)

1. **Cadaba glandulosa** *Forsk.*—F.W.T.A. 1: 89; Gilg & Benedict in Engl. Bot. Jahrb. 53: 225 (1915); Chev. Fl. Viv. 1: 177. *APD acc*

A low much-branched shrub; fruit glandular-bristly, about 1/2 in. long.

Fr. Sud.: Goundam (Aug.) Chev. 2508! Tacadji (Aug.) Chev. 2506. **Fr. Nig.:** fide Chev. l.c.

Extends to Red Sea and [Arabia](#), Somaliland and E. Africa.

2. **Cadaba farinosa** *Forsk.*—F.T.A. 1: 89; Gilg & Benedict l.c.; Chev. Fl. Viv. 1: 178.

APD: Synonym of Cadaba benguellensis Mendes

A hoary shrub, branched from the base, erect or scrambling amongst other shrubs and trees; fruits subtorulose, 11/2–21/2 in. long.

Sen.: Walo Heudelot! Dakar (Apr.) Hagerup 2! **Fr. Sud.:** Sebi (July) Chev. 1164! Gourma, Konkobiri (July) Chev. 24323! **G. C.:** Kubori to Mangkurugu (May) Kitson 504! Kumbungu (May) Kitson 505! Yambga (Mar.) Vigne 4730! **N. Nig.:** Sokoto Ryan 37! Katagum (Nov.) Dalz. 140! Near L. Chad (Dec., Jan.) E. Vogel 19! Elliott 113!

All over the [Sudan](#) to the Red Sea, S. [Arabia](#) and India, and E. Africa.

6. CRATEVA

Linn.—F.T.A. 1: 99.

- 1 A tree; branches glabrous; leaves trifoliate, appearing after the flowers; leaflets ovate-lanceolate, narrowed into the petiolule at the base, acutely long-acuminate, about 9 cm., rarely up to 12 cm. long, 3–5 cm. broad, thinly papery, glabrous, finely reticulate beneath; flowers white with the stamens and sometimes the tips of the petals lilac; fruits subglobose, stoutly long-stipitate, 4–5 cm. or more in diameter, with a hard yellow pericarp [religiosa](#)

Crateva religiosa *Forst. f.*—F.T.A. 1: 99; Gilg & Benedict in Engl. Bot. Jahrb. 63: 169 (1915); Aubrév. Fl. For. Soud.-Guin. 45.

APD: Synonym of Crateva adansonii DC. subsp. adansonii

Crateva adansonii *Oliv.*—F.W.T.A., ed. 1, 1: 86; Chev. Fl. Viv. 1: 179.

A tree in [savannah](#), often planted, 15 to 20 ft. or more high; flowers appearing before the leaves, generally in February.

Sen.: Sieber 28! Richard Tol (May) Döllinger 62! Walo Heudelot! **Gam.:** Sounders 58! **Fr. Sud.:** Gao (Apr.) De Wailly 5379! **Fr. G.:** Kankan (May) Chev. 567! Kouroussa (Jan.) Pobéguin 643! **G. C.:** Shai Plains (Feb.) Irvine 1975! Accra Plains (fl. & fr. Apr.) Bally 57! **N. Nig.:** Ketsa, Nupe Barter 1103! Sokoto (Feb., Apr.) Ryan 33! 62! Lely 806! Katagum Dalz. 399! Bauchi Plateau (Mar.) Lely P. 185! Bornu (Apr.) E. Vogel 77! Yola (Mar.) Dalz. 181! **S. Nig.:** Lagos (Dec.) Dalz. 1149! Fiditi Foster 167!

Widely spread throughout drier parts of tropical Africa north of the equator and in India and Burma.

7. RITCHIEA

R. Br.—F.T.A. 1: 100; Gilg & Benedict in Engl. Bot. Jahrb. 53: 173 (1915).

- 1 Petals numerous (8–20), generally linear or filiform; inflorescences generally at the end of the shoots, not, or rarely, axillary along the shoots:2
- Petals 4, generally spatulate or broadly linear, or obovate:8
- 2 Erect shrubs; pedicels generally less than 4.5 cm. long in open flowers:3
- Scandent shrub or liane; pedicels generally more than 4.5 cm. long in open flowers, inflorescences terminal on relatively short lateral branches; leaves 3-foliolate, rarely simple; leaflets broadly elliptic to obovate, lateral leaflets unequal at base, abruptly and very shortly acuminate, sometimes with acumen bent back, up to 16 cm. long and 7 cm. broad; lateral nerves about 4 [7. longipedicellata](#)
- 3 Leaves 3–5-foliolate:4
- Leaves all simple:7
- 4 Leaves generally 5-foliolate, but with some 3-foliolate leaves; pedicels 1.5–4.5 cm. long, closely arranged in many-flowered inflorescences, bracts lanceolate, 1.5–2 cm. long; leaflets oblong-ob lanceolate, acutely acuminate, gradually narrowed to base, 15–20 cm. long, 5–7 cm. broad [1. pentaphylla](#)
- Leaves 3-foliolate; pedicels 1.5–3 cm. long:5
- 5 Stamens and petals up to 5 cm. long; lateral nerves 6–10 pairs:6
- Stamens 6 cm. long, petals 7–8 cm. long; leaflets with 3–5 pairs of lateral nerves, oblong, 8–16 cm. long, 4–8 cm. broad, long-acuminate [4. macrantha](#)
- 6 Leaflets very shortly and abruptly acuminate, up to 15 cm. long and 6 cm. broad; petals about 8 [2. erecta](#)
- Leaflets gradually acutely long-acuminate, 11–30 cm. long, 5–12 cm. broad; petals about 14 [3. polypetala](#)
- 7 Leaves coriaceous, lateral nerves deeply impressed above, very prominent beneath, markedly looped with a strong intra-marginal nerve, obovate-elliptic, 15–20 cm. long, 5–7 cm. broad; inflorescence very shortly racemose; pedicels about 2 cm. long [5. simplicifolia](#)
- Leaves thinly papery, lateral nerves slightly prominent or slightly impressed above, slightly prominent beneath; looped with a rather weak intra-marginal nerve, oblanceolate to oblong-obovate, 18–25 cm. long, 8–10 cm. broad; inflorescence shortly racemose; pedicels 0.5–2.5 cm. long [6. brachypoda](#)
- 8 Petals shorter than the sepals; sepals 5–6 mm. long; leaves always simple, obovate to oblong-ob lanceolate, acuminate, 8–12 cm. long, 3–5 cm. broad, with about 10 prominently looped lateral nerves; pedicels slender, about 2.5 cm. long [8. duchesnei](#)
- Petals longer than the sepals; sepals at least 1.5 cm. long:9
- 9 Leaves 3-foliolate, sometimes with unifoliolate leaves as well (especially in *R. albersii*):10
- Leaves all simple or unifoliolate:12
- 10 Inflorescences axillary along the shoots as well as terminal; scandent shrubs or lianes:11
- Inflorescences terminal only; tree or erect shrub; leaflets ovate-oblong to elliptic, acuminate, cuneate at base, 7–14 cm. long, 2.5–6 cm. broad, 4–7 pairs of lateral nerves; simple leaves usually present with the 3-foliolate, especially near the inflorescence [11. albersii](#)
- 11 Lateral nerves 4–7 pairs, slightly raised on the upper surface, not very prominent beneath; leaflets oblong-elliptic, up to 20 cm. long and 7 cm. broad, gradually acuminate [9. capparoides](#)
- Lateral nerves 2–4 pairs, impressed above, very prominent beneath; leaflets ovate-rotundate, up to 12 cm. long and 7 cm. broad [10. fragariodora](#)
- 12 Tree or erect shrub with long-petiolate (well over 1 cm.) unifoliolate leaves and terminal many-flowered inflorescence; see above [11. albersii](#)
- Scandent or low shrubs with simple leaves; petiole up to 1 cm. long:13
- 13 Sepals oblong, 1.5 cm. long, 5 mm. broad, acutely long-acuminate; petals about 2.5 cm. long [12. afzelii](#)
- Sepals broadly oblong-ovate, 2–2.5 cm. long, about 1 cm. broad, obtusely mucronate; petals about 5 cm. long; leaves ovate-elliptic, obtuse and shortly mucronate at apex, rounded at base, 7–15 cm. long, 3–7 cm. broad [13. reflexa](#)

1. *Ritchiea pentaphylla* Gilg & Benedict in Engl. Bot. Jahrb. 53: 180 (1915).

APD: *Synonym of Ritchiea erecta* Hook. f.

APD: *Synonym of Ritchiea albersii* Gilg

Erect shrub, flowers white.

S. Nig.: Lagos (Apr., Aug.) Rowland! Moloney 10! Punch 27. Ilaro (May) Millen 102! Abeokuta Barter 3378!

2. *Ritchiea erecta* Hook. f.—Gilg & Benedict l.c. 181. *APD acc*

Erect shrub, calyx green, petals and filaments white.

F. Po: (Nov.) T. Vogel 227! Bokoko (Oct.) Mildbr. 6934.

3. *Ritchiea polypetala* Hook. f. in Bot. Mag. t. 5344 (1862), excl. distrib. Abeokuta; Gilg & Benedict l.c. 180.

APD: Synonym of Ritchiea erecta Hook. f.

Ritchiea glossopetala Gilg in Engl. Bot. Jahrb. 33: 210 (1903); F.W.T.A., ed. 1, 1: 87.

Ritchiea obanensis Hutch. & Dalz. F.W.T.A., ed. 1, 1: 86; Kew Bull. 1928: 25.

Erect shrub.

S. Nig.: Oban Talbot 58! Crosa R. (Dec.) Holland 231! **Br. Cam.:** Victoria (Oct., Nov.) Preuss! Ludwigs 586! **F. Po:** Mann!

[The type of *R. polypetala* Hook. f. is a specimen grown at Kew from material sent by Mann from an unspecified part of West Africa. I suggest it came from Fernando Po where Mann collected herbarium material of what is evidently the same species—R.W.J.K.]

4. *Ritchiea macrantha* Gilg l.c. 211 (1903); Gilg & Benedict l.c. 180. *APD acc*

Erect shrub.

S. Nig.: Cross R. (July) Johnson! **Br. Cam.:** Barombi Preuss 392!

5. *Ritchiea simplicifolia* Oliv. F.T.A. 1: 100 (1868); Gilg & Benedict l.c. 183. *APD acc*

A shrub in forest, 4–6 ft. high.

Br. Cam.: Cameroons R. (Jan.) Mann 2190!

Also in **French Cameroons** and **Spanish Guinea**.

6. *Ritchiea brachypoda* Gilg in Engl. Bot. Jahrb. 33: 213 (1903).

APD: Synonym of Ritchiea erecta Hook. f.

Erect shrub, to 2 ft. high, in dense forest; petals white, stamens pale bluish-green.

Br. Cam.: Barombi, between Mafura and Mambanda (Dec.) Preuss 50! S. Bakundu F.R. (Jan.) Keay FHI 28557!

7. *Ritchiea longipedicellata* Gilg l.c. 211 (1903); Gilg & Benedict l.c. 181; Chev. Fl. Viv. 1: 182.

APD: Synonym of Ritchiea capparoides var. *longipedicellata* (Gilg) DeWolf

Scandent shrub, calyx green, petals and stamens cream; fruit 2–2½ in. long.

Togo: Afern Kersting A. 564. **Dah.:** fide Chev. l.c. **S. Nig.:** Lagos, Ikoyi Plains (Feb.) Dalz. 1150! Ebute Metta (Oct.) Millen 8! Near Abeokuta (Jan.) Irving 153! Rowland! Millson! Russell FHI 25655! Ibadan (Dec.) Meikle 906! Ubulubu, Asaba Div. (Feb.) Thomas 2322!

8. *Ritchiea duchesnei* (De Wild.) Keay in Kew Bull. 1952: 161, t. 2.

APD: Synonym of Maerua duchesnei (De Wild.) F. White

Capparis duchesnei De Wild. in Miss. Laurent 1: 87 (1905).

Capparis afzelii Pax in Engl. Bot. Jahrb. 14: 299 (1891), not of DC. (1824); Gilg & Benedict l.c. 199; F.W.T.A., ed. 1, 1: 85; Chev. Fl. Viv. 1: 170.

A small tree, or shrub, in forest, with smooth red-brown bark and shining leaves; petals white, turning reddish, stamens red; fruit ellipsoid, 1–1½ in. long.

S. L.: Afzelius! Benna (Jan.) Sc. Elliot 5433! **iv. C.:** fide Chev. l.c. **G. C.:** Atrokpe, Krobo (Nov.) Irvine 1703! Ejan, N. Agogo (Jan.) Vigne 1783! **Dah.:** Hollis country, between Masse and Ketou (Feb.) Chev. 23010! **S. Nig.:** Lagos Foster 56! Olokemeji (Nov.) Jones FHI 4937! **Br. Cam.:** Barombi (Sept.) Preuss 545! Staudt 765.

Also from **French Cameroons** to **A.–E. Sudan**, **Uganda** and **Belgian Congo**.

9. **Ritchiea capparoides** (*Andr.*) *Britten* in J. Bot. 55: 279 (1917). *APD acc*

Crateva capparoides *Andr.* Bot. Rep. t. 176 (1801).

Crateva fragrans *Sims* in Bot. Mag. t. 596 (1802).

Ritchiea fragrans (*Sims*) *R. Br.*—F.T.A. 1: 101, partly (excl. syn.); Gilg & Benedict l.c. 176; F.W.T.A., ed. 1, 1: 87; Chev. Fl. Viv. 1: 181.

Scandent shrub or liane to 20 ft. high; calyx bright green, petals pale green, filaments white.

Sen.: Badioure to Bignona (Feb.) Chev. 2509! **Port. G.:** Pussube (Mar.) Esp. Santo 1147! **S. L.:** Bunce Isl. (Mar.) Kirk 31! Rowala (fr. July) Thomas 1206! Njala (Mar.) Deighton 1934! Also in **French Cameroons**, **Gabon** and **Kenya**.

10. **Ritchiea fragariodora** *Gilg* in Engl. Bot. Jahrb. 33: 207 (1903); Gilg & Benedict l.c. 176.

APD: *Synonym of Ritchiea capparoides (Andrews) Britten var. capparoides*

Scandent shrub 15–20 ft. high.

S. Nig.: Eket Talbot 3147! Degema Taloot! Calabar (Feb.) Mann 2263!

Also in **French Cameroons** and **Angola**.

11. **Ritchiea albersii** *Gilg* l.c. 208 (1903); Gilg & Benedict l.c. 178. *APD acc*

Ritchiea macrocarpa *Gilg* l.c.; F.W.T.A., ed. 1, 1: 87.

Tree, to 35 ft. high, in **forest**; calyx green, petals pale green, stamens yellow; fruit ovoid, up to 2 1/2 in. long.

S. Nig.: Ikwette Plateau, Obudu, 5,200 ft. (Dec.) Keay & Savory FHI 25212! **Br. Cam.:** Buea, 3,000–3,200 ft. (fl. Jan., fr. Apr., May) Lehm巴赫 180! 223! Maitland 188! 716!

Also widespread in eastern Africa.

12. **Ritchiea afzelii** *Gilg* l.c. 212 (1903); Gilg & Benedict l.c. 183; Chev. Fl. Viv. 1: 183. *APD acc*

Shrub with slender erect shoots, to 18 in. high.

Fr. G.: Diaragouela (Feb.) Chev. 477. **S. L.:** Afzelius.

13. **Ritchiea reflexa** (*Thonn.*) *Gilg & Benedict* l.c. 183 (1915); Chev. Fl. Viv. 1: 182. *APD acc*

Capparis reflexa *Thonn.*—F.T.A. 1: 98.

Maerua grandiflora *Pax* (1892).

Ritchiea grandiflora (*Pax*) *Gilg* (1903).

Scandent shrub, flowers cream.

Fr. G.: Kouroussa (Feb.) Chev. 365. **G. C.:** Accra (fl. Jan.–Mar., fr. Apr.) Dalz. 130! Milne-Redhead 5056! Shai Plains (Jan.) Johnson 562! Akroful Cummins 21! Assuantsi (Feb.) Dalz. 8295! Adafo (Nov.) Krause! **Togo:** Lome (Nov.) Warnecke 61! Mildbr. 7508! Akepe Busse 3262. Ho Schröder 202.

8. EUADENIA

Oliv.—F.T.A. 1: 90.

- 1 Racemes short and subcorymbose; pedicels stout, 5–6 cm. long; leaflets subsessile, about 16 cm. long; petals

yellow; fruits unequally torulose, 15–30 cm. long, 6–10 mm. in diam. [1. *eminens*](#)

Racemes elongated; pedicels slender, not more than 3 cm. long; leaflets distinctly petiolulate: [2](#)

- 2** Larger petals up to 6 mm. broad, 3.5–8 cm. long, green, turning red; sepals 7–12 mm. long; leaflets acuminate, long-petiolulate, up to about 15 cm. long, variable in shape; fruit cylindrical, not torulose, about 5 cm. long and 1.8 cm. in diam. [2. *trifoliolata*](#)

Larger petals up to 2 cm. broad, up to 8 cm. long, broadly oblanceolate, yellow with conspicuous red veins; leaflets broadly obovate, long-acuminate, up to 17 cm. long and 7 cm. broad, very long petiolate, but petiolules less than 1 cm. long; fruit not known [3. *pulcherrima*](#)

- 1. *Euadenia eminens* Hook. f. Bot. Mag. t. 6578 (1881); Gilg & Benedict in Engl. Bot. Jahrb. 58: 170 (1915); Chev. Fl. Viv. 1: 183. *APD acc***

***Euadenia major* Hua-Chev. Bot. 32.**

A branching rather soft-wooded shrub, 2–5 ft. high, with strong odour.

S. L.: Smeathmann! Bagroo R. Mann 872! Kukuna, Scarcies R. (Jan.) Sc. Elliot 4758! Waterloo (Oct.) Lane-Poole 299! Mamaka (fr. Nov.) Thomas 4411! Juring (Dec.) Cam.:** Johann-Albrechtshöhe Staudt 7641

Also in **French Cameroons** and **Gabon**.

10. BOSCIA

Lam.—F.T.A. 1: 91; Gilg & Benedict in Engl. Bot. Jahrb. 53: 203 (1915).

- 1 Leaves elongate-lanceolate or linear, willow-like, very acute, up to 12 cm. long, 1–1.5 cm. broad, midrib prominent beneath and often straw-coloured, with rather obscure ascending lateral nerves; inflorescence densely racemose, usually leafless, shortly tomentose; fruit smooth and shining, 1–1.25 cm. in diam. [1. *salicifolia*](#)

Leaves shortly lanceolate or oblong-lanceolate, up to 5 cm. long, 1–1.5 cm. broad, mucronate to reflex, very finely and closely reticulate, glabrous; inflorescence accompanied by the leaves, shortly racemose, slightly pubescent, terminating short leafy branchlets; fruit pitted and rugulose, globose, 1–1.25 cm. in diam. 2. *angustifolia*..... [2. *Boscia*](#)

Leaves elliptic to ovate-elliptic, obtuse or mucronate, up to 9 cm., very rarely up to 14 cm. long, 2–4 cm. broad, with about 5–6 lateral nerves raised on both surfaces and prominently looped, distinctly reticulate, glabrous or more usually finely pubescent; racemes accompanied by the leaves, short, crowded, corymbose, thinly pilose; fruit globose, 1–1.5 cm. in diam., warted and sometimes slightly tomentellous [3. *senegalensis*](#)

1. ***Boscia salicifolia* Oliv.** F.T.A. 1: 93 (1868); Gilg & Benedict in Engl. Bot. Jahrb. 53: 211 (1915); Chev. Fl. Viv. 1: 190 (incl. var. *nivea* A. Chev.); Aubrév. Fl. For. Soud.-Guin. 47. **APD acc**

APD: *Synonym of Boscia praecox Hauman*

Savannah tree, up to 40 ft. high with graceful drooping foliage.

Sen.: Kounoun Trochain 1150. **Fr. Sud.:** Gourma Chev. 24456. **Iv. C.:** Bouzoum Aubrév. 2681. **G. C.:** Nebiowalli, Guo Hills (May) Kitson 508! **N. Nig.:** Sokoto (Jan.) Gillman 2! Zurmi (fr. Apr.) Keay FHI 16165! Yola (Feb.) Dalz. 182!

Extending to the Red Sea; widespread in E. Africa, and extending to Bechuanaland.

2. ***Boscia angustifolia* A. Rich.** in Gulll. & Perr. Fl. Seneg. 26, t. 6 (1830); F.T.A. 1: 92; Gilg & Benedict l.c. 210; Chev. l.c. 1: 189; Aubrév. l.c. 49. **APD acc**

***Boscia tenuifolia* A. Chev.** l.c. 190 (fide Aubrév. l.c.).

Shrub or small tree of **savannah**, to 25 ft. high, with glabrous branches; flowers greenish, fragrant.

Sen.: Walo and Bondou Heudelot 361! Tivaouane (Dec.) Chev. 2499! Thies (Dec.) Chev. 2501! **Fr. Sud.:** Koulikoro (Oct.) Chev. 2511. Ouacoro (Oct.) Chev. 2497! **Fr. Nig.:** fide Chev. l.c. **N. Nig.:** Sokoto to Birnin Kebbi (Oct.) Dalz. 381! Lema F.R., Argungu (Nov.) Jibrin FHI 5152! Nupe Barter 1730! Jebba (Dec.) Hagerup 749a!

Throughout the **Sudan** to Abyssinia and S. **Arabia**.

3. ***Boscia senegalensis* (Pers.) Lam. ex Poir.**—F.T.A. 1: 92; Gilg & Benedict l.c. 209; Chev. Fl. Viv. 1: 187; Aubrév. l.c. 49. **APD acc**

***Podoria senegalensis* Pers.** (1806).

***Boscia octandra* Hochst. ex Radlk.** (1884); Chev. l.c. 188.

Shrub or small tree of **savannah**.

Sen.: Dakar (Dec.) Vigne 1772! Debeaux 149! And many other localities fide Chev. l.c. **Fr. Sud.:** San (fr. June) Chev. 1071! Djinyin (Aug.) Chev. 2495! And many other localities fide Chev. l.c. **Fr. Nig.:** Zinder (Oct.) Hagerup 574a! Birnin Kebbi (Oct.) Dalz. 381a! Sabon Birni (Dec.) Ryan 64! Sokoto Lely 851! Katagum Dalz. 143! Kukawa (Apr.) E. Vogel 93!

Also in **Mauritania** and extends to Eastern **Sudan** and Abyssinia.

11. COURBONIA

Brongn.—F.T.A. 1: 87; Gilg & Benedict in Engl. Bot. Jahrb. 53: 216 (1915).

- 1 A glaucous glabrous shrub; branches long and slender, leafy, ribbed; leaves lanceolate to elliptic, acutely acuminate, 2–3 cm. long, almost sessile, mostly obscurely 3-nerved; flowers solitary, axillary; pedicel 2 cm. long; sepals united at the base, free part ovate, about 1 cm. long, acute; fruits ovoid or ellipsoid, beaked, 2 cm. long, long-stipitate, smooth [virgata](#)

Courbonia virgata *Brongn.*—F.T.A. 1: 88; Gilg & Benedict in Engl. Bot. Jahrb. 53: 217 (1915); Chev. Fl. Viv. 1: 192.

APD: *Synonym of Maerua pseudopetalosa (Gilg & Gilg-Ben.) DeWolf*

Courbonia pseudopetalosa *Gilg & Benedict* l.c.; F.W.T.A., ed. 1, 1: 89.

A low shrub or undershrub, 1–2 ft. high, with straight branches from a woody rhizome, smelling of dung; flowers greenish-white; stamens white.

Sen.: Ferlo Heudelot 158! **Fr. Sud.:** Gourma (July) Chev. 24332. **G. C.:** Bele Plateau (May) Kitson 789! Bunsuru (May) Vigne 3846! **N. Nig.:** Bornu (Nov.–Feb.) Elliott 131! Talbot 1217! Yola (Jan.) Dalz. 180!

Extends to **Uganda**, A.–E. **Sudan**, Somaliland and Abyssinia.

MORINGACEAE

Trees with gummy bark. Leaves deciduous, alternate, 2–3 times pinnate, pinnae opposite; stipules none, or represented by stipitate glands at the base of the petioles and pinnae. Flowers in axillary panicles, white or red, hermaphrodite, zygomorphic. Calyx-tube short, with 5 unequal spreading or reflexed lobes, the fifth posticous, imbricate. Petals 5, the two upper smaller, the lateral ones ascending, the anticus larger. Disk lining the calyx-tube, with a short free margin. Stamens inserted on the margin of the disk, declinate, 5 perfect, alternating with the same number of antherless stamens or reduced to setae; filaments free; anthers dorsifixed, 1-celled, opening lengthwise by a slit. Ovary stipitate, terete, villous, curved, 1-celled, with 3 parietal placentas; style terminal, slender, tubular, truncate at the apex; ovules numerous, in 2 series on each placenta. Capsule long, beaked, 3–6-angled, torulose, 1-celled, 3-valved. Seeds 3-winged or not; embryo without endosperm, straight.

Natives of India and **Arabia**, but now introduced into the tropics generally.

Easily recognized by the compound-pinnate leaves, zygomorphic flowers, shortly stipitate ovary with parietal placentas, and the long fruit and winged seeds.

MORINGA

Adans.—F.T.A. 1: 101.

- 1 A tree with soft wood and pale bark; leaves 2–3-pinnate; rachis softly pubescent; leaflets opposite, up to about 5 pairs, the terminal one larger, all more or less elliptic, rounded at each end, shortly petiolulate, 1–2 cm. long, glaucous beneath and very slightly pubescent; flowers white, paniculate; calyx-tube campanulate, lobes 5, longer than the tube, finely pubescent; petals unequal, slightly longer than the sepals; fruit 3-angled, elongate-linear, about 1 ft. long; seeds globose, with 3 membranous wings produced beyond the ends [oleifera](#)

Moringa oleifera *Lam.* Encyl. 1: 398 (1785); Pax in E. & P. Pflanzenfam. 17B: 697 (1936). *APD acc*

M. pterygosperma Gaertn. (1791)—F.T.A. 1: 101; F.W.T.A., ed. 1, 1: 90; Chev. Fl. Viv. 1: 194. **Sen.:** Roger! St. Louis Brunner! Djoloff (Feb.) Dubai 275! **Fr. Sud.:**, **Fr. Native of India. cultivated all over the tropics.

CRUCIFERAE

Annual or perennial herbs, rarely somewhat shrubby, with watery juice. Indumentum of simple, medifixed or stellate hairs, rarely glandular. Leaves alternate or rarely opposite; stipules absent. Flowers hermaphrodite, mostly actinomorphic, usually racemose, rarely bracteate. Sepals 4, free, imbricate in 2 series, rarely valvate. Petals 4, rarely 0, mostly equal, often long-clawed, imbricate or contorted. Glands mostly present on the torus, often opposite the sepals. Stamens 6, tetradynamous, very rarely numerous or fewer, free or connate in parts; anthers 2– (rarely 1–) celled, opening lengthwise. Ovary sessile or rarely stipitate, usually of 2 united carpels, 1-celled with 1–2 parietal placentas and divided by a spurious membranous septum, or sometimes transversely several- or many-celled; stigmas 2, free or connate; ovules usually many. Fruit elongated (silique) or short (silicule), bivalved or indehiscent, rarely transversely jointed. Seeds without endosperm (very rarely a little endosperm present); embryo usually folded; cotyledons accumbent or incumbent.

A large natural family widely spread throughout the world, but poorly represented in our area.

At once recognized by the herbaceous habit, four sepals and petals, and six stamens, four of which are longer and two shorter (tetradynamous).

1. EREMOBIUM

Boiss.—O. E. Schuiz in E. & P. Pflanzenfam. 17B: 570 (1936). *APD acc*

- 1 Annual or perennial herb, woody at the base, prostrate or ascending, forming compact clumps to 30 cm. high; stems and narrowly oblong entire leaves densely white stellate-pubescent; flowers in dense racemes, sepals about 5 mm. long, exceeded by the pink petals; fruits 2–3 cm. long, pubescent, somewhat constricted between the seeds[aegyptiacum](#)

Eremobium aegyptiacum (*Spreng.*) *Hochr.* in Ann. Conserv. Jard. Bot. Genev. 7–8: 159 (1904); Burt & Lewis in Kew Bull. 1949: 287. *APD acc*

Malcolmia aegyptiaca *Spreng.-Chev.* Fl. Viv. 1: 217.

Fr. Nig.: Tabello Petit-Lagrange 55. Agades to Tintaouine Chev. 43484. Tasolé Chev. 43515.

Also in [Mauritania](#), [Sahara](#), [N. Africa](#), [Egypt](#), [Palestine](#) and [Arabia](#).

2. FARESTIA

Turra—F.T.A. 1: 61.

- 1 Petals about 6 mm. long, slightly longer than the 4–5 mm. long pubescent sepals; flowers few in lax racemes;

fruits oblong with sinuate margins up to 2.5 cm. long, rather densely covered with appressed medifixed hairs, 4–5 seeded, beaked with the persistent style; stems rather woody, densely covered with closely appressed medifixed hairs, leaves linear, obtuse, entire, 1-nerved, 4–5 cm. long, up to 5 mm. broad, usually less, covered on both surfaces with long appressed medifixed hairs [1. ramosissima](#)

Petals about 2 cm. long, sepals about 1 cm. long with membranous margins; flowers in elongated racemes; fruits linear with nearly straight margins, distinctly 1-nerved, about 4 cm. long, rather thinly pubescent with appressed hairs, beaked; leaves up to 8 cm. long and 5 cm. broad [2. stenoptera](#)

1. *Farsetia ramosissima* Hochst. ex Fourn.—F.T.A. 1: 63; Chev. Fl. Viv. 1: 222.

APD: *Synonym of Farsetia stylosa R. Br.*

Pale green twiggy herb; flowers white.

Fr. Sud.: Larneb Monod 4033. Goundam (Aug.) Chev. 2554! Timbuktu (July) Hagerup 178! **Fr. Nig.:** several localities fide Chev. l.c. **N. Nig.:** L. Chad: Kalkala Golding 70! Baga (Jan.) Daggash FHI 24965!

Extends to the A.–E. **Sudan**.

2. *Farsetia stenoptera* Hochst. in Flora 31: 176 (1848); F.T.A. 1: 62. *APD acc*

***Farestia grandiflora* Fourn.** in Bull. Soc. Bot. Fr. 11: 55 (1864); F.T.A. 1: 62; Chev. Fl. Viv. 1: 220, incl. var. *apiculata* A. Chev. (petals pure white, oblong-apiculate).

Erect herb, flowers pink.

Fr. Sud.: Ouahigouya (Aug.) Chev. 24736! Yatenga (Aug.) Chev. 24776! **Fr. Nig.:** Adrar Douchi Chev. 43259 (type of var. *apiculata*). Tinkademi Arnaud. Yatakala to Tillabery Rogeon 501.

Extends to the A.–E. **Sudan**.

3. BRASSICA

Linn.—F.T.A. 1: 65; O. E. Schulz in Engl. Pflanzenr. Crucif. 21 (1919).

- 1** Cauline leaves amplexicaul, entire; plant entirely glabrous and glaucous; petals yellow, 7.5–18 mm. long; fruit 3–5 cm. long; roots tuberculate [1. napus var. sahariensis](#)

Cauline leaves sessile or petiolate, not amplexicaul; plants with strong taproot: **2**

- 2** Flowers relatively large, petals obovate, 6.5–12 mm., sepals 3.5–6 mm. long; leaves glabrous or glabrescent: .. **3**

Flowers smaller, petals narrowly oblong-obovate, 5–7 mm., sepals 3 mm. long; leaves and stems bristly pubescent with rigid hairs; basal leaves in a rosette, several times deeply pinnatifid [4. tournefortii](#)

- 3** Basal leaves deeply lobed at the base, coarsely and irregularly dentate, lyrate; upper cauline leaves oblanceolate, entire or nearly so; fruit about 3 cm. long and 2–3.5 mm. broad, 4-ribbed and distinctly nervose, beaked with persistent style [2. juncea](#)

Basal leaves not deeply lobed or only with small lobes on the petiole, both basal and upper leaves irregularly crenate; otherwise similar to above [3. integrifolia](#)

1. *Brassica napus* var. *sahariensis* A. Chev. in Rev. Bot. Appliq. 1932: 829; Fl. Viv. 1: 208. *APD acc*

Fr. Sud.: Timbuktu Chev. 43809; 43838. Gao Chev. 43053.

Cultivated in Sahara and French **Sudan**.

2. *Brassica juncea* (Linn.) Coss. in Bull. Soc. Bot. Fr. 6: 609 (1859); F.T.A. 1: 65; Chev. Fl. Viv. 1: 209. *APD acc*

***Sinapis juncea* Linn.** (1753).

Erect herb to 3 ft. high; flowers yellow.

Fr. G.: Kankan (Mar.) Chev. 592! Faraba (Jan.) Chev. 281. Konianke country (Feb.) Chev. 20825. **S. L.:** Regent (Dec.) Sc. Elliot 3984! Magbile (Dec.) Thomas 5913! 5933! Port Loko (Sept.) Glanville 408!

Introduced from north temperate regions of Old World, now widely cultivated and naturalized in the tropics as Indian Mustard.

3. **Brassica integrifolia** (West) O. E. Schulz in Urb. Symb. Antill. 3: 509 (1903); Chev. Fl. Viv. 1: 210.

APD: *Synonym of Brassica carinata A. Braun*

Sinapis integrifolia West (1793).

Brassica integrifolia var. **chevalieri** Portères in Rev. Bot. Appliq. 1935: 1120, with fig.

Glabrous herb, to 3 ft. high, with pale yellow flowers.

Iv. C.: Man Chev. 34180.

Cultivated and widespread in Asia, Africa and America.

4. **Brassica tournefortii** Gouan—F.T.A. 1: 66; Chev. Fl. Viv. 1: 209. APD acc

Herb to 2 ft. high with small cream flowers.

Sen.: Podor Chev. 25748. **Fr. Nig.:** Air Rogeon in Hb. Chev. 43382.

Also in Sahara, north Africa and east Africa, S. Europe and western Asia.

Brassica oleracea Linn.

Several varieties of Cabbages are cultivated in our area; other species may also occur in cultivation or as aliens.

Brassica campestris Linn.

Several varieties of Turnips are cultivated in our area; other species may also occur in cultivation or as aliens.

Brassica rapa Linn.

Several varieties of Rapes are cultivated in our area; other species may also occur in cultivation or as aliens).

4. RORIPPA

Scop.—Hylander in Bot. Notiser. 1950, 1: 1–13 (1950);

Nasturtium R. Br.—F.T.A. 1: 57.

- 1 Stem very short, plant almost acaulescent with rosette of prostrate, irregularly pinnate leaves up to 20 cm. long; leaflets ovate or orbicular, toothed or sinuate; flowers very small, sepals 1–1.3 mm. long, petals smaller; fruits 4–14 mm. long [1. humifusa](#)

Stem well-developed, to 40 cm. high or more, hollow; leaves pinnate with about 4 pairs of narrowly ovate leaflets, oblique and unequal at base, obtuse at apex, margin irregularly sinuate; sepals 2.5–3 mm. long, petals considerably longer; fruits 1–2 cm. long, seeds in two ranks, the testas with rather coarse aerolation [2. nasturtium-aquaticum](#)

1. **Rorippa humifusa** (Guill. & Perr.) Hiern in Cat. Welw. 1, p. xxvi (1896); Brenan in Kew Bull. 1950: 212.

APD: *Synonym of Rorippa madagascariensis (DC.) Hara*

Nasturtium humifusum Guill. & Perr.—F.T.A. 1: 58; F.W.T.A., ed. 1, 1: 92; Chev. Fl. Viv. 1: 213.

Nasturtium benuense Hutch. & Dalz. F.W.T.A., ed. 1, 1: 92 (1927); Kew Bull. 1928: 26.

Cardamine hirsuta of A. Chev. in Comptes Rendus 1909, 2: 459, not of Linn.

Low annual herb on sandy ground by water.

Sen.: Walo (Nov.–Mar.) Perrottet! Heudelot 195! **Iv. C.:** Sanrou (May) Chev. 21585! Anno (Dec.) Chev. 22538. Comoe valley (Dec.) Chev. 22552. **G. C.:** R. Birrim, Anyinam (Mar.) Irvine 1756! **N. Also in Belgian Congo, Angola, Uganda and Madagascar.

2. **Rorippa nasturtium-aquaticum** (Linn.) Hayek Sched. Fl. Stir. Exs. 22 (1905); Hylander in Bot. Notiser. 1950, 1: 1–13 (1950). APD acc

Sisymbrium nasturtium-aquaticum Linn. (1753).

Nasturtium officinale R.Br.—F.T.A. 1: 58; Chev. Fl. Viv. 1: 212.

The Common Watercress, introduced to, and naturalized in, certain localities within our area; flowers white.

Fr. Sud.: Timbuktu fide Chev. l.c. **Fr. Nig.:** Agades fide Chev. l.c. **Br. Cam.:** Cam. Mt., below Musake hut 5,500 ft. (Nov., Jan.) Migeod 52! Keay FHI 28581!

[The above description is based on the Cameroons' plant.]

5. CARDAMINE

Linn.—F.T.A. 1: 60; O. E. Schulz in Engl. Bot. Jahrb. 32: 280–623 (1902).

- 1 Leaves trifoliate, long-petiolate, up to 16 cm. long including the petiole; leaflets ovate, acute, coarsely crenate-dentate, with distinct petiolules about 1 cm. long, setulose-pubescent on both surfaces; petals present, 3–5 mm. long; pedicels up to 1 cm. long in fruit; fruits 2·5–4·5 cm. long [1. africana](#)
- Leaves pinnate; fruits 1·2–3 cm. long: **2**
- 2 Petals present, 2·5–3 mm. long; leaves up to about 6 cm. long, leaflets rounded at apex; fruits 1·2–2·5 cm. long, on pedicels up to about 5 mm. long, not congested at the apex of the shoots [2. hirsuta](#)
- Petals absent, sepals 1·2–2·5 mm. long; leaves similar to above; fruits 1·5–3 cm. long, congested, subumbellate at the tips of the shoots [3. trichocarpa](#)

1. *Cardamine africana* *Linn.*—F.T.A. 1: 60; Schulz in Engl. Bot. Jahrb. 32: 414 (1902). *APD acc*

A weak herb, 1–2 ft. high, with white flowers.

Br. Cam.: Cam. Mt., Esele Camp, 7,000 ft. (fr. Feb.) Maitland 1345! Cam. Mt., above Mimbia, 6,200 ft. (fl. & fr. Mar.) Brenan 9352! **F. Po:** 7,500 ft. Mann 1448! Musola to Moka (Jan.) Guinea 1581!

Also in **S. Tomé**, the mountains of east and central tropical Africa, **S. Africa**, **Madagascar**, **India** and **Brazil**.

[Mann's specimen from Fernando Po has been identified as var. *arabica* (DC.) O. E. Schulz l.c. 416 (syn. *C. borbonica* Pers. var. *arabica* DC., syn. *C. africana* Linn. var. *pubescens* Hook. f., name only).]

2. *Cardamine hirsuta* *Linn.*—F.T.A. 1: 61; Schulz l.c. 464. *APD acc*

APD: *Synonym of Cardamine obliqua Hochst. ex A. Rich.*

Small annual, often much-branched or tufted at the base; petals white.

Br. Cam.: Cam. Mt., 8,000–10,000 ft. (Nov.) Mann 2032!. **F. Po:** 7,500–8,500 ft. Mann 1460!

Common in temperate regions and on the mountains of tropical Africa.

3. *Cardamine trichocarpa* *Hochst. ex A. Rich.*—F.T.A. 1: 60; Schulz l.c. 462; Chev. Fl. Viv. 1: 214. *APD acc*

Weakly erect annual herb.

Br. Cam.: Buea, 3,000ft. (fr. Jan., Apr., Nov.) Migeod 228! Maitland 216! Brenan 9586! Cam. Mt., Musake Camp, 5,600 ft. (Jan.) Maitland 1237! Bali, Bamenda (May) Ujor FHI 30397!.

Also in the mountains of tropical Africa and India.

6. LEPIDIUM

Linn.—F.T.A. 1: 68.

- 1 An erect glabrous annual; leaves variable, often deeply pinnatisect, with linear segments; flowers shortly racemose, white, small; fruits compressed, broadly elliptic, emarginate, slightly winged towards the top, 5–6 mm. long, about 4 mm. broad; seeds ellipsoid, smooth, 3 mm. long, brown or red [sativum](#)

Lepidium sativum *Linn.*—F.T.A. 1: 69; Chev. Fl. Viv. 1: 197. *APD acc*

The Common Cress.

Commonly [cultivated in regions away from the coast](#); naturalized in some places.

Fr. Sud.: Goundam Vuillet in Hb. Chev. 25971. **Fr. G.:** Siquiri Chev. 301. **Fr. Nig.:** Agades Chev. 43474. **N. Nig.:** Kano (Feb.) Dalz. 333! Baradau, Bauchi Plateau (fr. May) Lely 87! Abinsi (fr. Feb.) Dalz. 791!

7. SCHOUWIA

DC.—F.T.A. 1: 67.

- 1** A woody glabrous herb, branching from the base; cauline leaves sessile, amplexicaul, oblong-lanceolate, deeply cordate-auriculate at base, acute, 4–8 cm. long, 2–4 cm. broad, papery, distinctly nervose; flowers racemose; sepals oblong, about 1 cm. long, with narrowly membranous margins; petals slightly longer, purplish; fruit compressed, winged, broadly elliptic, 2.5 cm. long, tipped by the persistent acute style about 0.5 cm. long
..... [schimperi](#)

Schouwia schimperi *Jaub. & Spach* in Ann. Sci. Nat. Bot. 3, Sér. 13: 366 (1849); Schulz in Engl. Pflanzenr. Crucif. 54, t. 16 (1923).

APD: *Synonym of Schouwia purpurea (Forssk.) Schweinf.*

Schouwia arabica of F.T.A. 1: 68; Chev. Bot. 24; F.W.T.A., ed. 1, 1: 92; not of (Vahl) DC.

Schouwia purpurea of Chev. Fl. Viv. 1: 200, not of (Forsk.) Schweinf.

Robust annual to 3 ft. high, flowers purplish.

Fr. Sud.: Mossi (July) Chev. 24581! **Fr. Nig.:** several localities fide Chev. l.c.

Also in [Mauritania](#), [central Sahara](#), [eastern Sudan](#), [Egypt](#), [Abyssinia](#) and [Arabia](#).

VIOLACEAE

Herbs, shrubs, or small trees. Leaves alternate or rarely opposite, stipulate. Flowers actinomorphic or zygomorphic, from solitary to paniculate. Sepals 5, imbricate. Petals 5, nearly equal or the lower larger and often clawed, imbricate. Stamens hypogynous, 5, alternate with the petals; anthers 2-celled, opening lengthwise, with the connective produced beyond the cells. Ovary superior, sessile, 1-celled, with usually 3 parietal placentas each with one or more ovules; style usually simple. Fruit an elastic loculicidal capsule, one- or more-seeded. Seeds with fleshy endosperm and central mostly straight embryo.

A widely spread family, the woody members mostly in the tropics, the herbaceous at higher altitudes and in temperate regions.

Recognized by the often zygomorphic flowers, definite stamens with produced connective, and parietal placentation.

- 1** Trees or shrubs; flowers more or less actinomorphic, with subequal petals, or if zygomorphic then lower petal not saccate or spurred at the base: **2**
Herbaceous or suffrutescent; flowers zygomorphic, with lower petal saccate, gibbous or spurred at base: **4**
- 2** Petals subequal; fruit a 3-valved capsule: **3**
Petals unequal, the lower petal hooded at the apex and covering the other broader petals in bud; ovary opening very early, seeds developing in the open, placentas becoming woody and bearing dense clusters of large drupe-like seeds **3. [Gymnorinorea](#)**
- 3** Flowers borne on older branches or main stem; seeds arillate, endosperm sparse; staminal appendages cohering with each other **1. [Allexis](#)**
Flowers terminal or axillary on leafy shoots; seeds not arillate, endosperm copious; stamens free, or connate below the anthers, staminal appendages quite free **2. [Rinorea](#)**
- 4** Lower petal conspicuously larger than the rest and clawed, saccate or gibbous at the base; sepals not produced below the base; seeds often longitudinally striate; stipules entire **4. [Hybanthus](#)**
Lower petal not clawed at the base, spurred or saccate; sepals produced below the base; seeds smooth; stipules foliaceous, divided **5. [Viola](#)**

1. ALLEXIS

Pierre in Bull. Soc. Linn. Paris 1: 25 (1898). *APD acc*

- 1 Small tree, to 7 m. high; leaves oblong, 14–30 cm. long, 4.5–10 cm. broad, acuminate, narrowed at base into winged petiole 2–4 cm. long, 9–15 pairs of lateral nerves; petals entirely reflexed and overlapping the sepals, 5 mm. long; pedicels 5–10 mm. long [obanensis](#)

Allexis obanensis (*Bak. f.*) *Melchior* in Notizbl. Bot. Gart. Berl. 8: 655 (1924). *APD acc*

Alsodeia obanensis *Bak. f.* in Cat. Talb. 6 (1913).

Rinorea obanensis (*Bak. f.*) *De Wild.* in Bull. Jard. Bot. Brux. 6: 179 (1920); F.W.T.A., ed. 1,1: 95.

Petals cream, anthers bright yellow; flowers on old branches.

S. Nig.: Oban Talbot 606!

2. RINOREA

Aubl. Pl. Gui. 1: 235 (1775).

Alsodeia Thouars—F.T.A. 1: 106.

- 1 Leaves spinose-dentate, coriaceous, oblong-ovate to lanceolate, long-acuminate, 12–22 cm. long, 3–9 cm. broad; flowers 3–4 mm. diam. on very short pedicels, sepals ribbed [1. ilicifolia](#)
 Leaf margin not spiny: **2**
- 2 Petals entirely reflexed and overlapping the sepals: **3**
 Petals not reflexed, or only at the tip: **4**
- 3 Ovary pilose; flowers numerous in 5–11 cm. long racemes, pedicels 8–15 mm. long; inflorescence densely short-pilose; leaves oblong, up to 12 cm. long and 3–5 cm. broad, crenulate [2. gracilipes](#)
 Ovary glabrous; flowers several in racemes up to 5 cm. long, pedicels 8–12 mm. long; inflorescence pilose; leaves ovate-elliptic to lanceolate, up to 8 cm. long and 1.5–3 cm. broad, crenulate [3. ardisiiflora](#)
- 4 Leaves auriculate to subauriculate at base: **5**
 Leaves obtuse, acute or cuneate at base: **9**
- 5 Lamina up to 15 cm. long: **6**
 Lamina 15–40 cm. long, oblanceolate: **7**
- 6 Margin of leaf obtusely serrate in upper part only, main lateral nerves 12–16 on each side; bush to 0.5 m. high [4. bussei](#)
 Margin of leaf denticulate from base to apex, main lateral nerves 9–12 on each side; tree to 7 m. high [5. kibbiensis](#)
- 7 Stems, midribs, lateral nerves beneath and inflorescence axis densely pubescent; sepals lanceolate, 5–8 mm. long [6. longisepala](#)
 Stems, midribs, lateral nerves beneath and inflorescence axis glabrous or sparsely pubescent; sepals oblong-ovate, 2–4 mm. long: **8**
- 8 Leaves glandular beneath, markedly auricled and amplexicaul at base; peduncles up to 3 cm. long; sepals about 4 mm. and petals about 6 mm. long [7. ledermannii](#)
 Leaves not glandular beneath, subauriculate, with definite petiole 7–10 mm. long; peduncles 4–7 cm. long; sepals about 2 mm. and petals about 4 mm. long [8. oblanceolata](#)
- 9 Sepals markedly ribbed fanwise: **10**
 Sepals not markedly ribbed, or only midrib prominent: **14**
- 10 Petioles up to 7 mm. long; inflorescences axillary along the shoots, slender, up to 7 cm. long, pubescent; branchlets and leaves sparsely pubescent; leaves obovate to broadly elliptic, 6–13 cm. long, 2.5–6 cm. broad; sepals broadly ovate, 1 mm. long; petals 6–7 mm. long, 2–2.5 mm. broad; ovary glabrous (see fig. 31, 3) [9. convallariiflora](#)
 Petioles more than 7 mm. long; inflorescences at ends of shoots, mainly terminal with subsidiary axillary branches: **11**
- 11 Filaments short but distinct, about 0.5 mm. long: **12**

- Anthers sessile: 13
- 12 Sepals 1.5 mm. long and broad; petals 5 mm. long and 1 mm. broad; appendage of anther ovate, emarginate; pedicels 2–3 mm. long; petioles 1–2 cm. long, lamina lanceolate, 10–15 cm. long, 2.5–5 cm. broad [10. afzelii](#)
- Sepals 2.5–3 mm. long, 2.5–3.5 mm. broad; petals 5–6 mm. long and 3 mm. broad, appendage of anther suborbicular not emarginate; pedicels 5–7 mm. long; petioles 0.8–2.2 cm. long, lamina elliptic, 13–20 cm. long and 6–11.5 cm. broad (see fig. 31, 4) [11. keayi](#)
- 13 Lamina 15–20 cm. long, 4–8 cm. broad; staminal appendage rounded at apex, connective produced into a spoon-shaped process not 1/4 length of anther [12. prasina](#)
- Lamina 15–27 cm. long, 6–10 cm. broad; staminal appendage subacute at apex, connective produced into a filamentous process half the length of the anther [13. crassifolia](#)
- 14 Leaves glandular beneath: 15
- Leaves not glandular beneath: 22
- 15 Ovary puberulous or pilose; inflorescence mainly terminal with occasional subsidiary branches: 16
- Ovary glabrous; inflorescences all or mostly in axils of full-sized leaves, sometimes with a terminal inflorescence in addition: 21
- 16 Ovary puberulous; petioles generally not exceeding 1 cm. long; lamina oblong, narrowing into the acumen: .. 17
- Ovary densely pilose; petioles generally exceeding 1 cm. long: 18
- 17 Extremities and rhachis glabrous; sepals 6 mm. long, 4 mm. broad; staminal tube free at the margin, lobed behind the anthers, appendage produced beyond the anthers and slightly emarginate at the tip [14. johnstonii](#)
- Extremities and rhachis pubescent; sepals 4 mm. long, 2 mm. broad; staminal tube not free, appendage produced beyond the anthers and bifid [15. talbotii](#)
- 18 Branchlets, midrib and nerves beneath and inflorescence long-hirsute: 19
- Branchlets, midrib and nerves beneath more or less glabrous, not bristly pilose; inflorescence densely but rather shortly hirsute: 20
- 19 Anthers sessile, pubescent; sepals 2 mm. long, 1.5 mm. broad; staminal tube free at the margin with long narrow lobes behind the anthers, connective produced into a spoon-shaped process; lamina obovate to oblanceolate, markedly acuminate, cuneate and serrate, 8–18 cm. long, 3–6 cm. broad (see fig. 31, 1) [16. elliotii](#)
- Anthers not sessile, filaments distinct, anthers glabrous or glabrescent; otherwise similar to elliotii [17. djalensis](#)
- 20 Connective not produced beyond the anthers which are crowned with a tuft of hairs; petiole 3–8 cm. long; lamina elliptic-oblanceolate, abruptly long-acuminate, 12–25 cm. long, 4–8 cm. broad; sepals rounded about 1.5 mm. diam.; inflorescence to 20 cm. long [18. longicuspis](#)
- Connective produced, bifid; petiole rather short; lamina oblanceolate to narrowly obovate, cuneate at base, gradually acuminate, 8–12 cm. long, 3–5 cm. broad; sepals ovate, about 2 mm. long; inflorescence 4–7 cm. long [19. arenicola](#)
- 21 Sepals glabrous except for ciliate margin, ovate to rotundate, 2 mm. diam.; inflorescences 4–5 cm. long, glabrous; petiole 2–4 cm. long; lamina elliptic to lanceolate, 15–22 cm. long, 6–8 cm. broad [20. parviflora](#)
- Sepals puberulous, oblong to broadly lanceolate, 3–4 mm. long; inflorescences 3–12 cm. long, puberulous; petiole 2–10 cm. long; lamina oblong, 20–30 cm. long, 8–14 cm. broad [21. kamerunensis](#)
- 22 Inflorescences axillary; petioles up to 7 mm. long; inflorescences pubescent, up to 1 cm. long; flowers about 3 mm. long, congested, bracts persistent; stamens free; branchlets densely pubescent; leaves elliptic, obtuse at base, acuminate, 5–10 cm. long, 2.5–5 cm. broad; stipules linear elongated; ovary minutely tuberculate [22. breviracemosa](#)
- Inflorescences terminal, sometimes with subsidiary axillary branches, to several cm. long; petioles usually well over 7 mm long: 23
- 23 Ovary pilose, pubescent or puberulous: 24
- Ovary glabrous: 30
- 24 Ovary densely pilose: 25
- Ovary sparsely pilose, pubescent or puberulous: 26
- 25 Staminal tube 1.5–2 mm. long; petals 5 mm. long, sepals setose; pedicel 2 mm. long; inflorescence up to 10 cm. long, spiciform; petiole 2–3 cm. long, lamina elliptic-lanceolate, 15–18 cm. long, about 6 cm. broad, glabrous [23. pilosa](#)
- Staminal tube 0.75 mm. long; petals 4 mm. long, sepals pilose; pedicel 1 mm. long; inflorescence up to 20 cm. long, paniculate; petiole 2.5–5 cm. long, thickened at each end, lamina oblong-oblanceolate, 16–20 cm. long, 5–7.5 cm. broad, sparsely pubescent, irregularly reddish-tinted beneath [24. rubrotincta](#)
- 26 Ovary pubescent at first, becoming furfuraceous, fruit furfuraceous: 27

- Ovary and fruit not furfuraceous: 28
- 27 Sepals 3–4 mm., petals 5–6 mm. long; staminal tube 3.5 mm. long; inflorescence 4–22 cm. long, generally laxly paniculate, densely puberulous; petiole 1–4 (rarely to 7) cm. long; lamina elliptic, oblong, or oblanceolate, entire to dentate, 12–30 cm. long, 4–13 cm. broad, midrib sparsely puberulous to glabrous [25. oblongifolia](#)
- Sepals 2 mm., petals 3–4 mm. long; staminal tube 1.5 mm. long; inflorescence a narrow panicle 3–7 cm. long, pubescent, usually hirsute at base; petiole 0.7–1.5 cm. long; lamina obovate-elliptic to oblanceolate, markedly dentate, 8–26 cm. long, 2.5–9 cm. broad; pubescent on midrib and nerves [26. dentata](#)
- 28 Sepals densely hirsute, 3 mm. long; petals 5–6 mm. long, reflexed at tip; staminal tube 0.75 mm. long; inflorescence spiciform, to 10 cm. long, hirsute; petiole 1–6 cm. long; lamina obovate to oblong, 10–20 cm. long, 4–10 cm. broad, midrib and nerves sparsely pubescent to glabrous [27. brachypetala](#)
- Sepals puberulous or glabrous: 29
- 29 Sepals 1.5–2 mm., petals 3–4 mm. long; staminal tube with free margin, ovary sparsely pilose; inflorescence 3–6.5 cm. long; petiole 1–4 cm.; lamina oblanceolate, 7–17 (rarely to 25) cm. long, 2.5–6 cm. broad, with 6–8 pairs of lateral nerves; branchlets sparingly pilose [28. aylmeri](#)
- Sepals 3 mm., petals 5 mm. long; staminal tube without free margin, ovary minutely puberulous; inflorescence 4–12 cm. long; petiole 1–4 (rarely to 7) cm. long, lamina elliptic to oblong 20–30 cm. long, 6–10 cm. broad, with 12–14 pairs of lateral nerves; branchlets glabrous [29. adnata](#)
- 30 Sepals 1–1.5 mm., petals 3 mm. long; inflorescence spiciform, 1.5–6 cm. long; petiole 1–4 cm.; lamina obovate-elliptic to narrowly elliptic, 5–19 cm. long, 2–8 cm. broad, subdentate, glabrous (see Fig. 31, 2) [30. subintegrifolia](#)
- Sepals 2–3 mm., petals 4–6 mm. long: 31
- 31 Sepals densely hirsute, petals reflexed at tip: 32
- Sepals not densely hirsute, mostly puberulous: 33
- 32 Petals 5–6 mm. long; petiole 1–6 cm. long, usually more than 2 cm.; shrub to 1.5 m. high; for other characters see above [27. brachypetala](#)
- Petals 4 mm. long; inflorescence 4–8 cm. long; petiole 1–2 cm. long; lamina obovate-elliptic to obovate-oblanceolate, 7–13 cm. long, 3.5–6 cm. broad, glabrous; tree to 6 m. high [31. poggei](#)
- 33 Petiole 3.5–8 cm. long; lamina oblong, 22–28 cm. long, 9–10 cm. broad, lateral nerves 10–11 pairs, glabrous; sepals 2 mm., petals 5 mm. long; inflorescences about 15 cm. long with several axillary as well as terminal panicles [32. preussii](#)
- Petiole 0.7–2.5 cm. long; lamina up to 18 cm. long and 8 cm. broad: 34
- 34 Inflorescence densely pubescent, spiciform, to 4 cm. long; anthers sessile, staminal tube very short; petiole 1–2 cm.; lamina elliptic, 5–10 cm. long, 3.5–5 cm. broad [33. whytei](#)
- Inflorescence sparsely puberulous to glabrous; filaments distinct, staminal tube 1.5 mm. long: 35
- 35 Staminal appendage lanceolate; petals not ciliate or very sparsely so, 6 mm. long; inflorescence 2.5–5 cm. long on a peduncle about 2 cm. long; petiole 1–2 cm. long; lamina narrowly oblong, 8–18 cm. long, 1.5–6 cm. broad, glabrous; branchlets glabrous, petiole pubescent [34. liberica](#)
- Staminal appendage short, rounded; petals densely ciliate, about 4 mm. long; inflorescence 3.5–8 cm. broad, rather widely paniculate; petiole 0.7–2.5 cm. long; lamina broadly elliptic to obovate, 9–18 cm. long, 2.5–8 cm. broad, pilose on midrib; branchlets and petiole pilose [35. microdon](#)

1. **Rinorea ilicifolia** (Welw. ex Oliv.) O. Ktze. Rev. Gen. Pl. 1: 42 (1891); De Wild. in Bull. Jard. Bot. Brux. 6: 166; Chev. Fl. Viv. 1: 231. *APD acc*

Alsodeia ilicifolia Welw. ex Oliv.—*F.T.A.* 1: 108.

Glabrous shrub or small tree, up to 15 ft.; flowers cream.

Fr. G.: Kouria (Nov.) Chev. 14820! **S. L.:** Sasseni, Scarcies K. (Jan.) Sc. Elliot 4427! Ninia, Talla Hills (Feb.) Sc. Elliot 4868! Kenema (Nov.) Deighton 407! Bumbuna (Jan.) Deighton 3594! **Iv. C.:** Aubrév. 1801! Bouroukrou (Dec.) Chev. 16641! 16741! **G. C.:** W. Afao Hills F.R. (Feb.) Darko 761! Juaso (Feb.) Akpabla 273! **S. Nig.:** Olokemeji (Jan.) Keay FHI 22470! Okomu F.R., Benin (Dec.) Brenan 8491! 8513! Eket Talbot!

Widespread in east tropical Africa and in **Angola**.

2. **Rinorea gracilipes** Engl. Bot. Jahrb. 33: 136 (1902); Exell & Mendonca Consp. Fl. Ang. 1: 75.

APD: *Synonym of Rinorea angustifolia subsp. engleriana* (De Wild. & T. Durand) Grey-Wilson

Shrub or small tree, flowers white.

Br. Cam.: Missellele, Tiko (Jan.) Box 3563!

Also in **French Cameroons**, **Gabon**, **Congo** and **Angola**.

3. **Rinorea ardisiiflora** (Welw. ex Oliv.) O. Ktze. l.c. 42 (1891); Exell & Mendonca l.c. 74.

APD: Synonym of Rinorea angustifolia subsp. ardisiiflora (Oliv.) Grey-Wilson

APD: Synonym of Rinorea angustifolia subsp. engleriana (De Wild. & T. Durand) Grey-Wilson

Alsodeia ardisiiflora Welw. ex Oliv. F.T.A. 1: 108.

Rinorea feliciania A. Chev. Fl. Viv. 1: 229 (1938), French descr. only.

Small tree, flowers white.

Fr. G.: Kindia (Apr.) Jac.-Fel. 72! **G. C.:** Ateiku (Nov.) Vigne 4749!

Also in **French Cameroons**, **Gabon**, **Congo** and **Angola**.

4. **Rinorea bussei** M. Brandt in Engl. Bot. Jahrb. 51: 125 (1913); De Wild. l.c. 155. *APD acc*

A bush 11/2 ft. high, with yellowish flowers.

Togo: Kpeta, 1,950 ft., in shady places (Nov.) Busse 3358.

5. **Rinorea kibbiensis** Chipp in Kew Bull. 1923: 292; Chev. Fl. Viv. 1: 232. *APD acc*

Shrubby tree, to 20 ft. high, with white flowers; common in understorey of forest.

Iv. C.: Mid. Comoé Valley (Dec.) Chev. 22567! 22572! Morenou (Nov.) Chev. 22440! 22454! **G. C.:** Kibbi Hills (Dec.) Johnson 507! Bibiani (Aug.) Vigne 1327! Kwahu Prasu (Feb.) Vigne 1615! **Br. Cam.:** Mayoko (Feb.) Dalz. 8219!

6. **Rinorea longisepala** Engl. Bot. Jahrb. 33: 143 (1902); Brenan in Kew Bull. 1952: 443. *APD acc*

Shrub, to 9 ft. high; sepals green, dull purplish towards the base.

S. Nig.: Oban Talbot 455! Kwa Falls, Calabar (Mar.) Brenan 9229!

Also in **French Cameroons** and **Spanish Guinea**.

7. **Rinorea ledermannii** Engl. Bot. Jahrb. 51: 121 (1913); Brenan l.c. *APD acc*

Straggling much-branched shrub about 5 ft. high; flowers yellow.

Br. Cam.: S. Bakundu F.R. (Mar.) Brenan 9290!

Also in **French Cameroons**.

8. **Rinorea oblanceolata** Chipp l.c. 292 (1923); Chev. Fl. Viv. 1: 232. *APD acc*

Shrub to 6 ft. high; flowers cream or greenish.

S. L.: Gorahun (Nov., Dec.) Deighton 378! 3803! Bandajuma (Nov.) Deighton 5267! **Lib.:** Begwai (Oct.) Bunting 21! Fayapulu (Oct.) Linder 1137! Bumbuma (Oct.) Linder 1322! **Iv. C.:** Lower Cavally, Grabo Chev. 19647; 19652.

9. **Rinorea convallariiflora** M. Brandt in Engl. Bot. Jahrb. 51: 106 (1914).

APD: Synonym of Rinorea convallarioides subsp. occidentalis Grey-Wilson

Rinorea euandra Engl. ex Zenker in De Wild. l.c. 194, name only.

Small tree 20 ft. high; flowers white.

G. C.: near Agogo, Ashanti (fl. & fr. Apr.) Vigne 1080! 1080a! Irvine 962! Amentia (Mar.) Vigne 1874! Birrim Dist. (Mar.) Moor 38!

Also in **French Cameroons**.

10. **Rinorea afzelii** Engl. Bot. Jahrb. 33: 138 (1902); De Wild. l.c. 150, partly. *APD acc*

A shrub.

S. L.: Afzelius. Gola Forest (Dec.) King 128b!

11. *Rinorea keayi* Brenan in Kew Bull. 1950: 336. *APD acc*

Tree 20–25 ft. high; flowers cream.

S. Nig.: below Mt. Koloishe, Obudu, 4,000 ft. (Dec.) Keay & Savory FHI 25023! Ikwette-Balegette path, Obudu, 4,500 ft. (Dec.) Keay & Savory FHI 25206!

12. *Rinorea prasina* (Stapf) Chipp in Kew Bull. 1923: 299. *APD acc*

Alsodeia prasina Stapf in Johnston Lib. 577 (1906); M. Brandt in Engl. Bot. Jahrb. 50, Suppl. 412 as synonym of *R. afzelii* Engl.

Glabrous shrub to 6 ft. high.

Gam.: near Bathurst (fr. Feb.) Johnston 91! **S. L.:** Njala (Oct., Feb.) Deighton 2544! 4704! York Pass (Dec.) Deighton 3336! Bumbuna (Jan.) Deighton 3595! **Lib.:** near Monrovia Whyte! Moylakwelli (Oct.) Linder 1315! **G. C.:** Abiabo, Axim (Nov.) Vigne 1424!

13. *Rinorea crassifolia* (Bak. f.) De Wild. in Bull. Jard. Bot. Brux. 6: 158 (1920). *APD acc*

Alsodeia crassifolia Bak. f. in Cat. Talb. 6 (1913).

A shrub 8–9 ft.; petals dull yellow.

S. Nig.: Oban Talbot 1260!

14. *Rinorea johnstonii* (Stapf) M. Brandt in Engl. Bot. Jahrb. 50, Suppl. 414 (1914); De Wild. l.c. 167; Chev. Fl. Viv. 1: 233. *APD acc*

Alsodeia johnstonii Stapf in Johnston Lib. 577 (1906).

A glabrous shrub with serrulate leaves; sepals dark, white-edged.

Lib.: Sinoe Basin Whyte! Grand Bassa Dinklage 1944! **Iv. C.:** Lower Cavally Chev. 19803; 19832

15. *Rinorea talbotii* (Bak. f.) De Wild. l.c. 188 (1920). *APD acc*

Alsodeia talbotii Bak. f. in Cat. Talb. 7 (1913).

Shrub to 6 ft. high.

S. Nig.: Oban Talbot 478!

Also in **Gabon**.

16. *Rinorea elliotii* Engl. Bot. Jahrb. 33: 144 (1902); De Wild. l.c. 161; Chev. Fl. Viv. 1: 233.

APD: *Synonym of Rinorea welwitschii* (Oliv.) Kuntze subsp. *welwitschii*

Rinorea punctata Chipp in Kew Bull. 1923: 293; F.W.T.A., ed. 1, 1: 95.

Small tree 4–30 ft. high; flowers yellow; **locally abundant in forest undergrowth.**

S. L.: Kofiu Mt. (Jan.) Sc. Elliot 4605! Kambui (Mar.) Lane-Poole 201! **Lib.:** Dinklage 3329! Moylakwelli (Oct.) Linder 1316! **Iv. C.:** several localities fide Chev. l.c. **G. C.:** Anwhiaso F.R. (Nov.) Vigne 189! R. Asenango F.R. (Feb.) Andoh FH 4304! **S. Nig.:** Okomu F.R. (Jan., Feb.) Brenan 8840! 8903! 9088! Sapoba (Mar.) Jones FHI 7448! Kennedy 411! 2193! Eket Talbot!

Also in **Gabon**.

17. *Rinorea djalonensis* A. Chev. ex Hutch. & Dalz. F.W.T.A. ed. 1, 1: 95 (1927); Kew Bull. 1928: 26; Chev. Bot. 34, name only; Chev. Fl. Viv. 1: 234. *APD acc*

Shrub or small tree.

Fr. G.: Dalaba-Diaguissa Plateau (Oct.) Chev. 18741. And several other localities fide Chev. l.c.

18. **Rinorea longicuspis** *Engl.* Bot. Jahrb. 33: 137 (1902); De Wild. l.c. 172.

APD: Synonym of Rinorea welwitschii (Oliv.) Kuntze subsp. welwitschii

Rinorea elliotii of Chev. Fl. Viv. 1: 233, partly.

Small tree to 24 ft. high, with yellow flowers.

Lib.: Boporo (Nov.) Baldwin 10387! **Iv. C.:** Banco Martineau 244! Abidjan Aubrév. 71! 174! 312! **G. C.:** Begoro (young fr. Mar.) Johnson 695! Obuasi (Feb.) Rea 1623!

Also in **French Cameroons**.

19. **Rinorea arenicola** *M. Brandt* in Engl. Bot. Jahrb. 51: 111 (1913); De Wild. l.c. 150.

APD: Synonym of Rinorea welwitschii (Oliv.) Kuntze subsp. welwitschii

A bush or small tree, with yellow flowers.

Lib.: Grand Bassa, among bushes towards the sea front (fl. and young fr. Oct.) Dinklage 1854.

20. **Rinorea parviflora** *Chipp* in Kew Bull. 1923: 295. *APD acc*

A glabrous shrub with almost entire leaves.

S. Nig.: Oban Talbot 1391!

Also in **Gabon**.

21. **Rinorea kamerunensis** *Engl.* Bot. Jahrb. 33: 139 (1902); De Wild. l.c. 167; Brenan in Kew Bull. 1952: 442. *APD acc*

Erect single-stemmed shrub, to 4 ft. high; flowers nodding, sepals yellowish, petals white.

Br. Cam.: between Victoria and Bimbia (Apr.) Preuss 1221! Near Barombi (Apr.) Preuss 143. S. Bakundu F.R. (Mar.) Brenan 9289! 9289a! 9289b!

Also in **French Cameroons**.

22. **Rinorea breviracemosa** *Chipp* in Kew Bull. 1923: 293. *APD acc*

Alsodeia latifolia ? *Thouars*—F.T.A. 1: 107.

Small tree, to 9 ft. high, in marsh **forest**; flowers white.

S. L.: (May) Barter! Aylmer 38! York Pass (fr. June) Sierra Leone Herb. No. 53! **Lib.:** Peahtah Linder 1045! **S. Nig.:** Omo F.R. (Mar.) Jones & Onochie FHI 17221! Oban Talbot 477!

23. **Rinorea pilosa** *Chipp* l.c. 294 (1923). *APD acc*

A shrub.

S. Nig.: Oban Talbot!

24. **Rinorea rubrotincta** *Chipp* l.c. 294 (1923); Chev. Fl. Viv. 1: 236. *APD acc*

Shrub or small tree to 30 ft. high.

Lib.: Begwai (Oct.) Bunting 155! **Iv. C.:** (May) Aubrév. 2112! Soumie (July) Aubrév. 453!

Widespread fide Chev. l.c.

25. **Rinorea oblongifolia** (*C. H. Wright*) *Marquand ex Chipp* l.c. 296 (1923); Chev. Fl. Viv. 1: 240, partly. *APD acc*

Pittosporum oblongifolium *C. H. Wright* in Kew Bull. 1897: 243.

Alsodeia welwitschii *Oliv.* F.T.A. 1: 110, partly.

Rinorea dichroa *Mildbr. & Melchior* in Notizbl. Bot. Gart. Bert. 10: 974, name only.

Tree, to 35 ft. high; petals yellowish.

S. L.: Kambia (Dec.) Sc. Elliot 4195! York Pass (Dec.) Lane-Poole! Bobobo near Gishwahun (Dec.) Deighton 3811! Near Kongohun (fr. Apr.) Deighton 3679! Jau (Oct.) Deighton 5214! **Lib.:** Ganta Harley! **Iv. C.:** Agboville (Nov.) Chev. 22380! **G. C.:** Larte (Oct.) Johnson 805! Ewisa, Saltpond Dist. (Aug.) Chipp 566! Bana Hill, Krobo (Jan.) Irvine 1923! Subiri F.R. (Feb.) Foggie 4939! **S. Nig.:** Old Calabar Thomson 100! Kwa Falls (Mar.) Brenan 9231! Iso Bendiga (Dec.) Keay FHI 28267! **Br. Cam.:** Cameroons R. (Jan.) Mann 737! Likomba (Dec.) Mildbr. 10765!

Also in **French Cameroons**, **Gabon** and **Uganda** and **A.-E. Sudan**.

26. **Rinorea dentata** (*P. Beauv.*) *O. Ktze.* Rev. Gen. Pl. 1: 42 (1891); De Wild. l.c. 159; Chev. Fl. Viv. 1: 239. *APD acc*

Ceranthera dentata *P. Beauv.* Fl. Oware 2: 11 (1808).

Alsodeia dentata (*P. Beauv.*) *Oliv.* F.T.A. 1: 110.

Rinorea bipindensis *Engl.* Bot. Jahrb. 33: 145.

Shrub, or small tree to 25 ft. high; petals yellow.

Lib.: Grand Bassa (Feb.) Dinklage 1785! **G. C.:** Axim (Dec.) Johnson 887! **S. Nig.:** Lagos Rowland! Lamborn 363! Ikirun (Feb.) Millson! Idanre (Jan.) Brenan 8728! Okomu F.R. (fl. & fr. Jan.) Brenan & Jones 8911! 8912! Eket Talbot 3132! **Br. Cam.:** Victoria (Mar.) Maitland 519! Likomba (Nov.) Mildbr. 10733! **F. Po.:** (Dec.) Mann 90! Ureka (Feb.) Guinea 2539!

Also in **Principe** and **French Cameroons**, and extending to **Angola** and **Uganda**.

(See Appendix, p. 25.) [Arborescent specimens from the Cameroons, with congested inflorescences may prove to be a distinct variety or species.—R.W.J.K.]

27. **Rinorea brachypetala** (*Turcz.*) *O. Ktze.* l.c. 42 (1891), partly; De Wild. l.c. 153; Chev. Fl. Viv. 1: 238. *APD acc*

Alsodeia brachypetala *Turcz.*—F.T.A. 1: 109, partly.

Shrub to 5 ft. high.

S. L.: Yonibana (Oct., Nov.) Thomas 4017! 4229! 5164! 5187! **Lib.:** Cook 58; 272; 331. **G. C.:** Subuma F.R. (Nov.) Cansdale 3975! Abetifi Kwahu (Jan.) Irvine 1689! **S. Nig.:** Lagos Moloney! Ilaro (Jan.) Millen 100! Shasha F.R. (Feb., Mar.) Richards 3065! 3097! 3171! Okomu F.R. (fl. & fr. Dec.—Feb.) Brenan 8500! 8855! 8855a! 8855b!

Also in **French Cameroons**, **Congo** and **Angola**.

28. **Rinorea aylmeri** *Chipp* in Kew Bull. 1923: 294; Chev. Fl. Viv. 1: 235. *APD acc*

Shrub, to 5 ft. high, in deep shade, near water; tree 12–15 ft. (fide Linder).

S. L.: Pujehun (Apr.) Aylmer 63! Yonibana (Oct., Nov.) Thomas 5159! 5166! 5279! Kenema (Nov.) Deighton 406! Njala (Oct., Nov.) Deighton 2408! 2538! **Lib.:** Gbanga (Sept.) Linder 606! Ganta Harley! **Iv. C.:** Mt. Nienokoue Chev. 19477.

29. **Rinorea adnata** *Chipp* l.c. 295; Brenan in Kew Bull. 1952: 442. *APD acc*

Shrub, to 7 ft. high, little-branched; flowers pale yellow.

Br. Cam.: S. Bakundu F.R. (Mar.) Brenan 9260!

Also in **French Cameroons**.

30. **Rinorea subintegrifolia** (*P. Beauv.*) *O. Ktze.* l.c. 42 (1891); De Wild. l.c. 187; Chev. Fl. Viv. 1: 239. *APD acc*

Ceranthera subintegrifolia *P. Beauv.* Fl. Oware 2: 11 (1808).

Alsodeia subintegrifolia (*P. Beauv.*) *Oliv.* F.T.A. 1: 109.

Rinorea viridis *Burt Davy*, name only.

Shrub, to 7 ft. high; flowers greenish-white or cream-yellow.

Fr. G.: Rio Nunez Heudelot 694! Kouria Chev. 14745! Bambaya (Feb.) Chev. 20674! **S. L.:** Regent (Dec.) Sc. Elliot 4159! Kambia (Dec.) Sc. Elliot 4385 (partly)! Mabonto (Oct.) Thomas 3492! Extends throughout tropical and S. Africa, Madagascar and also in tropical Asia and Australia.

5. VIOLA

Linn.—F.T.A. 1: 105.

- 1 Creeping; stems up to 60 cm. long, rooting at the nodes, glabrous; leaves ovate or ovate-orbicular, widely cordate at base, subacute, 1.5–2.3 cm. long, 1–1.5 cm. broad, crenate, more or less sparingly setulose-pubescent on both surfaces, sometimes with dark-coloured scattered linear resinous bodies beneath; petiole shorter than the leaf; stipules foliaceous, deeply divided into lanceolate acute segments, nearly half as long as the petiole; flowers solitary on long slender pedicels bibracteate towards the apex; valves of capsule about 0.5 cm. long [*abyssinica*](#)

***Viola abyssinica* Steud. ex Oliv.** F.T.A. 1: 105 (1868); R. E. Fries in Act. Hort. Berg. 8: 3 (1925). *APD acc*

Creeping or weakly erect herb; corolla very pale mauve to purple.

S. Nig.: Ikwette Plateau, Obudu, 5,200 ft. (Dec.) Keay & Savory FHI 25221! **Br. Cam.:** Cam. Mt., 5,200–9,000 ft. (Jan.–Mar.) Mann 1331! Maitland 1013! 1324! Brenan 9358! **F. Po:** 10,000 ft. Mann 297! Between Musola and Moka (Jan.) Guinea 1592!

Widespread in the highlands of tropical Africa.

RESEDACEAE

Annual or perennial herbs with watery juice, rarely woody. Leaves alternate, simple or pinnately divided; stipules small, gland-like. Flowers mostly zygomorphic, hermaphrodite or rarely unisexual, racemose or spicate. Galyx persistent, mostly zygomorphic, 4–7-lobed, imbricate. Petals small and inconspicuous or none, valvate, free or slightly coherent, often laciniate, sometimes with a scale at the base. Disk present, often dilated on the adaxial side. Stamens 3–40, perigynous or on the disk, not covered by the petals in bud; filaments free or united at the base; anthers 2-celled, introrse. Ovary of 2–6 free or connate carpels, closed or gaping at the top, each carpel with a separate stigma; ovules numerous on parietal placentas or at the base of the ovary. Fruit a gaping capsule or baccate. Seeds numerous, kidney- or horse-shoe-shaped; endosperm absent; embryo curved or folded.

A small family represented in our area by only one species; several other species and genera occur in the Sahara North of Lat. 18° N. (see Chev. Fl. Viv. 1: 250).

Recognized by the small flowers with much-divided petals, and parietal ovules.

RESEDA

Linn.—F.T.A. 1: 103.

- 1 Stems herbaceous, woody at the base, thinly villous-pilose; leaves deeply 3-lobed or simple, lobes linear-lanceolate, narrowed at the base, subacute, up to 10 cm. long and 2 cm. broad, thinly pilose; racemes up to 45 cm. long, rather dense-flowered; pedicels short; sepals 6; stamens about 40; fruits oblong, about 1 cm. long, slightly pilose on the sutures; seeds reniform, about 1 mm. long, very minutely and closely warted [*villosa*](#)

***Reseda villosa* Coss.** in Bull. Soc. Bot. Fr. 6: 392 (1859); Chev. Fl. Viv. 1: 250. *APD acc*

***Reseda sudanica* A. Chev.** (1900).

Robust herb, to 21/2 ft. high; flowers white.

Fr. Sud.: Timbuktu, near Gassa wells (Aug.) Chev. 2521. Also in Sahara, Morocco and Algeria.

POLYGALACEAE

Herbs, shrubs, climbers or rarely small trees. Leaves alternate, rarely opposite, simple; stipules none. Flowers hermaphrodite, zygomorphic; pedicels often articulated. Sepals 5, free, imbricate, the two inner larger, often petaloid, wing-like. Petals 3–5, hypogynous, declinate, outer 2 free or united with the lowermost, upper 2 free or minute and scale-like or 0. Stamens 8, rarely 5 or 4, monadelphous beyond

the middle or rarely free, the sheath split above, often adnate to the petals; anthers erect, 1–2-celled, opening by an apical pore, rarely 2-valved or opening nearly to the base. Torus small or rarely expanded into an annular disk within the stamens. Ovary free, 2-celled or rarely 1-celled or 3–5-celled; style simple; ovules solitary in each cell, rarely more, pendulous. Fruit a capsule, samara or drupe. Seeds often pilose, with a conspicuous strophiole; endosperm mostly present; embryo straight.

Fairly abundantly represented in our area.

Conspicuous by their zygomorphic flowers, often brightly coloured and resembling the Papilionaceae, but the ovary consisting of more than one carpel each with one or more pendulous ovules, and often pilose seeds with conspicuous strophiole.

- 1 Petals 5, subequal, united into a tube at the base; fruit drupaceous; stamens 5:2
 Petals 3, the lateral ones free from the abaxial one (keel); shrubs or trees; fruit indehiscent, samaroid, 1-celled, 1-seeded; stamens 83. [Securidaca](#)
 Petals 3, or the remainder minute, the lateral ones united with the abaxial one into a unilateral corolla, the middle petal often crested; usually herbaceous; fruit a compressed 2-celled capsule, dehiscing loculicidally at the edges; stamens 84. [Polygala](#)
 2 Fruit fleshy, yellow or red; seeds very densely villous, with copious fleshy endosperm1. [Carpolobia](#)
 Fruit hard, crustaceous; seeds finely hairy, without endosperm2. [Atroxima](#)

1. CARPOLOBIA

G. Don—F.T.A. 1: 135.

- 1 Keel petal about 16 mm. long, 3–4 mm. broad (i.e. breadth = 1/4 length or less), not much broader than the other petals; outer 3 sepals (2–6 mm. long, 1.5–3.5 mm. broad) smaller than the 2 inner sepals (6–7.5 mm. long, 3–6 mm. broad):2
 Keel petal 10–13 mm. long, 3–5 mm. broad (i.e. breadth = 1/3 length or more), twice as broad as the other petals; outer 3 sepals (2.5–4 mm. long, 2 mm. broad) subequal to the 2 inner sepals (3–4.5 mm. long, 2–3 mm. broad); branchlets and midribs pubescent; leaves very variable in shape and size, ovate, ovate-oblong, oblong, oblong-lanceolate, obovate or almost orbicular, 3.5–13 cm. long, 1.5–6.5 cm. broad, obtuse at base, acuminate at apex; racemes 2–7-flowered3. [lutea](#)
 2 Leaves 2–7.5 cm. long, 1–2.8 cm. broad; branchlets and midribs densely pubescent; lamina variable in shape, ovate, ovate-elliptic, oblong, or narrowly elliptic, obtuse or rounded at base, more or less acuminate, or obtuse at apex, main lateral nerves more or less parallel and rather close; racemes 1–2-flowered1. [alba](#)
 Leaves 5–12.5 cm. long, 2.3–4 cm. broad; branchlets pubescent to glabrescent, midrib sparingly pubescent; lamina oblong to obovate, rounded to cuneate at base, acuminate, main lateral nerves arching and rather distant; racemes 2–5-flowered2. [glabrescens](#)

1. **Carpolobia alba** *G. Don*—F.T.A. 1: 135, partly, including var. *parvifolia* Ollv.; Chev. Fl. Viv. 1: 276. *C. parvifolia* (Oliv.) Stapf in Johnston Lib. 578; F.W.T.A., ed. 1, 1: 99; Chev. Fl. Viv. 1: 276. **APD acc**

Shrub or small tree to 15 ft. high, in forest; flowers white with crimson spot at base of the two uppermost petals.

Widespread in tropical Africa.

4. POLYGALA

Linn.—F.T.A. 1: 125; Chodat Monogr. Polygal. 1 (1891) .1

- 1 Lateral sepals less than 3 mm. long; with 3 principal unbranched nerves; small herbs with linear or acicular leaves up to 1.5 cm. long and 2.5 mm. broad;2
Lateral sepals well over 3 mm. long; larger herbs or undershrubs; lateral sepals generally with branched and anastomosing nerves:4
- 2 Seeds without aril; posterior and anterior sepals subequal; lateral sepals glabrous; stems very slender and rather sparsely branched; leaves up to 1 mm. broad:3
Seeds arillate, pilose; posterior sepal about twice as large as the anterior; lateral sepals oblanceolate to narrowly elliptic, pubescent, about 2.5 mm. long; much-branched leafy herb to 30 cm. high, leaves up to 1.5 cm. long and 2.5 mm. broad3. *myriantha*
- 3 Seeds narrowly oblong-ovoid, 3 times as long as broad, densely pilose with the hairs extended beyond the blunt end of the seed to form a "tail"; plant to 25 cm. high, racemes up to 6 cm. long, laxly flowered; lateral sepals 2–2.5 mm. long, 1–1.25 mm. broad; pedicels about 1/2 as long as flower; capsule oblong-ellipsoid1. *lecardii*
Seeds oblong-orbicular to oblong-ovoid, less than twice as long as broad, rather sparsely clothed with more or less spreading hairs, hairs not extended to form a "tail"; plant to 25 cm. high, racemes up to 5.5 cm. long, densely flowered except towards the base; lateral sepals 1.5–2.2 mm. long, narrowly obovate; pedicels about 1/4 as long as flower; capsule suborbicular; leaves up to 1.5 cm. long, usually much less2. *micrantha*
- 4 Lateral sepals deciduous in fruit:5
Lateral sepals persistent and often membranous in fruit:8
- 5 All the sepals deciduous in fruit:6
Only the lateral sepals deciduous; leaves filiform or acicular:7
- 6 Leaves broadly ovate-orbicular, pilose with long-ciliate margins; lateral sepals about 6 mm. long, anterior sepals united; racemes terminal, up to 15 cm. long, densely flowered; seeds conical, long-pilose4. *bennae*
Leaves elliptic with acuminate apex and cuneate base, sparsely setulose; lateral sepals about 9 mm. long, anterior sepals united; racemes axillary, up to 7 cm. long, densely flowered; seeds conical, short-pilose5. *cabrae*
- 7 Anterior sepals free; stems herbaceous, slender with scattered filiform leaves up to 3 cm. long; inflorescence elongated, slender, simple with scattered flowers; pedicels about 1/2 as long as flower, slender; fruit widely bilobed6. *guineensis*
Anterior sepals connate, stems woody, densely leafy, the leaves mostly in clusters, acicular, up to 5 cm. long; inflorescence dense, mostly branched; pedicels very short and stout; fruits deeply notched7. *acicularis*

- 8 Anterior sepals connate: 9
 Anterior sepals not connate, sepals all free: 12
- 9 Keel-petal not cristate; lateral sepals with conspicuous coloured nerves, distinctly clawed at the base, 4–5 mm. long, about equal to the fruit in length and not completely hiding it; seeds densely long-pilose all over: 10
 Keel-petal cristate, lateral sepals faintly veined, scarcely clawed, longer than the fruit and completely hiding it; stems deeply grooved, glabrous; seeds shortly pilose: 11
- 10 Sparingly branched slender herb; leaves linear, acute, less than 3 mm. broad; racemes up to 20 cm. long, flowers rather distantly spaced [8. *petitiana*](#)
 Much-branched leafy herb; leaves lanceolate, 3–6 mm. broad; racemes up to 12 cm. long, flowers rather crowded [9. *xanthina*](#)
- 11 Lateral sepals 6–8 mm. long; leaves up to 7 cm. long; often with several lateral inflorescences; seeds rather sparingly short-pilose [10. *rarifolia*](#)
 Lateral sepals 3.5–4.5 mm. long; leaves up to 16 mm. long; inflorescence terminal; seeds rather densely short-pilose [11. *atacorensis*](#)
- 12 Flowers in short lateral racemes crowded amongst the leaves, never in terminal racemes; leaves linear to lanceolate, obtuse or subobtuse, shortly pubescent, up to 2.5 cm. long; lateral sepals pubescent; fruits oblong-obovate, ciliate; seeds narrow, long-pilose all over [12. *eriptera*](#)
 Flowers in terminal racemes, sometimes also with axillary racemes: 13
- 13 Flowers in dense, often subcapitate, terminal and often also numerous axillary racemes, shorter than the leaves and exceeded by the upper leaves: 14
 Flowers in elongated racemes much exceeding the upper leaves: 15
- 14 Flowers in dense terminal head-like racemes; plant of sympodial growth so that floriferous secondary branches much exceed the primary terminal raceme; leaves linear to broadly oblanceolate, very variable, up to 7 cm. long and 1 cm. broad; lateral sepals long, becoming whitish in fruit, pubescent; fruits elliptic, glabrous; seeds oblong, long-pilose all over [13. *arenaria*](#)
 Flowers in oblong racemes, plant of monopodial growth with the primary terminal raceme above the numerous short secondary floriferous branches; leaves linear to oblong-linear, attenuate at each end, 2–6 cm. long, 1–6 mm. broad; lateral sepals about 5 mm. long, glabrous; fruit oblong, emarginate, narrowly winged, ciliate; seeds pilose [14. *stanleyana*](#)
- 15 Ovary and fruit glabrous on the margin, the latter narrowly winged: 16
 Ovary and fruit ciliate on the margin, the latter not usually winged; seeds pilose, arillate: 18
- 16 Seeds conical, densely pilose, with the aril completely covered by long hairs; flowers laxly arranged in elongated racemes; lateral sepals 5–5.5 mm. long, 4–4.5 mm. broad, sparsely puberulous; leaves linear-oblanceolate, obtuse, up to 3.5 cm. long, appressed-pubescent [15. *irregularis*](#)
 Seeds oblong, aril not hidden by hairs; flowers densely arranged: 17
- 17 Seeds glabrous except at the tips, 4.5–6 mm. long, aril much reduced; flowers in long, dense racemes; lateral sepals 8–9 mm. long and 7 mm. broad, glabrous; stems softly pubescent; leaves linear, acute, 8–16 cm. long, 0.5–1 cm. broad, midrib very prominent [16. *butyracea*](#)
 Seeds pubescent, with a tuft of bristles from the relatively large aril, about 4.5 mm. long; flowers in short dense racemes; lateral sepals elliptic, glabrous; posterior sepal hirsute; anthers setose; leaves linear, 5–8 cm. long, 0.5–1 cm. broad [17. *pobeguini*](#)
- 18 Ovary and fruit glabrous except on the margin; lateral sepals glabrous or ciliate; leaves well over 3 cm. long: 19
 Ovary and fruit hairy over the surface as well as the margin; lateral sepals pubescent all over; leaves up to 3 cm. long: 22
- 19 Keel-petal very distinctly cristate; pedicels pubescent: 20
 Keel-petal slightly cristate; pedicels glabrous, slender, about 3 mm. long, flowers rather lax in numerous long terminal racemes; lateral sepals 4.5–6 mm. long, glabrous; stems slender, well-branched; leaves linear, 2–10 cm. long, 1.5–4 (rarely to 8) mm. broad [21. *multiflora*](#)
- 20 Leaves linear, 5–20 cm. long, up to 8 mm. broad, usually 4–6 mm.; stems sparingly branched with one to a few stiffly erect narrow racemes; pedicels short, about 1 mm. long, flowers rather crowded: 21
 Leaves lanceolate, 4–9 cm. long, 0.8–2.5 cm. broad; stems sparingly branched with numerous axillary as well as terminal racemes 2–15 cm. long; pedicels slender about 4 mm. long, flowers crowded; lateral sepals 6–8 mm. long and broad, ciliate to glabrescent [20. *persicariifolia*](#)
- 21 Lateral sepals 5–7 mm. long, glabrous, shorter than the shortly crested keel petal [18. *baikiei*](#)
 Lateral sepals 8–10 mm. long, glabrous, longer than the longly crested keel petal [19. *cristata*](#)
- 22 Racemes dense-flowered, flowers contiguous; flowers and axes densely pilose: 23
 Racemes more or less lax, flowers scattered; flowers and axes shortly pubescent; inflorescence simple or

sparingly branched; lateral sepals 4–6 mm. long, 4 mm. broad, pubescent; seeds pilose; leaves linear or linear filiform, up to 1 mm. broad [24. sparsiflora](#)

- 23** Leaves linear or linear-filiform, up to 1 mm. broad; inflorescence with numerous stiffly erect racemes, lateral sepals 4–5 mm. long, 3 mm. broad, densely pilose; seeds densely long-bristly [22. ukirensis](#)

Leaves narrowly linear-lanceolate up to 3 mm. broad; inflorescence with several erect densely flowered racemes; lateral sepals 5–6 mm. long, 4.5–5 mm. broad, pilose; seeds sparingly pubescent except for the "tail" [23. tenuicaulis](#)

1. *Polygala lecardii* Chodat Monogr. Polygal. 222 (1891); Chev. Fl. Viv. 1: 261. *APD acc*

Polygala paludosa of F.T.A. 1: 131, not of St.-Hil.

Polygala clarkeana Chodat in Bull. Herb. Boiss. 4: 235 (1896): F.W.T.A., ed. 1, 1: 101. [Not *P. clarkeana* of Chev. Fl. Viv. 1: 262.]

Polygala pygmaea of Chev. Bot. 41.

Erect annual, up to 1 ft. high; flowers white, pink, blue or purple.

Fr. Sud.: Lecard 150. **Fr. G.:** Jac.-Fel. 618g! **S. L.:** Brown! Freetown (Oct.) Deighton 2056b! (Aug.) Jordan 68! Waterloo Burbridge 1421 (Aug.) Deighton 2056! Bonthe (Oct.) Adames 95! Rokupr (Nov.) Jordan 160!

2. *Polygala micrantha* Guill. & Perr. Fl. Seneg. 1: 39 (1831); F.T.A. 1: 131, partly (excl. Welw. spec.); Chodat Monogr. Polygal. 217; Chev. Fl. Viv. 1: 263.

APD: *Synonym of Polygala fernandesiana Paiva*

APD: *Synonym of Polygala capillaris E. Mey. subsp. capillaris*

Polygala paludosa of Chev. Bot. 41, not of St.-Hil.

Polygala clarkeana of Chev. Fl. Viv. 1: 262, not of Chodat.

Erect annual, up to 1 ft. high; flowers white or mauve.

Sen.: Perrottet! **Fr. G.:** Kouroussa Pobéguin 335! Fouta Djallon (Sept., Oct.) Chev. 18376! Jac.-Fel. 584! **S. L.:** Makali (July) Deighton 4397! **Lib.:** Painesville (Oct.) Harley 1683! **Iv. APD: Synonym of Polygala usafuensis Gürke

APD: Synonym of Polygala sparsiflora var. ukirensis (Gürke) Paiva

Polygala djalensis Chev. Bot. 40.

Erect annual, simple or sparingly branched, 2–4 ft. high; flowers greenish-white or pink.

Fr. G.: Fouta Djallon (Sept.) Chev. 18641! **S. L.:** Morson! Waterloo (Oct.) Lane-Poole 407! Mabang, Kolifa (Jan.) Glanville 146!

Also in **Upper Shari**.

VOCHYSIACEAE

Large trees, shrubs or climbers. Leaves opposite or verticillate, rarely alternate, simple; stipules small or absent, or reduced to glands. Flowers hermaphrodite, zygomorphic, racemose or paniculate. Sepals 5, imbricate, the posterior often the largest and gibbous or spurred at the base. Petals 1–5, contorted. Stamens hypogynous or perigynous, only 1 fertile; filaments free; anthers 2-celled, opening lengthwise. Ovary superior, or rarely adnate to the calyx and hence practically inferior, often oblique, 1–3-celled; style 1; ovules 1-many in each cell, axile. Fruit capsular or samaroid; seeds one or more, often winged, sometimes pilose; endosperm absent or rarely present; embryo straight.

A large family of tropical America, with only a single genus in Africa.

ERISMADELPHUS

Mildbr. in Engl. Bot. Jahrb. 49: 549 (1913); Keay & Stafleu in Acta Bot. Neerl. 1: 594 (1953).

- 1 A tall tree, branchlets densely tomentellous; leaves opposite, broadly elliptic, sometimes suborbicular, rounded to cordate at base, obtuse to shortly acuminate at apex, petiole 8–15 mm. long, lamina 8–18 (–25) cm. long, 7–11 cm. broad, coriaceous, with 5–8 pairs of main lateral nerves very prominent beneath, midrib and main nerves puberulous; flowers numerous in subcorymbose terminal panicles, all parts tomentellous; bracts persistent, sessile, reniform-cordate, about 8 mm. long and 9–10 mm. broad; sepals 5, the 2 exterior lateral ones obliquely lanceolate, 7 mm. long and 2–2.5 mm. broad; posterior sepal suborbicular, 4–5 mm. in diam., produced at the base into two blunt superposed spurs; 2 anterior sepals oblong, 6–7 mm. long, 3–3.5 mm. broad; petals 5, subequal, 9–10 mm. long, 4.5–6 mm. broad, obovate-rhomboid with a long claw; ovary adnate to the calyx and hence practically inferior, 1-celled with a single anatropous ovule; fruit with the anterior sepals enlarged into wings up to 6 cm. long and 2–7 cm. broad, the other sepals enlarged but considerably smaller *exsul* var. *platyphyllus*

Erismadelphus exsul var. *platyphyllus* Keay & Stafleu in Acta Bot. Neerl. 1: 598 (1953). *APD acc*

Straight forest tree to 110 ft. high and 10 ft. girth; flowers greyish-green.

S. Nig.: Leopard Town, Calabar (fl. Apr., fr. June) Robson FHI 1027! Oban (fr. Nov.) Gray 6/10! Ikom (fl. & fr. Aug.) Mackay! Catterall 40! Ukon F.R. Kennedy 3128! **Br. Cam.:** Kumba Div. (fl. Apr.) Dundas FHI 8489! Ejiofar FHI 29315!

Also in **Gabon**.

[*E. exsul* Mildbr. var. *exsul*, occurring in the French Cameroons, Gabon and Belgian Congo, has narrower, glabrous leaves, acutely cuneate at the base.]

CRASSULACEAE

Herbs and undershrubs, usually succulent; leaves opposite or alternate, exstipulate. Flowers actinomorphic, hermaphrodite, usually cymose. Sepals free or united into a tube, often 4 or 5. Petals the same number as the sepals, free or variously connate, hypogynous. Stamens as many or twice as many as the petals, if few then alternate with the petals, slightly perigynous; filaments free; anthers 2-celled, introrse, dehiscing longitudinally. Hypogynous scales present within the stamens. Carpels superior, the same number as the petals free or united at the base, 1-celled; ovules many or rarely few, inserted on the adaxial suture; styles short or elongated. Fruit follicular, membranous or leathery, often surrounded by the persistent membranous corolla, opening on the adaxial side. Seeds mostly minute, usually with fleshy endosperm; embryo straight.

Widely distributed in temperate and tropical regions, especially in mountainous districts, rare in South America and Australasia.

Easily recognized by the succulent habit and often opposite leaves, the cymose slightly perigynous flowers, the definite number of stamens, the more or less free carpels and numerous minute seeds.

- 1 Flowers small or medium-sized, axillary or corymbose; petals free or slightly united at the base; stamens the same number as the petals *L. Crassula*
Flowers usually fairly large; petals united beyond the middle into a tube; stamens twice the number of the petals:

-2
- 2 Calyx nearly as long as the corolla, becoming inflated and membranous, about 3 cm. long; flowers in a lax panicle, drooping [2. Bryophyllum](#)
- Calyx much shorter than the corolla, and neither inflated nor becoming membranous; flowers numerous in cymes or racemes; corolla becoming membranous and surrounding the carpels:3
- 3 Leaves opposite, not peltate; inflorescence cymose; sepals 4 [3. Kalanchoe](#)
- Lower leaves peltate, orbicular, alternate; inflorescence a simple raceme, rarely with a few basal branches; sepals 5 [4. Umbilicus](#)

1. CRASSULA

Linn.—F.T.A. 2: 388, incl. Tillaea Linn.

- 1 Flowers very small, axillary; stems slender, usually with very crowded leaves; small or prostrate herbs:.....2
- Flowers medium-sized, in dense terminal corymbose cymes; stems stout, erect; basal leaves linear-lanceolate, acute, sheathing at the base, up to about 10 cm. long and 1 cm. broad, the cauline ovate-lanceolate, with short broad papillae on the margin; cymes up to 10 cm. in diam. [4. alba](#)
- 2 Leaves broadly ovate, subacute, abruptly narrowed into the claw-like base, 1–1.5 cm. long, 6–8 mm. broad; pedicels about 6 mm. long; stems with a longitudinal line of hairs [1. alsinoides](#)
- Leaves lanceolate, acute, about 7 mm. long, broadened towards the base; flowers sessile; stems angular, nearly glabrous [2. pentandra](#)
- Leaves linear-subulate, very acute, 3–4 mm. long; flowers pedicellate on very short axillary branchlets; stems flattened, glabrous [3. pharnaceoides](#)

1. *Crassula alsinoides* (Hook. f.) Engl. in Abb. Preuss. Akad. Wiss. 1891, 2: 231 (1892). *APD acc*

Tillaea alsinoides Hook. f.—F.T.A. 2: 387.

Fleshy prostrate or ascending herb; corolla white.

Br. Cam.: Cam. Mt., 5,800–7,600 ft. (Nov.–Mar.) Migeod 152! Maitland 896! 1065! Brenan 9519! Nchan, Bamenda, 5,000 ft. (June) Maitland 1784! L. Oku, Bamenda, 7,800 ft. (Jan.) Keay FHI 28473!

Also on mountains of east and south tropical Africa.

2. *Crassula pentandra* (Royle ex Edgew.) Schoenl. in E. & P. Pflanzenfam. 3, 2A: 37 (1890).

APD: Synonym of Crassula schimperi Fisch. & C.A. Mey. subsp. schimperi

Tillaea pentandra Royle ex Edgew.—F.T.A. 2: 886.

Tufted herb, a few inches high.

Br. Cam.: Cam. Mt., 8,000 ft. (nov.) Mann 2037!

Also on mountains of E. Africa and **Angola**, and in India.

3. *Crassula pharnaceoides* (Hochst.) Fisch. & Mey. in Ind. Sem. Hort. Petrop. 8: 56 (1841).

APD: Synonym of Crassula alata subsp. pharnaceoides (Fisch. & C.A. Mey.) Wickens & Bywater

Tillaea pharnaceoides Hochst.—F.T.A. 2: 387.

Small herb, a few inches high.

Br. Cam.: Cam. Mt., 9,000 ft. (Nov.) Mann 1991!

Also in **east and south Africa** and **N.W. Himalaya**.

4. *Crassula alba* Forsk. Fl. Aegypt.-Arab. 60 (1775). *APD acc*

APD: Synonym of Crassula vaginata Eckl. & Zeyh. subsp. vaginata

Crassula mannii Hook. f. in J. Linn. Soc. 7: 193; F.W.T.A., ed. 1, 1: 104.

Crassula abyssinica A. Rich.—F.T.A. 1: 388.

Erect herb to 3 ft. high. with stout stem; flowers white.

Br. Cam.: Cam. Mt., 6,000–10,000 ft. (May–Dec.) Mann 1304! 2036! Maitland 644! 827! Mildbr. 10861! Bambulue Hill, Bamenda, 7,000–7,800 ft. (Sept., Oct.) Johnstone 209/31! Savory 549!

Widespread in highlands of tropical Africa.

2. BRYOPHYLLUM

Salisb.—F.T.A. 2: 389.

- 1 A fleshy shrub 60–120 cm. high, branched from the base; leaves opposite, simple or trifoliate, petiolate, obovate to obovate-orbicular, about 10 cm. long and 5–6 cm. broad, coarsely crenate, sometimes the teeth bearing bulbils in their axils, glabrous; flowers drooping in lax panicles; calyx inflated, tubular, 4-lobed, 3 cm. long, greenish-yellow and purplish at the base, lobes triangular, very acute; corolla gamopetalous, tubular, contracted above the base, a little longer than the calyx, 4-lobed, reddish-purple in the upper part; lobes ovate-lanceolate, abruptly acute-acuminate; stamens 8, a little exserted [pinnatum](#)

Bryophyllum pinnatum (Lam.) Oken in Allg. Naturgesch. 3, 3: 1966 (1841); S. Kurz in J. As. Soc. Beng. 40, 2: 52 (1871); Chev. Fl. Viv. 1: 280.

APD: Synonym of Kalanchoe pinnata (Lam.) Pers.

Cotyledon pinnata Lam. Encyl. 2: 141 (1786).

Bryophyllum calycinum Salisb.—F.T.A. 2: 390.

Kalanchoe pinnata (Lam.) Pers. Syn. 1: 446 (1805).

S. L.: Regent (May) Barter! Hill Station (Dec.) Deighton 482! **Lib.:** Monrovia Whyte! **Iv. C.:** fide Chev. l.c. **G. C.:** Aburi (Jan.) Johnson 890! Bushua beach (Apr.) Native of Madagascar; introduced to and now naturalized in many parts of tropical Africa, and also in Asia and S. America.

3. KALANCHOE

Adans.—F.T.A. 2: 390.

- 1 Stems, pedicels and calyx quite glabrous; calyx divided to the base, segments linear-lanceolate, acutely acuminate; corolla lobes ovate-lanceolate, acute; leaves distinctly petiolate, lamina more or less elliptic (in our area), margin doubly crenate [1. laciniata](#)
- Stems, pedicels or calyx pubescent or glandular-pilose: [2](#)
- 2 Leaves distinctly petiolate; connate portion of the calyx as long or almost as long as the lobes; inflorescence more or less densely glandular-pilose; stems not angular [2. crenata](#)
- Leaves sessile; connate portion of the calyx much shorter than the lobes; inflorescence sparingly pilose; stems more or less quadrangular [3. lanceolata](#)

1. **Kalanchoe laciniata** (Linn.) DC. Pl. Succ. Hist. t. 100 (1802); R. Hamet in Bull. Herb. Boiss. Sér. 2, 7: 897 (1907); Berger in E. & P. Pflanzenfam. 18A: 406 (1930). *APD acc*

APD: Synonym of Kalanchoe crenata (Andrews) Haw.

Cotyledon laciniata Linn. Sp. Pl. 430 (1753).

Kalanchoe crenata of F.T.A. 2: 394, partly.

Kalanchoe petitiانا of F.W.T.A., ed. 1, 1: 106; Chev. Fl. Viv. 1: 281.

Herb, to 6 ft. high; flowers yellow, orange, or magenta.

S. Nig.: Oban Talbot! Balleghele (Jan.) Rosevear 13/30! **Br. Cam.:** Cam. Mt., 3,000–7,600 ft. (Dec., Jan.) Mann 1315! 2038! Maitland 962! Mba Kokeka Mt., 7,500 ft. (Jan.) Keay FHI 28401!

Widespread in the tropics.

2. *Kalanchoe crenata* (Andr.) Haw. Syn. Pl. Succ. 109 (1812); Berger l.c. 406; F.T.A. 2: 394, partly; Chev. Fl. Viv. 1: 279. *APD acc*

Also in **French Camerouns** and **S. Tomé**.

3. *Kalanchoe lanceolata* (Forsk.) Pers. Syn. 1: 446 (1805); R. Hamet in Bull. Herb. Boiss. Sér. 2, 8: 32 (1908); Berger l.c. 406; Chev. Fl. Viv. 1: 280. *APD acc*

Cotyledon lanceolata Forsk. Fl. Aegypt.-Arab. 89 (1775).

Kalanchoe glandulosa Hochst.—F.T.A. 2: 396.

A herb, to 4 ft. high, amongst rocks; flowers yellow to salmon-pink.

Fr. Sud.: Balani (Jan.) Chev. 149. **G. C.:** Shai Hills (Jan.) Irvine 646! **N. Nig.:** Naraguta (Nov.) Lely 700!

Widespread in tropical Africa.

4. UMBILICUS

DC.—F.T.A. 2: 398, under *Cotyledon*. Linn.

- 1 An erect, simple or slightly branched, glabrous fleshy herb, up to about 30 cm. high; lower leaves peltate, long-petiolate, orbicular, slightly crenate, 3–4 cm. in diameter, the upper ones more or less basifixed and more shortly petiolate; bracts often foliaceous and then larger than the flowers; pedicels "about 3 mm. long; sepals ovate-triangular, acute, about 2 mm. long; corolla ellipsoid, about 7 mm. long [botryoides](#)

Umbilicus botryoides Hochst. ex A. Rich. Tent. Fl. Abyss. 1: 308 (1848). *APD acc*

APD: *Synonym of Umbilicus paniculiformis Wickens*

Cotyledon umbilicus of F.T.A. 2: 398, not of Linn.

Br. Cam.: Cam. Mt., 7,000–10,000 ft. (Nov.–Jan.) Mann 1286! 2035!

Also on the mountains of eastern Africa from Somaliland to **Tanganyika**.

Formerly identified with the western European *U. pendulinus* DC., but differing in its shorter pedicels, short and broad sepals and more globular corolla.

SAXIFRAGACEAE

Herbs, not or slightly succulent. Leaves usually alternate (opposite in *Vahlia*), exstipulate. Flowers actinomorphic, hermaphrodite, rarely solitary. Sepals usually 5, imbricate or valvate. Petals alternate with the sepals or absent, often clawed, perigynous or rarely epigynous. Stamens inserted with the petals, 5–10; filaments free; anthers 2-celled, dehiscing longitudinally. Ovary 1–5-celled, free or adnate to the receptacle; styles usually free; ovules numerous, on axile or parietal placentas or the latter pendulous from the apex of the cells. Fruit a capsule. Seeds usually numerous, small, with endosperm; embryo minute, straight.

Widely distributed in temperate regions, rare in the tropics.

Represented in our area by the single genus *Vahlia*, which is remarkable in the family in having opposite leaves and the placentas pendulous from the top of the ovary. This genus is liable to be mistaken for *Oldenlandia* (Rubiaceae), which has interpetiolar stipules, united petals and axile placentas.

VAHLIA

Thunb.—F.T.A. 2: 383.

Herbs with opposite exstipulate ovate to linear leaves, often glandular. Flowers paired, axillary, subsessile or pedunculate. Sepals 5, valvate. Petals 5, scarcely exceeding the sepals. Stamens 5. Ovary inferior, 1-celled, with 2 pendulous many-ovuled placentas. Capsule dehiscent at the apex.

- 1 Plant very viscous with gland-tipped hairs; leaves ovate or ovate-lanceolate, rarely linear-lanceolate; flowers subsessile, in axillary pairs or solitary; calyx-lobes ovate, about as long as the tube; filaments filiform, ciliate, with a small hairy appendage at the base; styles as long as the calyx-lobes [1. *digyna*](#)

Plant not or slightly viscous; leaves linear; flowers paired on axillary peduncles; calyx-lobes lanceolate or ovate-lanceolate, shorter than the tube at least in fruit; filaments about twice as long as the anthers, not ciliate and not appendaged; styles rather short, stout and divaricate [2. *dichotoma*](#)

1. ***Vahlia digyna* (Retz.) O. Ktze.** in Rev. Gen. Pl. 1: 227 (1891); F.W.T.A., ed. 1, 2: 605. *APD acc APD acc*

APD: *Synonym of Vallisneria spiralis f. aethiopica (Fenzl) T. Durand & Schinz*

***Oldenlandia digyna* Retz.** Obs. 4: 23 (1786).

Daggash FHI 24966!

Widespread in dry regions of tropical Africa and Asia.

DROSERACEAE

Herbs, often stemless with rosettes of leaves, the latter usually covered with sticky stipitate glands which entrap insects. Flowers actinomorphic, hermaphrodite, in usually simple circinate cymes. Sepals 5–4, more or less connate at the base, imbricate, persistent. Petals 5, hypogynous, very rarely perigynous, nervose. Stamens 4–20, often 5, hypogynous, free or rarely united at the base; anthers 2-celled, extrorse, opening by longitudinal slits. Ovary free, 1-celled, with parietal or subbasal placentas; ovules many or rarely few; styles 3–5, mostly free. Fruit a loculicidal capsule. Seeds numerous, with fleshy endosperm; embryo straight; cotyledons short.

A small family generally found in swampy or sandy situations in tropical and temperate regions of both hemispheres; not found in rain-forest areas.

Easily recognized by the herbaceous habit and the stipitate-glandular leaves which entrap insects, the smallish fugacious flowers, and the syncarpous ovary with parietal placentas.

DROSEREA

Linn.—F.T.A. 2: 401; Diels in Engl. Pflanzenr. Droserac. (1906).

Herbs with sticky glandular hairs. Sepals and petals 5 (rarely 4–8). Stamens the same number as the petals, and alternating with them. Placentas 3–5.

- 1 Leaves spatulate; pedicels up to 3 mm. long:2
 Leaves linear; pedicels 6–10 mm. long; stems elongated with the leaves evenly spaced, deflexed when old; leaves 2–10 cm. long and 3–4 mm. broad; stipules setiform or obsolete3. *indica*
- 2 Leaves evenly spaced along the elongated (up to 15 cm.) stem; leaves with definite petiole 1.5–3 cm. long, lamina about 2 cm. long and 3–5 mm. broad, old leaves deflexed; stipules broad, pectinate, persistent, scarious; inflorescences 10–30 cm. long; seeds fusiform1. *madagascariensis*
 Leaves in a close whorl on the very short stem; leaves attenuate at the base into the rather flattened petiole, generally rather shorter than above, with relatively broad lamina; stipules small, not conspicuous; inflorescences 5–15 cm. long; seeds minute, ovoid2. *burkeana*

1. *Drosera madagascariensis* DC. Prod. 1: 318 (1824); Diels in Engl. Pflanzenr. Droserac. 98; Chev. Fl. Viv. 1: 287. *APD acc*

Drosera ramentacea of F.T.A. 2: 403, not of Burch.

Flowers pink.

Fr. Sud.: Sikasso (May) Chev. 788. Folo (May) Chev. 842. **Fr. G.:** Labé Pobéguin 2084. **N. Nig.:** Nupe Barter 1332! Kontagora (Nov.) Dalz. 63! Vom Dent Young 89! **Br. Cam.:** Bansa, Bamenda, 6,000 ft (Jan.) Keay FHI 28450!

Widespread in tropical Africa, S. Africa and Madagascar.

2. *Drosera burkeana* Planch.—F.T.A. 2: 402; Diels l.c. 88. *APD acc*

APD: *Synonym of Drosera pilosa* Exell & J. R. Laundon

Flowers pink; in grassland.

Br. Cam.: Bum, Bamenda, 4,000 ft. (May) Maitland 1499! Nchan, 5,000 ft. (May) Maitland 1499 bis!

Widespread in east and south tropical Africa, and in S. Africa

3. *Drosera indica* Linn.—F.T.A. 2: 402; Diels.c. 77; Chev. Fl. Viv. 1: 286. *APD acc*

Flowers pink, mauve or white; the commonest species in W. Africa.

Sen.: Casamance (Jan., Feb.) Chev. 3145; 3146. **Gam.:** Brown-Lester 38! **Fr. Sud.:** Koulikoro (Oct.) Chev. 3148! **Fr. G.:** Kindia (Dec.) Pobéguin 1316! **S. L.:** Waterloo (Oct.) Widespread in tropical Africa, Asia and Australia.

PODOSTEMACEAE

Aquatic herbs of rocks or stones in swift-flowing water or spray of waterfalls. Plant-body often reduced to a thallus usually attached to the substratum by haptera. Shoots (when present) arising from a thalloid base and bearing simple or deeply divided, alternate, exstipulate or minutely stipulate leaves. Flowers solitary or cymose, bracteate, hypogynous, zygomorphic. Perianth 3-phyllous or rudimentary and then usually of 2 minute more or less subulate tepals in which case the flower is enclosed (and often inverted) within a spathaceous bract (spathella) which ruptures irregularly on emergence of the flower.

Stamens 1–2 (rarely 3 or 4), filaments free or connate at the base; anthers 4-locular, opening lengthwise; staminode inserted between 2 stamens in *Stonesia*; pollen-grains solitary or geminate. Ovary sessile or shortly stipitate, of 2–3 united carpels, 1–3-locular; stigmas 1–3; ovules numerous on axile placentas. Fruit a septicidal capsule. Seeds minute, exalbuminous.

Predominantly tropical; a few species in warm north temperate region.

A remarkable family on account of the unusual habitat with attendant modification in vegetative and floral morphology, the species commonly resembling mosses, hepatics or algae.

- 1 Perianth of 3 equal or subequal tepals; spathella absent; stamen 1; styles 3; capsule opening by 3 valves [1. *Tristicha*](#)
Perianth reduced to 2 minute tepals; flower enclosed in a tough (rarely membranous) spathella which ruptures irregularly at anthesis; stamens usually 1 or 2 (very rarely 3 or 4); styles 2; capsule opening by 2 valves: [2](#)
- 2 Flower erect within the unruptured spathella with the pedicel shorter than the gynoecium: [3](#)
Flower inverted within the unruptured spathella with the pedicel at least as long as the gynoecium: [5](#)
- 3 Capsule ellipsoid, ribbed: [4](#)
Capsule globose, smooth and unribbed [4. *Letestuela*](#)
- 4 Caulescent herbs with stems and leaves dichotomously branched; stigmas subulate [2. *Pohliella*](#)
Acaulous herb with a ribbon-like branched thallus bearing small 1-flowered shoots along each margin; leaves rosulate, simple, subulate; stigmas complanate, elliptic in outline [3. *Butumia*](#)
- 5 Stamens 2, with an interposed subulate staminode; capsule ribs 12–18, those nearest the commissures shortest and not extending throughout the length of the capsule [5. *Stonesia*](#)
Stamens usually 2, sometimes 1 and very rarely 3 or 4; staminode absent; capsule 8–10-ribbed, including the double commissural ribs, all ribs running the length of the capsule [6. *Inversodicraea*](#)

1. TRISTICHA

Thouars—F.T.A. 6, 1: 121; Engl. in E. & P. Pflanzenfam. 18A: 35 (1930).

- 1 A polymorphic herb varying considerably according to habitat and season, with a linear branched thallus closely attached to the substratum, bearing usually small leafy moss-like shoots but the leafy shoots varying greatly in size from about 3 mm. to occasionally over 30 cm. in length; leafy shoots bearing rows (tristichous) of closely set imbricate to more or less distantly arranged leaves; leaves sessile, ovate to narrowly lanceolate at apex, entire at margin, up to 1 mm. in length, membranous, (often obscurely) 1-veined, sometimes prominently keeled; flowers terminal on leafy branchlets, often clustered, pedicels slender, rigid and wiry, up to 1.5 cm. in length; perianth of 3 equal usually more or less connate 1-nerved tepals; stamen 1, filament filiform, anther lobes contiguous, pollen grains 1-celled, trisulcate; ovary 3-locular, styles 3, erect or spreading; ovary 3-celled with many ovules; capsule ellipsoid, 3-valved, valves conspicuously 3-ribbed [trifaria](#)

Tristicha trifaria* (Bory) Spreng. Syst. 1: 22 (1825). *APD acc

The most widespread species in the family. Widely distributed in tropical Africa, Madagascar and the Mascarene Islands; also in **India** and in **the West Indies, central and tropical S. America**.

2. POHLIELLA

Engl. Bot. Jahrb. 60: 457 (1926).

- 1 A caulescent herb up to 21 cm. high, attached to rocks by a thallus-like base; stems branching; slightly compressed; floating leaves flabellate in outline, much-branched dichotomously with the ultimate segments capillary, up to 3 cm. long and 2 cm. broad, vaginate at the base; spathellae borne on the thallus and also axillary towards the apex of flowering branches, narrowly ellipsoid, about 1 mm. long; flower erect within the spathella; stamen 1, filament ultimately 4.5 mm. long, anther 0.5–0.75 mm. long and 3.5 mm. broad; capsule ellipsoid, about 3.5 mm. long, valves equal, 3-ribbed apart from the marginal ribs[flabellata](#)

Pohliella flabellata *G. Tayl.* in *Bull. Brit. Mus. (Nat. Hist.)*, Bot. Ser. 1: 53 (1953).

APD: Synonym of Saxicolella flabellata (G. Taylor) C. Cusset

Forming dense masses on rocks below water.

S. Nig.: R. Afi, on Aboabam-Boje path (Dec.) Keay FHI 28240!

3. BUTUMIA

G. Tayl. in *Bull. Brit. Mus. (Nat. Hist.)*, Bot. Ser. 1: 55 (1953).

- 1 An acaulous plant with a branched ribbon-like thallus; dwarf 1-flowered shoots arising along each margin of the thallus; leaves rosulate, sessile, subulate, slightly amplexicaul at the base, inner leaves subtending the flower minutely stipulate; flower erect within the spathella on short pedicel; stamen 1, filament ultimately about 1.2 mm. long, anther about 0.5 mm. long; ovary ellipsoid, about 3.5 mm. long; stigmas subulate-filiform, about 2 mm. long; capsule ellipsoid, about 3.5 mm. long, valves equal, 3-ribbed apart from the marginal ribs[marginalis](#)

Butumia marginalis *G. Tayl.* in *Bull. Brit. Mus. (Nat. Hist.)*, Bot. Ser. 1: 55, t. 2 (1953).

APD: Synonym of Saxicolella marginalis (G. Taylor) C. Cusset ex Cheek

Moss-like plant on smooth granite rocks in fast-flowing stream.

S. Nig.: R. Butum, Utanga, 2 miles north of Bagga, Obudu (Dec.) Keay, Savory & Russell FHI 25152!

4. LETESTUELLA

G. Tayl. in *Bull. Brit. Mus. (Nat. Hist.)*, Bot. Ser. 1: 57 (1953).

- 1 A slender branched herb up to 3.5 cm. high, probably with a thalloid base; leaves narrowly linear, entire or shortly bifid, up to 2 cm. long, vaginate at the base; spathella borne at the ends of branches, with stalk up to 1 cm.; stamens 2, filaments and andropodium together about 1.5 mm. long; pedicel of infructescence about 1 cm. long; capsule globose, smooth and shining, valves equal and unribbed[chevalieri](#)

Letestuella chevalieri *G. Tayl.* in *Bull. Brit. Mus. (Nat. Hist.)*, Bot. Ser. 1: 59 (1953).

APD: Synonym of Letestuella tisserantii G. Taylor

Leiothylax sphaerocarpa of Chev. *Fl. Viv.* 1: 295, partly (excl. spec. Cameroons), not of Engl.

Fr. Sud.: falls of the Niger (Mar.) Chev. 44058 bis.

5. STONESIA

G. Tayl. in *Bull. Brit. Mus. (Nat. Hist.)*, Bot. Ser. 1: 59 (1953).

- 1 Spathellae borne singly on the thallus and axillary on branched stems, or singly along almost efoliate stems; stigmas filiform, at least 0.3 mm. long:.....2

Spathellae in nodal clusters towards the base of the stems; stigmas short, about 0.1 mm. long [3. fascicularis](#)

- 2 Spathellae monomorphic, ellipsoid both on the thallus and stems, those on the stems more or less closely arranged (singly or 2 to 3 at the nodes) along the lower parts of the stems; stems simple or sparingly branched towards the apex [1. gracilis](#)

Spathellae dimorphic, those on the thallus compressed with a ring-like cartilaginous margin, those on the much-branched stems involuclate [2. heterospathella](#)

1. ***Stonesia gracilis* G. Tayl. in Bull. Brit. Mus. (Nat. Hist.), Bot. Ser. 1: 65, t. 7 (1953). APD acc**

Caulescent herb up to 22 cm. long; stems arising from a thalloid base, slender, simple or occasionally sparingly branched towards the apex; leaves deciduous and at time of flowering only persisting towards the apices of the stems; spathellae about 2 mm. long; flowers within the spathellae about 1.8 mm. long; pedicel about 1.8 mm., ultimately up to 4 mm. long; tepals 0.8 mm. long; filaments 0.5 mm. long; anthers 0.75 mm. long; staminode 0.5 mm. long; andropodium within the spathella about 0.5 mm. but ultimately up to 1 mm. long; ovary 1 mm. long; stigmas about 0.3 mm. long; capsule 14-ribbed, each valve 7-ribbed, the persistent valve slightly inrolled.

Fr. G.: Great Falls, Kindia (Nov.) Abbayes 355/1951!

2. ***Stonesia heterospathella* G. Tayl. l.c. 60, t. 5 (1953). APD acc**

Dicraeia garrettii of Chev. Bot. 539; F.W.T.A., ed. 1, 1: 108, partly (Fr. G. spec.).

Dicraeanthus parmelioides A. Chev. Fl. Viv. 1: 294, t. 43B (1938), French descr. only.

Caulescent herb up to 12 cm. long; stems arising from a thalloid base, elongate and dichotomously branched; leaves lacinate, the upper segments with the small persistent bases of deciduous laciniae; spathellae about 2 mm. long; flower within the spathella 1.5 mm. long; pedicel 1.5 mm. ultimately up to 4 mm. long; tepals 0.5 mm. long; filaments 0.3 mm. long; anthers 0.4 mm. long; staminode 0.3 mm. long; andropodium very short; ovary 1 mm. long; stigmas 0.5 mm. long; capsule subglobose or ellipsoid, 12–18-ribbed, each valve 6–8-ribbed, the persistent valve strongly inrolled.

Fr. G.: Ditinn to Diaguissa (Apr.) Chev. 12842! Great Falls (Dec.) Chev. 20231. Great Falls, Ditinn (Nov.) Abbayes 877/1948! 887/1948! Falls of R. Kinkon, Pita (Nov.) Abbayes 897 bis/1948!

3. ***Stonesia fascicularis* G. Tayl. l.c. 65, t. 6 (1953). APD acc**

Caulescent herb up to 36 cm. long; stems elongated, branched towards the base; leaves up to 15 mm. long, 2–3-bifid; spathellae about 2 mm. long; flower in the spathella about 1.5 mm. long; pedicel about 2 mm. ultimately up to 5 mm. long; tepals 0.6 mm. long; filaments 0.6 mm. long, anthers 0.75 mm. long; staminode about 0.5 mm. long; ovary 1.25 mm. long; stigmas about 0.1 mm. long; capsule 14-ribbed; each valve 7-ribbed, the persistent valve slightly inrolled.

Fr. G.: falls of R. Kinkon, Pita (Nov.) Abbayes 897/1948!

6. INVERSODICRAEA

Engl. Pflanzenw. Afr. 3, 1: 271–275 (1915); E. & P. Pflanzenfam. 18A: 53 (1930).

- 1 Leaves rosulate or polystichous, or deciduous and plant appearing leafless in the fruiting stage:2
 Leaves distichous and some at least persisting to the fruiting stage:8
- 2 Leaves polystichous, sometimes linear and 1–2-bifid, but mostly small, scale-like, cartilaginous and variously lobed or toothed, closely crowded towards the apex of the branches, or deciduous and the plants apparently leafless at maturity; stems usually much-branched, rarely subcaulous and then plants not reaching 2 cm. in height:3
 Leaves rosulate, linear-subulate, persistent; dwarf, subcaulous, unbranched herb with 1–3-flowered shoots arising from a flat thallus [7. tenuifolia](#)
- 3 Plants at maturity more than 2 cm. high; stems repeatedly branched and bare or with scattered scale-like leaves on the lower parts of the plant:4
 Plants at maturity dwarf, usually less than 1 cm. and not exceeding 2 cm.; leaves closely imbricated throughout

- the length of the stem [6. pygmaea](#)
- 4 Branching stems, slender and only slightly compressed and almost leafless below except for a few scattered hair-like bristles; tips of the flowering shoots swollen and strobiliform with closely aggregated linear or linear-lanceolate scale-like entire or 3-dentate leaves surrounding the developing spathe and also with finely and repeatedly dichotomously divided capillary leaves [1. abbayesii](#)
- Branching stems rather stout, often compressed and with scattered scale-like (not bristle-like) leaves; tips of the flowering branches not noticeably swollen; upper leaves broad scale-like, commonly 3-toothed, sometimes with a few 1–3-bifid leaves with linear segments: 5
- 5 Stems strongly compressed, spathe clustered on the tip of the branches, which are often leafless: 6
- Stems at most slightly compressed; spathe 1–3 at or towards the tips of the foliose branches: 7
- 6 Stamens 2; capsule slightly compressed [2. garrettii](#)
- Stamen 1; capsule cylindrical [3. macrothyrsa](#)
- 7 Loosely branched herb up to 13 cm. high with the lower parts of the branches smooth or bearing sparse scale-like leaves; spathe up to 6 mm. long; fruiting pedicels 2 cm. long; capsule 3 mm. long [4. adamesii](#)
- Closely branched herb 3–4 cm. high with the lower parts of the stems somewhat ridged or corrugated with scale-like leaves or persistent bases of leaves; spathe about 1.5 cm. long; fruiting pedicel 1.5 mm. long; capsule 2 mm. long [5. ledermannii](#)
- 8 Leaves linear and entire or 1–2-bifid with narrow segments, up to 1.5 cm. long: 9
- Leaves cymbiform, up to 2 mm. long: 10
- 9 Branched herb up to 3 cm. high; leaves linear, entire; stamens 2; stigmas botuliform, 1 mm. long [8. musciformis](#)
- Unbranched herb, or obscurely branched at the flowering apices, not exceeding 1 cm. in height; leaves 1–2-bifid; stamens (1-) 2(–4); stigmas very short, clavate or flabellate and then lobed [9. variabilis](#)
- 10 Dwarf acaulous herb not exceeding 1 cm. in height; stigmas very short [10. aloides](#)
- Caulescent herb up to 6 cm. high; stem unbranched and naked below; dwarf flowering shoots with closely imbricated leaves, congested into heads or fascicles [11. keayi](#)

1. *Inversodicraea abbayesii* G. Tayl. in Bull. Brit. Mus. (Nat. Hist.), Bot. Ser. 1: 67, t. 8 (1953).

APD: *Synonym of Ledermannia abbayesii* (G. Taylor) C. Cusset

Branched herb up to 30 cm.; scale-like leaves 0.5–1 mm. long, branched capillary leaves up to 3.5 cm. long; spathe up to 3 mm. long; pedicel in spathe 2.75 mm. (eventually up to 7.5 mm.) long; tepals 0.8 mm. long; filaments when single 1.5 mm. long at time of flowering, when 2, filaments 1.25 mm and then andropodium 0.75 mm. long; anthers 1.5 mm. long; ovary 1.5 mm. long; stigmas 0.75 mm.; capsule cylindrical, about 3.5 mm. long.

Fr. G.: falls of R. Kinkon, Pita (Nov.) Abbayes 898/1948!

2. *Inversodicraea garrettii* (C.H. Wright) G. Tayl. l.c. 67 (1953).

APD: *Synonym of Macropodiella garrettii* (C.H. Wright) C. Cusset

Dicraea garrettii C. H. Wright in F.T.A. 6, 1: 126 (1909); F.W.T.A., ed. 1, 1: 108, partly (excl. Fr.G. spec.).

Branched herb up to 10 cm. with horny compressed stems; leaves about 2 mm. long, irregularly lobed or 1–3-bifid, apparently soon deciduous and plant appearing leafless; flowers in terminal fascicles; fruiting pedicel 12 mm. long; filaments 4 mm. long; gynophore 1 mm. long; capsule slightly compressed, 1.75 mm. long; valves with 3 ribs and also marginal ribs.

S. L.: Sherbro (Oct.) Garrett!

3. *Inversodicraea macrothyrsa* G. Tayl. l.c. 67 (1953).

APD: *Synonym of Macropodiella macrothyrsa* (G. Taylor) C. Cusset

Saxicolella macrothyrsa A. Chev. Fl. Viv. 1: 293, t. 43A (1938), French descr. only.

Caulescent herb up to about 20 cm.; stems branched dichotomously, flattened and 2–4 mm. broad; spathe terminal or lateral, in dense unilateral cymes, 3 mm. long, shortly pedunculate; pedicel 6–8

mm. long; stamen 1, filament 3–4 mm. long; anthers 1–5 mm. long; ovary ovoid, 1.5 mm. long; gynophore 0.3 mm. long; capsule 1.5–2 mm. long, valves 3-ribbed.

Fr. G.: Fouta Djallon, in branches of *R. Dindia* Caille in Hb. Chev. 14740.

4. *Inversodicraea adamesii* *G. Tayl.* l.c. 69, t. 9 (1953).

APD: *Synonym of Ledermanniella adamesii (G. Taylor) C. Cusset*

Dichotomously branched herb; spathellae 1–3 at the tips of branches, narrowly obovoid with a tapering base; pedicel flexuose within the spathella, about 7 mm. long, eventually erect and up to 10 mm. long; tepals needle-like, about 1 mm. long; filaments 2 mm. long; andropodium 3 mm. long; anthers 1.25 mm. long; ovary about 2 mm. long, 6-ribbed excepting the inconspicuous commissural ribs; gynophore 0.5 mm, long; capsule valves equal and each 3-ribbed.

Port. G.: Chitale, Saltenho (Feb.) Esp. Santo 2670! **S. L.:** Kambia Bridge (Dec.) Adames 177!

5. *Inversodicraea ledermannii* (*Engl.*) *Engl.* Pflanzenw. Afr. 3, 1: 274 (1915); Chev. Fl. Viv. 1: 297, partly. *APD acc*

Dicraea ledermannii *Engl.* Bot. Jahrb. 43: 381, t. 2, Q-X (1909).

Branched herb with a ribbon-like thallus; leaves scale-like, cartilaginous, 0.5 mm. long.

Iv. C.: foot of Mt. Do, near Gouékangouiné (May) Chev. 21421!

Also in **French Cameroons**.

6. *Inversodicraea pygmaea* *G. Tayl.* l.c. 72, t. 10 (1953).

APD: *Synonym of Ledermanniella taylorii C. Cusset*

Inversodicraea ledermannii of A. Chev. Fl. Viv. 1: 297, partly.

Dwarf herb, up to 11 mm. including the pedicellate infructescence; stems simple or occasionally branched at the base arising from a narrow ribbon-like thallus; leaves linear-oblong, densely imbricated along the length of the stem, 3-toothed at the apex with the middle tooth longest, up to 1 mm. long; spathellae sessile, apical, obovoid, up to 2 mm. long; tepals needle-like, about 0.5 mm. long; stamen 1, filament up to 1.5 mm. long; anthers about 0.5 mm. long; ovary ellipsoid, about 1.25 mm. long, slightly 6-ribbed; gynophore about 0.3 mm. long; stigmas subulate, about 0.3 mm. long; capsule ellipsoid, 1.5 mm. long, valves equal 3-ribbed.

Fr. G.: Great Falls, Kindia (Dec.) Abbayes 353/1951! Chev. 20232!

7. *Inversodicraea tenuifolia*, *G. Tayl.* l.c. 72, t. 11 (1953).

APD: *Synonym of Ledermanniella tenuifolia (G. Taylor) C. Cusset*

Small caulescent herb with a flat basal thallus; leaves sessile, exstipulate, up to 4.5 mm. long; spathellae usually 2–3 produced on the dwarf rosulate shoots, subobovoid, about 2.75 mm. long; flower within the spathella about 8 mm. high; pedicel 2.5 mm. becoming up to 8 mm. long; stamens 2, filaments up to 3 mm. long; anthers 1 mm. long and 0.75 mm. broad; ovary ellipsoid, about 1.75 mm. long, and 0.8 mm, broad, slightly 8-ribbed; gynophore 0.5–0.75 mm. long; capsule ellipsoid, 2 mm. long, valves equal, 3-ribbed excepting the thin marginal commissural ribs.

S. Nig.: R. Afi, on Boje-Aboabam path (Dec.) Keay FHI 28241!

8. *Inversodicraea musciformis* *G. Tayl.* l.c. 75, t. 12 (1953).

APD: *Synonym of Ledermanniella musciformis (G. Taylor) C. Cusset*

Branched caulescent herb; lower leaves scale-like, minute, needle-like or linear; upper leaves linear-subulate, sheathing at the base, exstipulate, up to 14 mm. long; spatheae at the ends of branches, ovoid, about 2.75 mm. long; pedicel 2 mm. becoming up to 8 mm. long; tepals acicular, 0.6 mm. long; stamens 2, filaments about 0.8 mm. long; andropodium about 0.5 mm. long; anthers 0.75 mm. long and 0.7 mm. broad; ovary ellipsoid or obovoid, 1.75 mm. long, slightly 8-ribbed; capsule ellipsoid, 1.75 mm. long, valves equal 3-ribbed excepting the thin marginal commissural ribs.

Br. Cam.: N.W. slopes of Mba Kokeka Mt., Bamenda, 7,500 ft. (Jan.) Keay FHI 28542!

9. *Inversodicraea variabilis* G. Tayl. l.c. 75, t. 13 (1953).

APD: Synonym of Ledermanniella variabilis (G. Taylor) C. Cusset

Dwarf herb with flowering stems from flat thallus; leaves up to 7.5 mm. long; spatheae ellipsoid or subovoid tapering and stipitate at the base, up to 3.25 mm. long; pedicel 3.25 mm. (in fruit 4 mm.) long; tepals about 0.5 mm. long; filaments about 1 mm. long; andropodium up to 1 mm. long; anthers 1 mm. long; ovary about 1.5 mm. long; capsule 1.5 mm. long.

Br. Cam.: R. Mun Aiya, by Ikom-Mamfe road ferry (Jan.) Keay FHI 28688!

10. *Inversodicraea aloides* Engl. l.c. 3, 1: 271, t. 175 (1915).

APD: Synonym of Ledermanniella aloides (Engl.) C. Cusset

Gregarious moss-like plant; spatheae 1.5 mm. long; pedicel up to 3 mm.; stamens 1 or 2; filaments about 1 mm. long; anthers about 1 mm. long; ovary 1 mm. long; capsule 1 mm. long; stigmas shortly ellipsoid.

S. Nig.: R. Butum, (Dec.) Keay FHI 25150! Utanga, R. Butum (Dec.) Keay FHI 25153!

Extends to [Angola](#).

11. *Inversodicraea keayi* G. Tayl. l.c. 78, t. 14 (1953).

APD: Synonym of Ledermanniella keayi (G. Taylor) C. Cusset

Leaves up to 2 mm. long; spatheae solitary at the ends of short congested leafy shoots, about 2.5 mm. long; pedicel 2 mm. (in fruit 3 mm.) long; filaments about 0.5 mm. long; andropodium about 0.5 mm. long; anthers 0.75 mm. long; ovary about 1.5 mm. long; gynophore about 0.5 mm. long; stigmas botuliform, about 0.5 mm. long; capsules 1.5 mm. long.

Br. Cam.: Bango, Bamenda, 5,400 ft. (Jan.) Keay FHI 28457! Near Sagbo, Ndop (Mar.) Adams 11073!

ELATINACEAE

Herbs or low shrubs. Leaves opposite or verticillate, simple; stipules present, paired. Flowers small, actinomorphic, hermaphrodite, axillary, solitary or cymose. Sepals 3–5, free, imbricate. Petals as many, hypogynous, imbricate, persistent. Stamens from as many to twice as many as the petals, free, hypogynous; anthers 2-celled, opening by longitudinal slits. Ovary superior, 3–5-celled; placentation axile; styles 3–5, free; ovules numerous. Fruit a septicidal capsule. Seeds without endosperm, straight or curved; embryo with short cotyledons.

Widely spread in the warmer parts of the world.

Resembling Caryophyllaceae and Lythraceae, but differing from the former by the several-celled ovary and the absence of endosperm, from the latter by the free imbricate sepals and the erect anthers in bud.

- 1 Sepals and petals usually 5, sepals membranous on the margin, acute at apex, usually with a strong median nerve; stamens 5–12; ovary 5-celled (rarely 4), narrowed to the apex into the free styles; capsule subcrustaceous ... [1. Bergia](#)

Sepals, petals and stamens 3 (in our species; sepals and petals 2–4 and stamens up to 8 in other species); sepals membranous, obtuse at apex, without a strong median nerve; ovary 3-celled (more in other species), depressed

at apex, style short; capsule membranous [2. *Elatine*](#)

1. BERGIA

Linn.—F.T.A. 1: 152. *APD acc*

- 1 Shrubby; sepals 4–5 mm. long, acute to acutely acuminate; petals subequal to sepals; leaves pseudo-vericillate, the larger ones elliptic, narrowed into a short petiole, up to 3 cm. long and 1 cm. broad, closely serrate, scabrid-pubescent [1. *suffruticosa*](#)
- Herbaceous; sepals at most 1.5 mm. long; leaves paired; flowers in dense verticillate clusters: [2](#)
- 2 Stems and leaves more or less pubescent, stems slender or wiry, not succulent; leaves varying from oblanceolate to linear-elliptic, sharply and distinctly serrulate or nearly entire, 0.8–2.5 cm. long; stamens 5–12 [2. *ammannioides*](#)
- Stems and leaves glabrous, stems succulent; leaves lanceolate, tapering at each end, 1–5 cm. long, entire; stamens 10 [3. *capensis*](#)

1. *Bergia suffruticosa* (Del.) Fenzl—F.T.A. 1: 153; Chev. Fl. Viv. 1: 300. *APD acc*

Lancretia suffruticosa Del. (1813).

Bergia guineensis Hutch. & Dalz. F.W.T.A., ed. 1, 1: 109 (1927); Kew Bull. 1928: 27.

A heath-like undershrub, often covering large patches of ground; flowers with stamens and ovary often pink, frequented by bees.

Sen.: Roger! Heudelot! **Fr. Sud.:** Niala near Djenne (June) Chev. 1134! Akaka (May) Hagerup 85! Timbuktu (July) Hagerup 165! **iv. C.:** Assikaso (Dec.) Chev. 22577! **Fr. Nig.:** several localities fide Chev. l.c. **N. Nig.:** Sokoto (Mar., Dec.) Moiser 192! 255! Katagum (July) Dalz. 190! Nguru (June) Onochie FHI 23340! Kukawa (Jan.) E. Vogel 14!

Extends from Mauritania to the Red Sea, **Arabia** and India.

2. *Bergia ammannioides* Heyne ex Roth Nov. Pl. Sp. 219 (1821); F.T.A. 1: 152; Chev. Fl. Viv. 1: 301. *APD acc*

Bergia peploides of Guill. & Perr.—F.W.T.A., ed. 1, 1: 109.

Bergia erecta of Guill. & Perr.—F.W.T.A., ed. 1, 1: 109.

Bergia pentandra of Guill. & Perr.—F.W.T.A., ed. 1, 1: 109.

Erect or decumbent herb of moist places and dried-up pools; flowers white or pink.

Sen.: Richard Tol (Dec.) Perrottet! Walo (Feb.–Apr.) Leprieur! Guillemin! Perrottet! **Fr. Sud.:** Gao (Mar.) De Wailly 4985! Timbuktu (June, July) Hagerup 115! 180! **Fr. Nig.:** Maradi to Maroua Chev. 43700.

Widespread in the drier parts of tropical Africa, Asia and Australia.

[Further study of this widespread species may reveal distinct entities, but the forms described by Guillemin and Perrottet do not appear to me to be specifically distinct,—R.W.J.K.]

3. *Bergia capensis* Linn. Mant. Pl. Alt. 241 (1771); Milne-Redhead in Kew Bull. 1948: 450. *APD acc*

Bergia verticillata Willd.—F.T.A. 1: 152.

Aquatic herb with pink succulent stems procumbent and rooting at the nodes or erect.

Gam.: Kuntaur Ruxton 117! **G. C.:** Shai, near Agomeda (June) Irvine 1643a!

Also in **Tanganyika**, **A.–E. Sudan** and **Egypt**, and in **Asia**, but not in S. Africa.

2. ELATINE

Linn.—Niedenzu in Engl. Pflanzenfam. 21: 274 (1925). *APD acc*

- 1 Much-branched aquatic herb, submerged or floating, glabrous; leaves opposite, oblanceolate, obtuse, to 1.5 cm. long; flowers solitary and sessile in the leaf axils, trimerous, with 3 stamens; capsule depressed-globose, about 1 mm. diam. [triandra](#)

Elatine triandra *Schkuhr*—Niedenzu l.c. 276; Chev. Fl. Viv. 1: 299. *APD acc*

Elatine triandra var. **major** *Trochain* in Assoc. Fr. Avanc. Sci. 1936: 343, with fig.

Sen.: Leprieur! Richard Tol (Jan.) Perrottet. Near M'Bane Trochain 2232.

Also in **Europe (north to Finland)**, **N. Africa** and **America**.

[Leprieur's specimen at Kew is too poor for certain identification but is likely to be the same as the others collected in Senegal.—R.W.J.K.]

CARYOPHYLLACEAE

Herbs, annual or perennial; leaves opposite, simple, often connected at the base by a transverse line; stipules absent or if present often scarious. Flowers actinomorphic, mostly hermaphrodite, solitary or in cymes. Sepals free or united into a tube, imbricate, often with membranous margins. Petals as many as the sepals, often small or absent. Stamens up to 10, free from one another or slightly united at the base; anthers 2-celled, dehiscing longitudinally. Ovary superior, sessile or shortly stipitate, 1-celled or imperfectly divided at the base, with free-central placentation; styles free or variously connate; ovules mostly numerous. Capsule opening by valves or apical teeth. Seeds with endosperm and a more or less curved peripheral or excentric embryo.

Widely distributed in the North Temperate Zone, especially in the Mediterranean region; comparatively rare in the tropics and mostly at high elevations.

- 1 Stipules absent; stamens 10 or fewer:2
 Stipules present, rarely inconspicuous; sepals free; stamens 5 or fewer:5
- 2 Sepals free from one another; ovary sessile:3
 Sepals connate in the lower half; stamens 5 or 10; styles 5; ovary sessile; straggling herb with long-pilose branches4. *Uebelinia*
 Sepals connate into a tube; styles 3; stamens 10; ovary stipitate; capsule dehiscing by 3 or 6 teeth or valves; erect herbs5. *Silene*
- 3 Petals bifid:4
 Petals entire; styles 5; capsule opening by valves3. *Sagina*
- 4 Styles 5, opposite the sepals; capsule more or less cylindrical1. *Cerastium*
 Styles 3, alternate with the sepals; capsule globose to oblong2. *Stellaria*
- 5 Stipules small and interpetiolar, divided into subulate segments, not scarious; styles 3, connate below; capsule 3-valved; filaments shortly united at the base6. *Drymaria*
 Stipules large and conspicuous, scarious, not divided:6
- 6 Sepals with a thick green keel and membranous margins7. *Polycarpon*
 Sepals not keeled, uniformly membranous8. *Polycarpaea*

1. CERASTIUM

Linn.—F.T.A. 1: 140.

- 1 Stems weak, with very long internodes, slightly glandular-pilose in the upper parts; leaves up to about 3.5 cm. long; flowers in small terminal few-flowered cymes; sepals scarcely membranous on the margin; capsule a little longer than the sepals1. *indicum*
 Stems rather short, with short internodes, densely glandular-pilose; leaves up to about 1.5 cm. long; flowers numerous, rather crowded in a leafy cyme; sepals with broadly membranous margins; capsule much exceeding the sepals2. *octandrum*

1. **Cerastium indicum** *Wight & Arn.* Prod. Fl. Pen. Ind. Or. 1: 43 (1834); Möschl in Mem. Soc. Brot. 7: 53 (1951), as var. *ruwenzoriense*. *APD acc*

Cerastium africanum (*Hook. f.*) *Oliv.* F.T.A. 1: 141; F.W.T.A., ed. 1, 1: 110.

Weak, sparingly branched herb, 1–2 ft. high; flowers white.

Br. Cam.: Cam. Mt., 7,000–10,000 ft. (Dec.) Mann 1941! Johnston 13! **F. Po:** St. Isabel Peak (Feb.) Guinea 2833!

Also on the mountains of central and E. Africa from Abyssinia to L. Nyasa and Transvaal; and in the **Mascarene Islands**.

2. **Cerastium octandrum** *Hochst. ex A. Rich.* Fl. Abyss. 1: 45 (1847); Möachl l.c. 26 (1951), as var. *humile*. *APD acc*

Cerastium vulgatum of F.T.A. 1: 140, not of Linn.

Cerastium viscosum of F.W.T.A., ed. 1, 1: 110, not of Linn.

Sticky herb, diffuse or ascending; flowers white.

Br. Cam.: Cam. Mt., 7,000–12,000 ft. (Dec.–Jan.) Mann! Maitland 813! 1255! L. Oku, Bamenda, 7,700 ft. (Jan.) Keay FHI 28468!

Widespread on the mountains of central and E. Africa from Abyssinia to **Tanganyika**.

2. STELLARIA

Linn.—F.T.A. 1: 141.

- 1 Sepals acute at apex, without hyaline margins, densely covered with relatively short glandular hairs; flowers few in lax terminal cymes; leaves long-petiolate, petioles not clasping the stem; lamina ovate, very acute to acuminate, with entire or crispate margin, 2–2.5 cm. long, 1–1.5 cm. broad; internodes long; stems drying yellowish *L. mannii*

Sepals rounded to obtuse at apex, with hyaline margins, laxly covered with rather long glandular hairs; flowers solitary from forks of leafy branches or in lax terminal cymes; leaves variable, sessile to long-petiolate, petioles clasping the stem; lamina at the most acute or apiculate at apex; internodes short or long, with softly pubescent line; stems drying pale green *2. media*

1. **Stellaria mannii** *Hook. f.*—F.T.A. 1: 141; Exell Cat. S. Tomé 109.

Diffuse straggling herb to 1 or 2 ft. high; petals white; native.

Br. Cam.: Cam. Mt., 5,500–7,600 ft. (Nov.–Mar.) Mann 1940! Migeod 43! Maitland 1014! Brenan 9518! **F. Po:** Moka (Jan.) Guinea 2239!

Also in **S. Tomé**, **Kenya**, **Tanganyika**, **Nyasaland** and **S. Rhodesia**.

2. **Stellaria media** (*Linn.*) *Vill.*—F.T.A. 1: 141; Chev. Fl. Viv. 1: 304; Exell l.c. 110. *APD acc*

Alsine media *Linn.* (1753).

Diffuse herb; petals white; **introduced**.

Fr. G.: Mali, 4,600 ft. Chev. **Br. Cam.:** Buea, 3,000 ft. (Jan–Mar.) Maitland 192! Brenan 9333! **F. Po:** Moka (Jan.) Tessman 2869; Guinea 2010! 2061!

Cosmopolitan weed, native in north temperate regions of Old World.

3. SAGINA

Linn.—F.T.A. 1: 142.

- 1 A small often tufted herb; leaves linear, acute, up to 2.5 cm. long; pedicels 1 cm. long; sepals ovate-lanceolate, acute, glabrous; petals shorter than sepals *abyssinica*

Sagina abyssinica *Hochst. ex A. Rich.*—F.T.A. 1: 142. *APD acc*

Perennial, forming little cushions; sepals green, petals white.

Br. Cam.: Cam. Mt., 9,000–12,000 ft. (Dec.–Mar.) Mann 1288! 2027! Mildbr. 10899! Maitland 1254! Brenan 9507! Keay FHI 28614! **F. Po:** 8,500 ft. (Apr.) Mann! Guinea 2836!

Also in **Abyssinia** and E. African mountains.

4. UEBELINIA

Hochst.—F.T.A. 1: 140; Th. C. E. Fries in Fedde Rep. 19: 81 (1923).

- 1 Stems hispid; leaves elliptic to orbicular, acute, margin and midrib setulose, narrowed at base to short-winged petiole, 7–15 mm. long, 4–9 mm. broad; flowers axillary; pedicels 1–3 mm. long, reaching 7–13 mm. in fruit; calyx 4–6 mm. long, 10-ribbed, setose, lobes acute; petals 2.5–3.5 mm. long; stamens 10 (or 5); capsule about 4 mm. long, persistent in the calyx [hispidula](#)

Uebelinia hispidula Pax in Engl. Bot. Jahrb. 17: 586 (1893).

APD: Synonym of Lychnis abyssinica (Hochst.) Lidén

Prostrate herb with straggling stems to 18 in. long; petals white.

Br. Cam.: Cam. Mt., 7,000–8,000 ft. (Jan., Sept.) Preuss 971! Maitland 916! L. Oku, Bamenda, 7,800 ft. (Jan.) Keay FHI 28472!

5. SILENE

Linn.—F.T.A. 1: 138.

- 1 Stems and leaves very shortly pubescent, not glandular; leaves narrowly linear, tapered to the apex; flowers in terminal cymose racemes, the pedicels in fruit up to 3 cm. long; calyx with strong coloured nerves, gradually tapered to the base [biafrae](#)

5. Silene biafrae Hook. f.—F.T.A. 1: 139. *APD acc*

Erect perennial herb, 6–30 in. high; calyx green with blackish-purple veins; petals blackish-purple above.

Br. Cam.: Cam. Mt., 9,000–12,000 ft. (Nov.–Mar.) Mann 2034! Maitland 1253! Dalz. 8328! Brenan 9508! Keay FHI 28609!

6. DRYMARIA

Willd.—F.T.A. 1: 143.

- 1 A weak straggling herb, glabrous or nearly so; stems quadrangular; leaves petiolate, opposite, distant, broadly ovate, rounded or subcordate at the base, mucronulate, 1–2.5 cm. long, up to 2 cm. broad, papery, 3–5-nerved; stipules interpetiolar, divided into subulate segments; flowers in terminal few-flowered puberulous cymes; sepals oblong-lanceolate, about 5 mm. long, with a distinct midrib and 2 lateral nerves, becoming dry and membranous in fruit; petals shorter than the sepals, bifid [cordata](#)

Drymaria cordata (Linn.) Willd.—F.T.A. 1: 143; Chev. Fl. Viv. 1: 305. *APD acc*

Holosteum cordatum Linn. (1753).

Slightly viscid herb with white flowers, stems up to 3 ft. long.

Fr. G.: Fouta Djallon (Sept.) Chev. 18682. Dalaba-Diaguissa Plateau (Oct.) Chev. 18716. **S. L.:** Yakala (Sept.) Thomas 2383! Kailahun (Feb.) Deighton 4007! **Iv. C.:** Gouekomna, Upper Sassandra (May) Chev. 21652! **S. Nig.:** Ikwette Plateau, Obudu (Dec.) Keay & Savory FHI 25191! **Br. Cam.:** Cam. Mt., 7,000 ft. (Dec., Jan.) Mann 1319! Bambui, Bamenda (Jan.) Keay FHI 28423! **F. Po:** (Nov., Dec.) Mann 581! Guinea 676!

Widely dispersed in tropics and sub-tropics.

7. POLYCARPON

Linn.—F.T.A. 1: 144.

- 1 A straggling herb sparsely clothed with branched hairs; leaves opposite or verticillate, oblanceolate or sublinear, acute, up to 1.5 cm. long and about 4 mm. broad; stipules scarious, ovate-lanceolate, acute, about 1/4 the length of the leaves; flowers very numerous in paniculate bracteate cymes; sepals with a thick keel and broad membranous margins, minutely ciliolate [prostratum](#)

Polycarpon prostratum (*Forsk.*) *Asch. & Schweinf.* in Ost. Bot. Zeitschr. 39: 128 (1889); Milne-Redhead in Kew Bull. 1948: 451 (q.v. for full synonymy). *APD acc*

Alsine prostrata *Forsk.* (1775).

Polycarpon loeflingii *Benth.* in Benth. & Hook. f. Gen. Pl. 1: 153 (1862); F.T.A. 1: 144; F.W.T.A., ed. 1, 1: 111; Chev. Fl. Viv. 1: 306.

Polycarpon memphiticum (*Del.*) *Fenzl ex Broun & Massey*; Chev. Fl. Viv. 1: 307.

Polycarpon glaucifolium *A. Chev.* Fl. Viv. 1: 306 (1938), French descr. only.

Annual herb on sand banks and mud of river beds.

Sen.: R. Senegal (Apr., May) Leprieux! **Fr. Sud.:** Sienao, San (June) Chev. 1043! Day (Aug.) Chev. 1337! L. Debo (May) Hagerup 152a! Kabara (Sept.) Hagerup 308! **S. L.:** Samaia (May) Thomas 182! Widespread in tropics of Old and New World.

8. POLYCARPAEA

Lam.—F.T.A. 1: 144; Pax in Engl. Bot. Jahrb. 17: 588 (1893).

- 1 Sepals loosely pubescent, 1.5–2 mm. long, silvery; leaves linear about 1–1.5 cm. long, with fine setose points; dwarf annual, very diffuse with very numerous flowers in lax cymes spreading all over the plant .. [1. eriantha](#)
- Sepals glabrous:2
- 2 Leaves obtuse, glabrous, lanceolate, finely punctate, about 1 cm. long and 2–3 mm. broad, rather obscurely 3-nerved; stipules about half as long as the leaves, with long filiform tips; flowers few in densely clustered heads [2. glabrifolia](#)
- Leaves linear with fine setiform tips:3
- 3 Sepals 1–2 mm. long, wholly golden or deep reddish-brown; flowers numerous in lax cymes; leaves linear to acicular 7–15 mm. long, stems densely to sparingly pubescent; plant often perennial, much branched [3. tenuifolia](#)
- Sepals 2 mm. or more long, silvery but sometimes with golden or reddish coloured markings on tips or at base:4
- 4 Flowers in compact many-flowered globose heads, solitary at the ends of the branches; inflorescence branches within each head not apparent; heads 0.8–3 cm. in diam.; sepals silvery, without coloured markings; leaves linear, up to 3 cm. long and 2 cm. broad [4. linearifolia](#)
- Flowers in lax cymes, or in compact corymbs with the inflorescence branches within each corymb quite apparent, or in small few-flowered heads laxly arranged in cymes:5
- 5 Flowers in small (about 5 mm. diam.), few-flowered (5–15) heads, the heads laxly arranged in cymes; sepals wholly silvery, very acute, 2–2.5 mm. long; leaves up to 2 cm. long and linear below, acicular 5–10 mm. long above; stipules with very long points, more than half as long as the leaves; plant erect, little branched [5. stellata](#)
- Flowers in lax cymes or compact corymbs:6
- 6 Flowers in compact corymbs, sometimes head-like but always with the lower inflorescence branches within each corymb quite apparent (contrasting with linearifolia); sepals 3–4 mm. long, very acute, rather jagged at the tips and usually tinged reddish at the tips (in W. African specimens), otherwise silvery; leaves linear, up to 2 cm. long and 1 mm. broad; plant well branched but erect and not diffuse [6. corymbosa var. corymbosa](#)
- Flowers in very numerous lax cymes, much branched and spreading all over the very diffuse richly branched plant (similar in habit to eriantha but sepals glabrous); sepals 2–3 mm. long, acute, silvery with reddish marking at base [6a. corymbosa var. effusa](#)

1. **Polycarpaea eriantha** *Hochst. ex A. Rich.* Fl. Abyss. 1: 303 (1848); Chev. Fl. Viv. 1: 312. *APD acc*

Polycarpaea corymbosa of F.T.A. 1: 146, partly.

Polycarpaea corymbosa var. *eriantha* (*Hochst. ex A. Rich.*) Pax in Engl. Bot. Jahrb. 17: 590.

Polycarpaea stellata of Chev. Bot. 47, not of DC.

Much-branched annual, up to 9 in. high, often much less; petals reddish.

Sen.: Bondou Heudelot 135! **Gam.:** Sounders 90! **Fr. G.:** Kouroussa Pobéguin 459! **Fr. Sud.:** fide Chev. l.c. **G. C.:** Accra (May, Oct.) Ansell! Brown 330! Navrongo, N.T. (Nov.) Widely distributed in tropical Africa.

MOLLUGINACEAE

Herbs. Leaves alternate or opposite; stipules none or very small and soon falling off. Flowers actinomorphic, hermaphrodite, solitary or cymose, usually small and inconspicuous. Sepals free or united at the base only, imbricate. Petals small or absent. Stamens hypogynous or slightly perigynous, definite or many; filaments free to connate at the base; anthers 2-celled, opening lengthwise. Ovary syncarpous (except *Gisekia*), usually several-celled; styles or stigmas as many as the cells; ovules curved or inverted. Fruit dry, dehiscent into the cells or by a transverse slit, rarely indehiscent, calyx usually persistent. Seeds with endosperm, the embryo curved.

Mostly weedy plants of dry places.

Distinguished from the Ficoidaceae, with which they were formerly united, by the hypogynous flowers and free sepals.

- | | | |
|---|--|---|
| 1 | Fruit indehiscent:..... | 2 |
| | Fruit a dehiscent 3–5-valved capsule:..... | 3 |
| 2 | Ovary syncarpous, fruit 2-coccos 1. Limeum | |
| | Ovary and fruit apocarpous, with 5 carpels; leaves marked with numerous raphides 2. Gisekia | |
| 3 | Seeds without a strophiole; erect plants, glabrous and often glaucous; radical leaves different from the stem leaves, or all leaves radical 3. Mollugo | |
| | Seeds with a conspicuous strophiole; diffuse or ascending herbs, tomentose or pubescent; no radical leaves 4. Glinus | |

2. GISEKIA

Linn.—F.T.A. 2: 593.

- 1 A rather variable weed, diffuse or decumbent; leaves opposite or subopposite, varying from oblanceolate to linear, subacute or obtuse, up to 4 cm. long and 1 cm. broad, thickly clothed beneath with numerous conspicuous raphides; flowers in sessile or pedunculate often many-flowered cymes at the nodes; pedicels up to 1 cm. long; sepals elliptic-rounded, trinerved, with hyaline margins; petals absent; carpels 5, muricate
..... *pharnacioides*

Gisekia pharnacioides Linn.—F.T.A. 2: 593, incl. vars. *congesta* and *pedunculata* Oliv.; Chev. Fl. Viv. 1: 325. *APD acc*

Gisekia linearifolia Schum. & Thonn. (1827).

Gisekia rubella of Chev. Fl. Viv. 1: 325, not of Hochst. (Hochstetter's type has the pedicels 6–12 mm. long and peduncles at least 5 mm. long; the W. African plants referred to *G. rubella* by Chevalier have very short pedicels, 1–5 mm. long).

The plant is often subject to a blight (*Exobasidium gisekiae* Allesch.) which renders it pink or wine-red in colour.

Sen.: Heudelot 498! Richard! Sieber 63! **Fr. Sud.:** Zamblora (June) Chev. 988! Timbuktu (July) Hagerup 140! 199a! **Iv. C.:** & **Dah.:** fide Chev. l.c. **Togo:** Lome Warnecke 33! **N. Nig.:** Sokoto (Mar.–Sept.) Moiser 101! Dalz. 416! Nupe Barter 1734! Katagum Dalz. 136!

Widespread in tropical and S. Africa, Madagascar and in Asia.

3. MOLLUGO

Linn.—F.T.A. 2: 589; Pax & Hoffmann in Engl. Pflanzenfam. 16C: 226 (1934).

- 1 Cauline leaves absent; leaves all radical, persistent, spatulate-ob lanceolate, up to 6 cm. long and 2 cm. broad; inflorescence laxly cymose-corymbose, the pedicels long and slender; seeds minutely and closely muricate, black or very dark reddish-brown [1. nudicaulis](#)
- Cauline leaves present: **2**
- 2 Flowers in lax terminal and axillary cymes with long slender peduncles and pedicels; radical leaves persistent, spatulate-ob lanceolate, up to 6 cm. long and 1.5 cm. broad; cauline leaves oblanceolate or lanceolate; seeds reddish-brown, minutely muricate [2. pentaphylla](#)
- Flowers subumbellate or in sessile or shortly pedunculate axillary clusters; radical leaves soon disappearing: ... **3**
- 3 Cauline leaves linear-acicular, pseudo-vericillate, obtuse; radical leaves spatulate-obovate, up to 1.5 cm. long; inflorescences subumbellate; seeds smooth, triangular, pale brown [3. cerviana](#)
- Cauline leaves narrowly oblanceolate, 1–1.5 cm. long, 3–4 mm. broad; flowers in sessile or shortly pedunculate clusters; seeds smooth or ridged on the back, dark red or black [4. verticillata](#)

1. *Mollugo nudicaulis* Lam.—F.T.A. 2: 591; Chev. Fl. Viv. 1: 391. *APD acc*

An erect glabrous annual, 3–10 in. high; in waste places; flowers greenish-white.

Found in tropics and subtropics generally.

Hauman in Fl. Congo Belge 2: 106 (1951) has divided these two wide-ranging and variable weeds into several species and varieties. Some of these forms occur also in our area, but I am following Pax and Hoffmann in E. & P. Pflanzenfam. 16C: 212 (1934) in recognizing only the above two species in this Flora, pending a revision covering the whole of the vast range of the genus. Difficult nomenclature as well as taxonomical problems are involved, and Hauman's treatment is not free from objection.—R.W.J.K.

FICOIDACEAE

Herbs or low shrubs, often fleshy. Leaves alternate or opposite, sometimes very small, stipulate or not. Flowers actinomorphic, usually hermaphrodite. Calyx-tube free or adnate to the ovary; lobes 5–8, imbricate or rarely valvate, herbaceous. Petals numerous or absent, 1— or more-seriate, inserted in the calyx-tube. Stamens perigynous, many or few, rarely 1, free or united at the base into bundles; anthers 2-celled, small, opening lengthwise. Ovary superior or inferior, 1-several-celled; ovules solitary to

many, basal, apical or axile. Fruit a capsule or nut-like and drupaceous, often clasped by the persistent calyx.

Generally found on sandy shores and desert places, mainly in the subtropics; comparatively rare in America.

Recognized by the usually fleshy habit, opposite leaves, small or narrow petals, several-celled ovary with axile placentas, endospermic curved seeds and curved embryo.

- 1 Ovary 3 (—5)-celled; styles 3 (—5); maritime plant [1. *Sesuvium*](#)
 Ovary 1–2-celled; styles 1–2; terrestrial plants [2. *Trianthema*](#)

1. SESUVIUM

Linn.—F.T.A. 2: 585.

- 1 A diffuse succulent glabrous herb with procumbent stems often rooting at the nodes; leaves opposite, succulent, linear-oblongate to obovate, obtuse, up to 4.5 cm. long and 1 cm. broad; flowers axillary, solitary, pedicellate, purplish or rose; calyx deeply 5-lobed, obconic at the base, lobes ovate-lanceolate with a small dorsal horn at the apex and fairly broad membranous margins; petals none; ovary 3-celled, superior; seeds black and nearly smooth [portulacastrum](#)

***Sesuvium portulacastrum* (Linn.) Linn.** Syst. Nat., ed. 10, 2: 1058 (1759); F.T.A. 2: 585; Chev. Fl. Viv. 1: 330. *APD acc*

***Portulaca portulacastrum* Linn.** Sp. Pl. 1: 446 (1753).

Common on the shores of the tropics and subtropics of both hemispheres. "Seaside Purslane."

Sen.: Sieber 19! Boivin! Dakar, Hann beach (May) Baldwin 5754! **S. L.:** Mapotolon, Samu (Mar.) Glanville 251! Turtle Isl. (Nov.) Deighton 2395! **G. C.:** Sekondi (Oct.) Howes 980! Accra (May) Irvine 666!

Also in other W. African coastal districts, but seldom collected. Common on the shores of the tropics and subtropics of both hemispheres (See Appendix, p. 30.)

2. TRIANTHEMA

Linn.—F.T.A. 2: 587.

- 1 Leaves flat, mostly obovate or oblong-obovate: **2**
 Leaves semi-terete, linear, fleshy, 5–10 mm. long, 2–3 mm. broad; flowers 2–3 or more, in axillary glomerules; style 1; cap of fruit discoid, about 1 mm. in diam.; seeds 2, superposed, or solitary [4. *sedifolia*](#)
- 2 Flowers solitary, partly enclosed by the sheathing leaf-base; style 1; cap of fruit dehiscent in one piece 3–4 mm. in diam.; leaves opposite or subopposite, anisophyllous, the larger leaf up to 3.5 cm. long and 1.5–3 cm. broad, distinctly petiolate, the lesser leaf much smaller; stems sparsely pubescent or glabrous [1. *portulacastrum*](#)
- Flowers not enclosed by sheathing leaf-base; styles 2: **3**
- 3 Flowers solitary; seeds numerous; cap of fruit conical, beaked, dehiscent in one piece; leaves opposite or subopposite, elliptic or oblanceolate, obtuse, about 1.5 cm. long and 5–8 mm. broad [2. *polysperma*](#)
- Flowers 2–3 or more in axillary glomerules; seeds few; cap of fruit dehiscent in two pieces; leaves opposite, only slightly anisophyllous, oblong-obovate, up to 5 cm. long and 2.5 cm. broad [3. *pentandra*](#)

1. ***Trianthema portulacastrum* Linn.** Sp. Pl. 223 (1753); Chev. Fl. Viv. 1: 331. *APD acc*

***Trianthema monogyna* Linn.**—F.T.A. 2: 587; Chev. Bot. 300.

Rather fleshy, almost glabrous, prostrate herb; sepals pink; a weed of waste places.

Sen.: & **Fr. Sud.:** fide Chev. l.c. **Gam.:** Genieri (July) Fox 113! **Iv. C.:** Mankono (June) Chev. 21961! **G. C.:** Cape Coast (July) T. Vogel 57! Accra (Feb.) Dalz. 69! Achimota (Aug.) Widespread in tropical Africa, Asia and America.

2. **Trianthema polysperma** *Hochst. ex Oliv.* F.T.A. 2: 588 (1871).

APD: Synonym of Sesuvium hydaspicum (Edgew.) Gonç.

Prostrate herb; calyx green outside, pink or red within.

Fr. Sud.: Timbuktu (Aug.) Hagerup 255!

Also in **A.–E. Sudan.**

3. **Trianthema pentandra** *Linn.*—F.T.A. 2: 588; Chev. Fl. Viv. 1: 332; Melville in Kew Bull. 1952: 263.

APD: Synonym of Zaleya pentandra (L.) C. Jeffrey

Prostrate herb with stout stem; flowers green.

Sen.: Roger 29! **Fr. Sud.:** Mopti (May) Hagerup 75! Timbuktu (July) Chev. 1303! **G. C.:** Accra (May) Irvine 1616! **Fr. Nig.:** fide Chev. l.c. **N. Nig.:** Borgu Barter 744! Katagum (July) Dalz. 146! Gashua (June) Onochie FHI 23368! Kukawa (Feb.) E. Vogel 52! 59! Kalkala Golding 44!

Widespread in the drier parts of Africa, and in **Arabia.**

4. **Trianthema sedifolia** *Visiani*—F.T.A. 2: 588; Chev. Fl. Viv. 1: 333. *APD acc*

Prostrate fleshy herb, forming clumps 1–2 ft. in diam.; flowers reddish-green.

Fr. Sud.: Oualata Jumelle!

Also in the **Sahara** and the dry regions of N.E. Africa.

PORTULACACEAE

Herbs or undershrubs, often, succulent; leaves alternate or opposite, with scarious or setose stipular appendages. Flowers actinomorphic, hermaphrodite, solitary or variously cymose or racemose. Sepals 2, imbricate, free or united at the base. Petals 4–6, imbricate, free or connate at the base, soon falling. Stamens as many as and opposite the petals or more numerous, free; anthers 2-celled. Ovary superior or half-inferior, 1-celled with basal placenta; ovules 1 to many; style usually variously divided. Fruit a capsule dehiscing by valves or by a transverse split (circumscissile), rarely a nut and indehiscent. Seeds globose-reniform; embryo surrounding the copious mealy endosperm.

Widely spread in warmer regions, often occurring as weeds in cultivated places.

Recognized by the succulent habit, 2 sepals, and the basal placentation.

- 1 Ovary superior; capsule opening by valves; seeds radiate-striate; flowers in lax inflorescences [1. Talinum](#)
 Ovary half-inferior; capsule opening by a transverse split (circumscissile); seeds verrucose; flowers solitary or fascicled [2. Portulaca](#)

1. TALINUM

Adans.—F.T.A. 1: 149; von Poellnitz in Fedde Rep. 35: 1–34 (1934).

- 1 Flowers in a loose, forking, few-flowered panicle; leaves obovate-lanceolate, emarginate and mucronate at apex, cuneate into petiole at base, 4–10 cm. long, 1.5–4 cm. broad, rather fleshy and glabrous; sepals ovate, acuminate, with 3 main green nerves, membranous on the margin; petals about twice as long as the sepals; capsule 5–6 mm. long, seeds radiate-striate [1. triangulare](#)
 Flowers in elongate racemes, or racemose panicles, with central axis erect and scarcely branched; leaves entire and apiculate at apex; otherwise similar to above [2. portulacifolium](#)

1. **Talinum triangulare** (*Jacq.*) *Willd.*-von Poellnitz in Fedde Rep. 35: 15 (1934); Chev. Fl. Viv. 1: 340.

APD acc

Portulaca triangularis *Jacq.* (1760).

Talinum crassicaule (*Jacq.*) *Willd.* (err. crassifolium)—F.T.A. 1: 150.

Erect herb with fleshy leaves, woody below; flowers pink, rarely white; capsule straw-coloured; **a naturalized weed, sometimes cultivated.**

Sen.: Dakar Chev. 33842. **S. L.:** Regent (Apr.) Sc. Elliot 5790! Bendu, Jemmi (Apr.) Deighton 1726! **Iv. C.:** Assikasso (Dec.) Chev. 22577! **G. C.:** Aburi (Oct.) Johnson 235! Waste places in warm countries.

POLYGONACEAE

Herbs, shrubs or climbers, rarely trees: leaves alternate, with the base of the petiole often dilated into a membranous sheath (ochrea). Flowers hermaphrodite, polygamous or dioecious, actinomorphic, small and inconspicuous. Sepals 3–6, imbricate, often enlarged and becoming membranous in fruit. Petals absent. Stamens usually 6–9, rarely more; filaments free or united at the base; anthers 2-celled, opening lengthwise. Disk annular or central. Ovary superior, sessile, 1-celled; styles 2–4, usually free; ovule solitary, basal, sessile or stalked. Fruit an indehiscent trigonous or 2-sided nut. Seeds with abundant mealy endosperm and often excentric embryo.

A cosmopolitan family.

Recognized by the alternate simple leaves with sheathing ochrea stipules, small apetalous flowers, often persistent enlarged sepals, 1-celled 1-ovuled ovary, and endospermic seeds.

- 1 Flowers unisexual; the male in lax panicles, with 20–30 stamens, inserted on a central disk; inner female sepals enlarged, enclosing the fruit and becoming pyramidal and trigonous; dioecious tree or shrub [1. *Symmeria*](#)
Flowers hermaphrodite or polygamous; stamens 5–8; inner sepals not as above: **2**
- 2 Liane with tendrils; leaves without a membranous sheath; pedicels with a broad wing on each side, elongating in fruit [2. *Afrobrunnichia*](#)
Herbs, erect or scandent, without tendrils; leaves with a membranous sheath (ochrea); pedicels not winged: **3**
- 3 Sepals unequal, the inner much enlarged and membranous in fruit; ochrea not bristly; leaves often cordate in our species: **4**
Sepals subequal; flowers 5– (rarely 4–) merous; fruits enclosed by the sepals; ochrea often with long bristles at apex; leaves never cordate in our species [5. *Polygonum*](#)
- 4 Flowers 3-merous; fruits without marginal setae, enclosed by the enlarged sepals [3. *Rumex*](#)
Flowers 5-merous; fruits with long barbed setae on the angles, longer than the enlarged sepals [4. *Harpagocarpus*](#)

Besides the above indigenous genera, *Antigonon leptopus* Hook. & Arn., a native of Mexico, is often met with; it is widely cultivated as an ornamental and is known as "Corallita."

1. SYMMERIA

Benth.—F.T.A. 6, 1: 118.

- 1 A dioecious tree or shrub; leaves almost amplexicaul, elliptic, more or less cordate at base, rounded at apex, 15–20 cm. long, 6–9 cm. broad, with about 12 lateral nerves, reticulate on both surfaces; petiole 1.5 cm. long, winged on the upper side, the wings overlapping; male inflorescence minutely rusty puberulous, up to about 20 cm. long, female inflorescence much smaller; fruits enclosed by the enlarged trigonous calyx, about 1.5 cm. long and 0.8 cm. broad [paniculata](#)

***Symmeria paniculata* Benth.**—F.T.A. 6, 1: 118. *APD acc*

Small tree or shrub, to 20 ft. high, with wide trunk; fruiting sepals yellow; by river banks.

Jan.) Millen 140! Okomu F.R. (fr. Feb.) Brenan 9030! Oban Talbot! Aboabam (Dec.) Keay FHI 28174!

Also in [French Cameroons](#), [Gabon](#) and [Belgian Congo](#).

3. RUMEX

Linn.—F.T.A. 6, 1: 114

- 1 Leaves hastate, more or less triangular, acuminate, 6–15 cm. long, up to 15 cm. broad; flowers in large much-branched panicles; persistent perianth segments entire, membranous, reticulate [1. abyssinicus](#)
- Leaves lanceolate, more or less narrowed at base, never hastate, up to 30 cm. long and 5 cm. broad; persistent perianth segments with pectinate hooked teeth [2. bequaerti](#)

1. *Rumex abyssinicus* *Jacq.*—F.T.A. 6, 1: 114. *APD acc*

Herb with stout perennial rootstock, 1 in. diam.; stems annual, up to several feet high.

N. Nig.: Bauchi Plateau (May) Lely P. 251! Hephama to Ropp (fl. & fr. July) Lely 367! **Br. Cam.:** Buea (fr. Jan.) Maitland 297! Cam. Mt., 4,000–7,600 ft. (fl. & fr. Nov.–Jan.) Mann 1217! 1978! Maitland 968! 1289! Bamenda, 5,500 ft. (fr. Jan.) Migeod 404!

Widespread in East, Central and South tropical Africa, and in Madagascar.

2. *Rumex bequaerti* *De Wild.* Pl. Bequaert. 5: 2 (1929); Robyns in Fl. Congo Belge 1: 400.

APD: *Synonym of Rumex nepalensis Spreng.*

Rumex nepalensis of F.T.A. 6, 1: 117 and F.W.T.A., ed. 1, 1: 120, not of Spreng.

Perennial herb, with stems 3–6 ft. high.

Br. Cam.: Cam. Mt., 5,800–9,000 ft. (fl. & fr. Nov.–Jan.) Mann 1235! 1990! Maitland 825! 967! 1276! Bamenda, 5,000 ft. (fl. & fr. Jan.–Mar.) Maitland 1614! Migeod 307!

Widespread in East, Central and South tropical Africa, and in Madagascar and S. Africa.

4. HARPAGOCARPUS

Hutch. & Dandy in Kew Bull. 1926: 363.

- 1 Scandent or weakly erect herb; leaves sagittate, the lower ones ovate-triangular up to 8 cm. long and 3 cm. broad, the upper linear-lanceolate; petiole slender, up to 5 cm. long; flowers in slender terminal and axillary racemes up to 15 cm. long; flowers 1 or 2 together; sepals 5, obovate, unequal, up to 3.5 mm. long and 2.5 mm. broad; ovary and fruit trigonous, fruit about 8 mm. long, with 2 mm. long setae on the angles, setae barbed at the tip with several backwards-directed barbs arranged in a radiate manner[snowdenii](#)

Harpagocarpus snowdenii *Hutch. & Dandy* in Kew Bull. 1926: 363, with fig.

APD: Synonym of Fagopyrum snowdenii (Hutch. & Dandy) S. P. Hong

Fagopyrum ciliatum *Jac.-Fel.* in Bull. Mus. Hist. Nat. 18: 409 (1946).

A "Rumex-like" plant, weakly erect or scandent, to 3 ft. high; flowers green; fruits with red or purple barbed setae.

Br. Cam.: Bamenda Prov.: Lakom, 6,000 ft. (Apr.) Maitland 1491! Basenako, 5,000 ft. (June) Maitland 1503! Ndu, 6,400 ft. (Jan.) Keay FHI 28441!

Also in **French Cameroons**, **Belgian Congo**, **Uganda** and **Tanganyika**.

5. POLYGONUM

Linn.—F.T.A. 6, 1: 103; A. N. Steward in Contrib. Gray Herb. Harv. 88 (1930).

- 1 Flowers arranged in axillary clusters or small heads; stems more or less prostrate:2
Flowers arranged in spike-like racemes or panicles:3
- 2 Leaves oblong or linear-oblong, subsessile, acute, 5–10 mm. long, 2–3 mm. broad, with revolute margins; ochrea more or less lacerate, white; flowers solitary or in axillary clusters; nutlet smooth and shining[1. plebeium](#)
Leaves ovate, about 1.5–2 cm. long and 1–1.5 cm. broad, narrowed into a winged petiole; ochrea entire, brownish; flowers in pedunculate clusters; nutlets closely pitted[2. nepalense](#)
- 3 Ochrea with a spreading or recurved herbaceous ciliate limb, long-pilose on the outside; leaves linear-lanceolate, up to 10 cm. long and 2 cm. broad, pubescent on nerves beneath or glabrous; racemes densely flowered[3. limbatum](#)
Ochrea without a spreading limb:4
- 4 Racemes very short, not more than 2 cm. long, borne on a dichotomously branched, glandular-pubescent rhachis; stems with recurved hairs or glabrous; ochrea membranous, glabrous except for the shortly ciliate apex; leaves lanceolate, cuneate at base, acute at apex, up to 15 cm. long and 2.5 cm. broad . [4. strigosum var. pedunculare](#)
Racemes elongated, much exceeding 2 cm. long:5
- 5 Leaves densely pilose, or woolly beneath:6
Leaves glabrous or rather sparingly pubescent beneath:7
- 6 Leaves white and woolly beneath with the hairs closely matted together; leaves lanceolate, 10–30 cm. long, 2–5 cm. broad, narrowed at base into a 2–4 cm. long petiole, acutely acuminate at apex; cilia at apex of ochrea absent or very small and weak[5. lanigerum var. africanum](#)
Leaves silky-pilose beneath, the hairs not closely matted together; leaves linear-lanceolate to lanceolate, 8–25 cm. long, 1–5 cm. broad, petiole up to 1 cm. long; cilia at apex of ochrea very long and conspicuous[6. pulchrum](#)
- 7 Ochrea without, or with very small and few, cilia at apex, 3–4 cm. long; leaves elongate ovate-lanceolate, about 15–20 cm. long and 3–5 cm. broad, long-cuneate at base, long-acuminate at apex, glandular-punctate on both surfaces, glutinous, more or less shortly appressed pubescent especially on midrib and nerves, margins ciliate[7. senegalense](#)
Ochrea with distinct long cilia at apex; leaves not glandular punctate and glutinous:8
- 8 Leaves glabrous beneath except on the margin and midrib, linear-lanceolate, up to 15 cm. long and 1.5 cm. broad, rather abruptly narrowed into the short petiole; inflorescence lax and slender, flowers not densely crowded; nutlets trigonous[8. salicifolium](#)
Leaves pubescent beneath; inflorescence with rather dense clusters of flowers; nutlets usually lenticular:9
- 9 Peduncles glabrous or glabrescent; leaves lanceolate to ovate-lanceolate, 6–18 cm. long, 2–5 cm. broad,

appressed pubescent beneath with crisped hairs [9. nyikense](#)

Peduncles appressed pubescent; leaves linear-lanceolate to lanceolate 8–18 cm. long, 1–3.5 cm. broad, appressed pubescent beneath with straight hairs [10. acuminatum](#)

1. *Polygonum plebeium* R.Br.—F.T.A. 6, 1: 105; Chev. Bot. 537. *APD acc*

Much-branched prostrate herb of **dry regions**; flowers pinkish-red or white; a very variable species.

Sen.: Roger 16! **Fr. Sud.:** Sikasso (Apr.) Chev. 749! Mopti Hagerup 701. Diafarabé (May) Lean 24! **N. Nig.:** Katsina (Apr.) Meikle 1365!

Widely distributed in the drier parts of Africa and tropical Asia; and in Australia.

2. *Polygonum nepalense* Meisn. Monogr. Polygon. 84 (1826); Steward in Contrib. Gray Herb. Harv. 88: 74 (1930).

APD: Synonym of Persicaria nepalensis (Meisn.) H. Gross

***Polygonum punctatum* var. *alatum* Buch.-Ham. ex D. Don** (1825).

***Polygonum alatum* (Buch.-Ham. ex D. Don) Spreng.** (1827); F.T.A. 6, 1: 104; F.W.T.A., ed. 1, 1: 120.

Annual, **by streams in forest**; flowers white.

F. Po: 7,500 ft. (Apr.) Mann 1449! Moka (Jan.) Exell 772!

Also in **central** and **east tropical Africa**, **Madagascar** and **eastern Asia**.

3. *Polygonum limbatum* Meisn.—F.T.A. 6, 1: 108; Chev. Bot. 537.

APD: Synonym of Persicaria limbata (Meisn.) H. Hara

Perennial, 3–4 ft. long, more or less ascending; **in swamps and ditches**.

Fr. Sud.: Sébi to Mopti (Aug.) Chev. 3459. **Fr. Nig.:** Zinder (Oct.) Hagerup 580! **N. Nig.:** Suri, Sokoto (July) Bakare FHI 5181! Katagum (Sept.) Dalz. 149! Komadugu Waube, Bornu (Dec.) Elliott 140!

Widespread in tropical Africa, and in **Egypt** and India.

4. *Polygonum strigosum* var. *pedunculare* (Wall. ex Meisn.) Steward l.c. 91 (1930).

APD: Synonym of Persicaria glomerata (Dammer) S. Ortíz & Paiva

***Polygonum pedunculare* Wall. ex Meisn.**—F.T.A. 6, 1: 107; F.W.T.A., ed. 1, 1: 120; Chev. Bot. 537.

Annual herb, erect or semidecumbent.

Fr. G.: Dalaba, Diaguissa, 3,500–4,000 ft. (Oct.) Chev. 18798. **N. Nig.:** Bauchi Plateau (Sept.) Lely P. 734!

Widespread in tropical Africa, Asia and Australia.

5. *Polygonum lanigerum* var. *africanum* Meisn. in DC. Prod. 14: 117 (1856).

APD: Synonym of Persicaria senegalensis f. albotomentosa (R.A. Graham) K. L. Wilson

Polygonum lanigerum of F.T.A. 6, 1: 109; F.W.T.A., ed. 1, 1: 120; Chev. Bot. 537.

Stout perennial, 5–6 ft. long; aquatic.

Gam.: Ingram! **Fr. Sud.:** Mopti (May) Hagerup 71! Diafarabé (Sept.) Lean 99! Berra (Nov.) De Wailly 4863! **Fr. G.:** Kankan (Mar.) Chev. 591! R. Niger, Dantilia Sc. Elliot 5265! **S. L.:** R. Waanje, Dama (Jan.) Adames 8! **Iv. C.:** fide Chev. l.c. **G. C.:** R. Afram (Jan.) Irvine 610! Tamale (Nov.) Williams 400! **N. Nig.:** Sokoto (Oct.) Moiser 119! Lely 106! Bauchi Plateau (Jan., June) Lely 323! P. 133! L. Chad. (Dec.) Elliott 156! Talbot 1498! **S. Nig.:** Olokemeji (Dec.) Latilo FHI 14654! Aboh Barter 175!

Throughout tropical and S. Africa; the species also occurs in N. Australia.

The Asiatic plant previously referred to *P. lanigerum* is regarded by Steward (l.c. 46) as *P. lapathifolium* Linn. var. *lanatum* (Roxb.) Steward. *S. Ortíz & Paiva*

APD: Synonym of Persicaria lapathifolia (L.) Delarbre

Perennial with long rhizome; stems 4–5 ft. long; in swamps and by rivers.

S. L.: Kambia (Dec.) Deighton 902! Fawkaw, Great Scarcies (Apr.) Glanville 256! Messima (Apr.) Adames 32! Rokupr (Apr.) Adames 178! **G. C.:** Essiama Fishlock 89! **Togo:** Kpedsu (Feb.) Howes 1126! **Dah.:** fide Chev. l.c. **S. Nig.:** Lagos Moloney! Nun R. (Sept.) Mann 493! Okomu F. R. (Dec.) Brenan 8586!

Widespread in tropical Africa and Asia.

7. Polygonum senegalense Meisn.—F.T.A. 6, 1; 111; Chev. Bot. 537.

APD: Synonym of Persicaria senegalensis (Meisn.) Soják

Polygonum glabrum of F.T.A. 6, 1: 113; F.W.T.A., ed. 1, 1: 120; Chev. Bot. 537; not of Willd.

Perennial, erect or semi-decumbent, 3–9 ft. high, in riverbeds, swamps, etc.; flowers pink and white.

Sen.: Roger 21! Döllinger! **Gam.:** Pirie 43! **Fr. Sud.:** Fafa Hagerup 426! **G. C.:** Aburi (Sept.) Johnson 1080! **Fr. Nig.:** Niamey to Gao Ryff! **N. Nig.:** Sokoto (Nov.) Moiser 223! Katagum (July) Dalz. 150! Bauchi Plateau (May) Lely 226! R. Kaduna, Bida (Mar.) Meikle 1327! **S. Nig.:** Badagry (Dec.) Don! R. Ogun, Lagos Millen 136!

Throughout tropical Africa and in Egypt.

[P. glabrum Willd. of Asia is very similar but has absolutely glabrous leaves with eciliate margins.] (See Appendix, P. 32.)

8. Polygonum salicifolium Brouss. ex Willd. Enum. Pl. Hort. Berol. 428 (1809).

APD: Synonym of Persicaria decipiens (R. Br.) K. L. Wilson

Polygonum serrulatum lag. (1816)—F.T.A. 6, 1: 107; F.W.T.A., ed. 1, 1: 120; Chev. Bot. 537.

Polygonum barbatum of Chev. Bot. 536, not of Linn.

Annual, 3–4 ft. long, erect or semi-decumbent; flowers pink and white; in marshy places.

Sen.: Roger! Döllinger! **Gam.:** Kuntaur Ruxton 95! **Fr. Sud.:** fide Chev. l.c. **Fr. G.:** Kouroussa (July) Pobéguin 343! **S. L.:** Kambia (Dec.) Sc. Elliot 4352! Deighton 843! Port Loko (Dec.) Thomas 5838! Rokupr (Mar.) Adames 163! **Lib.:** R. Cess, Tchian (Aug.) Baldwin 9007! Vonjama (Oct.) Baldwin 9866! **Iv. C.:** fide Chev. l.c. **G. C.:** E. Ancobra (Jan.) Irvine 1082! **Togo:** Kpandu Robertson 41! **N. Nig.:** Sokoto (Sept.) Moiser! Nupe Barter 1551! Ilorin (Aug.) Thornton! Bauchi Plateau (Jan., May, July) Lely 365! 430! P. 132! P. 260! **S. Nig.:** Lagos Rowland! Akinjare, Owo (Apr.) Jones FHI 3121! **Br. Cam.:** Amba Bay (Feb.) Mann 762! Bali, Bamenda (May) Ujor FHI 30387!

Widespread in the tropics and S. Europe.

9. Polygonum nyikense Bak. in Kew Bull. 1897: 280.

APD: Synonym of Persicaria setosula (A. Rich.) K. L. Wilson

Polygonum acuminatum of F.T.A. 6, 1: 112, partly.

Perennial herb, decumbent below, to 3 ft. high.

Br. Cam.: Cam. Mt., 4,400 ft. (Apr.) Maitland 1115! **F. Po:** Guinea 1600! Moka (Jan.) Exell 793!

Widespread in central and east Africa, extending to Nyasaland.

[An unmatched specimen from Bamenda (Tamajong FHI 23458) is near this, but has distinctive long narrow inflorescences; further material may show this to be a distinct species.]

10. Polygonum acuminatum H.B. & K.—F.T.A. 6, 1: 112.

APD: Synonym of Persicaria madagascariensis (Meisn.) S. Ortiz & Paiva

Polygonum barbatum of F.T.A. 6, 1: 109, partly, not of Linn.

Perennial, erect or semi-decumbent, 3–4 ft. high; in moist places.

S. L.: Falaba (Mar.) Sc. Elliot 4454! R. Scarcies (Jan.) Sc. Elliot 4498! R. Bum-Kittam, Gbap (Sept.) Fisher 1767! Laminaiya (Apr.) Thomas 139! **G. C.:** Tamale (Nov.) Williams 403! **N. Nig.:** Nupe Barter 874! S. Kano (Dec.) Thornehill

147! Bauchi Plateau (May, July) Lely 200! P. 371! L. Chad Talbot 695! Yola (Mar.) Dalz. 209! **S. Nig.:** Olokemeji (Aug.) Foster 338! Onitsha (Feb.) Jones FHI 720!

Widespread in tropical and S. Africa and in tropical America.

The field worker should look out for possible hybrids which sometimes occur in this genus.

Polygonum baldschuanicum Regel

A native of central Asia, is sometimes cultivated in our area.

ILLECEBRACEAE

Herbs, rarely subshrubs. Leaves mostly opposite, small, simple, often connate at the base, mostly entire; stipules scarious, simple or connate, rarely absent. Flowers small, herbaceous, green or white, often with scarious bracts, mostly hermaphrodite, actinomorphic. Calyx herbaceous or leathery, persistent, 4–5-lobed or parted, lobes imbricate. Petals absent or sometimes replaced by small staminodes. Stamens the same number as and opposite the calyx-lobes, rarely fewer or more, mostly perigynous; filaments free or connate at the base into a ring; anthers 2-celled, opening lengthwise. Ovary free, sessile, 1-celled; style 1, terminal, or styles 2–3; ovule 1, rarely 2, erect or pendulous from a basal funicle. Fruit a utricle or nut, mostly indehiscent, 1-seeded, included by the calyx. Seed with copious or small endosperm; embryo annular to straight.

CORRIGIOLA

Linn.—F.T.A. 6, 1: 12.

Perianth herbaceous 5-partite, segments oblong, obtuse. Stamens 5, perigynous, alternating with 5 scale-like staminodes. Ovary ovoid; style very short; stigmas 3; ovule 1, amphitropous, suspended from a basal funicle. Fruit an indehiscent crustaceous nutlet enclosed in the persistent perianth. Seed subglobose, pendulous; embryo annular.

- 1 Annual or biennial, stems 3–6 cm. long, close to the ground, forming a clump 6–12 cm. diam.; leaves alternate, closely arranged, oblong, 2–2.5 mm. long, 1 mm. broad, narrowed at base into a petiole scarcely 0.5 mm. long; stipules scarious, very small; flowers in congested cymes in the axils of the upper leaves, about 0.7 mm. diam.; borne on pedicels 0.3–0.5 mm. long; fruit about 1 mm. diam. [russelliana](#)

Corrigiola russelliana A. Chev. in Bull. Mus. Hist. Nat. Sér. 2, 4: 1008 (1932); Pax & Hoffmann in E. & P. Pflanzenfam. 16C: 299 (1934); Chev. Fl. Viv. 1: 316.

APD: *Synonym of Corrigiola litoralis L. var. litoralis*

Sen.: R. Diorbivol Trochain 2914. **Fr. Sud.:** Niala, Djenne (fl. & young fr. June) Chev. 1131. R. Bani, Djenne Chev. 42945; s.n.!

PHYTOLACCACEAE

Herbs, shrubs or trees. Leaves alternate, entire; stipules absent or minute. Flowers hermaphrodite or unisexual, actinomorphic or nearly so, hypogynous, in simple or compound terminal or axillary racemes. Perianth simple, herbaceous or coriaceous. Sepals free or some connate, imbricate, equal or unequal. Petals absent. Stamens 3 to many, often inserted on a hypogynous disk; filaments free or slightly connate at the base; anthers 2-celled, cells parallel and dehiscing longitudinally. Ovary superior, composed of 1 or several carpels either free or variously connate; style almost none or short; ovule solitary in each carpel, basal. Fruit of 1 or many carpels, fleshy or dry. Seed erect, with the large embryo in the periphery and enclosing the endosperm.

- 1 Liane, dioecious; sepals equal; carpels usually 5, connate at base; fruit fleshy, usually 5-lobed [1. Phytolacca](#)
Erect herb, flowers hermaphrodite; sepals unequal, the lower one the largest; carpel 1; fruit dry [2. Hilleria](#)

***Petiveria alliacea* Linn.**

A herb from the West Indies and tropical America, occurs at Lagos and Olokemeji in Nigeria as a casual.

1. PHYTOLACCA

Linn.—F.T.A. 6, 1: 96.

- 1** Dioecious liane; older branches marked with prominent callous leaf-scars; leaves elliptic or ovate-elliptic, shortly cuneate or rounded at base, acute or acuminate at apex, 4–15 cm. long, 2–10 cm. broad, thinly papery, glabrous, petiole 1–5 cm. long; racemes Blender up to 40 cm. long, pedicels 2–12 mm. long; male flowers with about 15 stamens up to 5 mm. long; female flowers with short rudimentary stamens, carpels usually 5, connate at base; fruits usually 5-lobed, about 5 mm. diam. [dodecandra](#)

Phytolacca dodecandra *L'Hérit.*—F.T.A. 6, 1: 97; H. Walt. in Engl. Pflanzenr. Phytolacc. 42; Chev. Bot. 536. *APD acc*

Scandent shrub or liane, to 50 ft. high; male flowers white or yellowish-green, in numerous conspicuous racemes; ripe fruits red.

Fr. G.: Labé Pobéguin 2041! **S. L.:** Talla Hills (Feb.) Sc. Elliot 4827! **Iv. C.:** Haut-Cavally (May) Chev. 21392. **G. C.:** Larte (Jan.) Johnson 178! **S. Nig.:** Lagos Millen 62! Ibadan (fr. Mar.) Meikle 1271! Ife (Dec.) Keay FHI 22461! Benin (Nov.) Ejiofor FHI 24650! Degema Talbot 3800! **Br. Cam.:** Lakom, Bamenda (Mar.) Johnstone 98/31!

Widespread in tropical and S. Africa, and in **Madagascar**.

Two incomplete specimens which may prove to be two other species of *Phytolacca* have been collected at Gama, Sierra Leone (Deighton 4384) and at Buea, British Cameroons (Maitland 547).

The plant recorded as *P. octandra* Linn. in F.T.A. 6, 1: 98 is *Sphenoclea zeylanica* Gaertn.

2. HILLERIA

Vell.—F.T.A. 6, 1: 95, as *Mohlana* Mart.

- 1** Herb up to 1 m. high; leaves ovate-elliptic, obtuse or subacute at the base, acutely acuminate, up to 15 cm. long and 6 cm. broad, entire, with numerous short lines of crystals resembling appressed hairs on the lower surface; lateral nerves about 6 on each side; petiole long, with setulose hairs on the upper side; racemes slender, up to about 12 cm. long; fruit ellipsoid-globose, about 2 mm. in diam., reticulate, glabrous [latifolia](#)

Hillieria latifolia (*Lam.*) *H. Walt.* in Engl. Pflanzenr. Phytolacc. 81, t. 25 (1909). *APD acc*

Rivina latifolia *Lam.* (1791).

Mohlana nemoralis *Mart.*—F.T.A. 6, 1: 95; Chev. Bot. 535.

M. guineensis *Moq.*—Chev. Bot. 535.

Perennial herb, often woody below; corolla white in a yellow or pinkish raceme; fruits yellow or orange, then deep purplish-black. **Naturalized in cultivated ground and along forest paths near villages in the forest regions.**

Lib.: Webo Dist. (July) Baldwin 6236! 6603! **Iv. C.:** fide Chev. l.c. **G. C.:** Kumasi Cummins 54! Aburi (Apr.) Brown 324! Achimota (Aug.) Irvine 12! **Togo:** Lome Warnecke 427! **S. Nig.:** Lagos Millen 92! Olokemeji (Apr.–July) Foster 283! MacGregor 296! Sapoba (May) Kennedy 1413! Oban Talbot 661! **Br. Cam.:** Amba Bay (Feb.) Mann 775! Kumba (Apr.) Hutch. & Metcalfe 160!

A native of S. America, naturalized in many parts of tropical Africa and Mascarene Islands.

CHENOPODIACEAE

Mostly annual or perennial herbs, sometimes shrubs, rarely small trees, often halophytic and with tendency to fleshiness. Leaves alternate, rarely opposite, simple, without stipules, entire or not, but characteristically never regularly serrate; sometimes the leaves reduced to scales. Flowers small to

minute, mostly green to grey, solitary and axillary, or more often variously clustered, usually regular, hermaphrodite or unisexual. Calyx (1–) 2–5-lobed, lobes more or less united below, imbricate or almost valvate, persistent after flowering, or variously modified in fruit. Petals absent. Stamens as many as or fewer than sepals, and opposite them. Ovary normally free and superior, one-celled. Stigmas 2 (–5). Ovule solitary, campylotropous, on a long or short almost always basal funicle. Fruit usually utricular, indehiscent, rarely circumscissile, often included in and falling with the calyx. Embryo peripheral, curved, annular or spiral, surrounding the endosperm, which may be absent.

Mostly weeds, or desert or maritime plants.

Often with fleshy leaves or apparently jointed fleshy stems; flowers usually very small and inconspicuous; embryo curved, usually surrounding the endosperm. Material of most of the West African genera is inadequate or lacking at Kew. Dried specimens of the fleshy genera should be supplemented by portions of the flowering branches in spirit, and by careful notes on habit and colour of the plants.

- 1 Leaves with flat and fairly large blade, distinctly petiolate, glandular or mealy on the surface ... [1. *Chenopodium*](#)
 Leaves small, linear, cylindrical, short and triangular or globose, or else the stem and branches appearing jointed, the leaves apparently absent: [2](#)
- 2 Stem and branches not appearing as if built up of succulent jointed sections: [3](#)
 Stem and branches apparently built up of succulent green to reddish jointed sections which ultimately shrivel and fall away, each joint derived from the connate sheathing bases of a pair of opposite leaves whose lamina is absent: [5](#)
- 3 Leaves cylindrical or subcylindrical; calyx not winged in fruit, flowers not in dense spikes [2. *Suaeda*](#)
 Leaves triangular to subglobose, short: [4](#)
- 4 Calyx with spreading membranous wings in fruit; plant more or less pubescent, at least on youngest shoots [3. *Salsola*](#)
 Calyx not winged in fruit; plant glabrous [4. *Halopeplis*](#)
- 5 Seeds glabrous; flowers in each group of three not fused with each other, more or less tubular, their calyces not conspicuously flattened at apex; embryo comma-shaped, along one side of the seed; endosperm copious, latera [5. *Arthrocnemum*](#)
 Seeds shortly hairy; flowers in each group of three more or less connate, their calyces flattened at apex; embryo folded like a closed U, filling the seed; endosperm absent or almost so [6. *Salicornia*](#)

1. CHENOPODIUM

Linn.—F.T.A. 6, 1: 77.

- 1 Plant more or less mealy, at least on young parts, with grey or whitish vesicular hairs, not aromatic, other sorts of hair and also glands absent; ripe seeds black when ripe, 1.2–1.5 mm. diam., acutely keeled [1. *murale*](#)
 Plant variably pubescent, and with yellow to amber glands, strongly aromatic, vesicular hairs absent; ripe seeds red-brown to blackish, 0.5–1.25 mm. diam., bluntly keeled [2. *ambrosioides*](#)

1. *Chenopodium murale* *Linn.*—F.T.A. 6, 1: 78; Trochain Contilb. Étude Vég. Sénégal 367 (1940). *APD acc*

Annual normally much-branched herb up to 3 ft. high, with mostly rhombic-ovate leaves and minute greenish flowers in divaricately branched leafy cymes.

Sen.: fide Trochain l.c.

Widespread both in the tropics and in temperate countries.

2. *Chenopodium ambrosioides* *Linn.*—F.T.A. 6, 1: 79.

Annual, sometimes perennial herb to 4 ft. high, with mostly lanceolate leaves and an ample panicle with small sessile flower-clusters arranged spicately along the ultimate branches.

Sen.: Cayor Poisson! *G. C.*: Aduamoa, Kwahu (Jan.) Irvine 1725! *S. Nig.*: Olokemeji (Feb.) Dodd 412! *Br. Cam.*: Buea (Oct.) Maitland 113!

Native of S. America, now widespread as a weed, except in cold countries.

Imperfectly known species.

Chenopodium sp.

Apparently herbaceous, glabrous except for yellowish-white vesicular hairs, especially on young parts; leaves narrowly elliptic in outline, sinuate-lobate, about 1.5–3 cm. long; flowers in small axillary clusters, only female known; sepals 4, vesicular-hairy, bluntly keeled near apex; seed vertical 1 mm. in diameter, somewhat compressed laterally.

Br. Cam.: Nchan, Bamenda, "about cultivation" (Apr.) Maitland 1512!

This is no previously known species of *Chenopodium*; more material, especially to show the other sex, is much needed.

2. SUAEDA

Forsk. ex Scop. Introd. Hist. Nat. 333 (1777); F.T.A. 6, 1: 91.

- 1 Shrubby perennial; leaves obtuse at apex, abruptly contracted at base; stigmas 3; seeds mostly vertical[1. *fruticosa*](#)

Annual; leaves tapering and acute at apex, not abruptly contracted at base, stigmas 2; seeds horizontal[2. *maritima*](#)

1. **Suaeda fruticosa** *Forsk. ex J. F. Gmel.* Syst. Nat., ed. 13, 2: 503 (1791); *Forsk. Fl. Aegypt.-Arab.* 70 (1775), nomen illegitimum; *Trochain Contrib. Étude Vég. Sénégal* 116, 384 (1940); *Clapham, Tutin & Warburg Fl. Brit. Isl.* 360 (1952).

APD: *Synonym of Suaeda vermiculata Forssk. ex J.F. Gmel.*

Erect or ascending, up to 4 ft.; leaves succulent, 4–11 (–18) mm. long, about 1 mm. wide, almost cylindrical; flowers axillary, sessile, one to few together.

Sen.: St. Louis Gandiole region, by lagoons near the shore fide *Trochain l.c.*

Coasts of Europe (including Britain) and the Mediterranean region, extending to Asia, Australia and N. America; in Africa southwards to S. Africa.

2. **Suaeda maritima** (*Linn.*) *Dumort* Fl. Belg. 22 (1827); *Trochain l.c.* 114, 384, t. 4, photo 366 (1940); *Clapham, Tutin & Warburg l.c.* 359 (1952). *APD acc*

Chenopodium maritimum *Linn.* Sp. Pl. 221 (1753).

Prostrate to erect, up to about 2 ft. high; leaves often wider than in *S. fruticosa*, otherwise the two species rather similar.

Sen.: L. Retba fide *Trochain l.c.*

Widespread along sea coasts.

3. SALSOLA

Linn.—F.T.A. 6, 1: 87.

- 1 Branchlets slender with distinct internodes, pubescent at first, becoming glabrous; leaves alternate, very small, triangular or ovoid, pubescent or glabrous, thinner at the margin; flowers crowded on short lateral branchlets, all forming a straggly panicle; calyx-segments with a spreading membranous wing on the back in fruit[1. *baryosma*](#)

Branchlets rather stout, closely hairy; leaves opposite, crowded, broadly triangular, thick, densely and softly tomentose; flowers forming spikes at the ends of the branchlets; calyx-segments as above[2. *tetrandra*](#)

1. **Salsola baryosma** (*Schult.*) *Dandy* in F. W. Andr. Fl. Pl. A.–E. Sudan 1: 111 (1950).

APD: Synonym of Caroxylon imbricatum (Forssk.) Akhani & Roalson

Chenopodium baryosmon Schult. Syst. 6: 269 (1820).

Salsola foetida Del. ex Spreng. Syst. 1: 925 (1825), not of Pall. ex Vest in Schult. Syst. 6: 238 (1820).

Salsola vermiculata var. *microphylla* of F.T.A. 6, 1: 88, not of Moq.

Salsola brevifolia of F.W.T.A., ed. 1, 1: 123, not of Desf.

A much-branched undershrub 1–4 ft. high.

Sen.: Sor Isl. Roger! **Fr. Sud.:** Oualata region Jumelle!

Also in **N. Africa**, and extending eastwards to India.

2. *Salsola tetrandra* Forsk. Fl. Aegypt.-Arab. 58 (1775); Trochain Contrib. Étude Vég. Sénégal 119, 382 t. 5, photo 355 (1940).

APD: Synonym of Caroxylon tetrandrum (Forssk.) Akhani & Roalson

Salsola tetragona Del.—F.W.T.A., ed. 1, 1: 123.

Sen.: delta of the river inland almost as far as Richard Tol fide Trochain l.c.

Also in **N. Africa** and **E. Mediterranean**.

4. HALOPEPLIS

Bunge ex Ungern-Sternb.—F.T.A. 6, 1: 84.

- 1 An annual much-branched herb 3–15 (–22) cm. high; leaves small, fleshy, semiglobose, clasping, shorter than internodes; flowers in dense ovoid to cylindrical spikes 0.3–2 cm. long, 2–3 mm. wide, the spikes numerous, lateral, alternate, divaricate, towards ends of branches [amplexicaulis](#)

Halopeplis amplexicaulis (Vahl) Ungern-Sternb. ex Boiss. Fl. Or. 4: 934 (1876); Trochain Contrib. Étude Vég. Sénégal 116, 374 (1940). *APD acc*

Salicornia amplexicaulis Vahl Symb. Bot. 2: 1 (1791).

Sen.: Gandiole, in a salt-marsh with *Arthrocnemum glaucum*, fide Trochain l.c.

Also in the Mediterranean region, from Sardinia, Italy and Sicily to **Egypt**; in S. Africa, presumably Introduced.

5. ARTHROCNUM

Moq.—F.T.A. 6, 1: 85. *APD acc*

- 1 Shrubby perennial about 0.6–1 m. high, very much branched; inflorescence of dense, sometimes branched, spikes 1.5–17 cm. long and 4–5 mm. in diameter, terminal on stems and branches, or both terminal and lateral and often aggregated; spikes composed of imbricate annular bracts, each subtending two groups of three flowers which are more or less sunken in the spike; seeds glabrous, papillose, deep red-brown [glaucum](#)

Arthrocnemum glaucum (Del.) Ungern-Sternb. in Atti Congr. Int. Bot. Firenze 283 (1876); A. Chev. in Rev. Bot. Appliq. 2: 747 (1922); Trochain Contrib. Étude Vég. Sénégal, 116, 365, t. 5, photo 299 (1940); A. Chev. in Rev. Bot. Appliq. 27: 294 (1947).

APD: Synonym of Arthrocnemum macrostachyum (Moric.) K. Koch

Salicornia glauca Del. in Descr. Egypt., Hist. Nat. 2: 49 (1813).

Arthrocnemum pachystachyum A. Chev. in Rev. Bot. Appliq. 2: 747 (1922), not of (Bunge ex Ungern-Sternb.) A. Chev. (see Trochain l.c. 115).

Salicornia indica of F.W.T.A., ed. 1, 1: 123, not of Willd. (see Trochain l.c. 115).

Arthrocnemum indicum auct. fide A. Chev. in Rev. Bot. Appliq. 27: 294 (1947), not of (Willd.) Moq.

Very similar in appearance to *Salicornia fruticosa*.

Sen.: St. Louis (May-June) Chev. 3524; 3525. St. Louis Gandiole region fide Trochain l.c. 116. L. Retba, N. of Rufisque fide Trochain l.c. 114.

Widely distributed on seashores in the Northern Hemisphere.

6. SALICORNIA

Linn.—F.T.A. 6, 1: 86.

The identity of *S. europaea* Linn. recorded from L. Tanma by Trochain, Contrib. Étude Vég. Sénégal 114, 382, t. 4, photo 359 (1940), requires checking. Indeed Chevalier does not at all explain how *S. praecox* and *S. senegalensis* differ from the polymorphic *S. europaea*.

- 1 Shrubby perennial up to about 1 m. high; each group of three fruits after falling leaving three cavities side by side in the spike [1. fruticosa](#)
- Herbaceous annuals up to about 0.45 m. high; each group of three fruits after falling leaving three cavities in the spike arranged more or less in a triangle: [2](#)
- 2 Plant robust, 30–45 cm. high, much-branched, pyramidal in outline; flowering spikes 15–25 mm. long, with about 10–13 joints [2. senegalensis](#)
- Plant more slender, 10–20 cm. high, much-branched above, ovoid in outline: [3](#)
- 3 Flowering spikes short, 6–15 (–20) mm. long, with 4–8 joints [3. praecox var. praecox](#)
- Flowering spikes long, 30–40 mm., with 15–20 joints [3a. praecox var. longispicata](#)

1. *Salicornia fruticosa* (Linn.) Linn. Sp. Pl., ed. 2: 5 (1762).

APD: *Synonym of Arthrocnemum fruticosum* (L.) Moq.

APD: *Synonym of Sarcocornia fruticosa* (L.) A.J. Scott

Salicornia europaea var. *fruticosa* Linn. Sp. Pl., ed. 1: 3 (1753)

? *S. arabica* of A. Chev. in Rev. Bot. Appliq. 27: 294 (1947), not of Linn.

Very similar in appearance to *Arthrocnemum glaucum*.

Sen.: saline tracts near mouth of R. Senegal fide Chev. l.c.

Widely distributed along sea coasts.

2. *Salicornia senegalensis* A. Chev. in Rev. Bot. Appliq. 27: 292, t. 12A (1947). *APD acc*

Sen.: (July–Aug.) Jaeger. Hann, Dakar Chev.

3. *Salicornia praecox* A. Chev. var. *praecox*—l.c. 27: 292 t. 12B (1947). *APD acc*

Sen.: Hann, Dakar (Feb.) Chev.

Growing mixed with the last.

3a. *Salicornia praecox* var. *longispicata* A. Chev. l.c. 27: 294, t. 12B, 1 (1947). *APD acc*

Sen.: L. Tanma (Dec.) Chev. 3452.

AMARANTHACEAE

Annual or perennial herbs, rarely undershrubs or climbers; leaves alternate or opposite, simple, exstipulate. Flowers actinomorphic, usually hermaphrodite, small, in spikes, heads or racemes, with often scarious bracts and bracteoles, the latter sometimes hooked. Sepals 3–5, free or nearly so, imbricate, more or less dry and membranous. Petals absent. Stamens mostly 5, opposite the sepals, hypogynous; filaments united at the base into a short tube, often with staminodes between; anthers 1- or 2-celled, opening by longitudinal slits. Ovary superior, 1-celled; style short or long; stigma capitate

or 2–3-fid; ovules solitary or rarely several, on basal funicles. Fruit dehiscing by a lid or indehiscent. Seeds globose, compressed or ellipsoid, smooth; embryo annular, surrounding the copious endosperm.

Mainly in the tropics and subtropics, often occurring as weeds or escapes from cultivation.

Recognized by the herbaceous habit, the alternate or opposite leaves without stipules, the small inconspicuous often scarious flowers without petals, the definite stamens shortly connate at the base, the 1-celled ovary, and annular embryo with endosperm.

- 1 Leaves alternate; 2
 Leaves opposite; 6
- 2 Flowers glabrous or nearly so; staminodes absent; 3
 Flowers accompanied by numerous soft woolly hairs; staminodes present or absent: 5
- 3 Ovules several; fruit with several seeds [1. Celosia](#)
 Ovule solitary; 4
- 4 Cymules with 2 or more fertile flowers, not accompanied by reduced sterile flowers [2. Amaranthus](#)
 Cymules with only 1 fertile flower accompanied by two sterile flowers reduced to scales [3. Digera](#)
- 5 Stamines present; fertile stamens 4–5 [4. Aerva](#)
 Staminodes absent; fertile stamens 1–2; leaves sometimes opposite [6. Nothosaerva](#)
- 6 Inflorescences with long hooked spines on the sterile flowers: 7
 Inflorescences without hooked spines: 8
- 7 Stamines present [6. Cyathula](#)
 Staminodes absent [7. Pupalia](#)
- 8 Anthers 2-celled: 9
 Anthers 1-celled: 14
- 9 Flowers 2 or more together in a cymule subtended by a bract, 1–2 flowers fertile, the rest sterile: 10
 Flowers solitary in the axis of each bract: 11
- 10 Sterile flowers developing long feathery filaments up to 2 cm. long, fertile flowers 2 in each cymule; flowers in large panicles of slender spikes; large climbing herb or liane [8. Sericostachys](#)
 Sterile flowers without long filaments, fertile flower solitary in each cymule; flowers in dense cylindrical spikes; undershrub (C. pobeguinii) [6. Cyathula](#)
- 11 Flowers in terminal spikes; staminodes present: 12
 Flowers in very numerous axillary spikes 5–15 mm. long; staminodes absent; leaves sometimes alternate (see above) [5. Nothosaerva](#)
- 12 Leaves sessile or subsessile; flowers not becoming reflexed in fruit [9. Pandiaka](#)
 Leaves petiolate; flowers reflexed in fruit: 13
- 13 Bracteoles consisting of a long spine with a membranous wing on either side at its base; perianth-segments subequal; mostly terrestrial [10. Achyranthes](#)
 Bracteoles ovate-orbicular, not spiny; perianth-segments very unequal; stout aquatic herb [11. Centrostachys](#)
- 14 Spikes pedunculate, terminal, or terminating short lateral branchlets: 15
 Spikes sessile, axillary [14. Alternanthera](#)
- 15 Glabrous, succulent, maritime plant [12. Philoxerus](#)
 Hairy, non-succulent, terrestrial plant [13. Gomphrena](#)

1. CELOSIA

Linn.—F.T.A. 6, 1: 16; Schinz in E. & P. Pflanzenfam. 16C: 29 (1934).

- 1 Perianth-segments 6–10 mm. long, linear-lanceolate; style 3–7 mm. long, very shortly 2–3-fid; spikes simple, continuous, very dense-flowered; leaves linear to linear-lanceolate [1. argentea](#)
 Perianth-segments 2–5 mm. long, oblong to oblong-elliptic; style up to 1 mm. long; spikes compound and often interrupted, with short lateral clusters of flowers; leaves more or less ovate: 2
- 2 Seeds with very shallow reticulation, very glossy, flattened; inflorescence lax, flower-clusters rarely over 1 cm. broad; bracteoles and perianth-segments whitish, the latter 2–3 mm. long; style less than 0.5 mm. long, 3-fid [2.](#)

trigyna

- Seeds rather deeply reticulate, not glossy and not flattened:3
- 3 Inflorescence elongated and pedunculate:4
- Inflorescence globose, sessile or subsessile, mostly axillary *6. globosa*
- 4 Inflorescence crowded, 5–20 mm. broad; perianth-segments 3–5 mm. long; style 3-fid, rarely 2-fid:5
- Inflorescence lax, with a long rhachis and rather widely spaced, few-flowered glomerules, up to 5 mm. broad; bracteoles and perianth-segments brownish when dry, the latter 2–3 mm. long; style usually 2-fid *5. leptostachya*
- 5 Bracteoles and perianth-segments white or pale-yellowish, the latter 3–5 mm. long; large straggling plant to 3 m. high *3. laxa*
- Bracteoles and perianth-segments brownish, the latter 3 mm. long; herb up to 1 m. high *4. bonnivairii*

1. *Celosia argentea* Linn.—F.T.A. 6,1: 17. *APD acc*

Erect branched annual, 2–6 ft. high; flowering spike silvery-white, often pink-tinged. **Probably introduced and naturalized; often cultivated.**

S. L.: Njala (Feb.) Deighton 1872! Newton (Aug.) Deighton 2204! **Lib.:** Kakatown Whyte! **G. C.:** Aburi (Nov.) Brown 373! **Dah.:** Le Testu 130! **N. Nig.:** Nupe Barter 154! Ilorin (Mar.) Lamb 38! Biu (Sept.) Noble 29! Yola (Oct.) State 90! **S. Nig.:** Lagos Dawodu 61! Benin City Dennett 16!

Widespread in tropical Africa and Asia.

[The name *C. argentea* forma *cristata* (Linn.) Schinz (syn. *C. cristata* Linn.) has been applied to the frequent and varied taclated forms, some of which have yellow or red flowers and are cultivated.]

2. *Celosia trigyna* Linn.—F.T.A. 6, 1: 19; Chev. Bot. 527. *APD acc*

Laxly erect annual herb, decumbent below, 6–24 in. high, or straggling up a support to about 4 ft.; flowers white with pink stamens. **A frequent weed in waste places in savannah and forest regions.**

Sen.: Heudelot 120! Roger! **Gam.:** Pirie 56! **Fr. Sud.:** fide Chev. l.c. **Fr. G.:** Kouroussa (July) Pobéguin 338! **S. L.:** N'tunga, Samu (Dec.) Sc. Elliot 4331! Kambia (Dec.) Deighton 879! Buea (Jan., June) Maitland 38! 211! Tiko (Jan.) Dunlap 172! **F. Po:** (Dec.) Mann 80! T. Vogel 158!

Extends to A.–E. **Sudan, Belgian Congo, Angola** and Rhodesia.

4. *Celosia bonnivairii* Schinz in Vierteljahrschr. Nat. Gesell. Zurich 76: 133 (1931); Hauman in Fl. Congo Belge 2: 21 (1951). *APD acc*

APD: **Synonym of *Celosia pseudovirgata* Schinz**

Forest herb with brownish flower spikes; sometimes rooting at the nodes.

S. Nig.: Okomu F.R. (Jan.) Brenan 8839! **Br. Cam.:** Cam. Mt. (Apr.) Maitland 1082! Bali-Ngemba F.R., Bamenda (May) Ujor FHI 30351! **F. Po:** Moka (Jan.) Guinea 2190!

Also in **Belgian Congo**.

5. *Celosia leptostachya* Benth.—F.T.A. 6, 1: 23. *APD acc*

Weakly erect herb, 1–2 ft. high, or straggling, sometimes rooting at the nodes; flower spikes white, becoming brownish.

S. L.: Freetown (Aug.) Deighton 2067! Mamunta (Nov.) Deighton 4930! **S. Nig.:** Lagos (May) Dalz. 1253! Ibadan (Nov.) Newberry 159! Owo (Mar.) Jones FHI 3081! Ibuzo (Nov.) Thomas 2007! **F. Po:** (June) Barter! (Nov.) T. Vogel 141! Mt. Balea (Dec.) Guinea 340!

Also in **French Cameroons** and **Belgian Congo**.

6. *Celosia globosa* Schinz l.c. 76: 137 (1931). *APD acc*

Erect or straggling herb, branches to 30 in. long; flowers brownish-yellow.

S. Nig.: Oban Talbot 1283! **Br. Cam.:** Kumba Dist. (July) Olorunfemi FHI 30697!

Also in **Belgian Congo** and **Uganda**.

2. AMARANTHUS

Linn.—F.T.A. 6, 1: 30; Thellung in Asch. & Grabner Synopsis 5, 1: 225–356 (1914). *APD acc*

- 1 Plant with a pair of axillary spines; female perianth-segments 5, with sharp spiny tips; spikes elongated, mostly paniculate at the ends of the branches, often with globose clusters of flowers in the leaf-axils; fruit a circumscissile capsule [1. spinosus](#)
Plant without axillary spines: **2**
- 2 Fruit a circumscissile capsule: **3**
Fruit not circumscissile, indehiscent or tardily dehiscent into irregular pieces: **6**
- 3 Female perianth-segments 5: **4**
Female perianth-segments 3: **5**
- 4 Fruit and bracteoles longer than the oblong female perianth-segments; inflorescence terminal and axillary, often richly branched; leaves narrowly cuneate at base [2. hybridus subsp. cruentus](#)
Fruit shorter than the subequal bracteoles and linear-spathulate female perianth-segments; inflorescence terminal and axillary; leaves rhomboid-ovate, broadly triangular at base [3. dubius](#)
- 5 Perianth-segments 1–1.5 mm. long, shortly pointed; flower clusters up to 5 mm. diam., all axillary; leaves very variable in shape, from linear to obovate, blade up to 4 cm. long and 2 cm. broad, usually much less [4. graecizans](#)
Perianth-segments 2–3 mm. long, longly aristate; flower clusters 5–15 mm. diam., many axillary, but with an elongated spike of clusters, usually with the clusters separated; leaves ovate, up to 10 cm. long, petiole 2–6 cm. long [5. tricolor](#)
- 6 Fruit warted, 1–2 mm. long; flowers in slender spike-like racemes, terminal and axillary [6. viridis](#)
Fruit more or less smooth, 2–2.5 mm. long; flowers in axillary clusters and in terminal clusters which unite in a large thick pseudo-spike [7. lividus](#)

1. *Amaranthus spinosus* Linn.—F.T.A. 6, 1: 32; Thellung in Asch. & Grabner Synopsis 5, 1: 267 (1914); Chev. Bot. 528. *APD acc*

Erect annual herb, 1–3 ft. high; **a common weed**.

Sen.: Heudelot 735! **Gam.:** Kuntaur Ruxton! **Fr. Sud.:** fide Chev. l.c. **S. L.:** Freetown (June, Dec.) T. Vogel 13! Deighton 479! Sherbro Sc. Elliot 5834! Njala (Nov.) Deighton 1501! Katagum (Oct.) Dalz. 156! Yola (Aug.) Dalz. 203! **S. Nig.:** R. Ogbesse, Owo (Apr.) Jones FHI 3101!

Throughout tropical Africa, and in S. Europe, America and Asia.

3. **Amaranthus dubius** Mart. ex Thell.—Thell. l.c. 265. *APD acc*

Annual herb, 1–3 ft. high; **cultivated and as a weed.**

S. L.: Freetown (Dec.) Deighton 477! Njala (Apr.) Deighton 1887! Kambia (Sept.) Glanville 406! **S. Nig.:** Ibadan (Oct.) Newberry 142!

Widespread in tropical Africa and America.

4. **Amaranthus graecizans** Linn. Sp. Pl. 990 (1753); Chev. Bot. 528. *APD acc*

Amaranthus angustifolius Lam. (1783)-Thell. l.c. 298.

Amaranthus blitum of F.T.A. 6, 1: 35, partly, and of F.W.T.A., ed. 1, 1: 125, partly.

Amaranthus sylvestris of Chev. Bot. 528.

Amaranthus oleraceus of F.W.T.A., ed. 1, 1: 126, partly, not of Linn.

A variable weed, up to 2 ft. high.

Fr. Sud.: Lom (June) Chev. 1022! Timbuktu Hagerup 138! 171a! **G. C.:** Accra T. Vogel 21! **Togo:** Lome Warnecke 363! **N. Nig.:** Nupe Barter 1716! 1727! Kano (Dec.) Hagerup 652! Mamu (May) Lely 166! Katagum (Jan., July) Dalz. 160! 303! Near L. Chad (Jan.) E. Vogel 31! Golding 48!

Widespread in Africa, Europe and Asia.

Many variants are recognized and A. W. Kloos has named the following at Kew: T. Vogel 21, Barter 1727 & Dalz. 303 as *A. angustifolius* Lam. subsp. *aschersonianus* Thell. var. *pseudangustifolius* Thell.; Barter 1716 as subsp. *aschersonianus* Thell. var. *pseudo-silvester* Thell.; Hagerup 652 & Dalz. 160 as var. *silvester* (Desf.) Thell.; the remaining specimens as var. *angustifolius* (=subsp. *graecizans* (Linn.) Thell.).

5. **Amaranthus tricolor** Linn.—F.T.A. 6, 1: 32; Thell. l.c. 272. *APD acc*

Erect herb, 2–6 ft. high; leaves, stems and flowers green or red; **a cultivated spinach.**

S. L.: Freetown (Dec.) Deighton 3350!

Widespread in Africa, Asia and S. Europe.

The only record from our area has been named by A. W. Kloos as var. *tristis* (Linn.) Thell. forma *inamoenus* (Willd.) Thell.

6. **Amaranthus viridis** Linn.—F.T.A. 6, 1: 33.

APD: Synonym of Amaranthus blitum subsp. emarginatus (Salzm. ex Uline & Bray) Carretero & al.

Amaranthus gracilis Desf.-Thell. l.c. 335.

Amaranthus oleraceus of F.T.A. 6, 1: 34, partly, and of F.W.T.A., ed. 1, 1: 125, partly, not of Linn.

Annual, erect herb, 1–3 ft. high; flowers yellowish-green, **a very common weed**; used as spinach.

Sen.: Farmar 3! 24! Dakar (May) Baldwin 5700! **S. L.:** Thomas 9630! Freetown (Dec.) Deighton 478! **G. C.:** Achimota (Nov., Dec.) Irvine 798! 1515! **Togo:** Lome Warnecke 295! **N. Nig.:** Nupe Barter 1055! Sokoto (Nov.) Moiser 66! Kano

(Dec.) Hagerup 651! Vom Dent Young 215! Katagum (July) Dalz. 157! 158! 159! **S. Nig.:** Idanre (Jan.) Brenan 8722! Aguku Thomas 771! 1093!

Widespread in warm countries.

7. *Amaranthus lividus* Linn.-Thell. l.c. 319.

APD: *Synonym of Amaranthus blitum L. var. blitum*

Amaranthus blitum of F.T.A. 6, 1: 35, partly, and of F.W.T.A., ed. 1, 1: 125, partly.

A variable species, occurring as a weed, and also cultivated. The Kew specimens have been referred to varieties by A. W. Kloos as shown below.

S. Nig.: Onitsha Barter 539 (var. *polygonoides* (Zoll.) Thell. forma *integrifolius* Thell.)! Aguku Thomas 580 (var. *ascendens* (Loisel.) Thell.)! Ibuzo (Nov.) Thomas 2016 (var. *polygonoides* (Zoll.) Thell.)!

Widespread in Africa, Asia, America and S. Europe.

For full synonymy and a key to the intraspecific variants reference must be made to Thellung in Asch. & Grabner, *Synopsis* 5, 1: 225–356 (1914). Reference should also be made to Hauman's treatment in *Fl. Congo Belge* 2: 26 (1951). I am much indebted to A. W. Kloos of Utrecht, who has identified most of the specimens of this genus at Kew.—R.W.J.K.

3. DIGERA

Forsk.—F.T.A. 6, 1: 29.

- 1 Much-branched herb; stem and leaves sparingly pilose with weak hairs, or nearly glabrous; leaves lanceolate or ovate, cuneate at base, 4–7 cm. long, 1–3.5 cm. broad, petiole 1–2.5 cm. long; spikes axillary, 2.5–10 cm. long, on peduncles 2.5–8 cm. long; flowers crowded, each fertile flower accompanied by two sterile scale-like flowers; perianth-segments elliptic, 4–5 mm. long [alternifolia](#)

Digera alternifolia (Linn.) Asch. in Schweint. Beitr. Fl. Aeth. 180 (1867); Schinz in E. & P. Pflanzenfam. 16C: 41 (1933).

APD: *Synonym of Digera muricata (L.) Mart. subsp. muricata*

APD: *Synonym of Pupalia micrantha Hauman*

Achyranthes alternifolia Linn. (1767).

Digera arvensis Forsk.—F.T.A. 6, 1: 29.

Straggling herb, 1–5 ft. high; flowers pale green; **a weed.**

S. Nig.: Awba Hills F.R. (Oct.) Jones FHI 7077!

Widespread in central and east Africa, and in **Arabia**, **Madagascar** and **Asia**.

4. AERVA

Forsk.—F.T.A. 6, 1: 37. *APD acc*

- 1 Inflorescence a terminal panicle of dense leafless long cylindrical spikes; stems densely covered with stellate hairs; leaves lanceolate, 2–7 cm. long, 1–2 cm. broad, sometimes almost linear, lanate beneath [1. javanica](#)
- Inflorescence short and small, mostly axillary; stem and leaves with simple hairs, or glabrescent; leaves ovate-elliptic, 1.5–5 cm. long, 1–3 cm. broad [2. lanata](#)

1. **Aerva javanica** (Burm. f.) Juss. ex Schult. Syst. Veg. 5: 565 (1819); Chev. Bot. 529. *APD acc*

Iresine javanica and *I. persica* Burm. f. (1768).

Aerva persica (Burm. f.) Merrill (1921).

Aerva tomentosa Forsk. (1775)—F.T.A. 6, 1: 37; F.W.T.A., ed. 1, 1: 125.

Erect or suberect undershrub, hoary-white, 2–4 ft. high; [in arid localities](#).

Sen.: Richard Tol (Feb.) Döllinger 11! **Fr. Sud.:** El Oualadji (July) Chev. 1174! Timbuktu (June, July) Chev. 1286! Hagerup 101! 236! Agadem (Dec.) E. Vogel! **Fr. Nig.:** Niamey (Oct.) Hagerup 541a! **S. Nig.:** Sokoto (Feb., Nov.) Lely 838! Katagum (July) Dalz. 151! Maiduguri (July) Ujor FHI 23902! Kukawa E. Vogel 15! L. Chad (Jan.) Daggash FHI 24964!

Extends from Mauritania through Africa to [Arabia](#) and India. Absent from Java.

2. *Aerva lanata* (Linn.) Juss. ex Schult.—F.T.A. 6, 1: 39; Chev. Bot. 530. *APD acc*

Achyranthes lanata Linn. (1753).

Straggling herb, to 3 ft. high, flowers white; [in moister localities than the above](#).

S. L.: Talla (Feb.) Sc. Elliot 4865! Binkolo (Aug.) Thomas 1830! **Lib.:** Peahtah (Oct.) Linder 1094! **Iv. C.:** fide Chev. l.c. **G. C.:** Kumasi (Jan., Feb.) Darko 525! Krobo (Dec.) Johnson 518! Widespread in tropical Africa and Asia including Malaysia.

5. NOTHOSAERVA

Wight-Schinz in E. & P. Pflanzenfam. 16C: 52 (1934).

- 1 Annual herb; stem glabrous; leaves opposite or alternate, elliptic or oblong-lanceolate, 2–5 cm. long, 0.5–2 cm. broad, thin and glabrous; spikes very numerous, axillary, often in clusters, 5–15 mm. long and scarcely 2 mm. broad; perianth-segments about 1.25 mm. long, villous outside [brachiata](#)

Nothosaerva brachiata (Linn.) Wight Icon. 6: 1 (1853); Schinz in E. & P. Pflanzenfam. 16C: 52 (1934). *APD acc*

Achyranthes brachiata Linn. (1767).

Aerva brachiata (Linn.) Mart.—F.T.A. 6, 1: 40; F.W.T.A., ed, 1, 1: 125.

Erect or straggling, branched herb, to 2 ft. high; flowers white.

Sen.: Heudelot 239! **N. Nig.:** Kukawa (Jan.) E. Vogel 7!

Also in [Ubangi-Shari-Chad](#), [A.–E. Sudan](#), [Angola](#), [Mascarene Islands](#) and [India](#).

6. CYATHULA

Blume—F.T.A. 6, 1: 42.

- 1 Sterile flowers with long hooked spines: 2
Sterile flowers without hooked spines; flowers in dense cylindrical spikes; cymules composed of one fertile flower with densely villous perianth-segments, and 2–6 short densely villous sterile flowers; leaves subsessile, elliptic, rounded at base, obtuse at apex, about 5 cm. long and 2.5 cm. broad; densely villous on both surfaces [6. pobeguinii](#)
- 2 Flowers in slender, elongated, spike-like racemes, up to 6 mm. broad, usually interrupted towards the base; perianth-segments less than 4 mm. long: 3
Flowers in dense cylindrical spikes, 1.2–2 cm. broad; or in globose heads 2–3 cm. diam.; perianth-segments 5–6 mm. long: 5
- 3 Cymules (flower-clusters) subglobose or ovoid, with 2–3 fertile flowers; perianth-segments 2–3 mm. long; bracts long-acuminate; leaves elliptic or rhomboid, shortly cuneate at base: 4
Cymules ovoid-lanceolate, with one fertile flower; perianth-segments 4 mm. long; bracts acute; leaves elliptic or obovate, long-cuneate at base, 3–18 cm. long, 1.5–9 cm. broad [3. achyranthoides](#)
- 4 Cymules subsessile or with pedicels up to 1 mm. long; fruiting cymules deflexed and touching the rhachis, hooked-spines narrowly radiating fan-wise; much-branched more or less erect herbs, with relatively stout stem up to 3 mm. diam.; stem and leaves rather densely pilose with long, weak hairs; leaves 2–8 cm. long, 1.5–4 cm. broad [1. prostrata](#)

Cymules with pedicels 1–2 mm. long; fruiting cymules patent, not touching the rhachis, hooked spines widely radiating; slender herb with prostrate stem scarcely more than 1 mm. diam., rooting at the nodes, and with sparingly branched erect shoots; stem and leaves sparingly and shortly pilose; leaves 2–5 cm. long, 1–3 cm. broad [2. *pedicellata*](#)

- 5 Flowers in cylindrical spikes up to 18 cm. long; bracts broadly ovate, about 6 mm. long and 4 mm. broad, shining, persistent; stems with long reflexed hairs; leaves elliptic to ovate-elliptic, acute, 5–7 cm. long, 2.5–3.5 cm. broad, pilose [4. *cylindrica* var. *mannii*](#)

Flowers in globose heads, 2–3 cm. diam.; bracts lanceolate, 5–6 mm. long and 1.5 mm. broad; stems pilose, densely so when young, with weak spreading hairs; leaves ovate to elliptic, acute, 5–10 cm. long, 2.5–7 cm. broad, densely appressed pilose [5. *uncinulata*](#)

1. *Cyathula prostrata* (Linn.) Blume—F.T.A. 6, 1: 43; Chev. Bot. 529. *APD acc*

Achyranthes prostrata Linn. (1762).

Pupalia atropurpurea of Chev. Bot. 529, not of Moq. (fide Hutch. & Dalz.).

More or less erect, much-branched weed, 1–3 ft. high; leaves green, sometimes tinged with red; flowers green, often galled; [in waste places and forest margins](#).

Gam.: Genieri (Feb.) Fox 90! **Fr. Sud.:** Timbuktu (July) Chev. 1300! **Fr. G.:** fide Chev. l.c. **S. L.:** Sherbro Sc. Elliot 5844! Njala (Sept.) Deighton 2108! Musaia (Apr.) Widespread in tropical Africa and Asia, and in [Australia](#) and [central America](#).

2. *Cyathula pedicellata* C. B. Clarke in F.T.A. 6, 1: 46 (1909).

APD: *Synonym of Cyathula prostrata* var. *pedicellata* (C.B. Clarke) Cavaco

Cyathula prostrata of F.W.T.A., ed. 1, 1: 127, partly.

Cyathula prostrata forma *pedicellata* (C.B.Cl.) Hauman in Fl. Congo Belge 2: 64.

Slender forest herb with prostrate stems rooting at nodes. erect shoots to 1 ft. high; leaves deep green above purple beneath; flowers and fruits greenish-red, often galled; [in closed forest](#).

S. L.: Lalahun, Gaura (Dec.) King 107b! **G. C.:** Begoro Dist. (Mar.) Irvine 1817! Manso, Akim (Dec.) Irvine 2097! **S. Nig.:** Okomu F.R. (Jan.) Brenan 8850! **F. Po.:** Mt. Balea (Dec.) Guinea 493!

Also in [Belgian Congo](#), [Uganda](#) and [Tanganyika](#).

3. *Cyathula achyranthoides* (H. B. & K.) Moq. in DC. Prod. 13, 2: 326 (1849); Chev. Bot. 529. *APD acc*

Desmochaeta achyranthoides H. B. & K. (1818).

Cyathula geminata (Thonn.) Moq.—F.T.A. 6, 1: 44.

Robust, much-branched herb, to 3 or 6 ft. high; leaves and flowers green; [in forests, swamps and waste places](#).

Fr. Sud.: fide Chev. l.c. **S. L.:** Mamaka (Nov.) Thomas 4537! Batkanu (Jan.) Deighton 2847! **Iv. C.:** fide Chev. l.c. **G. C.:** Nsawam (Aug.) Deighton 3394! **N. Nig.:** Lokoja Barter! **S. Nig.:** Akilla (Feb.) W. D. MacGregor 499! Okomu F.R. (Jan.) Brenan 8851! **F. Po.:** (Nov.) T. Vogel 253!

Also in [Belgian Congo](#) and [Uganda](#), and in [central tropical America](#) and [south tropical America](#).

4. *Cyathula cylindrica* var. *mannii* (Bak.) Suesseng. in Mitt. Bot. Staats. Münch. 6: 188 (1953).

APD: *Synonym of Cyathula cylindrica* Moq. var. *cylindrica*

Cyathula mannii Bak.—F.T.A. 6, 1: 46; F.W.T.A., ed. 1, 1: 127.

Scandent herb, stems to 10 ft. long; calyx green, corolla white.

Br. Cam.: Cam. Mt., 5,000–7,000 ft. (Dec., Jan.) Mann 2007! Dunlap 34! Mildbr. 10812! Maitland 261! **F. Po.:** 10,000 ft. Mann 296!

The species is widespread in east, central and south Africa and in [Madagascar](#).

5. *Cyathula uncinulata* (Schrad.) Schinz in De Wild. Pl. Bequaert. 5: 386 (1932). *APD acc*

Achyranthes uncinulata Schrad. (1833).

Cyathula globulifera Moq.—F.T.A. 6, 1: 44.

Climbing herb; stems to 16 ft. high; flowers pale greenish-yellow.

Br. Cam.: Bamenda, 4,800 ft. (Feb.) Migeod 477!

Widespread in east, central and south tropical Africa, and in [Madagascar](#).

6. *Cyathula pobeguinii* Jac.-Fel. in Bull. Soc. Bot. Fr. 96: 196 (1949). *APD acc*

Hairy undershrub, branches decumbent below, erect above.

Fr. G.: Dabola Pobéguin 987. Mali, 4,500 ft. Jac.-Fel. 2017.

***Cyathula fernando-poensis* Suesseng. & Friedrich** in Mitt. Bot. Staats. Münch. 6: 188 (1953). *APD acc*

F. Po: El Pico, 7,000 ft. (Dec.) Boughey 123; 124.

Since going to press this new species has been described.

7. PUPALIA

Juss.—F.T.A. 6, 1: 47.

- 1** A herb; branches very shortly and softly pubescent; leaves ovate, petiolate, abruptly cuneate at base, acute at apex, about 4–6 cm. long and 2–3.5 cm. broad, velvety-pubescent when young; lateral nerves distinct; inflorescence pedunculate, usually interrupted, especially in fruit; partial inflorescence sessile, armed with strong hooks [lappacea](#)

***Pupalia lappacea* (Linn.) Juss.**—F.T.A. 6, 1: 47; Chev. Bot. 529. *APD acc*

Achyranthes lappacea Linn. (1753).

A weed, 2–4 ft. high, sometimes woody below, with greenish flowers, yellow or red stamens, and burr fruits.

Sen.: Heudelot 486! Roger 78! **Gam.:** Ingram! **Fr. Sud.:** Bamba (Sept.) Hagerup 323! **S. L.:** (Mar.) Deighton 553! **G. C.:** Cape Coast Castle (July) T. Vogel 26! Igbatoro, Owo (May) Jones FHI 3588! Aboh Barter 474!

Widespread in Africa, Madagascar and [Arabia](#), extending through tropical Asia to New Guinea.

8. SERICOSTACHYS

Gilg & Lopr.—F.T.A. 6, 1: 70.

- 1** Liane, or climbing herb; stem and leaves glabrous or sparingly pubescent; leaves elliptic or obovate, cuneate at base, long-acuminate, 6–10 cm. long, 3–6 cm. broad, petiole 1–2 cm. long; flowers in large terminal panicle with tomentose rhachis; each cluster with one fertile and 2–3 sterile flowers, the latter developing feathery white filaments, about 2 cm. long when plant is in fruit; perianth-segments 4–5 mm. long [scandens](#)

***Sericostachys scandens* Gilg & Lopr.**—F.T.A. 6, 1: 71. *APD acc*

Forest liane, very striking in fruit with its large feathery white panicles.

S. Nig.: Sapoba (fr. Mar.) Jones FHI 7444! **Br. Cam.:** Buea Collier FHI 1757! **F. Po:** Musola (Jan.) Guinea 1118!

Also in **French Cameroons**, **Belgian Congo** and **Uganda**.

9. PANDIAKA

(*Moq.*) *Hook. f.*—F.T.A. 6, 1: 67; Suessenguth & Overknott in Bot. Archiv. 41: 80 (1940).

- 1 Leaves lanceolate or ovate-lanceolate, sessile, subacute, up to 7 cm. long and 3 cm. broad; whole plant long-pilose; flower heads subtended by foliaceous, ovate bracts, about 1 cm. long [1. *involucrata*](#)
 Leaves linear, subsessile acute, up to 8 cm. long and 8 mm. broad; whole plant sparingly pubescent; flower heads subtended by linear, leaf-like bracts, up to 5 cm. long [2. *heudelotii*](#)

1. **Pandiaka involucrata** (*Moq.*) *Hook. f.*—F.T.A. 6, 1: 67; Suesseng. & Overknott in Bot. Archiv. 41: 80 (1940), incl. var. *megastachya* Suesseng. *APD acc*

Achyranthes involucrata *Moq.* in DC. Prod. 13, 2: 310 (1849).

A hairy, erect, branched herb, 2–4 ft. high; flower heads white; in savannah, especially dry hills and rocky places.

Gam.: (July) Brooks 17! **G. C.:** Dukwesein, Ashanti (Dec.) Chipp 609! Sekodumasi (Oct.) Vigne 3408! **Togo:** Kpedsu (Dec.) Howes 1032! **Dah.:** Burton! **Fr. Nig.:** Niamey (Oct.) Hagerup 497! **N. Nig.:** Pandiaki (Sept.) Ansell! Nupe Barter 944! Bauchi Plateau (May–Sept.) Lely 239! 581! P. 389! And many other localities. **S. Nig.:** Lagos Rowland! beokuta Irving! Opi, Nsukka (Aug.) Jones FHI 5868!

Also in **French Camerouns** and **Ubangi-Shari-Chad**.

2. **Pandiaka heudelotii** (*Moq.*) *Hook. f.*—F.T.A. 6, 1: 58; Suesseng. & Overknott l.c. 81, incl. var. *spicata* and var. *subglobosa* Suesseng.

APD: *Synonym of Pandiaka angustifolia (Vahl) Hepper*

Achyranthes heudelotii *Moq.*; Chev. Bot. 530.

Achyranthes angustifolia *Benth.*, not of Vahl; Chev. Bot. 530.

Achyranthes benthami *Lopr.*

Pandiaka benthami (*Lopr.*) *Schinz*; Suesseng. & Overknott l.c.

A long-branched herb, 2–3 ft. high; tips of calyx and bracteole often reddish.

Sen.: Bakel Heudelot 280. **Gam.:** Hayes 585! **Fr. Sud.:** Amango (Sept.) Hagerup 385! **Fr. G.:** Scaetta 3143! **S. L.:** Makunde (Apr.) Sc. Elliot 5699! Rowala (July) Thomas 1077! **G. C.:** Accra Brown 390! Irvine 542! **Togo:** Lome Warnecke 182! **N. Nig.:** R. Niger T. Vogel 98! Nupe Barter 1724! Bauchi Plateau (Aug.) Lely 557! P. 641! Katagum Dalz. 154! **S. Nig.:** Aguku Thomas 624! Jesse (Sept.) Butler-Cole 7!

Also in **Ubangi-Shari-Chad**, **Congo**, **Angola** and **A.–E. Sudan**.

10. ACHYRANTHES

Linn.—F.T.A. 6, 1: 62. *APD acc*

- 1 Perennial herb with short woody stems; stem and leaves shortly and sparingly pubescent; leaves linear to lanceolate, 3–8 cm. long, 5–12 mm. broad; spikes slender, up to 15 cm. long; flowers about 4 mm. long, becoming well separated from each other towards base of spike in fruit [1. *talbotii*](#)

Annual herbs or perennials with well-branched woody stems; leaves ovate-lanceolate, ovate or broadly elliptic: 2

- 2 Leaves broadly elliptic, 8–26 cm. long, 3–10 cm. broad, sparingly pubescent or glabrescent; bracts as long or nearly as long as the perianth; basal wings of bracteole inserted on the thick base of the spine, otherwise free from it; spike remaining rather dense towards the base [2. *bidentata*](#)

Leaves more or less ovate or ovate-lanceolate, generally not exceeding 10 cm. long and 5 cm. broad, long silky pilose to almost glabrous; bracts 1/2–2/3 as long as the perianth; basal wings of bracteoles adnate throughout their length to the spine; spike elongating and leaving the flowers well separated towards the base ... [3. *aspera*](#)

1. **Achyranthes talbotii** *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 127 (1927); Kew Bull. 1928: 29. *APD acc*

Perennial herb with short woody stems to 18 in. high, on rocks by streams; flowers green with crimson stamens. Keay FHI 28264 has lanceolate leaves 2·5–4 cm. long, 10–12 mm. broad, obtuse at apex, and is the type of var. *ogojensis* Suesseng. in Mitt. Bot. Staats. Münch. 4: 102 (1952).

S. Nig.: Oban Talbot! British Obokum (Dec.) Keay FHI 28264! **Br. Cam.:** R., Joke (Mar.) Brenan 9497!

2. *Achyranthes bidentata* Blume—F.T.A. 6, 1: 64. *APD acc*

APD: *Synonym of Achyranthes aspera var. pubescens (Moq.) C. C. Towns.*

An erect **forest** herb, 2–4 ft. high; leaves comparatively large, turning black-green on drying; flowers glistening green.

S. Nig.: Idanre Hills (Jan.) Brenan 8726! Oban Talbot! **Br. Cam.:** Johann-Albrechtshöhe Staudt 546! **F. Po:** Mann!

Widespread in the wetter parts of tropical Africa and Asia.

3. *Achyranthes aspera* Linn.—F.T.A. 6, 1: 63. *APD acc*

A common weed of waste places, very variable; much-branched, 1–6 ft. high, sometimes subscandent, sometimes woody; flowers green or pinkish.

Sen.: Sieber 57! Brunner 3! **Fr. Sud.:** Timbuktu Hagerup 284! **S. L.:** Njala (Dec.) Deighton 2584! Hangha (Jan.) Thomas 7781! Musaia (Feb.) Deighton 4202! **G. C.:** Abetifi, Kwahu (Jan.) Irvine 1670! Kumasi Cummins 175! **N. Nig.:** Sokoto (Nov.) Moiser 14! Bauchi Plateau (Sept.) Lely P. 742! **S. Nig.:** Lagos Millen 101! Aguku Thomas 1383! **Br. Cam.:** Cam. Mt., 4,000–9,000 ft. (Jan., Apr., Dec.) Mann 1307! 1977! Bambui, Bamenda (Jan.) Keay FHI 28335! Ndu, Bamenda (Jan.) Keay FHI 28439!

Throughout-the hotter parts of the world.

Achyranthes nodosa Vahl—F.T.A. 6, 1: 65.

We have not seen a specimen of this, which was collected by Isert at Whydah in Dahomey. It was supposed by Bentham to be a species of *Pandiaka*. Imperfectly known species.

11. CENTROSTACHYS

Wall.—Schinz in E. & P. Pflanzenfam. 16C: 62 (1934).

- 1 Aquatic herb, with stout, conspicuously grooved, floating stems; leaves lanceolate to ovate, cuneate at base, acute at apex, 7–18 cm. long, 2–6 cm. broad, pilose beneath with appressed white hairs when young; spikes 10–30 cm. long, flowers not very acutely reflexed in fruit; bracts and bracteoles ovate-orbicular, 3–4 mm. long; perianth-segments unequal, 5–8 mm. long, the outer longest one terminating in a firm, slightly recurved, subulate tip [aquatica](#)

Centrostachys aquatica (R. Br.) Wall.—Schinz in E. & P. Pflanzenfam. 16C: 62 (1934). *APD acc*

Achyranthes aquatica R. Br.—F.T.A. 6, 1: 64; F.W.T.A., ed. 1, 1: 127; Chev. Bot. 530.

Stout herb in marshy places; stems up to 6 ft. long, rooting at the lower nodes.

Sen.: Kaédi (Dec.) Chev. 3446. **N. Nig.:** Katagum (Oct.) Dalz. 152!

Widespread in tropical Africa and Asia.

12. PHILOXERUS

R. Br.—F.T.A. 6, 1: 74.

- 1 A decumbent, glabrous, rather succulent herb; leaves linear, slightly broader towards the apex, abruptly acute, amplexicaul at the base, up to 5 cm. long and 0·5 cm. broad, fleshy; spikes sessile, ovoid to cylindrical, up to 2·5 cm. long, sometimes clustered; bracts white, ovate-acute, about 3 mm. long, 1-nerved [vermicularis](#)

Philoxerus vermicularis (Linn.) P. Beauv. Fl. Oware 2: 65, t. 98 (1818); Milne-Redhead in Kew Bull. 1948: 452.

APD: Synonym of Blutaparon vermiculare (L.) Mears var. *vermiculare*

Gomphrena vermicularis Linn. (1753).

Philoxerus vermiculatus Sm.—F.T.A. 6, 1: 75.

Iresine vermicularis (Linn.) Moq.-Chev. Bot. 531.

Decumbent herb with woody root; flowers silvery-white; a coastal sand-binder.

Sen.: Perrottet 482! Richard Tol (May) Döllinger 59! Dakar (Jan.–May) Hagerup 779! Baldwin 5746! Niayes (Dec.) Chev. 3448! **Gam.:** Genieri (Feb.) Fox 67! **Fr. G.:** Conakry Rattray! **S. Hutch. & Metcalfe 136!

Coasts of W. Africa from Senegal to **Angola**, and on eastern coasts of central America.

13. GOMPHRENA

Linn.—F.T.A. 6, 1: 75.

- 1 A hairy annual up to 1 m. high; stems and branches contracted at the nodes; leaves obovate-oblongate, shortly petiolate, very acute, about 5–8 cm. long and up to 3 cm. broad, pilose with long weak hairs; spikes subglobose or rarely shortly cylindrical, up to 4.5 cm. long and 2 cm. broad, with an involucre of 2–3 foliaceous leaves, the bracts and flowers persisting, pink or yellow, the former with slightly toothed margins [globosa](#)

Gomphrena globosa Linn.—F.T.A. 6, 1: 75. *APD acc*

A native of S. America, cultivated as an ornamental, also subsontaneous.

S. L.: Njala (Feb.) Deighton 1875! **N. Nig.:** Sokoto (Nov.) Moiser 31! **S. Nig.:** Brass Barter 116! Old Calabar (Apr.) Holland 121! Oban Talbot 662!

Widespread in the tropics.

G. celosioides Mart., also a native of S. America, is common as a weed in eastern Africa as far west as Katanga; it is not yet recorded from our area. See Milne-Redhead in Kew Bull. 1944: 23 (1947).

14. ALTERNANTHERA

Forsk.—F.T.A. 6, 1: 72. *APD acc*

Telanthera R. Br.—F.T.A. 6, 1: 72.

- 1 Plant maritime with fleshy stem and leaves; stems rooting at nodes; leaves oblanceolate to obovate, mucronate, narrowed to base, 3–5 cm. long, 1.5–3 cm. broad; flower-clusters axillary, ovoid, up to 1.5 cm. long; perianth-segments unequal, the two outer longer segments about 6 mm. long, strongly 3-nerved; stamens 5, longer than the gynaecium; anthers linear; fruit not, or only slightly, flattened [1. maritima](#)
Plant not maritime, stem and leaves not fleshy; stamens 3, not longer than the gynaecium; anthers ovate; fruit flattened and winged: [2](#)
- 2 Perianth-segments ending in a hard, sharp spine; segments unequal, the two outer larger ones about 5 mm. long, 3-nerved; leaves obovate or rounded-obovate, mucronate, entire, 2–4 cm. long, 1–2 cm. broad, pustulate and sparingly pubescent on the nerves [2. repens](#)
Perianth-segments acute but not ending in a hard spine; segments equal: [3](#)
- 3 Perianth-segments 4 mm. long, very acute, completely hiding the mature fruit; leaves linear-lanceolate, acute or subacute, obscurely undulate, up to 7 cm. long and 1 cm. broad, glabrous or nearly so [3. nodiflora](#)
Perianth-segments 2–2.5 mm. long, not very acute, not hiding the mature fruit; leaves oblanceolate or elliptic, up to 8 cm. long and 2 cm. broad, but often much smaller, glabrous or nearly so and often pustulate [4. sessilis](#)

1. **Alternanthera maritima** (Mart.) St.-Hil.—Schinz in E. & P. Pflanzentam. 16C: 74 (1934); Chev. Bot.

530.

*APD: Synonym of Alternanthera littoralis var. maritima (Mart.) Pedersen**Bucholzia maritima* Mart. (1826).*Telanthera maritima* (Mart.) Moq.—F.T.A. 6, 1: 72; F.W.T.A., ed. 1, 1: 128.

Coastal plant, with long creeping stems, up to 20 ft. long; flowers silvery-white on erect shoots.

Sen.: Döllinger 51! Dakar (Jan.) Chev. 3449! **Gam.:** Hayes 504! **S. L.:** Turtle Isl. (Nov.) Deighton 2344! Mano Salija (Nov.) Deighton 276! **Lib.:** Grand Bassa (July) T. Vogel 4! **Iv. Widespread in the warmer parts of the world.

Alternanthera bettzickiana (Regel) Nicholson*Telanthera bettzickiana* Regel

Is commonly grown in gardens as an ornamental edging plant.

BASELLACEAE

Twining with slender stems and rather fleshy alternate entire petiolate leaves; stipules absent. Flowers hermaphrodite, actinomorphic, in spikes, racemes or panicles; bracts small; bracteoles 2, often united to the base of the calyx. Sepals 5, often coloured, almost free or united into a 5-lobed tube, imbricate, persistent in fruit. Petals absent. Stamens 5, inserted opposite and at the base of the sepals; filaments free, short; anthers with 2 parallel cells opening longitudinally. Ovary superior, 1-celled, with a solitary basal shortly stalked ovule; style terminal, often deeply divided into 3 stigmas. Fruit indehiscent, surrounded by the persistent often fleshy calyx. Seed solitary, almost spherical, with a membranous testa; endosperm copious, surrounded by the spirally twisted embryo.

A small family, mostly in tropical South America, the genus *Basella* African and Asiatic, and often cultivated.

BASELLA

Linn.—F.T.A. 6, 1: 94. *APD acc*

Leaves alternate, entire. Spikes simple or branched, slender; bracts small; bracteoles 2, united into a two-lipped cup adnate to the calyx. Flowers small, hermaphrodite; sepals 5, united into a fleshy tube, the lobes incurved over the fruit; stamens 5, inserted near the top of the calyx-tube; ovary ovoid.

- 1 Twiner, glabrous, with slender somewhat fleshy branches; leaves broadly ovate, petiolate, widely cordate at the base, usually acutely acuminate, up to 10 cm. long and 7 cm. broad, with 4–5 pairs of lateral nerves; spikes axillary, simple and slender or shorter and branched; bracts broadly ovate, submembranous, acute, about half the length of the flower; fruit enclosed by the persistent succulent calyx, broadly ovoid, almost 0.5 cm. long[alba](#)

***Basella alba* Linn.**—F.T.A. 6, 1: 94; Chev. Bot. 535. *APD acc*

***Basella rubra* Linn.**—Chev. Bot. 535.

A climber, cultivated in vegetable gardens; sometimes subsponaneous.

S. L.: Kukuna, Scarcies Sc. Elliot 4664! Masasa Glanville 45! **IV. C.:** Bouaké (July) Chev. 22126. **Togo:** Sokode Kersting A. 684! **Dah.:** Djougou (June) Chev. 23901. **S. Nig.:** Lagos Dalz. 1030! Ologbo, Benin Kennedy 2152! **Br. Cam.:** Cam. Mt., 1,000 ft. (Dec.) Mann 1250!

Also in other parts of **tropical Africa**, **Asia** and the **West Indies**.

GERANIACEAE

Annual herbs or undershrubs, rarely arborescent; leaves alternate or opposite, mostly lobate, dissected or compound; stipules often paired. Flowers often handsome, hermaphrodite, actinomorphic or slightly zygomorphic, axillary, solitary to subumbellate. Sepals persistent, 4–5, free or connate to the middle, imbricate or rarely valvate, the dorsal one sometimes spurred. Petals 5, rarely 4, very rarely absent, hypogynous or subperigynous, imbricate, rarely contorted. Stamens 2–3 times the number of the sepals, sometimes a few without anthers; filaments mostly more or less connate at the base; anthers 2-celled, opening lengthwise. Ovary 3–5-lobed; ovules 1–2 in each cell, superposed, pendulous, rarely more than 2. Fruit lobed; lobes 1-seeded, rarely more-seeded, often beaked, opening from the base upwards. Seeds pendulous, with thin or no (rarely copious) endosperm and mostly curved or folded embryo.

A cosmopolitan family, numerous in temperate and subtropical regions.

Leaves stipulate; petals mostly imbricate; fruits often with long beaks and deeply lobed at the base.

- 1 Stamens 15, united into 5 bundles; leaves (in our species) ovate or lanceolate, denticulate[1. Monsonia](#)
 Stamens 10, free or slightly connate at the base; leaves (in our species) digitately divided[2. Geranium](#)

1. MONSONIA

Linn.—F.T.A. 1: 289.

- 1 Flowers solitary; peduncle about 2 cm. long, with a pair of 1 cm. long subulate bracts subtending the 1–2 cm. long pedicel which becomes sharply bent in fruit; sepals abruptly caudate-acuminate, silky-pilose; fruits 7–9 cm. long; leaves ovate, 2–3 cm. long, 1.5–2 cm. broad, cordate at base, acute at apex, repand-denticulate, 7–9-nerved at base, slightly pubescent beneath on the nerves; petiole about 1½ times as long as lamina; stipules interpetiolar, subulate, about 8 mm. long [1. *senegalensis*](#)

Flowers 2–6, umbellate on a slender straight peduncle 7–10 cm. long, with several bracts about 3 mm. long subtending the pedicels which do not bend back in fruit; sepals mucronate, silky; fruits 4 cm. long; leaves ovate-lanceolate, about 1.7 cm. long and 1 cm. broad, rounded at base, subacute at apex, crenate with prominent lateral nerves, villous on both surfaces; petiole and stipules similar to above [2. *nivea*](#)

1. ***Monsonia senegalensis* Guill. & Par.**—F.T.A. 1: 290; R. Knuth in Engl. Pflanzenr. Geraniac. 301 (1912). *APD acc*

Herb of dry regions, woody at base; flowers pink.

Sen.: Perrottet 136! Richard Tol Leievre. **Fr. Nig.:** Amango (Sept.) Hagerup 381! **N. Nig.:** Katagum Dalz. 60!

Across to Abyssinia, **Egypt** and western India; also in **S.W. Africa**, **Ngamiland** and **Transvaal**.

2. ***Monsonia nivea* (Decne.) Decne. ex Webb** Fragm. Fl. Aethiop. 59 (1854); R. Knuth l.c. 293; Chev. Bot. 98. *APD acc*

***Erodium niveum* Decne.** (1835).

Hoary herb with long woody underground stem; flowers pink.

Fr. Sud.: Bilma (Feb.) Chev. 28642. Also in Mauritania, N. Africa, Egypt, Arabia and Palestine.

2. GERANIUM

Linn.—F.T.A. 1: 290.

- 1 Weak straggling perennial; stems densely pilose with simple hairs or glabrescent; pedicels 10–35 mm. long; petals uniformly pink or mauve; carpels smooth, when ripe ejecting the seed [1. *simense*](#)

More or less erect annual; stems rather densely pilose with both glandular and simple hairs; pedicels 2–20 mm. long; petals pink or mauve with a deep purplish basal area; carpels with transverse ridges, when ripe falling off with the seed enclosed [2. *ocellatum*](#)

1. ***Geranium simense* Hochst. ex A. Rich.**—F.T.A. 1: 291, incl. vars. *glabrior* Oliv. and *repens* Oliv.

APD: *Synonym of Geranium arabicum subsp. latistipulatum (Hochst. ex A. Rich.) Kokwaro*

A diffusely branched herb up to 8 ft. high with scrambling habit; leaves digitately divided to below the middle; petals pink or mauve.

S. Nig.: Sonkwala, 5,200 ft. (fr. Dec.) Keay & Savory FHI 25256! **Br. Cam.:** Cam. Mt., 5,000–9,000 ft. (fl. Nov.–Mar., fr. Jan.–Apr.) Mann 1323! 1966! Maitland 1234! Mildbr. 10873! Preuss 648! Mioko (fl. & fr. Jan.) Guinea 1871!

Widespread on the mountains of tropical Africa and **Arabia**.

2. ***Geranium ocellatum* Cambess.**—R. Knuth in Engl. Pflanzenr. Geraniac. 62 (1912).

APD: *Synonym of Geranium mascatense Boiss.*

***Geranium favosum* var. *sublaeve* Oliv.** F.T.A. 1: 292.

***Geranium ocellatum* var. *camerunense* R. Knuth** l.c. 63.

***Geranium ocellatum* var. *sublaeve* (Oliv.) Milne-Redhead** in Kew Bull. 1948: 453.

***Geranium brevipes* Hutch. & Dalz.** F.W.T.A., ed. 1,1: 138; Kew Bull. 1928: 30.

A more or less erect annual up to 4 ft. high; leaves digitately divided below the middle; flowers pink or mauve with a darker centre.

Br. Cam.: Cam. Mt., 6,000–9,000 ft. (fl. & fr. Nov.–Mar.) Mann 1261! Maitland 811! Mildbr. 10872! Brenan 9554! Ndu, Bamenda, 6,400 ft. (fl. & fr. Jan.) Keay FHI 28437!

Widespread on the mountains of tropical Africa and eastwards to western Himalayas.

OXALIDACEAE

Herbaceous or suffrutescent, rarely arborescent. Leaves alternate, digitately or pinnately compound, sometimes simple by suppression of the leaflets; leaflets spirally coiled when young, usually closing at night; stipules absent. Flowers hermaphrodite, actinomorphic, sometimes of two kinds, some perfect and others minute and apetalous, solitary or subumbellate, rarely racemose or cymose. Calyx 5-fid or 5-partite, imbricate. Petals 5, shortly clawed, free or shortly connate at the base, contorted. Stamens 10, hypogynous, connate at the base, sometimes 5 of them without anthers; anthers 2-celled, opening lengthwise. Ovary 5-celled, superior; styles 5, free, persistent; stigmas capitate or shortly divided; ovules 1 or more, axile. Fruit mostly a capsule. Seeds often with an elastic epidermis; endosperm fleshy, copious; embryo straight.

A small family but rich in species, very numerous in the drier parts of South Africa.

Leaves sometimes sensitive; petals contorted; stamens double the number of the petals; styles free.

- 1 Leaves trifoliate; valves of the fruit persisting around the central axis; leaflets obcordate; leaves not sensitive to touch [1. *Oxalis*](#)
- Leaves pinnate; valves of the fruit finally spreading; leaflets not obcordate; leaves sensitive to touch [2. *Biophytum*](#)

Averrhoa carambola Linn.

5–10 leaflets, flowers on leafy shoots, fruit acutely angled, the Carambola is occasionally cultivated for its fruits.

A. bilimbi Linn.

10–20 or more leaflets, flowers on older wood, fruit obtusely angled, the Blimbing, is occasionally cultivated for its fruits.

1. OXALIS

Linn.—F.T.A. 1: 295.

- 1 Plant with well-developed prostrate or ascending stems; petiole 1–8 cm. long, leaflets deeply obcordate, 5–12 mm. long and broad; peduncles 1–7 cm. long, 1–5-flowered; sepals about 4 mm. long; corolla 8–10 mm. long, yellow; fruit tomentellous, 1.5–2 cm. long [1. *corniculata*](#)
- Plant acaulous, with the rootstock surrounded by brown bulbils about 4 mm. long; petiole 15–25 cm. long, leaflets broadly orbicular-obcordate, 1.5–4 cm. long and broad; peduncles 15–30 cm. long, 5–12-flowered; sepals 5–7 mm. long; corolla 12–25 mm. long, pink [2. *corymbosa*](#)

1. *Oxalis corniculata* Linn.—F.T.A. 1: 206; Chev. Bot. 98; R. Knuth in Engl. Pflanzenr. Oxalidac. 146 (1930). *APD acc*

A variable, diffuse, slender herb, with the leaves green or reddish-brown; flowers yellow; a weed of waste ground, common in most places, but rare in Sierra Leone (fide Deighton, 1941).

Fr. G.: Kissi (Feb.) Chev. 20762. **S. L.:** Hill Station (May) Deighton 3969! **Lib.:** Dinklage 2604. **Iv. C.:** between Tabou and Beriby (Aug.) Chev. 19979. **G. C.:** Kumasi (Jan.) Dalz. 63! Cosmopolitan.

2. *Oxalis corymbosa* DC. Prod. 1; 696 (1824).

APD: *Synonym of Oxalis debilis Kunth*

Oxalis martiana Zucc. in Denkschr. Akad. Muench. 9: 144 (1824; in the same work Zuccarini also cites *O. corymbosa* DC. with page reference); R. Knuth l.c. 250.

An ornamental plant, often cultivated, but naturalized around Aburi and Buea; flowers pink. Fruits apparently not produced; reproduction by bulbils.

G. C.: Aburi (Mar.) Deighton 614! Br. Cam.: Buea (Jan., Oct.) Deistel 150; Maitland 255! Dundas FHI 20353!

Native of America; introduced to many parts of the world.

2. BIOPHYTUM

DC.-R. Knuth in Engl. Pflanzenr. Oxalidac. 391–417 (1930); F.T.A. 1: 297, under *Oxalis* Linn.

- 1 Stem unbranched; median leaflets exceeding 5 mm. long:.....2
Stem branched (except in juvenile stage), woody, perennial; leaves 3–9 cm. long, with 7–20 pairs of leaflets; median leaflets oblong to suborbicular, rounded at apex, 2–4 mm. long, 2–3 mm. broad, margins ciliate, lateral nerves faint beneath; sepals 4–5 mm. long; peduncle 4–6 cm. long [4. zenkeri](#)
- 2 Sepals 2–2.5 mm. long; leaflets membranous, translucent, 6–11 pairs with the apical pair 10–14 mm. long, 5–6 mm. broad and considerably larger than the others, which decrease in size to the base; leaves 3–6 cm. long; peduncles 2–7 cm. long [1. abyssinicum](#)
Sepals 4–5 mm, long; leaflets subrigid and opaque:.....3
- 3 Annual; leaves 2–6 cm. long, with 3–8 pairs of leaflets; median leaflets rectangular-ovate, rounded at apex, 5–8 mm. long and 3–4 mm. broad; nerves prominent beneath, rhachis pubescent, leaflets glabrous or sparsely pubescent; peduncles up to 4 cm. long, or inflorescence sessile [2. petersianum](#)
Perennial; leaves 7–10 cm. long, with 10–20 pairs of leaflets; median leaflets obliquely rectangular, acute at apex, 8–10 mm. long, 2.5–3 mm. broad, basal leaflets smaller; lateral nerves numerous, closely parallel and rather prominent beneath, rhachis pubescent, leaflets glabrous; peduncles up to 1 cm. long, or inflorescence sessile [3. talbotii](#)

1. *Biophytum abyssinicum* Steud. ex A. Rich. Fl. Abyss. 1; 122 (1847); R. Knuth in Engl. Pflanzenr. Oxalidac. 395 (1930). APD acc

Oxalis abyssinicum (Steud. ex A. Rich.) Walp.—F.T.A. 1: 297.

Slender annual; corolla yellow at base, mauve at tips.

N. Nig.: Bauchi Plateau (July) Lely P. 545! Mandara Mts. (Aug., Dec.) E. Vogel 47! Royer 147!

Also in [Abyssinia](#), [E. Africa](#), [Nyasaland](#) and [Angola](#).

2. *Biophytum petersianum* Klotzsch in Peters Naturwiss. Reis. Mossamb. Bot. 81, t. 15 (1861).

APD: *Synonym of Biophytum umbraculum Welw.*

Oxalis apodoscias Turcz. (1863).

Biophytum apodoscias (Turcz.) Edgew. & Hook. f. (1874); F.W.T.A., ed. 1, 1: 140; Chev. Bot. 98.

Oxalis sessilis Buch.-Ham. ex Baill. (1886).

Biophytum sessile R. Knuth l.c. 406 (1930).

Oxalis sensitiva of F.T.A. 1: 297, partly, not of Linn.

Stems slender, short or up to 1 ft. high; leaves (as in other species) in a terminal crown, sensitive to weather and to touch; flowers yellow, orange or red. [A common weed](#).

Lagos (Nov.) Dawodu 34! Millen 14! Abeokuta Irving! **Br. Cam.:** Cameroons R. (Jan.) Mann 936! Buea (Jan., Apr.) Maitland 1290!

Widespread in tropical and subtropical Africa and Asia, and in **New Guinea**.

3. **Biophytum talbotii** (*Bak. f.*) *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 140 (1927); Knuth l.c. 406 (1930). *APD acc*

Oxalis talbotii *Bak. f.* in Cat. Talb. 16 (1913).

Biophytum kamerunense *Engl. & Knuth ex Engl.* Pflanzenw. Afr. 3, 1: 717 (1915), in obs.

Perennial herb with woody stem, up to 1 ft. high; flowers pink; on earthbanks of shaded forest streams.

Lib.: Peterstown (Nov.) Bunting 103! Grand Bassa Dinklage 1611. **S. Nig.:** Calabar Thomson 24! Oban Talbot 1409! Afi River F.R. (May, Dec.) Jones FHI 18930! Keay FHI 28192!

Also in **French Cameroons**.

4. **Biophytum zenkeri** *Guillaumin* in Notulae Syst. 1: 26 (1906); Knuth l.c. 408. *APD acc*

Perennial with stout woody stems, to 1 ft. high, becoming well-branched; flowers yellow; in rock crevices in river beds in forest.

S. Nig.: Oban Talbot 429! Kwa Falls, Calabar (Mar.) Brenan 9240! **Br. Cam.:** Rio del Rey Johnston! R. Ndian (Apr.) Dunlap!

Also in **French Cameroons, Gabon, Congo** and **Angola**.

R. Knuth l.c. 393, gives the following record for *B. sensitivum* (Linn.) DC.: "Sierra Leone: Felsen des Morro do Bango, Buchner 561." This specimen evidently came from Angola and not from Sierra Leone, and the species is not otherwise recorded from our area. It is widespread in east and south tropical Africa and in Asia.

BALSAMINACEAE

Succulent herbs; leaves alternate or opposite, simple, penninerved; stipules absent. Flowers zygomorphic, hermaphrodite, brightly coloured, solitary to subumbellate. Sepals 3, rarely 5, coloured, imbricate, unequal, the lowermost hollowed out into a spur. Petals 3, the upper one outside, usually erect, concave, the lateral ones often 2-lobed. Stamens 5; filaments short and broad; anthers 2-celled, connate around the ovary. Ovary superior, 5-celled, with axile placentas; stigmas 1–5, more or less sessile; ovules numerous. Fruit a succulent capsule, opening elastically into 5 twisted valves. Seeds without endosperm and with straight embryo.

Mostly Asiatic, several in Africa, a few in Europe and North America.

Recognized by the zygomorphic brightly coloured flowers with spurred lower sepal and connate anthers.

IMPATIENS

Linn.—F.T.A. 1: 298; Warburg in Engl. Bot. Jahrb. 22: 46–53 (1895); Gilg in Engl. Bot. Jahrb. 43: 97–128 (1909).

- 1 Flowers on simple pedicels in the axils of the leaves, sometimes two together:2
Flowers subumbellate, or racemose, on a common peduncle:..... 11
- 2 Lip broadly saccate, abruptly narrowed into the spur which is bent back on to the lip:3
Lip gradually tapered into the straight or curved spur; spur not bent back on to the lip, but sometimes very shortly reflexed at the tip:.....4
- 3 Lip broadly tubular-campanulate, about 3 cm. long (from receptacle to mouth of spur); spur reflexed, about 1.5 cm. long, straight; lateral sepals lanceolate, entire; pedicels about 4 cm. long; leaves alternate, elliptic-lanceolate, acute at each end, long-petiolate, 10–15 cm. long, 3–5 cm. broad, glabrous or pubescent, crenate, teeth with subulate points almost in the crenatures, becoming larger towards the base and on the petiole[L. niamniamensis](#)
Lip obliquely campanulate, triangular when pressed, 1–1.5 cm. long (from receptacle to mouth of spur) and 2–

- 2.5 cm. broad; spur 8–12 mm. long; wings 3–4 cm. long; lateral sepals ovate, each with denticulations and a pair of appendages; leaves alternate or subopposite, ovate or elliptic-lanceolate, acute at each end, 8–15 cm. long, 3–8.5 cm. broad, petiole 3–8 cm. long [2. zenkeri](#)
- 4** Spur 2 cm. or more long, longer than the limb of the flower: **5**
 Spur not, or scarcely, exceeding 1 cm. long, as long as or shorter than the limb of the flower: **9**
- 5** Petiole short, not exceeding 3 cm.: **6**
 Petiole 3–7 cm. long; leaves glabrous, 14–18 cm. long, 3–4 cm. broad; flowers glabrous: **8**
- 6** Spur 3–4 cm. long; leaves serrate or serrulate, 8–15 cm. long, 2–3.5 cm. broad; seeds warty, glabrous: **7**
 Spur 2 cm. long; leaves crenate, lanceolate, 9 cm. long, 2 cm. broad; seeds smooth, sparsely pilose; flowers, stem and leaves glabrous [4. jacquesii](#)
- 7** Spur, stem and lower leaf-surface glabrous; leaves lanceolate [3. irvingii var. irvingii](#)
 Spur pubescent especially in the upper wide part; stem and lower surface of leaves rusty pubescent; leaves elliptic-lanceolate [3a. irvingii var. setifera](#)
- 8** Spur 6–7 cm. long; lamina of leaves broadest in the middle; seeds ellipsoidal, with vermicular hairs .. [5. bennae](#)
 Spur 3.5–4.7 cm. long; lamina of leaves broadest in the upper third; seeds narrowly ellipsoidal, glabrous or finely glandular-pubescent [6. nzoana](#)
- 9** Spur, lip and stem, especially in the upper part, more or less densely pilose: **10**
 Spur, lip and stem glabrous; midrib and nerves beneath glabrous to sparingly pilose; lip 3–5 mm. long and about 1 cm. broad; wings about 2 cm. long with a broad blade, and long narrow basal portion bearing a small lateral lobe; lip and spur more or less distinctly mottled or barred [9. mannii](#)
- 10** Stems erect, to 1 m. high, not rooting at the nodes; leaves 4–12 cm. long, 2–5 cm. broad; lip about 8 mm. long and 1 cm. broad; wings about 2.5 cm. long [7. burtoni](#)
 Stems prostrate, rooting freely at the nodes; leaves 3–5 cm. long, 1.5–2 cm. broad; lip about 4 mm. long; wings about 1 cm. long [8. deistelii](#)
- 11** Lip elongate-conic or trumpet-shaped, gradually narrowed into the relatively short, stout and more or less reflexed spur: **12**
 Lip short, suddenly narrowed into the long slender spur; spur not reflexed: **14**
- 12** Leaves opposite or whorled, petioles and nerves of the leaves rusty pubescent; lamina elliptic or ovate-elliptic, cuneate at base, acutely acuminate, 8–16 cm. long, 3–6 cm. broad, deeply crenate with subulate teeth; lip elongate-conic, gradually narrowed into a short spur with a swollen tip, longitudinally grooved, spur and lip together 2–2.5 cm. long; wings scarcely longer than mouth of lip [10. sakeriana](#)
 Leaves alternate, glabrous: **13**
- 13** Wings narrow, linear, adjacent close to the mouth of the lip, overlapping in front; lip with a steeply inclined mouth, elongate-conical, 2.5–3.5 cm. long, with a short, thick, abruptly reflexed spur; inflorescence racemose; leaves ovate-elliptic, rounded at base, acutely acuminate, 8–12 cm. long, 4–5 cm. broad, crenate, with teeth becoming cilia towards the base [11. hians](#)
 Wings large, 3–4 cm. long and 1.5–2 cm. broad; lip obliquely trumpet-shaped, about 1 cm. long and 1.5 cm. broad, suddenly contracted into a short slender incurved spur; peduncle 10–20 cm. long; pedicels about 2 cm. long, subumbellate; leaves ovate, abruptly cuneate at base, acutely acuminate at apex, 8–15 cm. long, 5–9 cm. broad, coarsely crenate with subulate teeth [12. macroptera](#)
- 14** Bracts crowded, imbricate, boat-shaped, about 6 mm. long; flowers with pedicels 1–1.8 cm. long, borne close together and hence subumbellate at the end of the 8–15 cm. long peduncle; leaves alternate, ovate-elliptic, setulose-crenate, 4–10 cm. long, 2.5–5 cm. broad [13. filicornu](#)
 Bracts separate, not crowded, up to 4 mm. long; flowers racemose or subcorymbose: **15**
- 15** Spur up to 1.5 cm. long; wings up to 1 cm. long; pedicels up to 1.5 cm. long; leaves alternate to subverticillate: **16**
 Spur exceeding 1.5 cm. long; wings exceeding 1 cm. long; pedicels exceeding 1.5 cm. long: **17**
- 16** Leaves deeply crenate, long-ciliate at base, oblong-ovate, 3–10 cm. long, 1–3 cm. broad, petiole 2–6 cm. long; inflorescence 7–9 cm. long, flowers subumbellate near the apex of the peduncle; pedicels 5–15 mm. long; bracts about 1 mm. long; wings about 7 mm. long; spur about 5 mm. long [14. preussii](#)
 Leaves serrulate with setae, becoming sparsely setose on the margin near the base, ovate, acuminate, 4–11 cm. long, 2–5 cm. broad, petiole 2–2.5 cm. long; inflorescence 8–12 cm. long, racemose; pedicels 10–15 mm. long; bracts 3 mm. long; wings 8–10 mm. long, deeply lobed; spur 10–13 mm. long [15. sp. A](#)
- 17** Inflorescence with numerous flowers densely arranged along an axis 1.5–3 cm. long at the end of a peduncle 5–12 cm. long; pedicels 1.5–2.5 cm. long; bracts 3–4 mm. long, deciduous; wings 1–1.5 cm. long; spur 1.5–2.5 cm. long; leaves alternate or opposite or verticillate, ovate, obliquely subacute at base, acuminate, margin serrate or crenate, with setae in the crenatures, 5–17 cm. long, 2.5–7 cm. broad, petiole 2–12 cm. long [16. kamerunensis](#)

Inflorescence lax, with 6–9 flowers arranged along an axis 3–8 cm. long at the end of a peduncle 8–16 cm. long; pedicels 2–2.7 cm. long; bracts 2–3 mm. long, persistent; wings about 1.5 cm. long; spur 2.5–4.5 cm. long; leaves sparsely pubescent, ovate-lanceolate, 7–12 cm. long, 4–5 cm. broad, crenate-serrate; petiole 1–4 cm. long [17. obanensis](#)

1. **Impatiens niamniamensis** *Gilg* in Engl. Bot. Jahrb. 43: 104 (1909); G. M. Schulze in Notizbl. Bot. Gart. Berl. 12: 733 (1935). *APD acc*

Impatiens bicolor *Hook. f.* (1862), not of Royle (1839); F.T.A. 1: 299.

Impatiens dichroa *Hook. f. ex Gilg* l.c. (1909), not of Hook. f. (1908); F.W.T.A., ed. 1, 1: 142.

Herb 1–3 ft. high, stem stout below; the spurred sepal forming a long, dark purple, crimson or red sac, other parts of flower greenish-white.

Br. Cam.: Cam. Mt., 3,500–5,500 ft. (Jan.–Apr.) Mann 1248! Dunlap 24! Sundas FHI 20384! Brenan 9360! Maitland 274!
F. Po: Clarence Peak, 4,500 ft. (Dec.) Mann 574! Moka (Feb.) Exell 854! Musola (Jan.) Guinea 1798!

Extends through the **Belgian Congo** to **Kenya**, **Uganda** and A.–E. **Sudan**.

2. **Impatiens zenkeri** *Warb.* in Engl. Bot. Jahrb. 22: 51 (1895).

APD: Synonym of Impatiens mackeyana subsp. zenkeri (Warb.) Grey-Wilson

Erect herb, to 3 ft. high; flowers white with pink and yellow markings.

Br. Cam.: Bali-Ngemba F.R., Bamenda (May) Ujor FHI 30394! R. Metschum waterfalls, Bamenda (Jan.) Keay FHI 28523!

Also in **French Cameroons**.

[Keay FHI 28523 differs somewhat from typical *I. zenkeri* but appears to be connected by intermediate forms.]

3. **Impatiens irvingii** *var. irvingii*—F.T.A. 1: 300 (1868); Gilg l.c. 111; Chev. Bot. 99. *APD acc*

Erect herb, 2–4 ft. high, half-aquatic; flowers uniformly red or pink; leaves peculiarly greyish tinted beneath.

Fr. G.: B. Diminkon, Benna (Dec.) Jac.-Fel. 2150! **S. L.:** Don! Kaballa (Sept.) Thomas 2333! Fundenbaia (Oct.) Thomas 2854! **Iv. C.:** fide Chev. l.c. **G. C.:** Sampa, Ashanti (Dec.) Vigne FH 3485! **Dah.:** Avrancou Lagoon (Jan.) Chev. 22746. **N. Nig.:** Nupe Yates! **S. Nig.:** Lagos Millen 97! Abeokuta Irving! R. Ado, Ilaro (Jan.) Millen 123! Sapoba (Nov.) Keay FHI 21505! 3a. **Impatiens irvingii** *var. setifera* *A. Chev.* in Bull. Soc. Bot. Fr. 58, Mém. 8: 143 (1912). *APD acc*

Impatiens villosocalcarata *Warb. & Gilg ex Gilg* in Engl. Bot. Jahrb. 43: 115 (1909); F.W.T.A., ed. 1, 1: 142.

Similar to above, but with a varying amount of rusty pubescence, and often with somewhat broader leaves.

Fr. G.: Konanké country (Feb.) Chev. 20810! Macenta (Mar.) Jac.-Fel. 1556! Nzérékoré (Oct.) Baldwin 9709! **S. L.:** Afzelius! Samu (Dec.) Sc. Elliot 4300! **Lib.:** Dinklage 3365! Ganta (Apr.–Nov.) Harley! **Iv. C.:** Dyola country (May) Chev. 21541. **N. Nig.:** Ilorin Prov. Clarke 15! **S. Nig.:** Lagos Rowland! Brass Barter 102! Angiama Barter 2135!

[There are various forms intermediate between the extreme hairy forms of *var. setifera* and the glabrous *var. irvingii* and I have included these in the *var. setifera*. *I. irvingii* Hook. f. (sensu lato) extends to A.–E. Sudan, Tanganyika and Nyasaland.]

4. **Impatiens jacquesii** *Keay* in Kew Bull. 1953: 287.

APD: Synonym of Impatiens hochstetteri subsp. jacquesii (Keay) Grey-Wilson

Impatiens jaegeri *Pellegr. & Jac.-Fel.* in Bull. Soc. Bot. Fr. 96: 168 (1950), not of Gilg (1909).

Impatiens petrophila *Gilg & Ledermann* in Engl. Pflanzenw. Afr. 5, 1; 62 (1925), name only.

Erect annual, to about 1 ft high; flowers pink.

Fr. G.: Benna Jac.-Fel. 1746. Bilima Jac.-Fel. 1828. Mali, Mt. Loura Jac.-Fel. 2000. **S. L.:** Loma Mts., 3,200–6,900 ft. Jaeger 229; 1182; 1320; 1332; 1428; 1451; 1557; 2019.

Also in **French Cameroons**.

5. *Impatiens bennae* Jac.-Fel. in Bull. Soc. Bot. Fr. 96; 170 (1950).

APD: *Synonym of Impatiens nzoana subsp. bennae* (Jacq.-Fél.) Grey-Wilson

Erect branched herb, to 21/2 ft. high, entirely glabrous.

Fr. G.: Benna Jac.-Fel. 1769.

6. *Impatiens nzoana* A. Chev. in Bull. Soc. Bot. Fr. 58, Mém. 8: 143 (1912). APD acc

A glabrous herb, simple or branched, up to 2 ft.; flowers pale rose; in rocky streams.

Iv. C.: source of R. Nuon, Nzo (Apr.) Chev. 21113!

7. *Impatiens burtoni* Hook. f.—F.T.A. 1: 299. APD acc

Erect or ascending herb, 2 ft. high; flowers pink, with green spur veined with purple, throat orange.

Br. Cam.: Cam. Mt., 2,500–5,700 ft. (Dec.–Apr.) Mann 1247! 1952! Preuss 574! Brenan 9337! Dunlap 18! Bamenda, 5,500–5,800 ft. (Jan.) Migeod 395! Keay FHI 28425!

[*I. eminii* Warb. of Belgian Congo, Uganda and Tanganyika is very close and possibly not specifically distinct.]

8. *Impatiens deistelii* Gilg in Engl. Bot. Jahrb. 43: 108 (1909).

APD: *Synonym of Impatiens mannii* Hook. f.

Prostrate herb, rooting at the nodes; flowers pale rose.

Br. Cam.: Cam. Mt., Buea (June) Deistel 659; 669!

9. *Impatiens mannii* Hook. f.—F.T.A. 1: 300; Gilg l.c. 107. APD acc

Impatiens affinis Warb. in Engl. Bot. Jahrb. 22: 52 (1895); Gilg l.c. 111; F.W.T.A., ed. 1, 1: 142.

Straggling herb 2–3 ft. high; petals white with pink tinge, spur yellow-green at tip, purplish above with more or less distinct transverse bars on the lip.

Br. Cam.: Cam. Mt., 2,500–6,000 ft. (Sept.–Apr.) Mann 1258! 1953! 1954! Preuss 583! 878b! Dalz. 8341! Brenan 9338! F. Po: 2,000–4,000 ft. (Apr., Dec.) Mann 585! s.n.! Moka (Jan.) Exell 774! Musola (Mar.) Guinea 1356!

[Gilg suggested that *I. affinis* is a hybrid between *I. burtoni* and *I. mannii*, but it appears to me to be only a pubescent form of *mannii*; the indumentum character is not correlated with the barring of the spur and lip as suggested by Hutch. & Dalz.—R.W.J.K.]

10. *Impatiens sakeriana* Hook. f.—F.T.A. 1: 301; Gilg l.c. 102. APD acc

Stout erect herb, to 9 ft. high, stems straggling at the ends; flowers deep red, with yellow standard petal marked with two deep crimson blotches.

Br. Cam.: Cam. Mt., 5,000–7,500 ft. (Nov.–Apr.) Mann 1256! 1970! Maitland 500! 891! Brenan 9356! 9366a! Bamenda, 7,500 ft. (Jan.) Migeod 385! Near L. Bambulue, Bamenda (Jan.) Keay FHI 28361! F. Po: St. Isabel Peak, 8,000 ft. (Nov.) Guinea 2719!

Also in French Cameroons.

11. *Impatiens hians* Hook. f.—F.T.A. 1: 301; Gilg l.c. 117. APD acc

Erect herb, to 2 ft; flowers dark red and greenish.

Br. Cam.: Buea, Preuss 881; 962! Deistel F. Po: 1,300–2,000 ft. (Dec.) Mann 309! 686!

Also in French Cameroons and Belgian Congo.

12. *Impatiens macroptera* Hook. f.—F.T.A. 1: 301; Gilg l.c. 115. APD acc

APD: *Synonym of Impatiens pseudomacroptera* Grey-Wilson

Erect herb, 2–4 ft. high; flowers green and white or purplish.

S. Nig.: Oban Talbot 1272! Ikom Rosevear 73/29! **Br. Cam.:** R. Limbe, Victoria (Nov.) Preuss 1352! Boana to Buea (Aug.) Preuss 946. Banti to Babesong Conrau 7. **F. Po:** 4,000–5,000 ft. (Apr.) Mann 386! 1451!

Also in **French Cameroons** and **Spanish Guinea**.

13. *Impatiens filicornu* Hook. f.—F.T.A. 1: 302; Gilg l.c. 124. *APD acc*

Impatiens baumannii Warb. l.c. 53 (1895).

Slender, glabrous herb, to 2 ft. high; flowers light purple.

Togo: Misahöhe (Mar.) Baumann 95. **Br. Cam.:** Johann-Albrechtshöhe (Mar.) Staudt 869. **F. Po:** 4,000–5,000 ft. (Dec.) Mann 573! Moka (Feb.) Exell 860! Musola (Jan.) Guinea 1781! St. Isabel Peak, 6,400 ft. (Feb.) Guinea 2620!

Also in **French Cameroons**, **Spanish Guinea** and **Belgian Congo**.

14. *Impatiens preussii* Warb. in Engl. Bot. Jahrb. 22: 50 (1895); Gilg l.c. 103.

APD: *Synonym of Impatiens palpebrata* Hook. f.

A slender, generally unbranched, herb, creeping at the base; flowers small, rose.

Br. Cam.: Buea, 3,300–3,750 ft. (Jan.) Preuss 692.

Also in **French Cameroons**.

15. *Impatiens* sp. A. *APD acc*

Erect herb, to 18 in. high; flowers magenta-purple.

S. Nig.: Sonkwa, Mt. Koloishe, 5,000 ft. (Dec.) Savory & Keay FHI 25066!

Possibly a new species, related to *I. kamerunensis* Warb.

16. *Impatiens kamerunensis* Warb. l.c. 51 (1895); Gilg l.c. 103. *APD acc*

Impatiens pleistantha Gilg l.c. 124 (1909).

Erect herb, to 3 ft. high; flowers pink or deep mauve.

Br. Cam.: Buea, 3,300–3,750 ft. (Dec.–Apr.) Preuss 590! Deistel 149! Migeod 250! Dundas FHI 15332! Cam. Mt., above Mimbia, 4,400 ft. (Apr.) Brenan 9362! R. Ndian, Ikaasa (May) Rudatis 9. LYTHRACEAE

Herbs, shrubs or trees; leaves opposite or verticillate, rarely alternate; stipules absent or very small. Flowers usually actinomorphic, hermaphrodite, solitary to paniculate. Sepals united into a tube, valvate, sometimes with appendages between the lobes. Petals present or absent, inserted towards the top of the calyx-tube, crumpled in the bud. Stamens usually 4 or 8, or rarely more, inserted below the petals; filaments usually inflexed in bud; anthers 2-celled, opening lengthwise. Ovary superior, sessile or shortly stipitate, completely or incompletely 2–6-celled (rarely 1-celled); style simple, variable in length; ovules numerous, on an axile placenta sometimes not extending to the top of the ovary. Fruit usually capsular, opening by a transverse slit, by valves, or irregularly. Seeds numerous, without endosperm; embryo straight.

Mainly in the tropics.

Recognized by the opposite exstipulate simple leaves, tubular calyx with valvate lobes, crumpled petals, insertion of the stamens, superior ovary, and numerous seeds without endosperm.

- 1 Shrubs or trees:2
- Herbs or suffrutices, never spiny:3
- 2 Calyx tubular, 10–12 mm. long; petals very small; capsule valvate; racemes axillary, 1–6-flowered; branchlets not spiny1. *Woodfordia*
- Calyx not tubular, 3–5 mm. long; petals well-developed; capsule indehiscent or tardily bursting irregularly; inflorescence a lax leafy terminal panicle; branchlets often spiny2. *Lawsonia*
- 3 Flowers solitary or subsolitary, sessile or subsessile in leaf axils; fruit a septicidal capsule3. *Rotala*
- Flowers in cymes, or umbels, or crowded into bracteate heads:4
- 4 Septae of ovary interrupted above the placenta which is not, therefore, continuous with the style; fruit a circumscissile capsule; flowers pedicellate in cymes; petals not corrugated in bud, or absent4. *Ammannia*
- Septae of ovary complete, the placenta consequently continuous with the style; fruit at length opening by valves; flowers in bracteate heads or umbels; petals corrugated in bud, or absent5. *Nesaea*

Lagerstroemia indica Linn.

A native of Asia, is frequently cultivated as ornamental shrubs and trees.

Lagerstroemia speciosa (Linn.) Pers. APD acc

Lagerstroemia flos-reginae Retz.

A native of Asia, is frequently cultivated as ornamental shrubs and trees.

1. WOODFORDIA

Salisb.—F.T.A. 2: 481.

- 1 Much-branched shrub; stem and leaves with small black glands; leaves opposite, ovate-lanceolate or lanceolate, rounded or subcordate at base; subsessile, acuminate, 3–10.5 cm. long, 0.6–3.5 cm. broad; racemes 1–6-flowered, axillary; calyx tubular 10–12 mm. long, constricted above the base, lobes triangular; petals very

small; stamens exserted [uniflora](#)

Woodfordia uniflora (A. Rich.) Koehne in Engl. Bot. Jahrb. 1: 334 (1881); Engl. Pflanzenr. Lythrac. 80 (1903); Aubrév. Fl. For. Soud.-Guin. 62. *Grislea uniflora* A. Rich. (1847). *APD acc*

Woodfordia floribunda of F.T.A. 2: 481, not of Salisb.

Shrub, to 10 ft. high; flowers bright red.

N. Nig.: Pankshin (Dec.) W. D. MacGregor 432!

Also in **French Cameroons**, and widespread in E. Africa from Abyssinia to **Uganda**.

2. LAWSONIA

Linn.—F.T.A. 2: 482.

- 1 A shrub or small tree, the older branchlets often indurated and spinescent; leaves opposite, elliptic to oblanceolate, acute at each end, up to about 4 cm. long and 2 cm. broad, glabrous, with the midrib impressed above; panicle many-flowered, with leafy bracts; flowers 4-merous, creamy-white, sweet-scented; pedicels about 2 mm. long; petals crumpled in bud; stamens 4–8; fruit globose, about 0.5 cm. diameter, with persistent style [inermis](#)

Lawsonia inermis *Linn.*—Koehne in Engl. Pflanzenr. Lythrac. 270, t. 59. *APD acc*

Lawsonia alba *Lam.*—F.T.A. 2: 483; Chev. Bot. 281.

Flowers creamy-white, sweet scented; widely cultivated as a dye-plant (Henna).

Sen.: fide Chev. l.c. **Fr. Sud.:** Sikasso Chev. 3004! Koulikoro (Sept.) Chev. 24991! **S. L.:** Barter! Waterloo (May) Deighton 2745! R. Scarcies, Kitchom (Dec.) Sc. Elliot 4314! **Lib.:** Farmar 344! **G. C.:** Aburi (Nov., Dec.) Johnson 892! 1097! **Dah.:** fide Chev. l.c. **Fr. Nig.:** Zinder Hagerup 587! **N. Nig.:** Borgu Barter 804! **S. Nig.:** Foster 147!

Throughout tropical Africa, Asia and Australia.

3. ROTALA

Linn.—F.T.A. 2: 466; Koehne in Engl. Pflanzenr. Lythrac. 24 (1903).

- 1 Leaves mostly in threes, linear, narrow at base, up to 13 mm. long and 0.5–1 mm. broad; stamens 2–3 [1. mexicana](#)
Leaves in pairs, mostly oblong to elliptic, broad at base, over 2 mm. broad; sometimes with ovate-lanceolate upper leaves and linear leaves towards base of stem (see No. 6): [2](#)
- 2 Calyx with subulate appendages between the lobes; leaves lanceolate-oblong, rounded at apex, 5–10 mm. long, 2–4 mm. broad; stamens 2–3 [2. decussata](#)
Calyx without appendages between the lobes: [3](#)
- 3 Stamens the same number as the sepals, usually 4; leaves oblong-elliptic, cordate at base, rounded at apex, 3–10 mm. long, 2–6 mm. broad [3. tenella](#)
Stamens 2: [4](#)
- 4 Petals 4; capsule oblong, about 3 mm. long; leaves ovate-lanceolate, subcordate at base, 4–8 mm. long, 2–4 mm. broad [4. elatinoides](#)
Petals absent; capsule globose: [5](#)
- 5 Leaves oblong, cordate or subcordate at base, 3–9 mm. long, 1.5–4 mm. broad [5. stagnina](#)
Upper leaves ovate-lanceolate, obtuse at base, 2–3 mm. long, about 1 mm. broad, lower leaves linear about 5 mm. long and 0.5 mm. broad [6. sp. nr. dinteri](#)

1. **Rotala mexicana** *Cham. & Schlechtd.*—Koehne in Engl. Pflanzenr. Lythrac. 29. *APD acc*

Rotala verticillaris of F.T.A. 2: 467, not of Linn.

Annual, prostrate, rooting and branched at base, 1–4 in. long; petals absent or early falling off.

N. Nig.: Nupe Barter 898!

World-wide in the tropics.

2. **Rotala decussata** *Hiern* in F.T.A. 2: 467, excl. syn. (1871); Koehne l.c. 34; Chev. Bot. 279.

APD: *Synonym of Rotala welwitschii Exell*

? **R. decussata** *DC.*

Much-branched annual, 2–9 in. long; petals 4 or 0; in [wet places by streams, etc.](#)

IV. C.: Nzi valley (Aug.) Chev. 22245, **Togo:** Lome Warnecke 229! **N. Nig.:** Lokoja (Nov.) Dalz. 210!

Also in [Angola](#).

3. **Rotala tenella** (*Guill. & Perr.*) *Hiern* in F.T.A. 2: 467 (1871); Koehne l.c. 39. *APD acc*

Ammannia tenella *Guill. & Perr.*

Stems creeping at base, with erect branches, pink; petals 4, white, soon falling off.

Sen.: Walo (Sept., Oct.) Perrottet 333! **Fr. Sud.:** Bura (Sept.) Hagerup 406! Dogo (May) Davey 133! **Fr. G.:** Toumanea Pobéguin 1897! **S. L.:** Talla Hills (Feb.) Sc. Elliot 4852! Kambia (Nov.) Jordan 377! Bonthe Isl. (Nov.) Deighton 2285!

Also in [A.–E. Sudan](#), [Belgian Congo](#) and [Transvaal](#).

4. **Rotala elatinoides** (*DC.*) *Hiern* in F.T.A. 2: 466 (1871); Koehne l.c. 39; Chev. Bot. 279. *APD acc*

Ammannia elatinoides *DC.*

Annual, creeping with ascending branches 2–4 in. high; petals 4, white or violet.

Sen.: Leprieur! Walo (Sept.–Feb.) Perrottet 332! M'bidjem Thierry 214! **Fr. Sud.:** Dogo (May) Davey 132!

5. **Rotala stagnina** *Hiern* in F.T.A. 2: 467 (1871); Koehne l.c. 39. *APD acc*

Stems reddish, often much-branched, to 6 in. long; fruits red.

N. Nig.: Kontagora (Jan.) Meikle 1040! Anara F.R. (Sept., Oct.) Keay FHI 20130a! FHI 24400! **Br. Cam.:** Wum, Bamenda (Apr.) Maitland 1594!

Also in [A.–E. Sudan](#) and [Abyssinia](#).

[Hinds 5013 from Lawra, Gold Coast is very close to this species, but differs in its shorter style.]

6. **Rotala sp. nr. dinteri** *Koehne ex Schinz*–l.c. 37. *APD acc*

Erect, to 3 in. high, stems red, leaves green, flowers white, fruits red; [in wet flushes on rocks](#).

N. Nig.: Anara F.R. (Oct.) Keay FHI 20130!

[*R. dinteri* Koehne ex Schinz is a S. African species and has a rather shorter style than the Nigerian plant.]

4. AMMANNIA

Linn.—F.T.A. 2: 476; Koehne in Engl. Pflanzenr. Lythrac. 42 (1903). *APD acc*

- 1 Style 1/3 mm. or more long, filiform; leaves all markedly auriculate at base; petals always present:**2**
Style very short, not up to 1/3 mm. long; leaves attenuate to truncate or subcordate, rarely some auriculate; petals present or absent:.....**3**
- 2 Style almost twice as long as ovary; capsule 2.5–3 mm. diam.; stamens 4–8; cymes lax, with filiform peduncles 6–18 mm. long [1. auriculata](#)
Style shorter than ovary; capsule about 1.5 mm. diam.; stamens 4; cymes congested, with peduncles 1.5–3 mm. long [2. priureana](#)
- 3 Leaves all markedly cuneate at base; calyx without appendages between the lobes in fruit; petals absent**3.**
[baccifera](#)

Leaves mostly truncate or subcordate, the lower leaves sometimes cuneate, calyx with small appendages between the lobes in fruit; petals 0–4:4

4 Stamens 84. *gracilis*

Stamens 45. *senegalensis*

1. ***Ammannia auriculata* Willd.**—Koehne in Engl. Pflanzenr. Lythrac. 46 (1903). *APD acc*

Ammannia auriculata var. *auriculata* Koehne l.c.

Ammannia senegalensis of F.T.A. 2: 477 and of F.W.T.A., ed. 1, 1: 144, partly.

Erect herb, 1–2 ft. high; flowers pink; in marshy places.

Sen.: fide Koehne l.c. **Fr. Sud.:** Sarédina (May) Davey 136! **S. L.:** Kambia (Dec., Jan.) Sc. Elliot 4446! Deighton 864! **N. Nig.:** Sokoto (Oct.) Dalz. 418! Lely 119! Birnin Gwari (fr. Dec.) Meikle 1586! Jebba (Dec.) Hagerup 696! Bauchi Plateau (Oct.) Lely P. 788! Tangale (Oct.) Lely 661! Abinsi Dalz.!

Also in **Egypt, N.E. and E. tropical Africa.**

2. ***Ammannia priureana* Guill. & Perr.**—Koehne l.c. 48. *APD acc*

Ammannia senegalensis of F.T.A. 2: 477 and of F.W.T.A., ed. 1, 1: 144, partly.

Ammannia auriculata var. *arenaria* (H. B. & K.) Koehne l.c. 46.

Erect herb, to 2 ft. high; flowers mauve; in marshy places.

Sen.: Leprieur; Perrottet 331! s.n.! Talmy! **Gam.:** Boteler! Dawe 32! **S. L.:** Falaba (Mar.) Sc. Elliot 5096! **Togo:** Lome Warnecke 300! **N. Nig.:** Sokoto (Nov.) Maiser 225! Minna (fr. Dec.) Meikle 1585! Anara F.R. (Mar.) Olorunfemi FHI 24421! **S. Nig.:** Ikirun (Feb.) Millson! Obudu (Dec.) Keay & Savory FHI 25003!

Also in **tropical E. Africa.**

3. ***Ammannia baccifera* Linn.**—Koehne l.c. 53; F.T.A. 2: 478. *APD acc*

Ammannia baccifera subsp. *baccifera*—Koehne l.c. 54.

Ammannia aegyptiaca of F.W.T.A., ed. 1, 1: 144, not of Willd.

Ammannia salicifolia of F.T.A. 2: 478, partly, not of Monti.

Ammannia attenuata Hochst. ex A. Rich.—Koehne l.c. 53.

Ammannia senegalensis of F.W.T.A., ed. 1, 1: 144, partly.

Erect herb, to 2 ft. high; flowers mauve; at edges of pools.

G. C.: Dukwesein, N. Agogo (Dec.) Chipp 615! **N. Nig.:** Yola (Jan.) Dalz. 176! **S. Nig.:** Awba Hills (Dec.) Jones FHI 5981! Cross R., Obokum (Jan.) Holland 260!

Widespread in tropical Africa, Asia and Australia.

4. ***Ammannia gracilis* Guill. & Perr.**—Koehne l.c. 52. *APD acc*

Ammannia diffusa of F.T.A. 2: 479, not of Willd.; Chev. Bot. 280.

A. filiformis of Chev. Bot. 280, not of DC. (fide Hutch. & Dalz.).

Stem prostrate, rooting at the base, with slender branches, about 1 ft. high; petals purple-violet to reddish-white.

Sen.: R. Casamance (Apr.) Perrottet 335! **Fr. Sud.:** Nafadié (Jan.) Chev. 154. Folo (May) Chev. 840. **Fr. G.:** Kollangui (Mar.) Chev. 15077.

Also in **Ubangi-Shari-Chad.**

[Chevalier's specimens cited here were all seen by Hutchinson, but have not been seen for this revision.]

5. ***Ammannia senegalensis* Lam.**—Koehne l.c. 52; F.W.T.A., ed. 1, 1: 144, in part only. *APD acc*

Ammannia senegalensis var. *filiformis* (DC.) Hiern—F.T.A. 2: 477.

Ammannia salsuginosa Guill. & Perr.—F.T.A. 2: 477.

Erect or procumbent herb, to 1 ft. high; in marshy places.

Sen.: M'bidjem Thierry 212! 213! 216! Walo (Sept.–Nov.) Perrottet 334! Heudelot! **Fr. Sud.:** Sarédina (May) Davey 98! **S. L.:** Sc. Elliot! **N. Nig.:** Kadara, Katagum (Jan.) Dalz. 310!

Also in [N.E. Africa](#).

5. NESAEA

Commers. ex H. B. & K.—F.T.A. 2: 470; Koehne in Engl. Pflanzenr. Lythrac. 221 (1903).

- 1 Flowers not congested into bracteate heads:.....[2](#)
- Flowers numerous and congested into heads subtended by leafy bracts:[5](#)
- 2 Stems thick and spongy, often rooting from the lower nodes, neither angular nor winged; leaves obovate-oblong-lanceolate, narrowed to base, rounded at apex, 10–40 mm. long, 5–20 mm. broad, glabrous; peduncles up to 15 mm. long; petals present[1. crassicaulis](#)
- Stems wiry, often angular or winged:.....[3](#)
- 3 Calyx less than 2 mm. long, appendages between the lobes conspicuous; petals absent; leaves lanceolate to oblong-lanceolate, 7–27 mm. long, 3–7 mm. broad; peduncle 2–3 mm. long[2. aspera](#)
- Calyx 3–4 mm. long, appendages absent or very minute; petals present, relatively large:.....[4](#)
- 4 Peduncle less than 5 mm. long; stamens 12–14; leaves linear-lanceolate, 10–65 mm. long, 1.5–5 mm. broad ..[3. dodecandra](#)
- Peduncle 12–25 mm. long; stamens 20–30; leaves ovate to lanceolate, 20–55 mm. long, 5–12 mm. broad[4. mossiensis](#)
- 5 Leaves distinctly cordate at base, sessile, ovate to lanceolate, 5–20 mm. long, 6–10 mm. broad; plant erect; flowers about 5 in each head, subtended by 2 large bracts acute at apex[5. cordata](#)
- Leaves not cordate at base:.....[6](#)
- 6 Leaves oblong-lanceolate, 8–22 mm. long, 2–5 mm. broad; stems more or less erect; flowers 3–7 in each head, subtended by 2 large bracts acute at apex[6. erecta](#)
- Leaves oblong-elliptic to oblong-lanceolate, 10–37 mm. long, 4–22 mm. broad; stems long and mostly decumbent; flowers numerous in each head, subtended by two large bracts, obtuse or rounded at apex[7. radicans](#)

1. *Nesaea crassicaulis* (Guill. & Perr.) Koehne in Engl. Bot. Jahrb. 3: 324 (1882); Engl. Pflanzenr. Lythrac. 225 (1903). *APD acc*

Ammannia crassicaulis Guill. & Perr.—F.T.A. 2: 479; F.W.T.A., ed. 1, 1: 144; Chev. Bot. 279.

Stem erect or ascending, up to 1 ft. long; flowers purple-violet; [in marshes and streams](#).

Sen.: Cayor (Mar.–May) Perrottet 337! M'bidjem (Dec.) Chev. 16769! **Fr. Sud.:** Bilma (Dec.) E. Vogel!

Also in [Angola](#), [Zanzibar](#) and [Madagascar](#).

2. *Nesaea aspera* (Guill. & perr.) Koehne in Engl. Bot. Jahrb. 3: 327 (1882); Pflanzenr. 226. *APD acc*

Ammannia aspera Guill. & Perr.—F.T.A. 2: 480; F.W.T.A., ed. 1, 1: 144.

Erect or ascending, branched near the base, 3–6 in. high; [in damp places](#).

Sen.: near Cape Verde (Mar.) Perrottet 338!

Also in [Angola](#).

3. *Nesaea dodecandra* (DC.) Koehne in Engl. Bot. Jahrb. 3: 334 (1882); Pflanzenr. 234. *APD acc*

Ammannia dodecandra DC. (1826).

Nesaea candollei Guill. & Perr. (1830–33)—F.T.A. 2: 473; Chev. Bot. 280.

Erect, branched herb, 1–2 ft. high; [in inundated meadows, etc.](#)

Sen.: Richard Tol (Sept-Dec.) Perrottet 58! 129! 339! Heudelot!

4. *Nesaea mossiensis* A. Chev. in Bull. Soc. Bot. fr. 58 Mém. 8: 171 (1912); Chev. Bot. 280.

APD: *Synonym of Nesaea angustifolia* A. Fern. & Diniz

APD: Synonym of Nesaea icosandra Kotschy & Peyr.

Undershrub or suffrutex, erect shoots to 2 ft. high, sparingly branched; petals and stamens bright scarlet; [in inundated meadows etc.](#)

Fr. Sud.: Mossi Prov. (July) Chev. 24540! **Fr. G.:** Maclaud! Kollangui (Mar.) Chev. 12194! Diaguissa (Apr.) Chev. 13549! Kouroussa (Mar.) Pobéguin 196! **N. Nig.:** Maska, Katsina (June) Hubbard T. 138! Keay FHI 25888! Kakangi (July) Keay FHI 25929.

[This species is very close to *N. icosandra* Kotschy & Peyr. (see F.T.A. 2: 471) from Ubangi and A.–E. Sudan and may prove conspecific when better known.]

5. Nesaea cordata Hiern in F.T.A. 2: 476 (1871); Koehne in Engl. Pflanzenr. Lythrac. 232; Chev. Bot. 280. *APD acc*

Erect annual, to 8 in. high; flowers pink or red; [in damp places.](#)

Fr. Sud.: Bamako (Nov.) Waterlot 1464! **Iv. C.:** Toumodi (Aug.) Chev. 22389! **N. Nig.:** Borgu Barter 763! Lokoja (Oct.) Dalz. 194!

Widespread in tropical and S. Africa.

6. Nesaea erecta Guill. & Perr.—F.T.A. 2: 474; Koehne l.c. 231; Chev. Bot. 280. *APD acc*

Annual, 2–10 in. high, much-branched; flowers purple.

Sen.: Casamance Heudelot 565! St. Louis (Oct.) Leprieur 9! Cayor (Mar.) Perrottet 342! 343! **Gam.:** Ingram! **Fr. Sud.:** Koulikoro (Oct.) Chev. 15762. Bamako (Nov.) Waterlot 1442! **N. Nig.:** Anchau (Nov.) Keay FHI 21671!

Widespread in tropical Africa and Madagascar.

7. Nesaea radicans Guill. & Perr.—F.T.A. 2: 474; Koehne l.c. 231; Chev. Bot. 280. Sterna up to 4 ft. long. *APD acc*

Sen.: Farmar 58! Talmy! Cayor (Oct.–Mar.) Perrottet 341! Niayes (Dec.) Chev. 15768! M'bidjem (Dec.) Chev. 15769! **Gam.:** Brown-Letter 11! 32!

Also in [Angola](#), [E. Africa](#) and [Madagascar](#).

ONAGRACEAE

Herbs, sometimes shrubs, very rarely trees. Leaves alternate, opposite or rarely whorled, simple; petiole not inflated in middle. Stipules absent or small. Flowers solitary and axillary, sometimes aggregated into racemes, or panicles, normally hermaphrodite, regular or rarely irregular. Sepals valvate, mostly 4, sometimes 5, rarely 2, 3, 6 or 7. Petals free, as many as sepals, contorted or imbricate, rarely absent. Stamens as many or twice as many as sepals, very rarely fewer. Ovary inferior, mostly 4-celled, rarely 1–7-celled. Style simple. Ovules axile, one to many per cell. Fruit a capsule, rarely a nut or a berry. Seeds without endosperm.

Mostly in the Northern Hemisphere.

Recognized by the inferior ovary, valvate sepals, definite number of stamens, and seeds without endosperm.

- 1 Seeds with an apical tuft of silky hairs; sepals caducous after flowering; petals (in our species) white to cream, often tinged pink later [1. Epilobium](#)
- Seeds without any hairs; sepals persistent after flowering; petals (in our species) yellow [1. Jussiaea](#)

1. EPILOBIUM

Linn.—F.T.A. 2: 486.

- 1 Stem appressed grey-puberulous; leaves lanceolate to oblong-linear, cuneate to narrowly rounded at base, obtuse or subacute at apex, 2–8 cm. long, 3–14 mm. broad, petiole usually 1.5–4.5 mm. long, margins and veins usually appressed-grey-puberulous; flowers nodding; sepals 4.5–7.5 mm. long; petals 6–11.5 mm. long, 3–4.5

(–7) mm. broad, elliptic or narrowly obovate-elliptic; style 3·5–7 mm. long; stigma variable in shape, usually oblong to ellipsoid, more rarely obovoid, entire or nearly so, 2–3·5 mm. long, 0·7–1·5 mm. broad; capsule 3–8 cm. long; pedicels 1·3–4·5 cm. long [salignum](#)

Epilobium salignum *Hauskn.* in Oesterr. Bot. Zeitschr. 29: 90 (1879); Hauskn. Monogr. Epilobium 236 (1884); Brenan in F.T.E.A. Onagr. 5, t. 1 (1953). *APD acc*

Epilobium neriophyllum *Hauskn.*

Herbaceous or thinly woody, to 5 ft. high, often branched above; flowers white or cream, often pink-tinged later.

Br. Cam.: Bango, Bamenda (Oct.) Tamajong FHI 28474!

Also in **French Cameroons**, **eastern Africa** and **southern Africa**, and in **Madagascar**.

2. JUSSIAEA

APD: Synonym of Ludwigia L.

Linn.—F.T.A. 2: 488; Munz in Darwiniana 4: 179–284 (1942); Brenan in Kew Bull. 1953: 163.

Ludwigia *Linn.*—F.T.A. 2: 490; F.W.T.A., ed. 1, 1: 146.

- 1 Floating roots absent from the nodes: **2**
Floating, white or pink, spongy, inflated roots produced from the nodes; see above [14. repens var. diffusa](#)
- 2 Seeds in 2 or more longitudinal rows from the base to the apex of each cell of the capsule, free (i.e. not enclosed in or surrounded by endocarp); sepals mostly 3–4, if 5 then capsule almost always 12 mm. long or less: **3**
Seeds in a single row in each cell, or in a single row in the lower part and in 2 or more rows in the shorter upper part of the capsule; sepals 4–5: **11**
- 3 Raphe much narrower than the body of the seed: **4**
Seeds each with an enlarged raphe almost as large as the body of the seed: **9**
- 4 Stamens 8 (–10): **5**
Stamens 3–4 (–5): **7**
- 5 Plant always pubescent or pilose; seeds 0·75–0·8 mm. long; capsule often 2–4 cm. long; petals 6–16 mm. long [1. stenorrhapha](#)
Plant glabrous (at least in African specimens); seeds 0·3–0·5 mm. long, 0·2–0·3 mm. broad; capsule not exceeding 2 cm. long: **6**
- 6 Leaves with petiole 3–15 mm. long; stems strongly angled; sepals 3–6 mm. long; petals 4–5 mm. long [2. erecta](#)
Leaves sessile or subsessile; stems narrowly winged; sepals 7–10 mm. long; petals 8–12 mm. long [3. decurrens](#)
- 7 Sepals 4–5; capsule not, or scarcely, tapering to the apex and there 2–4 mm. diam.; plant usually erect; leaves lanceolate to linear, 1·5–9 cm. long, 1·5–15 mm. broad [4. perennis](#)
Sepals 3 (–4); capsule normally tapering to the apex and there less than 2 mm. diam.; plant usually prostrate; leaves obovate to oblanceolate: **8**
- 8 Ovary and stem (under x 20 lens) puberulous; seeds pale brown; leaves mostly shortly obovate; capsule often shorter and more oblong than in senegalensis [5. pulvinaris](#)
Ovary and stem (under x 20 lens) glabrous or nearly so; seeds red-purple or red-brown; leaves usually oblanceolate [6. senegalensis](#)
- 9 Leaves mostly lanceolate to linear-lanceolate, those subtending flowers 2–10 mm. broad, gradually tapering towards the apex, not parallel-sided; more or less spreading-hairy, sometimes densely so, on stems, leaves and young shoots, or sometimes the spreading hairs on young shoots only [7a. suffruticosa var. brevisepala](#)
Leaves linear, those subtending flowers 1–2 (–3) mm. broad, more or less parallel-sided: **10**
- 10 Leaves and stem puberulous, appearing subglabrous, sometimes with a few spreading hairs on young parts only [7b. suffruticosa var. linearis](#)
Leaves and stem more or less plentifully clothed with long spreading hairs .. [7c. suffruticosa var. piloso-linearis](#)
- 11 Capsule mostly with a slightly enlarged cylindrical apical portion in which the seeds are free and in 2 or more rows in each cell; seeds in lower, longer portion in a single row in each cell, almost pendulous and each

- enclosed in a piece of endocarp; sepals 4, 2–3.5 mm. long; petals about 3 mm. long; stamens 8; ovary minutely puberulous (x 20 lens essential) [9. linifolia](#)
- Capsule mostly not enlarged towards the apex, always with the seeds in a single row throughout each cell: **12**
- 12** Seeds free (i.e. not enclosed in or surrounded by endocarp), pendulous; sepals 6–8 mm. long, 1.2–1.5 mm. broad at base; capsule 4–4.5 cm. long, 1–5 mm. diam.; pedicels 8–14 mm. long [8. gracilis](#)
- Seeds each enclosed in or surrounded by a piece of endocarp, horizontal (except in repens): **13**
- 13** Sepals 3–14 mm. long; petals 5–24 mm. long; stamens 8–10 (–14); capsule 2.5–4 mm. diam. (except in africana): **14**
- Sepals 1.75–3 mm. long; petals 1.5–3.5 mm. long; stamens 4 (–5); capsule 1–2 mm. diam.; ovary and stem glabrous [13. abyssinica](#)
- 14** Capsule 2.5–4 mm. diam.; sepals of ten 5 or more; petals of ten more than 5 mm. long: **15**
- Capsule 1.5–2.5 mm. diam., puberulous; sepals 4, 3–4.5 mm. long; petals about 5 mm. long; pedicels 3–8 mm. long [12. africana](#)
- 15** Sepals 5–14 mm. long: **16**
- Sepals 3–5 mm. long; plant more or less densely spreading pilose; leaves usually elliptic with 10–25 lateral nerves on each side of midrib; capsule densely hairy; seeds horizontal [11. affinis](#)
- 16** Leaves with 11–20 lateral nerves on each side of midrib; capsule marked on outside with little bumps 0.5 mm. apart corresponding to the seeds inside; seeds horizontal, each surrounded by, but free within, a horseshoe-shaped piece of endocarp, the actual seed 0.8–1 mm. long [10. leptocarpa](#)
- Leaves with 6–12 lateral nerves on each side of midrib; capsule marked on outside with little bumps 1.5–2 mm. apart corresponding to the seeds inside; seeds pendulous, each enclosed by and firmly attached to its piece of endocarp, the actual seeds 1–1.5 mm. long; plant creeping or floating [14. repens var. diffusa](#)

1. *Jussiaea stenorraphe* Brenan in Kew Bull. 1953: 164; Brenan in F.T.E.A. Onagr. 10, t. 2, 1, t. 3 (1953).

APD: Synonym of Ludwigia stenorraphe (Brenan) H. Hara subsp. stenorraphe

Jussiaea villosa of F.W.T.A., ed. 1, 1: 146, partly.

Jussiaea suffruticosa **Linn.** var. *stenosperma* **Berhaut** in Bull. Soc. Bot. Fr. 99: 323 (1953).

Shrubby, or less often herbaceous, 3–10 ft. high; sepals often turning bright red within after the petals fall.

Fr. Sud.: Nafadié (Jan.) Chev. 159! **Fr. G.:** Kouroussa (Dec.) Pobéguin 601! **G. C.:** Birrifwa, N.W. Dist. (Feb.) Kitson! **Togo:** Kpedsu (Dec.) Howes 1043! **Dah.:** fide Berhaut l.c. **N. Nig.:** Zaria (Dec.) Meikle 834! Anara F.R. (Mar.) Olorunfemi FHI 24424! Kaduna (Nov.) Keay FHI 28113! Bauchi Plateau (Sept., Oct.) Lely 574! P. 846! Lokoja Barter! Yola (Oct.) Shaw 96! **S. Nig.:** Eruwa Rowland!

Widespread in tropical Africa, with three other variants in E. Africa.

2. *Jussiaea erecta* Linn. Sp. Pl. 388 (1753); Munz in Darwiniana 4: 195 (1942); Berhaut l.c. 322 (1953); Brenan in F.T.E.A. Onagr. 12, t. 2, 2 (1953).

APD: Synonym of Ludwigia erecta (L.) H. Hara

Jussiaea acuminata **Sw.**, not of F.W.T.A., ed. 1, 1: 146.

Jussiaea altissima **Perr. ex DC.** Prod. 4: 55 (1828); Guill. & Perr. Fl. Seneg. 1: 293 (1833).

Jussiaea linifolia of F.W.T.A., ed. 1, 1: 146 (excl. Brown-Lester 10).

Sen.: Perrottet! Farman 41! **Fr. Sud.:** Timbuktu (July) Chev. 1276! 1277! Hagerup 163c! **S. L.:** Laminaiya (Apr.) Thomas 142! Mange, Bure (Jan.) Deighton 1036! **Fr. Nig.:** Daddara (Dec.) Brenan 8928!

Widespread in tropical Africa, Madagascar, Mascarene Islands, and in tropical America.

3. *Jussiaea decurrens* (Walt.) DC. Prod. 3: 56 (1828); Munz l.c. 198.

APD: Synonym of Ludwigia decurrens Walter

Ludwigia decurrens **Walt.**

Erect annual herb.

Gam.: Sounders 5! **S. Nig.:** R. Waiya, Ikom (Dec.) Keay FHI 28289! Atan Eki, Itu (Jan.) Jones FHI 5039! Cross R., Ikot Okpora (Apr.) Akpata FHI 3934!

Native of tropical and subtropical America.

4. **Jussiaea perennis** (Linn.) Brenan in Kew Bull. 1953: 163; Brenan in F.T.E.A. Onagr. 13, t. 2, 4 (1953).

APD: *Synonym of Ludwigia perennis* L.

Ludwigia perennis Linn.

Ludwigia parviflora Roxb.—F.T.A. 2: 490; Trochain in Bull. Soc. Bot. Fr. 82: 144 (1935).

Isnardia multiflora Guill. & Perr. Fl. Seneg. 1: 295.

Annual herb; capsules 12 mm. long or less.

Sen.: Perrottet 320. Richard Tol Leprieur! Walo (Jan.) Perrottet! Bakel (Sept., Oct.) Heudelot 328.

Also in **Chad**, **A.-E. Sudan**, **E. Africa** and **Madagascar**; widespread in tropical Asia, the Philippines and New Caledonia; possibly in Australia.

5. **Jussiaea pulvinaris** (Gilg) Brenan l.c. 163 (1953).

APD: *Synonym of Ludwigia senegalensis* (DC.) Troch.

Ludwigia pulvinaris Gilg—F.W.T.A., ed. 1, 1: 146; Trochain l.c. 144 (1936).

Small prostrate herb.

Fr. Sud.: Tiguibéri (Jan.) Chev. 295! Island in R. Niger, between Bourem and Bamba (Mar.) Leclercq 42321; Chev. 42947.

Fr. G.: Kouria (Oct.) Caille 15027. **S. L.:** Njala (Mar.) Deighton 3370!

Also in **Belgian Congo** (?), **Rhodesia** and **Angola**.

6. **Jussiaea senegalensis** (DC.) Brenan l.c. 164 (1953).

APD: *Synonym of Ludwigia senegalensis* (DC.) Troch.

Prieurea senegalensis DC.

Jussiaea prieurea Guill. & Perr.

Ludwigia prieurea (Guill. & Perr.) Trochain l.c. 142–3 (1935).

Ludwigia senegalensis (DC.) Trochain Contrib. Vég. Sénégal 378 (1940).

Small prostrate herb.

Sen.: Leprieur! Dangana Leprieur. Matam (Nov.) Trochain 992. **Fr. Sud.:** Koulikoro (Oct.) Chev. 15774. Dogo (May)

Davey 128! **S. L.:** Mange, Bure (Dec.) Jordan 723!

Also in **A.-E. Sudan**.

7. **Jussiaea suffruticosa** Linn. Sp. Pl. 388 (1753); Munz l.c. 235.

APD: *Synonym of Ludwigia octovalvis* (Jacq.) P.H. Raven

Jussiaea villosa Lam.

- 7a. **Jussiaea suffruticosa** var. **breviseipala** Brenan in Kew Bull. 1953: 168; Brenan in F.T.E.A. Onagr. 14, t. 2, 5 (1953).

APD: *Synonym of Ludwigia octovalvis* (Jacq.) P.H. Raven

Jussiaea villosa Lam. of F.W.T.A., ed. 1, 1: 146, partly.

Herb, to 4 ft. high; sepals 3.5–6 mm. long, 1.5–3.25 mm. broad; petals 5–8 mm. long, 3–4.5 mm. broad.

Gam.: Wallikunda (Aug.) Macluskie! **S. L.:** Mahera (Nov.) Deighton 5683! Njala (Oct.) Deighton 2808! Baoma (Apr.) Deighton 3167! Yonibana (Oct., Nov.) Thomas 4059! 4741! **Lib.:** Bushrod Isl. Maitland 1593!

Widespread in tropical Africa.

7b. *Jussiaea suffruticosa* var. *linearis* (Willd.) Oliv. ex O. Ktze. Rev. Gen. Pl. 1: 251 (1891); Brenan in F.T.E.A. Onagr. 15 (1953).

APD: Synonym of Ludwigia octovalvis (Jacq.) P.H. Raven

***Jussiaea linearis* Willd.;** Berhaut l.c. 323 (1953).

***Jussiaea villosa* Lam.**—F.W.T.A., ed. 1, 1: 146, partly.

Herb to 4 ft. high; sepals 3–5 mm. long, 1–2 mm. broad; petals 3–4 mm. long, 2–2.5 mm.

Sen.: M'bidjem Thierry 80! Dakar (May) Baldwin 5749! **Gam.:** Ruxton 24! **Fr. Sud.:** Nafadié (Jan.) Chev. 158! **Fr. G.:** Pobéguin 446! Ditinn (Apr.) Chev. 12946! **Lib.:** Grand Bassa T. Vogel 5! **G. C.:** Aboma F.R. (Nov.) Vigne 3448! Accra (May) Irvine 697! **Fr. Nig.:** Niamey Hagerup 531! **N. Nig.:** Lokoja (Sept.) Parsons L. 15! Lemme (May) Lely 93! Abinsi (Nov.) Dalz. 766! 767! **S. Nig.:** Olokemeji (June) Jones & Keay FHI 18820!

Widespread in tropical Africa, and in Madagascar.

7c. *Jussiaea suffruticosa* var. *piloso-linearis* Brenan in Kew Bull. 1953: 169; Brenan in F.T.E.A. Onagr. 15 (1953).

APD: Synonym of Ludwigia octovalvis (Jacq.) P.H. Raven

***Jussiaea villosa* Lam.**—F.W.T.A., ed. 1, 1: 146, partly.

Herb, similar to var. *linearis*, but more or less densely pilose.

Togo: Baumann 246! **S. Nig.:** Abeokuta Irving 71! R. Ogbesse, Akinjare (Apr.) Jones FHI 3110!

Also in **Belgian Congo** and **Kenya**.

8. *Jussiaea gracilis* Brenan in Kew Bull. 1953: 170.

APD: Synonym of Ludwigia brenanii H. Hara

Herb, from a few to 30 in. high; petals pale yellow.

Togo: Kpandu Robertson 66!

9. *Jussiaea linifolia* Vahl Eclog. Amer. 2: 82 (1798); Munz l.c. 250; F.W.T.A., ed. 1, 1: 146, partly (Brown-Lester 10 only); Berhaut in Bull. Soc. Bot. Fr. 99: 321 (1953).

APD: Synonym of Ludwigia hyssopifolia (G. Don) Exell

Jussiaea acuminata of F.W.T.A., ed. 1, 1: 146, partly, not of Sw.

Erect herb, much branched, to 2 ft. high, rarely more.

Sen.: fide Berhaut l.c. **Gam.:** Brown-BokuprLester 10! Pirie 47! **S. L.:** Barter! Mange, Bure (Jan.) Deighton 1035! Diamain (Apr.) Adames 37! Port Loko (Dec.) Thomas 6513! Yonibana (Oct., Nov.) Widespread in tropical Africa and in tropical and subtropical America.

11. Jussiaea affinis DC. Prod. 3: 53 (1828); Munz l.c. 259.

APD: Synonym of Ludwigia affinis (DC.) H. Hara

Jussiaea pilosa of F.W.T.A., ed. 1, 1: 146, partly (Sc. Elliot 4368 and Thomas 7626 only).

Herbaceous, or shrubby, to 4 ft. high or more.

S. L.: Samu (Dec.) Sc. Elliot 4368! Port Loko (Dec.) Thomas 6525! 6548! Kenema (Jan.) Thomas 7522! 7626! **Lib.:** Nyaake, Webo (June) Baldwin 6173! Brewerville (June) Barker 1324! **Iv. C.:** Man (Jan.) Schnell 4021!

Native of tropical America.

12. Jussiaea africana Brenan in Kew Bull. 1953: 171.

APD: Synonym of Ludwigia africana (Brenan) H. Hara

Habit uncertain, probably herbaceous, at least 1 1/2 ft. high; flowers often several together on short lateral branchlets, often aggregated into a leafy panicle.

S. L.: Burbridge 540!

Also in **French Cameroons** and **Spanish Guinea**.

13. Jussiaea abyssinica (A. Rich.) Dandy & Brenan in F. W. Andr. Fl. Pl. A.–E. Sudan 1: 145 (1950); Brenan in F.T.E.A. Onagr. 18, t. 2, 7, t. 4 (1953).

APD: Synonym of Ludwigia abyssinica A. Rich.

Ludwigia abyssinica A. Rich.

Jussiaea acuminata of F.W.T.A., ed. 1, 1: 146, partly.

Herb or weak shrub, straggling or erect, to 10 ft. high, much branched; flowers characteristically appearing as though in axillary clusters.

Fr. G.: Kouria Chev. 15012! Nzérékoré (Oct.) Baldwin 9734! **S. L.:** Port Loko (Dec.) Thomas 5849! 6522! Yonibana (Nov.) Thomas 4779! 4939! Magbille (Dec.) Thomas 5886! Yetaya (Sept.) Cam.:** Rio del Rey Johnston! Lakom, Bamenda (May) Maitland 1448!

Widespread in tropical Africa, also in **Natal**, **Zululand** and **Madagascar**.

14. Jussiaea repens Linn. Sp. Pl. 388 (1753); Munz l.c. 270. *APD acc*

Jussiaea repens var. diffusa (Forsk.) Brenan in Kew Bull. 1953: 171; Brenan in F.T.E.A. Onagr. 19, t. 2, 8 (1953).

APD: Synonym of Ludwigia adscendens subsp. diffusa (Forssk.) P.H. Raven

Jussiaea diffusa Forsk.—F.T.A. 2: 488; F.W.T.A., ed. 1, 1: 146.

Jussiaea stolonifera Guill. & Perr. Fl. Seneg. 1: 292 (1833).

Jussiaea pilosa of F.W.T.A., ed. 1, 1: 146, partly (Chev. 1273; 1275).

Jussiaea repens of Berhaut in Bull. Soc. Bot. Fr. 99: 321 (1953).

Herb creeping and rooting at nodes, or more often floating in water.

Sen.: Perrottet! **Gam.:** Hayes 5321 **Fr. Sud.:** Mopti (May) Hagerup 76! Timbuktu (July) Chev. 1273! 1275! **S. L.:** Gbap (Apr., June) Adames 23! 51! **G. C.:** Botchiano Irvine 1030! Accra to Prampram (Apr.) Irvine 2841! **Dah.:** Le Testu 225! **Fr. Nig.:** Mayatiki (May) Lean 33! **N. Nig.:** Sokoto (Mar.) Dalz. 521! Bauchi Plateau (May, July) Lely 172! P. 149! P. 560! Katagum (Jan.) Dalz. 302! Odeko, Kabba Prov. Jones FHI 2843! **S. Nig.:** Lagos (Oct.) Moloney!

Widespread in the Near East and Africa; the typical plant is widespread in tropical Asia, and other varieties are in America.

TRAPACEAE

Aquatic floating herbs. Leaves alternate, floating, resented, only present at the upper nodes; stipules small, scarious, cleft to base and thus apparently more than two per leaf; petiole spongy and more or less inflated about the middle; lamina rhombic to deltoid. Adventitious roots (?) submerged, paired but not opposite, one from either side of leaf-scar, chlorophyllose and thus leaf-like, pinnatisect into many filiform segments. Flowers solitary from upper axils, pedunculate, hermaphrodite, regular. Sepals, petals and stamens 4, latter perigynous. Petals white. Ovary half-inferior, bilocular; ovules pendulous, one per loculus. Fruit a one-seeded, top-shaped drupe; pericarp soon disappearing; endocarp very hard, variously 2–4-horned, the horns derived from the persistent sepals.

Clearly related to and probably derived from Onagraceae, but so distinct in its morphology that it is better as a separate family. The germination is very remarkable, one cotyledon only being exposed, the other remaining within the pyrene (endocarp)-see Hegi, Ill. Fl. Mitteleuropa 5, 2: 889 (1925) for illustration. The family has only the following genus.

TRAPA

Linn.—F.T.A. 2: 491.

- 1 Annual; leaves with lamina often broader than long, 1.5–4.5 cm. long, 1.5–7 cm. broad, toothed in upper part, glabrous above, beneath varying from almost glabrous to densely hairy all over; sepals about 4–7 mm. long; petals white, obovate-oblong to obovate, about 8–16 mm. long; fruit 2–4-horned, the horns very variable in shape, size and direction [natans](#)

Trapa natans *Linn.* Sp. Pl. 120 (1753); Hegi Ill. Fl. Mitteleuropa 5, 2: 884 (1925); Brenan in F.T.E.A. Trapac. (1953). *APD acc*

Trapa natans var. *bispinosa* (*Roxb.*) *Makino* in Inuma, Somoku-Dzusetzu, ed. 3, 1: 137 (1907). *APD acc*

Trapa bispinosa *Roxb.*—F.T.A. 2: 491; F.W.T.A., ed. 1, 1: 146 (probably).

Fruits always 2-horned, horns from upper angles, sharp, reflexedly barbed below points, erecto-patent to almost horizontal, straight or slightly curved.

Port. G.: Bafata by R. Geba (fr. June) Esp. Santo 2263! **N. Nig.:** Yola, in pools (Mar.) Dalz. 67!

The solitary W. African specimen placed under *T. bispinosa* *Roxb.* in the F.W.T.A., ed. 1, 1: 146, Dalz. 67, lacks fruits so its identification is uncertain, but it is probably var. *bispinosa*. I consider *T. bispinosa* *Roxb.* best regarded as *T. natans* var. *bispinosa* (*Roxb.*) *Makino*. The aggregate species has a very wide discontinuous range through Europe, Asia and Africa; it is naturalized in N. America and Australia; more widespread in Tertiary times than to-day.

HALORAGACEAE

Herbs or undershrubs, often aquatic; leaves alternate, opposite or verticillate, sometimes very large, the submersed ones often much divided; stipules absent. Flowers hermaphrodite or unisexual, solitary to paniculate or corymbose, often very small. Calyx-tube adnate to the ovary; lobes 2–4 or absent. Petals 3–4 or absent, valvate or slightly imbricate. Stamens 2–8, rarely 1, large; anther basifixed, 2-celled,

opening lengthwise. Ovary inferior, 1–4-celled; styles 1–4; ovules as many as the styles, pendulous from the apex of the cells. Fruit small, a nut or drupe, sometimes winged, indehiscent or rarely breaking up into cocci. Seeds pendulous, with copious endosperm and straight fairly large (rarely small) embryo.

A small family, widely spread and usually found in damp or boggy places. Only two species represented in our area.

LAUREMBERGIA

Berg.—Schindler in Engl. Pflanzenr. Halorrh. 61 (1905); F.T.A. 2: 405 as *Serpicula* Linn.

- 1 Stem and leaves pubescent, especially when young, or glabrous; flowers minute, up to about 11 in each leaf axil; leaves alternate or opposite, linear or linear-oblongate, entire, or very minutely serrate towards the apex, 10–13 mm. long and 1 mm. broad [1. engleri](#)

Stem and leaves densely white-villous all over; flowers up to 7 in each leaf-axil; leaves opposite, oblong or obovate, with one tooth on each margin near the apex, or tricuspidate, about 12 mm. long and 4 mm. broad [2. villosa](#)

1. *Laurembergia engleri* Schindler in Engl. Pflanzenr. Halorrh. 73, fig. 21 (1905).

APD: Synonym of Laurembergia repens subsp. brachypoda (Welw. ex Hiern) Oberm.

Creeping herb in marshy ground; stems reddish, flowers greenish-yellow or brownish.

G. C.: Atwabo, W.P. (Feb.) Irvine 2296! (possibly distinct?). **N. Nig.:** Nupe Barter 1665! Bida (Mar.) Meikle 1326!

Also in **A.–E. Sudan.**

2. *Laurembergia villosa* Schindler l.c. (1905).

APD: Synonym of Laurembergia repens subsp. brachypoda (Welw. ex Hiern) Oberm.

A minute undershrub in damp ground.

Sen.: M'boro Perrottet 742; Leprieur.

Mildbraed in Wiss. Ergebn. 1910–11, 2: 189 (1922) records also Tessmann 2890 from Moka, Fernando Po, which he identifies as *L. cf. tetrandra* (Schott) Kanitz, a species of N. Africa and S. America (see Schindler l.c. 74).

THYMELAEACEAE

Trees, shrubs or rarely herbs; leaves opposite or alternate, entire, often small and ericoid; stipules absent. Flowers actinomorphic, usually hermaphrodite, sometimes capitate. Calyx tubular, more or less cylindric, sometimes long and slender; lobes 4–5, imbricate. Petals present or absent, sometimes very small, mostly inserted at the mouth of the calyx-tube. Stamens as many or twice as many as the calyx-lobes, inserted in the calyx-tube; anthers 2-celled, opening lengthwise. Disk hypogynous or absent. Ovary superior, 1–2-celled; ovule solitary in each cell, pendulous; style simple; stigma entire. Fruit a nut, drupe or pyrene, usually enclosed in the base of the calyx-tube. Seeds with or without endosperm; embryo straight.

Mainly South African, Mediterranean and Australian.

Recognized by the woody habit, absence of stipules, actinomorphic tubular often coloured calyx, and reduced or absent petals.

- 1 Petals large and conspicuous, mostly as long as the calyx-lobes and often deeply divided; leaves very oblique, acuminate; flowers solitary, or 2–4 together, in leaf-axils [1. Dicranolepis](#)
- Petals absent, or very small and scale-like: **2**
- 2 Flowers not capitate, in axillary clusters, umbels or racemes: **3**
- Flowers capitate, surrounded by an involucre of bracts: **6**
- 3 Calyx divided nearly to the base; petals present, scale-like in pairs opposite the sepals [2. Octolepis](#)
- Calyx tubular: **4**

- 4 Petals present, fused into a ring at the mouth of the calyx-tube[3. *Synaptolepis*](#)
 Petals absent:[5](#)
- 5 Inflorescence pedunculate; ovary 2-celled; calyx-tube rather broad and cylindrical, with very short, broad lobes[4. *Peddiea*](#)
 Inflorescence not pedunculate; ovary 1-celled; calyx-tube slender, with linear lobes[5. *Craterosiphon*](#)
- 6 Calyx-lobes 4; calyx-tube glabrous, or shortly and sparingly pubescent:[7](#)
 Calyx-lobes 5; calyx-tube densely long-villous; petals present, rarely absent; stamens shortly exerted from the calyx-tube[8. *Lasiosiphon*](#)
- 7 Petals present, sometimes very small; stamens slightly exerted from the calyx-tube[6. *Gnidia*](#)
 Petals absent; stamens included in the calyx-tube[7. *Arthrosolen*](#)

1. DICRANOLEPIS

Planch.—F.T.A. 6, 1: 238; Staner in Bull. Jard. Bot. Brux. 13: 326 (1935).

- 1 Calyx with stalked glands; calyx-tube 4–5 cm. long, calyx-lobes about 1 cm. long; petals 15–18 mm. long; stigma club-shaped; leaves obliquely oblong-ovate, caudate-acuminate, 10–20 cm. long, 4.5–7.5 cm. broad [1. *glandulosa*](#)
 Calyx without stalked glands; calyx-tube generally less than 4 cm. long; leaves generally less than 12 cm. long: [2](#)
- 2 Calyx glabrous outside or only sparsely pubescent; petals shorter than calyx-lobes:[3](#)
 Calyx densely hairy outside:[4](#)
- 3 Calyx-tube 8–10 mm. long, calyx-lobes 5–6 mm. long; stigma discoid or capitate; leaves obliquely oblong or ovate, caudate-acuminate, 5–12 cm. long, 3–5.5 cm. broad[2. *buchholzii*](#)
 Calyx-tube 20–32 mm. long, calyx-lobes 6–10 mm. long; stigma club-shaped or capitate; flowers solitary, or 2–4 together; leaves obliquely rhomboid-elliptic, caudate-acuminate, 2–9 cm. long, 1–3.5 cm. broad[3. *disticha*](#)
- 4 Stigma discoid or capitate:[5](#)
 Stigma club-shaped:[6](#)
- 5 Petals longer than calyx-lobes; calyx-tube 30–40 mm. long, calyx-lobes 12–14 mm. long; petals 15–22 mm. long; anthers well exerted; bracteoles subulate; leaves obliquely rhomboid, caudate-acuminate, 5–8 cm. long, 1.5–3.5 cm. broad[4. *grandiflora*](#)
 Petals shorter than calyx-lobes; calyx-tube 15–25 mm. long, calyx-lobes 8–12 mm. long; petals 6–10 mm. long; anthers only just exerted; bracteoles ovate or ovate-lanceolate; leaves obliquely elongate-rhomboid, caudate-acuminate, 5–10 cm. long, 1.5–3 cm. broad[5. *vestita*](#)
- 6 Leaves fairly large, about 8–10 cm. long and 2–4 cm. broad; petals much exceeding the calyx-lobes; calyx-tube 25–30 mm. long, calyx-lobes striate about 10 mm. long; petals 16–20 mm. long[6. *persei*](#)
 Leaves smaller, up to 7 cm. long and 2.5 cm. broad; calyx-lobes and petals subequal:[7](#)
- 7 Segments of the petals entire; calyx-tube very slender, 25–27 mm. long, calyx-lobes and petals about 8 mm. long; leaves very obliquely rhomboid-lanceolate, 2.5–3.5 cm. long, about 1 cm. broad[7. *polygaloides*](#)
 Segments of the petals more or less toothed; leaves obliquely ovate; 4–7 cm. long, 1.5–2.5 cm. broad:[8](#)
- 8 Calyx-tube 25–30 mm. long, glabrous inside[8. *laciniata*](#)
 Calyx-tube about 20 mm. long, pubescent inside[9. *pubescens*](#)

1. *Dicranolepis glandulosa* H. H. W. Pearson in F.T.A. 6, 1: 242 (1910). *APD acc*

Shrub or treelet, with horizontal branches; flowers white.

Br. Cam.: Bibundi (Nov.) Mildbr. 10652!

Also in **French Cameroons**.

2. *Dicranolepis buchholzii* Engl. & Gilg—F.T.A. 6, 1: 241. *APD acc*

Low shrub or treelet, 3 ft. high.

Br. Cam.: R. Mungo Buchholz. Likomba (Nov.) Mildbr. 10691! Johann-Albrechtshöhe Staudt 803!

3. *Dicranolepis disticha* Planch.—F.T.A. 6, 1: 243; Chev. Bot. 545; Staner in Bull. Jard. Bot. Brux. 13:

329 (1935). *APD acc**Dicranolepis mannii* Baill.—F.T.A. 6, 1: 242; F.W.T.A., ed. 1, 1: 148.*Dicranolepis stenosphon* H. H. W. Pearson in F.T.A. 6, 1: 240; F.W.T.A., ed. 1, 1: 148.

Shrub or treelet, 3–10 ft. high; calyx pale green outside; inside of calyx-lobes, and petals, stamens and style white, becoming cream.

Widespread in tropical and S. Africa.

NYCTAGINACEAE

Herbs, shrubs or trees. Leaves alternate or opposite, simple; stipules absent. Flowers actinomorphic, hermaphrodite or unisexual, usually cymose, sometimes surrounded by brightly coloured bracts, the latter occasionally simulating a calyx. Calyx tubular, often petaloid, valvate or folded in the bud. Petals absent. Stamens 1 to many, hypogynous, free or connate at the base, involute in bud; anthers 2-celled, opening lengthwise. Ovary superior, 1-celled; style slender; ovule solitary, erect and inverted. Fruit indehiscent, enclosed in the persistent base of the calyx, often glandular. Seeds with copious or scanty endosperm and straight or curved embryo.

Mainly in tropical America, a few in the tropics and subtropics of the Old World.

Recognized by the absence of stipules, regular apetalous flowers with tubular perianth, superior 1-celled ovary and indehiscent often glandular fruit.

- 1 Bracts small and free, not resembling a calyx:2
Bracts connate and forming a calyx-like involucre; flowers hermaphrodite; fruits not glandular4. *Mirabilis*
- 2 A spiny shrub; flowers polygamo-dioecious; fruits on long pedicels, clothed with rows of numerous sticky gland-tipped tubercles1. *Pisonia*
Not spiny; herbaceous; flowers hermaphrodite:3
- 3 Perennial plants with climbing or scrambling stems; flowers in umbels or verticels; fruits clavate, obscurely ribbed, with large, scattered mucilaginous glands2. *Commicarpus*
Annual or perennial diffuse herbs, flowers in capitula or lax cymes; fruits narrowly obovoid with 3–5 prominent ribs, smooth or minutely and densely glandular3. *Boerhavia*

Bougainvillea Comm. ex Juss.

Species of *Bougainvillea* from S. America, are cultivated in our area.

1. PISONIA

Linn.—F.T.A. 6, 1: 8.

- 1 Climbing shrub, armed with stout sharp axillary curved spines; leaves broadly elliptic-subacute at the base, obtuse at the apex, 6–9 cm. long, 3–5 cm. broad, finely tomentellous beneath when young, at length glabrous; flowers unisexual, cymose; calyx tomentellous; stamens exserted; fruits on long pedicels, clothed with rows of numerous hard sticky gland-tipped tubercles, tomentellous between the rows*aculeata*

Pisonia aculeata Linn.—F.T.A. 6, 1: 8. *APD acc*

Scandent shrub, to 30 ft. high; flowers cream. Local, and possibly introduced.

4. MIRABILIS

Linn.—F.T.A. 6, 1: 1.

- 1 Erect herb; leaves ovate-triangular, acutely acuminate, more or less truncate at the base, up to 10 cm. long and 6 cm. broad, conspicuously marked with cystolith; petiole rather long and slender; flowers cymose, few; bracts calyx-like, connate in the lower part, puberulous; calyx petaloid, long-tubular with an expanded 5-lobed limb, tube 4 cm. long, glabrescent; fruit about as long as the involucre, black when dry, ribbed, glabrous[jalapa](#)

Mirabilis jalapa Linn.—F.T.A. 6, 1: 2. *APD acc*

Flowers purple, magenta, yellow or white, opening in late afternoon; widely cultivated as an ornamental, now established in many parts.

S. L.: Thomas 9662! **G. C.:** Cummins! **S. Nig.:** Lagos Punch 19! Ibadan (Sept.) Latilo FHI 13516!

A native of Peru.

PROTEACEAE

Trees or shrubs. Leaves alternate, rarely opposite, simple or much divided; stipules absent. Flowers (in our species) in a bracteate capitulum or elongated spike. Calyx petaloid, tetramerous, valvate, tubular in bud, one segment soon splitting away from the others and releasing the style, three segments remaining united. Stamens 4; anthers opposite the calyx-lobes, subsessile, 2-celled, opening lengthwise.

Hypogynous scales often present. Ovary superior, 1-celled; style long, simple; ovule 1 (in our species), subpendulous. Fruit a nut, densely bearded, crowned by the persistent style. Seed without endosperm.

Mainly confined to South Africa and Australia.

A distinct family with the flowers in our species in large bracteate heads or elongated spikes.

- 1 Flowers in an elongated spike without an involucre [1. *Faurea*](#)
 Flowers in a head surrounded by numerous bracts [2. *Protea*](#)

1. FAUREA

Harv.—F.T.A. 6, 1: 207.

- 1 Tree, with catkin-like spikes of flowers; leaves broadly lanceolate, acute at each end, 12–18 cm. long, 3–8 cm. broad, with numerous lateral nerves prominent on both surfaces, branched or looped near the margin, sparingly pubescent, shining on the upper surface; petiole 5–10 mm. long; flowers about 15 mm. long, curved before opening; calyx petaloid, softly pubescent [speciosa](#)

***Faurea speciosa* Welw.**—F.T.A. 6, 1: 211; Engl. Pflanzenw. Afr. 3, 1: 65; Hauman in Fl. Congo Belge 1: 232; Aubrév. Fl. For. Soud.-Guin. 68.

*APD: Synonym of *Faurea rochetiana* (A. Rich.) Chiov. ex Pic. Serm.*

Faurea saligna of F.T.A. 6, 1: 209, partly (Dalz. 393), of F.W.T.A., ed. 1, 1: 153, and of Chev. Fl. Viv. 1: 353, not of Harv.

Savannah tree, to 30 ft. high; flower spikes reddish; rare.

4. **Protea argyrophaea** *Hutch.* in Kew Bull. 1922: 398.

APD: Synonym of Protea madiensis Oliv. subsp. madiensis

Shrub, to 4 ft. high; flowers white with silvery bracts.

N. Nig.: Bauchi Plateau, 3,000–5,000 ft. (June–Aug.) Lely 381! P. 394! P. 673! Kennedy FHI 7259!

DILLENIACEAE

Shrubs or undershrubs, often climbing, rarely trees or herbs; leaves alternate, simple, entire or dentate (rarely divided); stipules very rare, and then adnate to the petiole and early deciduous. Inflorescence various. Flowers yellow or white, hermaphrodite or polygamous, rarely dioecious. Sepals 5, rarely fewer, imbricate, persistent. Petals 5 or fewer, imbricate, fugacious. Stamens hypogynous, numerous, rarely 10 or fewer, free or variously united at the base. Carpels 1 or many, generally free; ovules 1 to many in each carpel. Fruits dehiscent by one or both sutures. Seeds 1 or few, with an aril; endosperm copious, with minute embryo.

Tropics generally and in Australia.

Recognized by the alternate strongly penninerved exstipulate simple leaves, persistent imbricate sepals, usually numerous stamens, divergent anther-cells, mostly free and few carpels, and arillate seeds.

Dillenia indica *Linn.*

"fruit" composed of fleshy sepals.

A native of tropical Asia, is cultivated in Sierra Leone, Gold Coast and Nigeria.

TETRACERA

Linn.—F.T.A. 1: 12. APD acc

Climbing shrubs, rarely trees. Leaves simple, entire or denticulate. Panicles terminal, spreading, rarely few-flowered. Flowers yellow, white, or calyx green. Sepals spreading. Filaments dilated above; anthers 2-celled. Carpels 3–5 (rarely 1–2), acuminate, coriaceous when mature, shining; ovules indefinite in two series. Seeds 1–5; aril lacinate, scarlet.

- 1 Outer surface of sepals glabrous or shortly pubescent:2
- Outer and inner surfaces of sepals densely sericeous, 5–6 mm. long; carpels sericeous when young:7
- 2 Sepals densely sericeous within; carpels pilose when young, sometimes sparsely so; fruiting carpels striate; flowers numerous, mostly clustered towards the tips of the branches of the lax panicles; inner sepals 4–5 mm. long; leaves oblong to elliptic, 4–11 cm. long, 2–5.5 cm. broad, dentate in the upper half, finely scabrid above [1. *potatoria*](#)
- Sepals not densely sericeous within, glabrous or nearly so:3
- 3 Carpels densely sericeous when young, strigose when mature; inner sepals about 10 mm. long and 7 mm. broad; leaves obovate-oblong, 7–13 cm. long, 4–7 cm. broad, margin entire, smooth on both surfaces, finely pubescent on midrib and nerves beneath [2. *dinklagei*](#)
- Carpels glabrous when young, rarely sparsely pubescent:4
- 4 Sepals 6–8 mm. long:5
- Sepals 4–4.5 mm. long:6
- 5 Leaves oblong to oblong-obovate, 6–16 cm. long, 3.5–9 cm. broad, margin entire or slightly undulate towards the apex, very shortly scabrid on both surfaces, sparsely pubescent on midrib and nerves beneath, or glabrescent [3. *alnifolia*](#)
- Leaves narrowly elliptic to oblong-lanceolate, gradually acute at each end, 8–12 cm. long, 2.5–4.5 cm. broad, margin entire, glabrous [4. *djalonica*](#)
- 6 Petiole winged, together with the midrib and nerves beneath covered with long stiff spreading hairs; leaves obovate-oblong to oblong-lanceolate, 7–18 cm. long, 3.5–6.5 cm. broad, margin more or less entire; sepals very sparsely pubescent outside [5. *podotricha*](#)
- Petiole not winged, together with the midrib and nerves beneath pilose; leaves oblong-elliptic to obovate, 6–12 cm. long, 3–6 cm. broad, margin serrate in upper third; lateral nerves markedly impressed above; sepals rather densely pubescent outside; fruiting carpels smooth [6. *leiocarpa*](#)
- 7 Petioles not winged, 1–2 cm. long; lamina oblong-elliptic, 6–8 cm. long, 3–4.5 cm. broad, denticulate towards the apex, scabrid above and beneath, pubescent on midrib and nerves beneath [7. *affinis*](#)
- Petiole winged; lamina oblong-elliptic to obovate, 6–12 cm. long, 3–6 cm. broad, denticulate towards the apex, scabrid above, pilose beneath [8. *eriantha*](#)

Tetracera calothyrsa Gilg & Lederm. ex Engl. Pflanzenw. Afr. 3, 2: 477 (1921).

Br. Cam.: Bali, Bamenda—no specimens cited.

Imperfectly known species.

PITTOSPORACEAE

Trees or shrubs. Leaves alternate, simple; stipules absent. Flowers actinomorphic, hermaphrodite. Sepals 5, imbricate, free or nearly so. Petals 5, longer than the sepals, imbricate, free or united at the base. Stamens 5, hypogynous, free, alternate with the petals; anthers 2-celled, opening lengthwise. Ovary 1-celled with parietal placentas or 2–5-celled and the placentas meeting in the middle, superior, sessile or shortly stipitate; style simple, terminal; ovules numerous. Fruit a loculicidal capsule with the placentas in the middle of the valves, or indehiscent. Seeds with hard endosperm and minute embryo.

Mostly an Australian family.

Recognized by the woody habit, definite stamens, usually parietal placentas, mostly 2-valved capsule, and seeds with copious endosperm and minute embryo.

PITTOSPORUM

Banks ex Soland.—F.T.A. 1: 124.

Shrubs or small trees; leaves often undulate on the margin. Sepals free or slightly connate. Petals sometimes coherent at the base. Ovary usually imperfectly 2–5-celled. Capsule mostly 2-valved with the placentas in the middle of the valves. Seeds smooth, scarlet or black, mostly covered by sticky resin.

- 1 Petals about 4 mm. long; sepals scarcely 1–5 mm. long, rather expanded and connate at base; flower-buds club-shaped; valves of ripe fruits thin, concave in transverse section, reflexed; seeds usually 4, basifixed; leaves always quite glabrous [1. mannii](#)
- Petals at least 5 mm., mostly 6–7 mm. long; sepals at least 2 mm. long; flower-buds egg-shaped; valves of ripe fruits flat or slightly gibbous along the middle, horizontally spreading; seeds mostly more than 4, superposed; leaves sometimes hairy viridiflorum [2](#)
- 2 Leaves, at least when young, more or less crisped-hairy beneath; sepals always free from each other [2. viridiflorum subsp. feddeanum](#)
- Leaves quite glabrous or rarely slightly appressed pubescent along the midrib when young; sepals sometimes connivent at base [3. viridiflorum subsp. dalzielii](#)

1. *Pittosporum mannii* Hoot. f.—F.T.A. 1: 124; Cuf. in Fedde Rep. 55: 81 (1952).

APD: Synonym of Pittosporum viridiflorum Sims

A tree or large shrub, up to 30 ft. high; corolla yellowish-white; seeds scarlet.

Br. Cam.: Cam. Mt., 4,000–8,000 ft. (fl. & fr. Dec.–Apr.) Mann 1202! 2186! Maitland 656! Preus 827! Brenan 9398! Bamenda Prov., 3,000–7,000 ft. (fl. Apr., fr. June–Oct.) Johnstone 19! 315! Maitland 1381! 1597! **F. Po:** Clarence Peak, 8,500 ft. (Dec., Apr.) Mann 386! 640!

Also in **French Cameroons**.

Also in **French Cameroons**, **Ubangi-Shari** and perhaps in Abyssinia.

Pittosporum undulatum Andr.

Is cultivated in Sierra Leone.

BIXACEAE

Shrubs or small trees with coloured juice. Leaves alternate, simple, palminerved, stipulate. Flowers hermaphrodite, medium-sized, showy, paniculate. Sepals 5, imbricate, deciduous, with a large fleshy gland at the base outside. Petals 5, large, imbricate, without a scale at the base. Disk none. Stamens numerous, hypogynous; filaments free; anthers horse-shoe-shaped, opening by short slits at the top. Ovary superior, 1-celled, with 2 parietal placentas; ovules numerous; style slender, recurved in bud; stigma 2-lobed. Fruit a densely echinate-setose or smooth capsule, 2-valved; valves thick, with the placentas in the middle. Seeds obovoid; testa rather fleshy, red; endosperm copious; embryo large; cotyledons broad, incurved at the apex.

A family now restricted to the single genus *Bixa*.

With numerous stamens and horseshoe-shaped anthers, parietal placentas, and 2-valved capsule.

BIXA

Linn.—F.T.A. 1: 113.

Characters of the family.

- 1 Branches and rhachis of the inflorescence covered with small rusty scales; leaves slightly cordate at the base, acutely acuminate, entire, up to 20 cm. long and about 12 cm. broad; flowers about 2.5 cm. long, pinkish-white, in terminal panicles; fruit narrowly ovoid, pointed, about 4 cm. long, densely covered with stiff slender bristles; opening into 2 divergent valves; seeds covered with a red pulp *orellana*

Bixa orellana Linn.—F.T.A. 1: 114; Chev. Bot. 36. *APD acc*

An introduced shrub; sometimes subsontaneous.

Widely cultivated in the tropics; a native of tropical America.

COCHLOSPERMACEAE

Trees, shrubs, or rhizomatous subshrubs, with coloured juice. Leaves alternate, palmatilobed, stipulate. Flowers hermaphrodite, showy, paniculate or racemose. Sepals 5, imbricate, deciduous. Petals 5, imbricate or subcontorted, alternate with the sepals. Stamens numerous, the filaments free, equal or some longer than the others; anthers 2-celled, linear, opening by terminal short often confluent pore-like slits. Ovary 1-celled, with parietal placentas projecting into the cell, or perfectly 3-celled; ovules numerous; style simple, with minutely denticulate stigma. Fruit a 3–5-valved capsule. Seeds glabrous or covered with woolly hairs, straight or cochleate-reniform; endosperm copious; embryo conforming to the shape of the seed, large; cotyledons broad.

A small family of two genera formerly included under Bixaceae.

Note the anthers opening by pores and the usually hairy seeds on parietal placentas.

COCHLOSPERMUM

Kunth—F.T.A. 1: 112.

Intermediate forms, which may well be hybrids, are found in places where the two species grow together.

Low shrubs. Leaves palmately lobed, variable. Sepals 5, unequal. Petals 5, large, imbricate. Stamens numerous, with linear anthers on slender equal filaments. Ovary with 3–5 parietal placentas; style slender. Fruit an obovoid often hairy capsule; endocarp rather membranous. Seeds covered with long cottony hairs.

- 1 Long cottony hairs closely adhering to the seed; flowers usually borne near the ground while plant is leafless, and sometimes also near apex of leafy shoots; leafy shoots seldom exceeding 75 cm. high; leaves usually deeply lobed with acute lobes, sometimes with lobes narrowly lanceolate, lobes usually serrate; lower surface of mature leaves glabrescent or pubescent [1. tinctorium](#)

Long cottony hairs loosely attached to membranous outer testa which is easily separable from the hard shining inner testa; flowers usually borne at the apex of leafy shoots 1–2.5 m. high; leaves seldom deeply lobed, lobes rounded, usually broadly oblong, seldom markedly serrate; lower surface of mature leaves more or less densely woolly [2. planchoni](#)

1. **Cochlospermum tinctorium** A. Rich. in Guill. & Perr. Fl. Seneg. 99, t. 21 (1831); F.T.A. 1: 113, partly (excl. syn. C. planchoni Hook. f.); Mildbr. in Engl. Bot. Jahrb. 58: 236 (1923); Pilger in E. & P. Pflanzenfam. 21: 317, t. 141 (1925); F.W.T.A., ed. 1, 1: 158, partly. *APD acc*

Cochlospermum gossypium (Linn.) DC.

A native of tropical Asia, is cultivated in several parts of our area.

FLACOURTIACEAE

Trees or shrubs. Leaves simple, alternate; stipules often soon falling off. Flowers hermaphrodite or unisexual, often dioecious or polygamous, variously arranged. Sepals sometimes not distinguishable from the petals, imbricate or open in bud. Petals sometimes not arranged regularly in relation to the sepals, large, small or absent, with or without an opposite scale inside the base, imbricate. Stamens numerous, rarely few, hypogynous, free; anthers 2-celled, often short, opening lengthwise by slits. Ovary 1-celled, with one or more parietal placentas, or rarely the placentas meeting in the middle; ovules 2 or more on each placenta; styles or stigmas as many as the placentas. Fruit indehiscent, mostly a berry or drupe, very rarely a capsule, sometimes large. Seeds with fleshy endosperm and medium-sized embryo; cotyledons often broad.

Mainly in the tropics and subtropics

Formerly included in the Bixaceae, but differing by their straight anthers opening lengthwise by slits, and by the frequently unisexual flowers.

- 1 Inflorescence not adnate to the midrib of the leaf:2
 Inflorescence adnate to the midrib of the leaf, the latter large and elongate-oblongate [10. Phyllobotryum](#)
- 2 Perianth spiral or without differentiation into sepals and petals:3
 Perianth cyclic, differentiated into sepals and petals or the latter absent:5
- 3 Inner perianth with scales adnate to the inner surface:4
 Inner perianth without scales [3. Camptostylus](#)
- 4 Stamens numerous, with long, sometimes pointed anthers; style 1 [1. Dasylepis](#)
 Stamens 5; styles 3 [2. Scottellia](#)
- 5 Petals present:6
 Petals absent:8
- 6 Shrubs or small trees, armed with stout straight or recurved spines; petioles short [4. Oncoba](#)
 Unarmed trees and shrubs; petioles often elongated:7
- 7 Flowers large, in short axillary inflorescences; stigma crenate or branched; seeds small, numerous; leaves scaly or thinly hairy [5. Caloncoba](#)
 Flowers small, in long axillary inflorescences; stigma undivided or slightly lobed; seeds few or often only 1 at maturity; leaves not scaly [6. Lindackeria](#)
- 8 Sepals imbricate; styles more or less spreading; seeds glabrous:9
 Sepals scarcely imbricate; styles erect or suberect; seeds often villous; stamens numerous; dioecious [9. Dovyalis](#)
- 9 Flowers dioecious in short racemes or glomerules; fruit a berry; stamens numerous [7. Flacourtia](#)
 Flowers hermaphrodite or polygamous in lax terminal panicles; fruit a capsule; stamens 5–6 [8. Ophiobotrys](#)

1. DASYLEPIS

Oliv.—F.T.A. 1: 123.

- 1 Pedicels 6–10 mm. long; flowers racemose, laxly arranged; leaves elliptic, shortly cuneate at base, obtusely acuminate, 12–20 cm. long, 6–9 cm. broad, distantly serrate, closely reticulate [1. racemosa](#)

- Pedicles up to 3 mm. long, or flowers subsessile; flowers crowded, more or less spicate, or racemose with short pedicels:[2](#)
- [2](#) Ovary and fruit densely long-pilose; pedicels up to 3 mm. long; leaves elongate-elliptic to elliptic-lanceolate, cuneate at base, long-acuminate, 12–25 cm. long, 4.5–6.5 cm. broad, distantly serrate, closely reticulate[2. sereti](#)
- Ovary and fruit glabrous or shortly pubescent on the angles only:.....[3](#)
- [3](#) Outer perianth segments, 8–9 mm. long; flowers on short stout pedicels; leaves thickly coriaceous, oblong-elliptic, rounded or broadly cuneate at base, abruptly and shortly acuminate, 12–20 cm. long, 6–9 cm. broad, subentire or slightly denticulate towards the apex, prominently reticulate on both surfaces, the midrib sharply prominent beneath; petiole 1.5–2 cm. long, slightly tumid in the upper half; fruits quadrangular with smaller intermediate ridges[3. blackii](#)
- Outer perianth segments 4–5 mm. long; leaves thin, or thinly coriaceous, with serrulate or dentate margins:[4](#)
- [4](#) Flowers with distinct pedicels 2–3 mm. long; leaves oblong-elliptic, shortly cuneate, gradually acuminate, 12–18 cm. long, 5–7 cm. broad, thinly coriaceous, serrulate; petiole 1–1.6 cm. long, tumid at apex [4. brevipedicellata](#)
- Flowers subsessile; leaves oblong-elliptic, rounded at base, rather long and broadly acuminate, about 12 cm. long, 4–5 cm. broad, thin, dentate; petiole 5 mm. long[5. assinensis](#)

1. *Dasylepis racemosa* Oliv.—F.T.A. 1: 123. *APD acc*

Tree, with spreading crown, to 45 ft. high; flowers yellowish.

Also in **Ubangi-Shari**, **French Cameroons** and **Angola**.

2. *Flacourtia vogelii* Hook. f. in Fl. Nigrit. 220 (1849); Aubrév. l.c. 72. *APD acc*

Flacourtia flavescens of F.T.A. 1: 121, partly.

A shrub or small tree, up to 30 ft. high; similar to above, but **apparently mainly in forest.**

S. L.: Rokupr (Feb., June) Deighton 5361! Jordan 445! Musaia (young fr. July) Deighton 4803! Njala (Mar.) Deighton 2621! **S. Nig.:** Abo Barter 162! Ibo country T. Vogel 34! **Br. Cam.:** Likomba Mildbr. 10762!

Also in **Ubangi-Shari**.

Flacourtia indica (Burm. f.) Merr.

Flacourtia ramontchii L'Hérit.

Is sometimes cultivated in our area; it is widespread in east and south tropical Africa.

8. OPHIOBOTRYS

Gilg in Engl. Bot. Jahrb. 40: 514 (1908).

- 1 A tree; young branches puberulous; leaves elliptic, shortly cuneate at base, obliquely acuminate at apex, 7–14 cm. long, 2.5–5.5 cm. broad, entire, glabrous; lateral nerves about 4 pairs, prominently looped; petiole about 1 cm. long; panicle with slender long branches, tomentellous; flowers subsessile; sepals obovate, 2 mm. long, glabrous; stamens 5–6, alternate with the sepals; disk-glands large and hairy; ovary tomentose; capsule 1.5 cm. long *zenkeri*

Ophiobotrys zenkeri Gilg in Engl. Bot. Jahrb. 40: 516, t. 2 (1908); Aubrév. Fl. For. C. Iv. 3: 8, t. 246. *APD acc*

Forest tree, to 100 ft. high, with buttresses and clear bole up to 5 ft. in girth; flowers whitish or pinkish-white.

IV. C.: Agboville-Abengourou (fl. June, fr. Aug.) Aubrév. 1390! **G. C.:** E. Akim (June) Johnson 737! 739! Kwahu Prasu (June) Vigne 1753! **S. Nig.:** Ikom (July) Catterall 9! 43! 92! **Br. Cam.:** Victoria (Feb., June) Maitland 425! 715! Okunde, Kumba (June) Rosevear 58/31!

Also in **French Cameroons** and **Gabon**.

9. DOVYALIS

E. Mey. ex Arn. in Hook. Journ. Bot. 3: 251 (1841); Gilg in Engl. Bot. Jahrb. 40: 504 (1908).

- 1 Leaves oblong-elliptic, shortly and gradually acuminate, obtusely rounded at base, about 6 cm. long and 2.5 cm. broad, pubescent on the nerves and petiole; spines 1.5 cm. long, straight; male flowers in axillary fascicles; fruits more or less globose, fleshy, about 3 cm. diam., with reflexed sepals at the base [1. afzelii](#)

Leaves ovate-elliptic, acutely and fairly long-caudate-acuminate, mostly rather broadly rounded at base, up to 9 cm. long and 5 cm. broad, minutely puberulous on the nerves; spines up to 2 cm. long; male flowers in axillary fascicles, hoary-pubescent [2. zenkeri](#)

1. *Dovyalis afzelii* Gilg in Engl. Bot. Jahrb. 40: 507 (1908).

APD: Synonym of Dovyalis zenkeri Gilg

A shrub or spiny tree.

S. L.: Afzelius. Near Regent (fr. Dec.) Sc. Elliot 4008! MacDonald Town (fr. Dec.) Deighton 3351! Njala (fl. Sept., Dec., fr. Dec.) Deighton 2562! 3024! Rokupr (May) Jordan 268!

2. *Dovyalis zenkeri* Gilg l.c. (1908). *APD acc*

A shrub or small tree, 12–18 ft. high, more or less densely spiny.

S. Nig.: Oban, Talbot 1261!

Also in **French Cameroons**.

A revision of the W. African species of this genus has not been undertaken for this edition, but it is clearly necessary. The plants are dioecious and specimens should be collected from both male and female shrubs, and should include mature fruits and show the range of variation in leaf-shape. In addition to the above species, I have seen the following, which may or may not prove to be distinct: -

1. *Dovyalis* sp. A.

Fr. G.: Macenta (Oct.) Baldwin 9845! **S. L.:** Rokupr (May) Jordan 270!

Imperfectly known species.

2. *Dovyalis* sp. B.

S. L.: Binkolo (Aug.) Thomas 1791! 1810! Magbile (Dec.) Thomas 6060! 6093! Giema, Dama (Jan.) Deighton 3895!

Imperfectly known species.

3. *Dovyalis* sp. C.

G. C.: Ampunyase (Feb.) Andoh FH 4136! **S. Nig.:** Olokemeji (fl. & young fr. Sept.) Jones FHI 20261!

Imperfectly known species.

10. PHYLLOBOTRYUM

APD: Synonym of Phyllobotryon Müll. Arg.

Muell. Arg. in Flora 47: 534 (1864).

- 1 Leaves clustered at apex of stem, elongate-oblongate, gradually narrowed to the scarcely petiolate base, cuspidate-acuminate, up to 1 m. long and 17 cm. broad, crenulate-serrate, with numerous spreading lateral nerves, glabrous; stipules lanceolate, about 2·5 cm. long; inflorescence completely adnate to the upper surface of the midrib, up to 3/4 of its length; flowers about 12 mm. diam., clustered, shortly pedicellate; sepals shortly ciliate; capsule ovoid, beaked, wrinkled, about 18 mm. long and 12 mm. diam., dehiscent by 3 valves, with about 5 white seeds [soyauxianum](#)

Phyllobotryum soyauxianum *Baill. in Bull. Soc. Linn. Paris 1: 287 (1881).*

APD: Synonym of Phyllobotryon spathulatum Müll. Arg.

Phyllobotryum zenkeri *Gilg in Engl. Bot. Jahrb. 40: 500 (1908).*

Phyllobotryum spathulatum of *Cat. Talb. 121*, not of *Muell. Arg.*

Sparingly branched erect shrub or small tree, to 12 ft. high; leaves closely clustered at the ends of the branches, reddish when young; sepals and petals mauve, stamens cream, ovary light red, style deep purple-red; fruits red.

S. Nig.: Oban Talbot 24! 26! Obutong, Oban (Mar.) Onochie FHI 7714! **Br. Cam.:** Johann-Albrechtshöhe (fl. & fr. Mar.) Staudt 865! S. Bakundu F.R. (fl. & fr. Mar., fr. June) Brenan 9306! Olorunfemi FHI 30648! R. Bombe, Ndifo, Kumba (fr. Apr.) Ejiofor FHI 29368!

Also in **French Camerouns.**

DIONCOPHYLLACEAE

Scandent shrubs or lianes. Leaves simple, alternate, exstipulate, elongate, with numerous close parallel nerves, sometimes hooked at the apex, or some leaves very narrow and linear bearing stalked glands. Inflorescences cymose, more or less supra-axillary. Flowers hermaphrodite, actinomorphic. Sepals 5, free or connate at the base in a short tube, valvate. Petals 5, free, contorted, caducous. Disk absent. Stamens hypogynous, 10 or 25–30, free or slightly connate, straight; anthers 2-celled, elongate-linear or shortly ellipsoid. Ovary superior, unilocular, of 2–5 carpels, early loculicidally dehiscent, each valve with a median parietal placenta; ovules anatropous, few; styles 2–5, free or subconnate at the base, filiform or plumose-laciniate. Fruits capsular, but opening when very young, with 2–5 open spreading valves. Seeds few, large, disciform, broadly winged, with a stout peltately attached funicle articulated at apex, hanging from the open valves of the fruit; seeds developing in the open from a very early stage; embryo large, discoid-obconical, axile; radicle very short, opposite the hilum; endosperm copious, cap-shaped, surrounding most of the embryo.

A West African family of three genera, previously included in the Flacourtiaceae.

Recognized by the large, disciform, winged seeds, with peltately attached funicle, developing in the open, and by the elongate leaves often hooked at the apex or heteromorphous.

- 1 Styles 2, filiform, unbranched; valves of "capsule" 2, suborbicular, small; stamens 10, nearly as long as the large, delicate petals; sepals large, elongate-elliptic, closed in bud; inflorescences rather dense-flowered, conspicuously bracteate; seed-body large (4·5–5·5 cm. diam.), with a relatively narrow non-shining wing; petioles stout, not articulate; leaves often hooked at apex [1. Habropetalum](#)
- Styles 5 (sometimes 3?), much branched above; valves of "capsule" 4–5, elliptic to oblanceolate-spathulate; stamens 10, much shorter than the relatively small, thick, subcoriaceous petals; sepals small, deltoid, open in bud; inflorescences lax, few-flowered, bracts small and inconspicuous; seed-body small (1·2–1·4 cm. diam.), with a very broad shining wing; petioles slender, articulated, base persistent; leaves trimorphic (hook-bearing on the long shoots, simple on the short shoots in their axils and occasionally on the young plants reduced to the midrib which bears numerous long-stipitate glands) [2. Triphyophyllum](#)

1. HABROPETALUM

Airy Shaw in Kew Bull. 1951: 334 (1952).

- 1 Stems finely striate, with conspicuous rusty furfuraceous indumentum; leaves elongate-oblong, cuneate at base, obtuse at apex, 12–45 cm. long, 2.5–5.5 cm. broad, midrib produced at apex and often bearing a pair of hooks; cymes axillary and terminal, bracts elliptic, up to 2 cm. long, sepals elongate-elliptic, 10–13 mm. long; petals spatulate-obovate, about 1.5 cm. long; filaments about 12 mm. long; styles 2, filiform with capitate stigmas; ovary obovoid; "capsule" 2-valved, the open valves suborbicular, about 8 mm. diam.; seeds 1–2 per valve; funicle 2–3.5 cm. long; seed body 4.5–5.5 cm. diam., 2–3 cm. thick, surrounded by the spreading or more or less reflexed 1–2.5 cm. wide wing [dawei](#)

Habropetalum dawei (*Hutch. & Dalz.*) *Airy Shaw* in Kew Bull. 1951: 336, t. 1 & 2 (1952). *APD acc*

Dioncophyllum dawei *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 165 (1927); Kew Bull. 1928: 31; Pellegr. in Bull. Soc. Bot. Fr. 80: 234, 236 (1933).

Shrub, often scandent, in [sandy coastal scrub](#); petals white, caducous.

S. L.: Mosente, Pujehun (fl. Dec., fr. Mar.) Deighton 5283! 5323! Mano Bonjema, Pujehun (fl. & fr. Feb.) Dawe 466! s.n.! Adames 1! Juring (Dec.) Deighton 332!

2. TRIPHYOPHYLLUM

Airy Shaw in Kew Bull. 1951: 341 (1952).

- 1 Stems terete, glabrous; leaves of three kinds: (1) on long shoots, narrowly oblong-elliptic, cuneate at base, obtuse at apex, 6–16 cm. long, 1.5–3 cm. broad, midrib produced at apex to form a pair of hooks, (2) on short shoots, oblong-oblancheolate, 20–35 cm. long, 1–5 cm. broad, not hooked, (3) on sterile shoots, often reduced to the midrib which bears numerous long-stipitate glands; cymes few-flowered, axillary; sepals deltoid, about 2 mm. long; petals obovate, about 13 mm. long; filaments very short; styles 5 (sometimes 3?), much branched above; "capsule" 4–5 valved, the open valves elliptic-lanceolate, 18–27 mm. long, 7 mm. broad; usually only 1 seed developing on each valve; funicle up to 5.5 cm. long; seed body 12–14 mm. diam., surrounded by the broad wing 4.5–7 cm. diam. [peltatum](#)

Triphyophyllum peltatum (*Hutch. & Dalz.*) *Airy Shaw* in Kew Bull. 1951: 342, t. 4 & 5 (1952). *APD acc*

Dioncophyllum peltatum *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 165 (1927); Kew Bull. 1928: 31; Pellegr. in Bull. Soc. Bot. Fr. 80: 234, 236 (1933).

Ouratea glomerata of Chev. Bot. 108, and of F.W.T.A., ed. 1, 1: 195.

Scandent shrub or liane of [high forest](#); flowers white.

SAMYDACEAE

Trees or shrubs. Leaves simple, alternate, often pellucid-dotted or lined; stipules small, deciduous or absent. Flowers hermaphrodite, actinomorphic, perigynous. Sepals united in the lower part, imbricate or valvate, persistent. Petals the same number or more than the sepals or absent, often persistent. Disk-glands alternate with the stamens. Stamens definite or indefinite in number, in one or more rows, sometimes in bundles opposite the petals; staminodes often present; filaments free or connate at the base; anthers 2-celled, short, opening lengthwise. Ovary free or adnate to the calyx-tube, sessile, 1-celled with 3–5 parietal placentas often towards the top of the cell; style simple or 3–5 distinct styles; ovules few or numerous. Fruit capsular or indehiscent. Seeds with fleshy copious endosperm and fairly large embryo.

Mainly a tropical family.

Very similar to the Flacourtiaceae, with which they have often been united; distinguished from that family by the constantly hermaphrodite perigynous flowers which are mainly provided with persistent petals.

- 1 Petals present; ovary partly adnate to the calyx-tube: **2**
 Petals absent; ovary free; staminodes alternate with the fertile stamens; stipules minute [4. Casearia](#)

- 2 Petals twice as many as the sepals; stamens very numerous; filaments pilose; stipules present[1. Dissomeria](#)
 Petals the same number as the sepals; stamens few or many; filaments not pilose:[3](#)
- 3 Petals persistent, becoming dry, spreading and often enlarged in fruit, not hooded; stamens singly or in bundles opposite the petals; stipules present[2. Homalium](#)
 Petals not enlarged in fruit, often connivent, hooded, with indexed margins; stamens alternate with and opposite the petals; stipules absent[3. Byrsanthus](#)

1. DISSOMERIA

Benth.—F.T.A. 2: 496.

- 1 Branchlets pubescent when young, at length marked by numerous lenticels; leaves elliptic to obovate-elliptic, obtusely cuneate at base, obtuse or shortly acuminate, 6–11 cm. long, 3–6 cm. broad, glabrous except in the axils of the nerves, crenate with gland-tipped teeth; lateral nerves 5–7 pairs, prominent beneath; petiole about 4 mm. long; stipules 5–6 mm. long, caducous; spikes axillary, about as long as the leaves; flowers crowded; sepals ciliate.; petals softly pubescent outside; filaments plumose[crenata](#)

Dissomeria crenata Hook. f. ex Benth.—F.T.A. 2: 496; Aubrév. Fl. For. C. Iv. 3: 15. *APD acc*

Shrub or tree, to 40 ft. high; **mainly in streamside forests in the savannah regions**; flowers white.

Fr. G.: R. Niger, Farana (Mar.) Sc. Elliot 5313! **S. L.:** Sugar Loaf Mt. (Apr.) Sc. Elliot 5768! Makunde, Limba (Apr.) Sc. Elliot 5706! Mano Smythe! **Iv. C.:** R. 2. HOMALIUM

Jacq.—F.T.A. 2: 497.

- 1 Stamens in bundles of 2–4 by each petal; leaves up to 10 cm. long and 4 cm. broad, more or less obovate, with 4–6 pairs of lateral nerves[1. angustifolium](#)
 Stamens solitary by each petal; leaves usually exceeding 10 cm. long and 4 cm. broad:[2](#)
- 2 Petals 5–15 mm. long in fruit:[3](#)
 Petals up to 3 mm. long in fruit; inflorescence much-branched:[12](#)
- 3 Inflorescence with long slender spreading hairs, up to 25 cm. long, branched; leaves with long pilose hairs beneath, especially on the midrib, often glabrescent, ovate-elliptic, acute to obtuse at base, acuminate, 8–18 cm. long, 3–10 cm. broad; petals 8–10 mm. long in fruit[2. smythei](#)
 Inflorescence shortly pubescent or tomentose; leaves tomentellous, shortly pubescent or glabrous beneath:[4](#)
- 4 Leaves more or less permanently pubescent or tomentellous beneath on lamina as well as on the midrib and nerves; lateral nerves 12–15, very prominent and more or less parallel beneath:[5](#)
 Leaves glabrous, or sparingly pubescent on the midrib and nerves but not on the lamina beneath:[7](#)
- 5 Inflorescence axillary, simple, up to 15 cm. long; leaves broadly elliptic, obtuse to rounded at base ...[3. dalzielii](#)
 Inflorescence terminal, much-branched, 20–35 cm. long; leaves broadly elliptic, rounded to subcordate at base: [6](#)
- 6 Lamina finely and sparingly tomentellous between the nerves beneath[4. neurophyllum](#)
 Lamina densely tomentellous all over the undersurface[5. patoklaense](#)
- 7 Leaves cordate at base, 12–30 cm. long, 5–14 cm. broad, very coriaceous, with strong tertiary nerves; stipules very early caducous; inflorescence terminal, much-branched, up to 40 cm. long; petals up to 12 mm. long in fruit[6. letestui](#)
 Leaves not cordate at base:[8](#)
- 8 Leaves with minute glandular scales beneath, ovate-elliptic to oblong-elliptic, cuneate at base, sometimes unequally so, obtuse to acuminate at apex, 6–12 cm. long, 3–6 cm. broad; inflorescence simple, axillary, up to 20 cm. long, stout; flowers in clusters, pedicels persistent; petals 5 mm. long in fruit[7. viridiflorum](#)
 Leaves without scales beneath:[9](#)
- 9 Inflorescence axillary, simple, or appearing compound by the fall or non-development of the leaves; leaves 8–20

- cm. long, 5–10 cm. broad: **10**
- Inflorescence truly compound; leaves 4–13 cm. long, 2.5–6 cm. broad: **11**
- 10** Petals in fruit 6–8 mm. long; leaves cuneate at base, usually coarsely (rarely obscurely) crenate, drying greyish-brown [8. aylmeri](#)
- Petals in fruit 10–15 mm. long; leaves rounded or obtuse at base, rather obscurely crenate, drying reddish-brown [9. macropterum](#)
- 11** Inflorescence axillary, up to 15 cm. long, densely brownish pubescent; pedicels 2 mm. long, articulated near the apex; stipules minute and early caducous; leaves gradually acuminate; mature fruit unknown ... [10. aubrevillei](#)
- Inflorescence terminal, 11–25 cm. long, greyish puberulous; pedicels 3 mm. long, articulated 1 mm. from the base; stipules linear, 4–5 mm. long, persistent; leaves abruptly acuminate; petals up to 8 mm. long in fruit . [11. angustistipulatum](#)
- 12** Flowers in dense clusters along the axes; stamens up to 2 mm. long; stipules foliaceous, reniform, often persistent; leaves obtuse to cordate at base: **13**
- Flowers not in dense clusters, pedicels 2 mm. long, distinct, or 2–4 flowers together; stamens 5–6 mm. long; stipules subulate, very early caducous; leaves cuneate at base, glabrous; mature fruit unknown . [10. aubrevillei](#)
- 13** Leaves permanently and softly pubescent beneath; branchlets densely pubescent [12. molle](#)
- Leaves glabrous beneath; branchlets sparingly pubescent: **14**
- 14** Leaves obtuse to rounded at base, petiole 5–15 mm. long; stipules up to 8 mm. diam., usually early caducous [13. africanum](#)
- Leaves cordate to subcordate at base, petiole 2–5 mm. long; stipules 10–25 mm. diam., usually persistent [14. sarcopetalum](#)

1. Homalium angustifolium Sm.—F.T.A. 2: 498. *APD acc*

Small tree to 15 ft. high, with slender trunk, or straggling and shrub-like; **in riverain forest; flowers greenish-white.**

Fr. G.: Conakry Maclaud! **S. L.:** Smeathmann! Bawbaw Lane-Poole 434! Colonial Reserve (Jan.) Macdonald 7! Talla Hills (fr. Feb.) Sc. Elliot 4874! 5016! Sugar Loaf Mt. (Dec.) Sc. Elliot 4022! Tombo (Dec.) Deighton 3315! Nganyama (Sept.–Oct.) Deighton 4025! 5190!

2. Homalium smythei Hutch. & Dalz. F.W.T.A., ed. 1, 1: 166 (1927); Kew Bull. 1928: 213. *APD acc*

Homalium djalonis A. Chev. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 166 (1927); Kew Bull. 1928: 212; Chev. Bot. 283, name only.

Homalium alnifolium Hutch. & Dalz. l.c., partly.

Tree, to 30 ft. high; inflorescences drooping; flowers cream or greenish; wood very hard.

Fr. G.: Diaguissa Plateau (Apr.) Chev. 12692! Dalaba (Apr.) Caille in Hb. Chev. 18220! **S. L.:** Smythe 55! Pujehun (Feb.) Aylmer 7! Bunabu (Mar.) Lane-Poole 16! Panguma (Mar.) Lane-Poole 19! 4. CASEARIA*Jacq.*—F.T.A. 2: 493.

- 1 Flower-clusters shortly pedunculate; branchlets shortly pubescent; leaves oblong, rounded and slightly oblique at base, shortly acuminate, 10–16 cm. long, 3–6 cm. broad, slightly serrulate, slightly pubescent on the nerves when young; lateral nerves about 10 pairs; petiole about 5 mm. long; sepals glabrous; staminodes pubescent [1. stipitata](#)
- Flower-clusters sessile: **2**
- 2 Leaf-blade unequal-sided at base: **3**
- Leaf-blade more or less equal-sided at base: **4**
- 3 One half of leaf-blade inserted much lower than the other; branches glabrous; leaves oblong-lanceolate, acuminate, 10–12 cm. long, 3–3.5 cm. broad, crenate, glabrous; lateral nerves about 7 pairs; petiole 5–8 mm. long; sepals glabrous; staminodes villous [2. inaequalis](#)
- One half of leaf-blade not inserted above the other; leaves obovate, cuneate on one side at base, shortly and abruptly acuminate at apex, 7–10 cm. long, 3.5–5.5 cm. broad; lateral nerves about 6 pairs; flowers not seen; fruits oblong-ellipsoid, 4 cm. long, with the persistent reflexed calyx at the base [3. dinklagei](#)
- 4 Flowers distinctly pedicellate; sepals glabrous; leaves oblong-elliptic to obovate-elliptic, rounded or shortly cuneate at the base, shortly acuminate, 9–18 cm. long, 3.5–7 cm. broad, with the lateral nerves prominent only beneath, the tertiary nerves numerous and subparallel beneath [4. barteri](#)
- Flowers nearly sessile; sepals pubescent; leaves obovate or obovate-elliptic, cuneate at base, very shortly and obtusely acuminate, 7–9 cm. long, 4–5 cm. broad, the lateral nerves prominent on both sides, the tertiary nerves few and laxly reticulate beneath [5. bridelioides](#)

1. Casearia stipitata *Mast.*—F.T.A. 2: 493. *APD acc*

A tree, about 20 ft. high.

S. Nig.: Aboh Barter 322!

2. Casearia inaequalis *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 168 (1927); Kew Bull. 1928: 213; Aubrév. Fl. For. C. Iv. 3: 22; Aubrév. Fl. For. Soud.-Guin. 74. *APD acc*

A medium-sized tree, with yellow, ridged fruit.

S. L.: Bandajuma (May) Aylmer 73! **Lib.:** Mecca, Boporo (fr. nov.) Baldwin 10430! **Iv. C.:** Tafiré Aubrév. 909! **S. Nig.:** Degema Talbot!

3. Casearia dinklagei *Gilg* in Engl. Bot. Jahrb. 40: 511 (1908); Kennedy For. Fl. S. Nig. 34.

APD: Synonym of Casearia prismatocarpa Mast.

Casearia barteri of Aubrév. l.c. 22, t. 252, not of Mast.

Shrub or tree, to 60 ft. high, with yellow fleshy ridged fruit.

S. L.: York (fr. Dec.) Deighton 3340! **Lib.:** Dukwia R. (Apr.) Cooper 408! Grand Bassa (fr. May) Dinklage 1908 **IV. C.:** Bingerville Aubrév. 1493! **S. Nig.:** Sapoba Kennedy 1578!

[These specimens are only provisionally referred to this species, as the type has not been available for study.]

4. *Casearia barteri* Mast. in F.T.A. 2: 494 (1871). *APD acc*

Casearia bule Gilg l.c. 513.

A shrub or tree, up to 50 ft. high; mainly in swamp forest.

G. C.: Axim (fr. Feb.) Irvine 2272! (?). **S. Nig.:** Okomu F.R. (Jan.) A. F. Ross 243! Sapoba Kennedy 2044! Onitsha Barter 1635! Degema Talbot! Oban Talbot 1630! **Br. Cam.:** Ambas Bay (Jan.) Mann 714! Johann-Albrechtshöhe (Jan.) Staudt 799! Victoria (Mar., May) Winkler.

Also in **French Cameroons** and **Gabon**.

5. *Casearia bridelioides* Mildbr. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 168 (1927); Kew Bull. 1928: 213; Kennedy For. Fl. S. Nig. 34.

APD: Synonym of Keayodendron bridelioides Leandri

APD: Synonym of Keayodendron bridelioides Leandri

A tall tree to 120 ft. high; straight hole without buttresses, 60–80 ft. to first branch; girth of mature trees 6–9 ft.; in swamp forest; flower pale green; fruits orange.

G. C.: Ofin Headwaters F.R. (Oct.) Vigne 3122. **S. Nig.:** R. Oni Sankey 17! Akilla (fr. Apr., May) Kennedy 2002. Shasha F.R. (fl. & fr. Feb.–Apr.) Richards 3046! 3374! Ross 69!

Also in **French Cameroons**.

FRANKENIACEAE

Herbs or shrublets; leaves opposite, exstipulate, often small and ericoid. Flowers actinomorphic, hermaphrodite, solitary or cymose, small. Sepals 4–6, persistent, connate, induplicate-valvate. Petals as many as the sepals, free, clawed, with a scale-like appendage on the inside, imbricate. Stamens usually 6, hypogynous, free or shortly connate at the base; anthers 2-celled, didymous, dehiscing longitudinally. Ovary superior, sessile, 1-celled, with 2–4 parietal placentas; ovules numerous; style simple, filiform. Capsule enclosed in the persistent calyx, opening by valves. Seeds with endosperm; embryo straight, axile.

Widely dispersed on maritime shores.

FRANKENIA

Linn.—F.T.A. 1: 136.

Characters of the family.

- 1 Leaves flat, obovate to almost orbicular, petiolate, about 3–5 mm. long, setulose-pubescent; flowers terminal; calyx 3–4 mm. long *pulverulenta*

Frankenia pulverulenta Linn.—F.T.A. 1: 136; Guill. & Perr. Fl. Seneg. 40. *APD acc*

A diffuse much-branched herb a few inches high, with opposite leaves, often covering the ground.

Sen.: Sieber 16! Sor Isl. (Oct.–Dec.) Perrottet! Also at M'bidjem and Dakar.

Maritime shores of the warmer parts of the Old World.

TAMARICACEAE

Shrubs or trees, with slender branches and small scale-like alternate leaves; stipules absent. Flowers very small, actinomorphic, usually hermaphrodite, in slender catkin-like spikes or racemes. Sepals 4–6, imbricate, free. Petals as many as the sepals, free. Disk present. Stamens hypogynous, 5–10, free or connate at the base; anthers 2-celled, opening by longitudinal slits. Ovary superior, 1-celled, with parietal or basal placentas; styles 3–4, free or united at the base; ovules numerous, ascending. Fruit a capsule. Seeds with or without endosperm, with a tuft of hairs at the apex or all round; embryo straight.

Temperate regions of Europe, N. Africa and Asia; mostly maritime shores.

Recognized by the scale-like leaves, minute flowers, definite stamens, disk, and the parietal or basal placentation.

TAMARIX

Linn.—F.T.A. 1: 151.

Stamens free or connate at the very base; anthers extrorse. Seeds with a crest of long hairs at the apex.

- 1 A shrub or small tree; branchlets slender; leaves alternate, ovate-triangular, very acute, about 2 mm. long, distinctly gland-dotted, otherwise glabrous; flowers very small in slender catkin-like racemes; bracts shorter than the flowers [senegalensis](#)

Tamarix senegalensis DC. Prod. 3: 96 (1828); Niedenzu in E. & P. Pflanzenfam. 21: 287 (1925). *APD acc*

Tamarix gallica of F.T.A. 1: 151, not of Linn.; Chev. Bot. 49; Aubrév. Fl. For. Soud.-Guin. 76, t. 11.

A twiggy shrub or small tree, [of maritime and dry inland sandy situations](#).

Sen.: M'bidjem Thierry 28! Sor Isl. Brunner! **Lib.:** Santa Maria (Oct.) Dinklage 3180! **Fr. Nig.:** Manga fide Aubrév. l.c. **N. Nig.:** Bornu Kerr!

Also in [Cape Verde Islands](#), [Mauritania](#), [Central Sahara](#) and [N.E. Africa](#).

PASSIFLORACEAE

Herbaceous climbers bearing tendrils, or erect trees or shrubs. Leaves alternate, entire or lobed, often with a glandular petiole; stipules usually small and deciduous. Flowers hermaphrodite or unisexual. Sepals 5, imbricate, persistent, free or partially united. Petals 5, rarely absent, free or shortly united, imbricate. Corona of one or more rows of thread-like processes or scales, or annular. Stamens 5 or more, hypogynous or perigynous, shortly united or in bundles, sometimes springing from the gynophore; anthers 2-celled, opening lengthwise. Ovary superior, 1-celled, with 3 or rarely 4–5 parietal placentas; ovules usually numerous; styles free or united; stigmas often capitate. Fruit a capsule or berry, indehiscent or loculicidally 3-valved. Seeds with pitted testa, surrounded by a pulpy aril; endosperm fleshy; embryo large, straight.

Almost exclusively tropical and subtropical.

Recognized by the usually climbing habit (the African representatives, however, are mainly trees and shrubs), alternate stipulate leaves often with a pair of glands at the base, the flowers provided with a corona, the superior 1-celled ovary with parietal placentas, and pitted seeds.

- 1 Flowers hermaphrodite; corona conspicuous:2
Flowers unisexual; corona small and inconspicuous; tendrils present; leaves glandular at the base [7. Adenia](#)
- 2 Styles free to the base or nearly so:3
Styles united; stigma capitate:6
- 3 Tendrils present; stamens 4–5, filaments partly adnate to a long gynophore; fruit stipitate; climber [1. Passiflora](#)

- Tendrils absent; trees or shrubs:4
- 4 Stamens numerous; flowers large and conspicuous, axillary [2. *Smeathmannia*](#)
- Stamens 5; flowers rather small:5
- 5 Flowers solitary or fasciculate in the leaf-axils or from the axils of the fallen leaves; leaves not glandular at the base [3. *Paropsia*](#)
- Flowers in terminal panicles; leaves with a pair of large glands at the base [4. *Androsiphonia*](#)
- 6 Fertile stamens numerous; flowers sessile, surrounded by numerous imbricate bracts; no tendrils [5. *Barteria*](#)
- Fertile stamens 5, inserted on a gynophore; flowers pedicellate, not conspicuously bracteate; tendrils present [6. *Crossostemma*](#)

1. PASSIFLORA

Linn.-Benth. & Hook. f. Gen. Pl. 1: 810.

- 1 A slender twiner with softly hispid branches; leaves digitately trilobed, widely cordate at base, acute at apex of the lobes, 5–10 cm. long and broad, thin, ciliate; tendrils axillary, not branched; flowers axillary, solitary, about 5 cm. in diam.; pedicel usually a little longer than the often ciliate petiole; bracts pinnatisect, with numerous gland-tipped cilia, about 2 cm. long, at length larger in fruit; petals white; corona multistriate, bluish-purple; fruit ovoid, up to 4 cm. long, glabrous, surrounded by the persistent calyx [foetida](#)

Passiflora foetida* Linn.—F.T.A. 2: 520; Chev. Bot. 284. *APD acc

Rank-scented; fruit yellow when ripe, edible, **naturalized in waste places.**

A native of tropical America.

***Passiflora edulis* Sims**

A native of tropical America, is cultivated for its fruits.

***Passiflora laurifolia* Linn.**

A native of tropical America, is cultivated for its fruits.

***Passiflora quadrangularis* Linn.**

A native of tropical America, is cultivated for its fruits.

2. SMEATHMANNIA

Soland. ex R.Br.—F.T.A. 2: 506.

- 1 Ovary villose; persistent calyx as long or longer than the fruit; branches more or less tomentose; leaves pubescent beneath, broadly elliptic to obovate, rounded at base, rounded and shortly acuminate at apex, 6–20 cm. (usually about 8 cm.) long, 4–7 cm. broad, undulately glandular-toothed [1. *pubescens*](#)
- Ovary glabrous; persistent calyx much shorter than the fruit; branches and leaves glabrous or nearly so:2
- 2 Leaves cuneate at base, obovate to oblong-elliptic, very acutely acuminate, 7–12 cm. long, 3–5 cm. broad [2. *laevigata* var. *laevigata*](#)
- Leaves rounded at base, oblong-elliptic, shortly acuminate, 7–15 cm. long, 4–6 cm. broad [2a. *laevigata* var. *nigerica*](#)

1. ***Smeathmannia pubescens* Soland. ex R.Br.—F.T.A. 2: 506; Chev. Bot. 285, incl. vars. *cordifolia* and *parviflora*; Aubrév. Fl. For. C. Iv. 3: 29, t. 254. *APD acc***

***Smeathmannia rosea* of Lemaire.**

***Smeathmannia emarginata* of Lemaire.**

A shrub or small tree, to 30 ft. high; flowers white, fragrant; fruit white or reddish, crustaceous.

Fr. G.: Scaëtta 3307! **S. L.:** Whitfield! Smeathmann! R. Bagroo (Apr.) Mann 867! Kambia, R. Scarcies (Jan.) Sc. Elliot 4387a! Njala (Sept.) Deighton 74! Yetaya (Sept.) 2a. **Smeathmannia laevigata var. nigerica A. Chev. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 171 (1927); Chev. Bot. 285.**

APD: Synonym of Smeathmannia laevigata Sol. ex R. Br.

A shrub or tree up to about 30 ft. high; flowers white; fruit ivory-white.

Sen.: Sedhiou (Feb.) Chev. 2999. **Fr. Sud.:** Sangarala (Feb.) Chev. 345! **Fr. G.:** Pobéguin 222! Kankan (Mar.) Chev. 568. Kouroussa Chev. 15713. **S. L.:** Kenema (June) Aylmer 87!

It seems very probable that this variety is only one of the results of hybridization between the two species, as suggested from a study of numerous specimens collected in Sierra Leone by Thomas (Nos. 7098 and 7022). Another combination of characters is also shown by Thomas' specimens (Nos. 5064, etc.), which have the narrow-based leaves of typical *S. laevigata* and the villous ovary of *S. pubescens*.

3. PAROPSIA

Noronha—F.T.A. 2: 505.

- 1 Branches rusty-pubescent; leaves oblong-elliptic, rounded or slightly cuneate at base, acuminate, 5–16 cm. long, 2–6 cm. broad, repand-dentate, thin, pubescent on the nerves, finely reticulate; flowers fasciculate on long inflorescences; pedicels densely pilose, about 8 mm. long; sepals spatulate-oblongate, subobtusate, about 1 cm. long; petals slightly longer than the sepals, glabrous [guineensis](#)

Paropsia guineensis Oliv.—F.T.A. 2: 505. *APD acc*

Paropsia pritzellii Gilg in Engl. Bot. Jahrb. 40: 471 (1908).

Tree, to 60 ft. high and 5 ft. girth; flowering when leafless, or nearly so.

S. Nig.: Olokemeji F.R. (Mar.) A. F. Ross 105! Okomu F.R. (fl. Mar., fr. May) A. F. Ross 194! Sapoba Kennedy 2345! 2127! Calabar Thomson 31! Oban Talbot 1623!

Also in **French Camerouns**, **Cabinda** and **Uganda**.

4. ANDROSIPHONIA

Stapf in J. Linn. Soc. 37: 101 (1905). *APD acc*

- 1 A shrub; leaves oblong-elliptic, acuminate, subacute and often with two large black glands on each side at the base, 12–25 cm. long, 4–7 cm. broad, denticulate, slightly puberulous when young, distinctly reticulate on both surfaces; lateral nerves about 6–8 pairs; flowers greyish-green in a terminal panicle; bracts leafy, conspicuously glandular; sepals tomentellous; petals about the same length [adenostegia](#)

Androsiphonia adenostegia *Stapf* in J. Linn. Soc. 37: 101 (1905); Chev. Bot. 288. *APD acc*

A shrub or small tree, to 12 ft. high; flowers greyish-green; fruits orange when ripe.

Chev. 21194.

5. BARTERIA*Hook. f.*—F.T.A. 2: 510. *APD acc*

Maitland 1578 from Ekwe-ngong and Ujor FHI 30375 from Bali, both in Bamenda, British Cameroons, may represent a new species, but more and better material is required.

- 1 Flowers solitary or up to 3 in the leaf-axils and inserted approximately at the same level; bracts acute; branchlets solid except for hollow spindle-shaped swellings here and there; leaves spirally arranged, oblanceolate to oblong, 10–22 cm. long, 4–8 cm. broad, with a narrow petiole *I. nigrifolia*

Flowers 4 or more arranged in the form of a long horseshoe on the stem around the base of the decurrent leaf; bracts rounded at apex; branchlets hollow throughout and cylindrical; leaves distichous, oblong or slightly obovate-oblong, 20–42 cm. long, 6–19 cm. broad, with a very broad petiole and decurrent lamina. *2. fistulosa*

1. Barteria nigrifolia *Hook. f.*—F.T.A. 2: 510. *APD acc*

Barteria braunii *Engl.* (1892).

A tree, 10–20 ft. high, rarely to 45 ft.; branchlets with spindle-shaped swellings occupied by stinging ants; flowers white, sweet-scented, with a large mushroom-shaped yellow stigma; fruit ovoid, yellowish, with compressed pitted seeds. **Often found in the coastal districts.**

S. Nig.: Lagos (Jan-Mar.) Dalz. 1061! Akassa Barter 2119! R. Bonny (Oct.) Mann 507! Udi (Mar.) Kitson! Enugu (Feb.) Jones FHI 654! Agulu Thomas 152! Oban Talbot! Calabar Thomson 32! **F. Po:** Bokoko Mildbr. 6838.

Also in **French Cameroons**, **Spanish Guinea**, **Gabon** and **Cabinda**.

2. Barteria fistulosa *Mast.* in F.T.A. 2: 511 (1871). *APD acc*

A tree to 40 ft. high, **in gaps in rain forest**; branches becoming hollow and cylindrical, inhabited by large stinging ants.

S. Nig.: Okomu F.R. Ross 127! Benin (May) Baldwin 12011! Kennedy 223! 2171! Oban Talbot 471! **Br. Cam.:** Victoria (Apr.) Maitland 616! Johann-Albrechtshöhe Staudt 9451! Barombi (Feb.) Preuss 31! **F. Po:** Mann 268!

Also in **French Cameroons**, **Gabon** and **Belgian Congo**.

6. CROSSOSTEMMA*Benth.*—F.T.A. 2: 511.

- 1 Climber; branchlets glabrous; leaves oblong-elliptic, obtuse or slightly cuneate at base, acutely acuminate, 7–11 cm. long, 3–5 cm. broad, strongly reticulate on both surfaces; lateral nerves much-branched, about 5 pairs; tendrils axillary with the few-flowered inflorescence; pedicels jointed in the middle; flowers yellow; sepals and petals subequal, closely marked with darker spots, about 1 cm. long; fruit ellipsoid, acute at each end, 6-sided, about 8 cm. long, valves boat-shaped with the placentas down the middle; seeds ovate, smooth, about 1 cm. long *laurifolium*

Crossostemma laurifolium *Planch. ex Benth.*—F.T.A. 2: 511; Chev. Bot. 285. *APD acc*

Forest climber, with white flowers and yellow or orange fruits.

7. ADENIA

Forsk.—F.T.A. 2: 512, as *Modecca* Lam. and *Ophiocaulon* Hook. f. *APD acc*

- 1 Leaves with a pair of separate glands at the top of the petiole; sepals united about half-way up:2
 Leaves with the glands at the apex of the petiole consolidated and forming a peltate base; sepals united about half-way up:6
 Leaves with a single often spatulate gland at the top of the petiole; sepals free to the base or at most united for one third their length:7
- 2 Peduncles very short, not more than 0.5 cm. long:3
 Peduncles longer, over 2 cm. long:4
- 3 Leaves oblong or oblong-elliptic, subacute at base, acute at apex, 6–8 cm. long, 2.5–4 cm. broad, entire, laxly reticulate beneath, glabrous; petiole biglandular at the top, up to 1.5 cm. long; male flowers about 2 cm. long 1. tenuispira
 Leaves widely cordate at base; other characters as below4. lobata
- 4 Leaves acute to rounded at base:5
 Leaves widely cordate or truncate at base, entire or repand-lobate, rarely deeply lobed, ovate, acuminate, 10–15 cm. long, 6–10 cm. broad, thin, glabrous, sub-5-nerved from the base; stems tuberculate; petiole half the length of the leaf, with 2 broad semilunar fleshy glands at the top; male flowers about 1.5–2.5 cm. long; calyx campanulate, lobes lanceolate, acute; petals lacinate4. lobata
- 5 Pedicels articulated about half-way up; male flowers about 1.5 cm. long; leaves oblong or ovate-oblong, acutely acuminate, subobtusate at base, 8–10 cm. long, 3.5–4.5 cm. broad, entire, glabrous, laxly venose; petiole 1.5–2 cm. long, biglandular at the top2. oblongifolia
 Pedicels articulated nearly at the apex; male flowers about 1 cm. long; leaves ovate to ovate-elliptic, rounded at base, gradually acuminate, 10–13 cm. long, 4–6 cm. broad, entire, glabrous, very laxly venose; petiole 1.5–2 cm. long, with two large glands at the top3. mannii
- 6 Inflorescence long-pedunculate; leaves 3-lobed to beyond the middle, 10–13 cm. long, glabrous, membranous, 5-nerved from the base; petiole 4–6 cm. long; peduncle 15 cm. long or more; male flowers about 2 cm. long; petals linear5. aspidophylla
 Inflorescence sessile; leaves 3–5-lobed to about the middle, thin, lobes rounded at the apex, glabrous, glaucous, about 5–8 cm. long; petiole about as long as the leaf, the glands at the apex connate and forming the peltate base; male flowers shortly pedicellate, 5 cm. long; female much shorter with linear calyx-lobes; fruits ellipsoid, 3–4 cm. long, distinctly nerved6. venenata
- 7 Leaves ovate-oblong, acutely acuminate, much longer than broad, slightly cordate at base, 5–9 cm. long, 2.5–4.5 cm. broad, glabrous, conspicuously black-spotted on the upper surface; male sepals free to the base, with small fleshy warts on the outside7. cynanchifolia
 Leaves very broadly ovate, truncate or widely cordate at base, about as broad or broader than long:8
- 8 Sepals free to the base; leaves conspicuously spotted:9
 Sepals connate for one third; leaves broadly ovate, widely and shallowly cordate, obtusely and shortly acuminate, 6–10 cm. long, 5.5–9 cm. broad, entire, minutely dotted on the upper surface when young, otherwise glabrous10. dinklagei
- 9 Inflorescence several-flowered, with a fairly long peduncle; leaves more or less rhomboid, averaging about 7 cm. broad, entire or slightly lobed; capsule 6-angled, ovoid, 2 cm. long; seeds black, coarsely pitted8. cissampeloides
 Inflorescence few-flowered and shortly pedunculate; leaves small, averaging about 4 cm. broad, mostly repand-lobate9. gracilis

1. *Adenia tenuispira* (Stapf) Engl. Pflanzenw. Afr. 3, 2: 603 (1921); Hutch. & Dalz. in Kew Bull. 1928: 214.

APD: *Synonym of Adenia lobata* (Jacq.) Engl. subsp. *lobata*

Modecca tenuispira Stapf in J. Linn. Soc. 37: 102 (1905).

M. nigricans of Chev. Bot. 287.

A dioecious glabrous climber with long fine tendrils and greenish flowers.

Lib.: Cook 346. SinoPflanzenfame Basin Whyte! **iv. C.:** Bouroukrou (Jan.) Chev. 17002. Aboisso (Mar.) Chev. 17812. **G. C.:** Assuantsi (Mar.) Irvine 1576!

2. **Adenia oblongifolia** *Harms* in Engl. Bot. Jahrb. 26: 236 (1899). *APD acc*

A slender glabrous twiner.

Br. Cam.: Johann-Albrechtshöhe (Feb.) Staudt 621.

Also In **French Cameroons**.

3. **Adenia mannii** (*Mast.*) *Engl.* Bot. Jahrb. 14: 375 (1891).

APD: *Synonym of Adenia lobata* (*Jacq.*) *Engl.*

Modecca mannii *Mast.* in F.T.A. 2: 516 (1871); Chev. Bot. 286.

A glabrous climber, with pale green flowers.

S. L.: Peri, Gaura (Oct.) Deighton 5241! **iv. C.:** Lower Cavally (Aug.) Chev. 19860. Upper Cavally (Apr.) Chev. 21347. **S. Nig.:** Oban Talbot! **Br. Cam.:** Amba Bay (Feb.) Mann 17!

4. **Adenia lobata** (*Jacq.*) *Engl.* l.c. (1891). *APD acc*

Modecca lobata *Jacq.*—F.T.A. 2: 516; Chev. Bot. 286.

M. caricifolia of Chev. Bot. 286.

M. incisa of Chev. Bot. 286.

Kolbia elegans *P. Beauv.* Fl. Owar. 2: 91, t. 120.

A tall woody climber, the older stems sometimes an inch or more in diameter and tubercled; leaves variable in shape; flowers greenish-yellow, sweet-scented; fruits yellow.

Sen.: Carabane (Jan.) Chev. 3000. **Fr. G.:** Labé (Apr.) Chev. 12290. Diaguissa (Mar.) Chev. 12642. **S. L.:** Bagroo R. (Apr.) Mann 837! Falaba (Mar.) Sc. Elliot 4463! Njala (July, Aug.) Extends to Spanish Guinea and Central Africa.

9. *Adenia gracilis* Harms in Engl. Bot. Jahrb. 26: 236 (1899).

APD: *Synonym of Adenia cissampeloides* (Planch. ex Hook.) Harms

A climber of the same habit as the preceding, with smaller flowers and leaves.

S. L.: Bo (fr. Jan.) Thomas 7457! **Lib.:** Gbanga (Sept.) Linder 546! Gbau, Sanokwele (Sept.) Baldwin 9441! Mecca, Boporo (Nov.) Baldwin 10421! **G. C.:** R. Ancobra, Axim (Feb.) Irvine 2149! **S. Nig.:** Oban Talbot 469! **Br. Cam.:** Buea (Jan.) Maitland 228!

10. *Adenia dinklagei* Hutch. & Dalz. F.W.T.A., ed. 1, 1: 174 (1927); Kew Bull. 1928: 214. *APD acc*

A climber with white stems.

Lib.: Cook 170. Grand Bassa Dinklage 2109!

Adenia triloba Engl. Pflanzenw. Afr. 3, 2: 602 (1925).

Description inadequate; no specimen cited.

Togo: Siafi Mt.

Imperfectly known species.

CUCURBITACEAE

Herbs or rarely undershrubs with watery juice, often scabrid; stems scandent or prostrate; tendrils mostly present, spirally coiled. Flowers monoecious or dioecious, very rarely hermaphrodite, actinomorphic. Male flower: calyx tubular, lobes imbricate or open; corolla polypetalous or gamopetalous, lobes imbricate or induplicate-valvate; stamens free or variously united, mostly 3, rarely 1–5, one anther always 1-celled, the others 2-celled, cells straight or often curved, flexuous or conduplicate, connective often produced. Female flower: calyx-tube adnate to the ovary and often produced beyond it; staminodes usually not present; ovary inferior or very rarely free; placentas often 3, parietal but often meeting in the middle; ovules numerous, rarely few, arranged towards the walls of the ovary; style simple or rarely 3 free styles; stigmas thick. Seeds various, often flattened, without endosperm.

Mainly a tropical family.

Of scandent habit and often with spirally coiled tendrils; flowers always unisexual; anthers often twisted; ovary inferior, with parietal placentas.

Several incomplete specimens which cannot at present be identified are also known from our area and may represent genera not included in the key.

- 1 Petiole with a pair of glands on each side at the top, or on each side of the decurrent leaf-base:2

Petiole without glands at the top:	4
2 Ovary 1-celled with intrusive placentas; fruit much exceeding 5 cm. long; petals free; glands on the petiole:.....	3
Ovary 3–4-celled with axile placentas; fruit ellipsoid, up to 1.5 cm. long; petals united; glands on the decurrent base of the leaf	3. Cayaponia
3 Dioecious; male flowers racemose, female solitary; petals entire; fruits globose or oblong-ellipsoid, up to about 12 cm. long	1. Adenopus
Monoecious; male and female flowers solitary; petals denticulate; fruits large, of variable shape ...	2. Lagenaria
4 Petals free:	5
Petals united in the lower part:	9
5 Tendrils simple; leaves digitately lobed; male inflorescence racemose or subfasciculate; petals linear or filiform; anthers longitudinally conduplicate; root tuberous	4. Trochomeria
Tendrils branched; petals not linear; male flowers racemose:	6
6 Petals covered by the calyx in bud; fruit dry when ripe, with a fibrous endocarp containing the seeds	5. Luffa
Petals exposed in bud:	7
7 Receptacle tubular, about 1.5 cm. long; petals obovate about 2 cm. long, much overlapping in bud; leaves coriaceous	6. Cogniauxia
Receptacle patelliform, very short; petals oblong, up to 8 mm. long; leaves membranous:	8
8 Anther cells conduplicate, connective not produced; leaves usually lobed, 10–25 cm. long and broad	7. Bambekea
Anther cells straight, connective produced to form a spur; leaves entire, up to about 12 cm. long and 9 cm. broad	8. Gerrardanthus
9 Anthers straight or curved, not flexuous:	10
Anther cells flexuous or conduplicate:	13
10 Bract foliaceous and fimbriate at the base of the inflorescence in the axils of the leaves, resembling a stipule; leaves deeply lobed nearly to the base; tendrils simple; male flowers few on a common peduncle, female solitary; fruit small, few seeded	9. Ctenolepis
Bracts minute or absent:	11
11 Style inserted on an annular or cup-shaped disk; anthers often sessile; fruits usually not beaked (not known in Oreosyce):	12
Style without a disk at the base; connective of anther produced at the apex; anthers not sessile; fruit beaked ..	12. Kedrostis
12 Connective of anther mostly produced at the apex; filaments distinct or anthers subsessile; receptacle shortly campanulate	10. Melothria
Connective not produced; anthers sessile; receptacle tubular	11. Oreosyce
13 Calyx and pedicels of male flowers broadly winged; petiole with a large leathery gland within the base; female sepals linear-spathulate, abruptly reflexed over the top of the fruit	13. Dimorphochlamys
Calyx and pedicels not winged; gland rarely present within the base of the petiole:	14
14 Corolla segments pectinate; fruit large with several very prominent ribs; seeds large and thick; leaves divided to the base; tendrils branched; flowers dioecious	14. Telfairia
Corolla segments entire or at most dentate; fruit not or scarcely ribbed:	15
15 Filaments free, or anthers sessile:	16
Filaments united into a column; anthers united; corolla campanulate; leaves pustulate-scabrid	24. Coccinia
16 Male receptacle with 2–3 incurved scales inside; peduncles often with large foliaceous bracts, connective not produced at the apex	15. Momordica
Male receptacle without scales inside:	17
17 Corolla lobed nearly to the base:	18
Corolla shortly lobed to about or above the middle; anthers united, filaments free:	23
18 Connective of anthers produced at the apex; anthers on free filaments; tendrils simple	16. Cucumis
Connective of anthers not produced:	19
19 Leaves deeply pinnately partite or pinnatifid; tendrils branched; flowers monoecious; male receptacle short, widely campanulate	17. Colocynthis
Leaves digitately or palmately lobed, or entire:	20
20 Anthers free:	21

- Anthers united, filaments free; male receptacle long, funnel-shaped, globose at the base; monoecious; tendrils branched [21. *Peponium*](#)
- 21** Filaments very short, anthers subsessile in the campanulate receptacle; male flowers clustered at the apex of a common peduncle, the female solitary in the same axil; tendrils simple [18. *Cucumeropsis*](#)
- Filaments well developed: **22**
- 22** Dioecious; male flowers in racemes, female solitary; tendrils simple [19. *Physedra*](#)
- Monoecious; male and female flowers fasciculate in the leaf axils; tendrils branched [20. *Bryonopsis*](#)
- 23** Ovary densely setose with stiff jointed hairs; staminodes absent; dioecious; tendrils simple ... [22. *Raphidiocystis*](#)
- Ovary not densely setose; staminodes present; monoecious; tendrils branched [23. *Cucurbita*](#)

***Cyclanthera explodens* Naud.**

A native of tropical America, it has been collected at Buea, British Cameroons (Dalz. 8221), where it is probably introduced.

***Sphaerosicyos sphaericus* (E. Mey.) Hook. f.**

Cogniaux and Harms in Engl. Pflanzenr. Cucurbit. 2: 99 (1924) record this species from Loko, R. Benue, Nigeria (Gürich 43). This species is widespread in East and Southern Africa, but is not at present known in our area, apart from this record. Specimens of *Sphaerosicyos* and *Adenopus* may easily be confused so the record of the former in Nigeria is open to some doubt.

1. ADENOPUS

Benth.—F.T.A. 2: 527. *APD acc*

- 1** Calyx-tube of male flower 4–5 cm. long: **2**
- Calyx-tube of male flower 2–3 cm. long, very shortly puberulous, lobes without glands; stems glabrous or sparsely pubescent; leaves scabrid above: **3**
- 2** Calyx-tube of male flower very shortly puberulous, lobes 3 mm. long with hardened glands on the margin; stems glabrous; leaves glabrous, trilobed or obscurely 5-lobed, more or less truncate at base, denticulate, 7–10 cm. long, about 7 cm. broad, 3-nerved at base; tendrils simple [1. *guineensis*](#)
- Calyx-tube of male flower densely rufous-pilose, lobes without glands; stems pubescent; leaves scabrid above, pubescent beneath, obscurely 3- or 5-lobed, widely cordate at base, denticulate, 8–16 cm. long, 6–14 cm. broad, 5-nerved at base; tendrils branched, but usually with one of the branches poorly developed [2. *rufus*](#)
- 3** Leaves mostly distinctly 5-lobed, markedly undulate-dentate, 8–17 cm. long and broad; tendrils branched [3. *breviflorus*](#)
- Leaves not lobed, denticulate, ovate to lanceolate-ovate, 7–12 cm. long, 4–7 cm. broad; tendrils simple [4. *ledermannii*](#)

1. *Adenopus guineensis* (G. Don) Exell in J. Bot. 72: 42 (1934).

*APD: Synonym of *Lagenaria guineensis* (G. Don) C. Jeffrey*

Bryonia guineensis G. Don (1834).

Adenopus longiflorus Benth. (1849)—F.T.A. 2: 528; Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 225; Chev. Bot. 289; F.W.T.A., ed. 1, 1: 179.

Herbaceous climber in regrowth bush, with white, faintly fragrant flowers, apparently opening in the evening; female flowers and fruits not known.

S. L.: Don! T. Vogel! Roruks (July) Deighton 3261! Joru, Gaura (Oct.) Deighton 5192! **lv. C.:** Middle Cavally (July) Chev. 19372. Upper Cavally (May) Chev. 21394.

2. *Adenopus rufus* Gilg in Engl. Bot. Jahrb. 34: 346 (1904); Cogn. & Harms l.c. 227.

*APD: Synonym of *Lagenaria rufa* (Gilg) C. Jeffrey*

Herbaceous climber in regrowth bush; flowers white or yellowish; fruit subglobose, about 4 in. diam., dark green with small orange and large cream oval blotches.

S. L.: Gbesebu, Kamagai (Aug.) Deighton 5561! R. Jong, Matru (Sept.) Adames 4363! Panguma Deighton 4881!

Also in **French Camerouns**.

3. **Adenopus breviflorus Benth.**—F.T.A. 2: 528; Cogn. & Harms l.c. 229; Chev. Bot. 289.

APD: Synonym of Lagenaria breviflora (Benth.) Roberty

Lagenaria angolensis Naud.—Chev. Bot. 289.

Luffa angolensis of Chev. Bot. 291.

A perennial, climbing high over trees; flowers fragrant, white with dark veins, closed by day; fruit oblong-ellipsoid, about 4 in. long, dark green with large and small oval cream blotches.

Sen.: Kounoum Leprieur; Perrottet. **Fr. G.:** Kouria (Aug.) Chev. 14653! Ditinn (Apr.) Chev. 13529! **S. L.:** T. Vogel! **Iv. C.:** Middle Cavally (July) Chev. 19328; 19358. **G. C.:** Aburi (July) Johnson 127! **Dah.:** Hollis country (Feb.) Chev. 22946! **N. Nig.:** Borgu Barter 710! Katsina Ala (fl. & fr. Dec.) Dalz. 735! Lemme (May) Lely 150! **S. Nig.:** Lagos Millen 213! Rowland! R. Ogun, Lagos Millen 146! Ibadan (fr. Dec.) Meikle 896! Aguku Thomas 617!

Also in **Principe**, **S. Tomé** and widespread in tropical Africa generally.

4. **Adenopus ledermannii Harms** in Engl. Pflanzenr. Cucurbit. 2: 230 (1924).

APD: Synonym of Lagenaria breviflora (Benth.) Roberty

A slender climber; leaves bright green, flowers greenish-white.

Br. Cam.: Likomba (Nov.) Mildbr. 10732! Johann-Albrechtshöhe Staudt 560 (?).

Also in **French Camerouns**.

2. LAGENARIA

Seringe—F.T.A. 2: 529.

- 1 A climbing herb; branches more or less densely pilose with jointed hairs; leaves with two small pore-like glands at the base, widely ovate with a broad sinus at the base, up to 20 cm. broad, denticulate, sometimes caudate-acuminate, softly tomentellous beneath with spicular hairs; tendrils branched; male flowers solitary on elongated pedicels; calyx-tube campanulate, about 1.5 cm. long, pubescent, lobes triangular; petals white, free, obovate, mucronate, denticulate, about 4 cm. long and 3 cm. broad, pilose within the base; ovary villous; fruits very variable in size and shape [siceraria](#)

Lagenaria siceraria (Molina) Standl. in Publ. Field Mus. Nat. Hist. Chicago Bot. Ser. 3: 435 (1930).

APD acc

Cucurbita siceraria Molina (1782).

Lagenaria vulgaris Ser. (1825)—F.T.A. 2: 529; Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 201; Chev. Bot. 290; F.W.T.A., ed. 1, 1: 176.

The Calabash, Bottle-Gourd or White Pumpkin.

Sen.: Brunner! **Fr. Sud.:** Sarankoro (Feb.) Chev. 360. **S. L.:** Roroks (July) Deighton 1329! Sendugu (June) Thomas 570! Binkolo (Aug.) Thomas 1792! **Lib.:** Cape Palmas Dinklage. **Iv. C.:** N. Baoulé (July, Aug.) Chev. 22113; 22237. **G. C.:** Brown 416! Achimota (Aug.) Irvine 865! **Togo:** Lome Warnecke 352! **N. Nig.:** Sokoto Lely 153! Katagum Dalz. 120! 121! 122! **S. Nig.:** Ado (fr. Mar.) Cons. of Forests 478! Obu Thomas 517!

Cultivated and subsontaneous in the tropics of both hemispheres.

3. CAYAPONIA

Manso—F.T.A. 2: 568, as *Trianosperma* Mart.

- 1 A slender climber, 5–7 m. high; branches scabrid; tendrils mostly simple; leaves triangular-ovate, shallowly 3-lobed, 3-nerved and with a sessile gland on each side of the decurrent base, shortly dentate, acute, 5–8 cm.

long, scabrid; petiole slender, twining, 1/2-1/3 as long as the leaf; male flowers axillary, solitary or fasciculate; fruit shortly stalked, ellipsoid, 1-5 cm. long, pericarp brittle, smooth [africana](#)

Cayaponia africana (*Hook. f.*) *Exell* in Cat. S. Tomé 186 (1944). *APD acc*

Trianosperma africana *Hook. f.* in F.T.A. 2: 568 (1871).

Cayaponia latebrosa *Cogn.* in DC. Monogr. 3: 776 (1881), partly; F.W.T.A., ed. 1, 1: 177.

Gam.: Albreda Perrottet. **G. C.:** Akim Oda (fr. Dec.) Akpabla 82! **S. Nig.:** Lagos Millen 60! Dawodu 264! **Br. Cam.:** Cam. Mt., 1,000 ft. (Dec.) Mann 1253!

Also in **S. Tomé**.

4. TROCHOMERIA

Hook. f.—F.T.A. 2: 524.

This genus has not been revised for this edition. It is at present extremely difficult to assess the range of variation which may be expected to occur in a species. Carefully collected specimens are much needed, and it is particularly important that the specimens should show the range of variation on individual plants and that each individual should be numbered separately.

- 1 Leaves slightly setulose mainly on the nerves beneath, digitately 5-lobed nearly to the base, lobes acute, coarsely dentate with few teeth; male flowers few, in very long-stalked racemes; pedicels slender, elongated, glabrous; calyx-teeth minute, recurved; petals filiform, 4-5 cm. long [1. macroura](#)

Leaves rather densely scabrid-setose more or less all over the lower surface, digitately 3-7-lobed almost to the base, lobes linear to narrowly ovate, acute, entire, or rarely the leaves with broad triangular lobes or teeth; male and female flowers sub-fasciculate; pedicels comparatively short; calyx-teeth minute; petals up to 5 cm. long, broadened towards the base [2. dalzielii](#)

1. **Trochomeria macroura** *Hook. f.* in F.T.A. 2: 525 (1871); *Cogn. & Harms* in Engl. Pflanzenr. Cucurbit. 2: 189; *Chev. Bot.* 289.

APD: Synonym of Trochomeria macrocarpa (Sond.) Hook. f. subsp. macrocarpa

A "climber in open country among low trees."

Fr. Sud.: Kodjar, Gourma (July) *Chev.* 24387. **Dah.:** Agouagou (May) *Chev.* 23517. **N. Nig.:** Nupe Barter 1524!

Also in **Ubangi-Shari-Chad**.

2. **Trochomeria dalzielii** *Bak. f. ex Hutch.* F.W.T.A., ed. 1, 1: 177 (1927); *Kew Bull.* 1928: 214.

APD: Synonym of Trochomeria macrocarpa (Sond.) Hook. f. subsp. macrocarpa

A climber on grass-stems and low shrubs; arising after grass-fires form a fleshy yam-like root; flowers green or brownish-tinged.

N. Nig.: Kontagora (Dec.) Dalz. 280! Nupe Barter! Katagum Dalz. 374! Abinsi Dalz. 736! Kyana (Feb.) Hepburn 6! Mada Hills (June) Hepburn 70! Jira (May) Lely 126!

Trochomeria atacorensis *A. Chev. Bot.* 288, name only.

Fr. Sud.: Gourma (July) *Chev.* 24397! **Dah.:** Atacora Mts. (June) *Chev.* 14000.

Imperfectly known species. Possibly a form of *T. dalzielii*.

5. LUFFA

Mill.—F.T.A. 2: 530.

- 1 Fruits 2-2.5 cm. long, covered with stout barbed bristles; petals 1-1.2 cm. long [1. echinata](#)

Fruits 15-50 cm. long, smooth; petals 2-3 cm. long: [2](#)

- 2 Fruits not ridged; seeds smooth, narrowly winged; leaves often deeply digitately lobed, about 7-nerved at the base, scabrid, lobes denticulate; petiole pubescent [2. aegyptiaca](#)
- Fruits with up to 10 sharp longitudinal ridges; seeds rugose, not winged; leaves more or less as above, but paler and not so deeply lobed [acutangula](#)

1. *Luffa echinata* *Roxb.*—F.T.A. 2: 531; Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 73. *APD acc*

Trailing or climbing herb; flowers yellow.

N. Nig.: Kaza, Bornu (Nov.) Davey FHI 27115!

Also in **A.–E. Sudan**, **Abyssinia**, **Natal** and **tropical Asia**.

2. *Luffa aegyptiaca* *Mill.*—F.T.A. 2: 530; Chev. Bot. 291.

APD: *Synonym of Luffa cylindrica M. Roem.*

Luffa cylindrica *M. J. Roem.*—Cogn. & Harms l.c. 2: 62; F.W.T.A., ed. 1, 1: 177; Chev. Bot. 291.

The Loofah Gourd; an annual climber with yellow flowers.

Cultivated, and commonly naturalized.

Sen.: Talmy! Heudelot 217. **Fr. Sud.:** & **Fr. G.:** fide Chev. l.c. **S. L.:** Kambia (Jan.) Sc. Elliot 4444! Njala (Sept.) Deighton 2243! **Lib.:** Sinoe Basin Whyte! Ganta (May) Harley! **iv. C.:** fide Chev. l.c. **G. C.:** Accra Moloney 5! **N. Nig.:** Jebba Barter! Katagum Dalz. 130! **S. Nig.:** Lagos Dawodu 369! R. Niger, Ibo country (Aug.) T. Vogel 41! Aguku Thomas 768! **F. Po.:** (Nov.) T. Vogel 78!

Common throughout the tropics.

Luffa acutangula *Roxb.*—F.T.A. 2: 530; Holl. 2: 331; Cogn. & Harms l.c. 68.

Like the preceding.

An Asiatic species which is probably only rarely cultivated in tropical Africa.

Holland and Dalziel both record it from our area. The fruit of the only specimen (Sc. Elliot 4641) cited in F.W.T.A., ed. 1, 1: 177 is *L. aegyptiaca*, while the leaves are those of a *Cucurbita* and of an unidentifiable *Luffa*.

Doubtfully recorded species.

6. COGNIAUXIA

Baill. in Bull. Soc. Linn. Paris 1: 423 (1884).

- 1 A climber; branches puberulous; leaves broadly ovate, deeply cordate, with a wide sinus, acutely acuminate, entire or slightly lobulate-toothed, 15–20 cm. long and broad, thinly coriaceous, very conspicuously and closely reticulate beneath, with prominent looped nerves; petiole not glandular, 4–6 cm. long; tendrils bifurcate; male flowers corymbose-racemose on long axillary peduncles; bracts linear; calyx-tube narrowed towards the apex, up to 1.5 cm. long, puberulous; sepals short, triangular, with subulate points; petals conspicuous in bud, obovate, mucronate, 3–4 cm. long, entire, nervose, finely puberulous; female flowers not seen [podolaena](#)

Cogniauxia podolaena *Baill.* in Bull. Soc. Linn. Paris 1: 424 (1884); Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 197. *APD acc*

Luffa batesi *C. H. Wright* in Hook. Ic. Pl. t. 2490 (1896). Climbing plant up to 20 ft. long; flowers yellow.

Br. Cam.: Cameroons R. (Jan.) Mann 719! Barombi Preuss 158.

Also in **French Cameroons**, **Spanish Guinea**, **Belgian Congo** and **North Angola**.

7. BAMBEKEA

Cogn. in Bull. Jard. Bot. Brux. 5: 115 (1916). *APD acc*

- 1 Dioecious climbing herb, glabrous; leaves broadly ovate-cordate, subentire to deeply 5-lobed, 10–25 cm. long and broad, lobes acutely acuminate, petiole 6–15 cm. long; tendrils branched; male inflorescence a 10–20-flowered raceme, 4–13 cm. long, pedicels spreading, 2–4 mm. long; receptacle saucer-shaped, sepals lanceolate about 3 mm. long; petals about 8 mm. long and 5 mm. broad; female flowers in racemes 5–12 cm. long with pedicels 3–7 mm. long; ovary glabrous [racemosa](#)

Bambekea racemosa Cogn. in Bull. Jard. Bot. Brux. 5: 116 (1916); Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 173, t. 20. *APD acc*

Stems intensely green; flowers yellow or orange.

S. Nig.: Okomu F.R. (Feb.) Brenan 9041! 9139! Sapoba Kennedy 2634! **Br. Cam.:** Barombi Preuss 295.

Also in **French Cameroons** and **Belgian Congo**.

8. GERRARDANTHUS

Harv.—F.T.A. 2: 519, as *Atheranthera* Mast.

- 1 A slender climber, with spirally coiled axillary tendrils; branches glabrous, grooved; leaves ovate-rounded, widely cordate at base, acutely caudate-acuminate, 9–12 cm. long, 7–9 cm. broad, very thin, entire, digitately 5-nerved; petioles up to half as long as the leaves, slender; tendrils exceeding the leaves, very slender; sepals oblong-ovate, rounded at apex, about 2 mm. long, thin, nervose outside; petals unequal, about 1 cm. long [zenkeri](#)

Gerrardanthus zenkeri Harms & Gilg ex Cogn. in Engl. Pflanzenr. Cucurbit. 1: 21 (1916).

APD: *Synonym of Gerrardanthus paniculatus (Mast.) Cogn.*

Gerrardanthus nigericus Hutch. & Dalz. F.W.T.A., ed. 1, 1: 178 (1927); Kew Bull. 1928: 215.

Petals pale yellow; fruit subcylindrical, 3-sided at apex, about 3 in. long, green, with reddish-brown seeds.

G. C.: Kumasi Cummins 146! **S. Nig.:** Oban Talbot 1454! Degema Talbot 3628!

Also in **French Cameroons**.

9. CTENOLEPIS

Hook. f. ex Naud.—F.T.A. 2: 557.

Blastania Kotschy & Peyr.—F.W.T.A., ed. 1, 1: 178.

- 1 Slender twiner; stems slightly scabrid, ribbed; leaves digitately 3–5-partite, up to about 7 cm. long, thin, lobes sharply toothed, scabrid-pubescent; petiole pubescent; bract foliaceous and resembling a stipule at the base of the inflorescence, ovate-orbicular, narrowed to the base, fimbriate, about 1 cm. long; male flowers few and very small on a common axillary peduncle up to 2 cm. long, female solitary, subsessile or shortly pedicellate; fruit few-seeded, globose, smooth, 1–1.5 cm. in diam. [cerasiformis](#)

Ctenolepis cerasiformis (Stocks) Naud.—F.T.A. 2: 258. *APD acc*

Zehneria cerasiformis Stocks (1852).

Blastania fimbriatipula Kotschy & Peyr. (1867)–Cogn. in Engl. Pflanzenr. Cucurbit. 1: 133; F.W.T.A., ed. 1, 1: 178.

Flowers creamy-white; fruit scarlet, cherry-like.

Sen.: Farmar 123! Waco Perrottet. Dagana Leprieur. **Fr. Sud.:** Bara (Sept.) Hagerup 369! **N. Nig.:** Katagum Dalz. 118!

Extends to Eastern **Sudan**, Abyssinia, **Angola**, East and South Africa; also in **Arabia** and **India**.

10. MELOTHRIA

APD: Synonym of Zehneria Endl.

Linn.—F.T.A. 2: 562.

- 1 Male flowers (where known) more or less umbellate, or racemose, on common axillary peduncles; female flowers and fruits shortly pedicellate; stamens with well-developed filaments; dioecious:2
Male flowers solitary or in axillary fascicles; anthers subsessile; monoecious:7
- 2 Leaves truncate at base, repand-dentate, acutely acuminate, 5–6 cm. long, 3–4 cm. broad at base, shortly hispid on the nerves beneath; petiole setulose; fruit not known [1. mannii](#)
Leaves deeply cordate at base:3
- 3 Fruits smooth; male flowers 2–8 together borne at the apex of a filiform, 5–20 mm. long peduncle:.....4
Fruits shallowly pitted; leaves scabrid above, shortly pilose beneath:6
- 4 Stems and under-surface of leaves glabrous or sparsely pubescent:.....5
Stems and under-surface of leaves hirsute; leaves scarcely lobed, 5–7 cm. long, 4–7 cm. broad, petiole 5–8 cm. long [2b. minutiflora var. hirtella](#)
- 5 Leaves pentagonal-ovate with two short lateral lobes, 6–8 cm. long, 5–6 cm. broad, petiole 4–5 cm. long2.
[minutiflora var. minutiflora](#)
Leaves as above, but 1.5–3 cm. long, 12–23 mm. broad, petiole 1.5–3 cm. long .. [2a. minutiflora var. parvifolia](#)
- 6 Leaves with subentire margin, shortly 5-lobed, pentagonal in outline, widely cordate, 4–6 cm. long3.
[fernandensis](#)
Leaves with markedly dentate margin, ovate or 3–5-lobed, cordate at base, 3–7 cm. long, 2–5 cm. broad4.
[punctata](#)
- 7 Female flowers and fruits sessile or nearly so; fruits globose, almost 1 cm. in diam., sparingly setulose; stems very scabrid; leaves shortly and subhastately lobed, deeply cordate at base, subacute at apex, up to 12 cm. long, denticulate or subentire, mostly very scabrid [5. maderaspatana](#)
Female flowers and fruits on slender pedicels; stems glabrous or sparsely pubescent, not scabrid:.....8
- 8 Fruits globose; leaves not or hardly lobed:.....9
Fruits ovoid or fusiform, acute at apex; leaves mostly triangular-hastate with divergent lobes, often deeply lobed: 10
- 9 Leaves broadly triangular, truncate or nearly so at base with the basal lobes acute, apex acute, margin denticulate, 3–7 cm. long and broad [6. capillacea](#)
Leaves ovate-cordate, cordate at base with rounded basal lobes, apex obtuse, margin entire or subentire, 4–6 cm. long and broad [7. cordifolia](#)
- 10 Fruit ovoid, 15–16 mm. long, 7–8 mm. broad; seed marginate [8. deltoidea](#)
Fruit spindle-shaped, 20–30 mm. long, 7–10 mm. broad; seed not marginate [9. tridactyla](#)

1. **Melothria mannii** *Cogn.* in DC. Monogr. 3: 617 (1881); Engl. Pflanzenr. Cucurbit. 1: 119.

APD: Synonym of Zehneria scabra (L. f.) Sond. subsp. scabra

Zehneria deltoidea *Hook. f.* in F.T.A. 2: 560 (1871), not of Miq.

A slender climber, 12–15 ft.; female flowers not known.

Br. Cam.: Cam. Mt., 4,500 ft. (Feb.) Mann 1277!

2. **Melothria minutiflora** *Cogn. var. minutiflora*—DC. Monogr. 3: 611 (1881); Engl. Pflanzenr. Cucurbit. 1: 110, partly (excl. t. 23). *APD acc*

Zehneria micrantha *Hook. f.* in F.T.A. 2: 560 (1871), not of F. v. Muell.

A very slender climber, 8–10 ft.

Br. Cam.: Cam. Mt., 7,000 ft. (Dec.) Mann 2010!

Also in **French Cameroons**.

2a. **Melothria minutiflora var. parvifolia** *Cogn.* in Engl. Pflanzenr. Cucurbit. 1: 111 (1916). *APD acc*

Br. Cam.: Cam. Mt., 8,000 ft. Preuss 929.

2b. **Melothria minutiflora** var. **hirtella** Cogn. l.c. (1916). *APD acc*

Br. Cam.: Cam. Mt., Buea, 3,000 ft. Preuss 958!

3. **Melothria fernandensis** Hutch. & Dalz. F.W.T.A., ed. 1, 1: 179 (1927); Kew Bull. 1928: 215.

APD: Synonym of Zehneria scabra (L. f.) Sond. subsp. scabra

Melothria scrobiculata of Cogn. l.c. 104, partly.

A climber, 20 ft.; female flowers white, turning yellow; male flowers not known.

F. Po: 3,000 ft. (Dec.) Mann 628!

4. **Melothria punctata** (Thunb.) Cogn. in DC. Monogr. 3: 615 (1881); Engl. Pflanzenr. Cucurbit. 1: 117, t. 26.

APD: Synonym of Zehneria scabra (L. f.) Sond. subsp. scabra

Bryonia punctata Thunb. (1794).

A slender climber.

Br. Cam.: Bamenda (fl. & fr. Feb.) Migeod 476! Ledermann.

Widespread in tropical and S. Africa; also in **Madagascar** and **Java**.

5. **Melothria maderaspatana** (Linn.) Cogn. in DC. Monogr. 3: 623 (1881); Engl. Pflanzenr. Cucurbit. 1: 126, t. 29.

APD: Synonym of Cucumis maderaspatanus L.

Cucumis maderaspatanus Linn. (1753).

Mukia scabrella (Linn. f.) Arn.—F.T.A. 2: 561; Chev. Bot. 296.

A prostrate or scandent annual, scabrid, with small white almost prickly hairs; flowers white or yellow; berry red; a common weed.

Sen.: Dakar (fl. & fr. May) Baldwin 5708! **Gam.:** Ingram! Brown-Lester! Cape St. Mary (fr. Jan.) Dalz. 8126! **Fr. Sud.:** & **Fr. G.:** fide Chev. l.c. **S. L.:** Kambia, R. Scarcies (fr. Dec.) Widespread in central and E. Africa.

7. *Melothria cordifolia* Hook. f. in F.T.A. 2: 563 (1871); Cogn. in Engl. Pflanzenr. Cucurbit. 1: 102.

APD: *Synonym of Neoachmandra gillettii* (De Wild.) W.J. de Wilde & Duyfjes

A slender climber.

Lib.: Cape Palmas Dinklage 2386.

Also in Gabon and S. Tomé.

8. *Melothria deltoidea* Benth. in Hook. Fl. Nigrit. 368 (1849), excl. spec. Vogel; Cogn. l.c. 94, t. 21 excl. spec. Vogel 45 and Barter 1522.

APD: *Synonym of Zehneria thwaitesii* (Schweinf.) C. Jeffrey

APD: *Synonym of Zehneria thwaitesii* (Schweinf.) C. Jeffrey

Bryonia deltoidea Schum. & Thonn. (1827).

Slender climber; flowers pale yellow turning orange; fruit reddish when ripe.

Sen.: fide Cogn. l.c. S. L.: Maswari (fl. & fr. Nov.) Deighton 5645! G. C.: Thonning. Odumase, Krobo Irvine 1023! Togo: Lome Warnecke 303. Bismarckburg Büttner 163. N. Nig.: Zaria (fl. & fr. Dec.) Milne-Redhead 5006! 5008! Bauchi Plateau (fl. & fr. July) Lely P. 393!

Also in French Cameroons, Gabon, Belgian Congo and Mozambique.

9. *Melothria tridactyla* Hook. f. in F.T.A. 2: 562 (1871); Cogn. l.c. 96; Chev. Bot. 296.

APD: *Synonym of Zehneria thwaitesii* (Schweinf.) C. Jeffrey

Melothria gourmaensis of Chev. Bot. 296.

A rather slender climber; flowers very small, yellow; fruit reddish when ripe.

Sen.: Bondou Heudelot 198. Fr. Sud.: Souloula (Mar.) Chev. 671. Gourma (July) Chev. 24536. S. L.: Pendembu (fr. July) Thomas 803! Kamakwie (Mar.) Deighton 4600! Lib.: Gbanga (Sept.) Linder 733! G. C.: Achimota (fr. Oct.) Milne-Redhead 5163! N. Nig.: Katagum (Oct.) Dalz. 127! S. Nig.: Lagos Colony (Sept.) Foster 342!

Extends to Angola, E. Africa and Mascarene Islands.

Melothria sp.

Slender herbaceous climber; male flowers white in racemes 3–7 cm. long; female flowers white in shortly pedunculate umbels.

S. Nig.: Akure F.R. (Oct.) Keay FHI 25457! Okomu F.R. (Dec.) Brenan 8509!

Evidently the same as Zenker 3682 from Bipinde, French Cameroons, cited by Cogniaux in Engl. Pflanzenr. Cucurbit 1: 111 as *M. minutiflora* Cogn., and the same as Cogniaux's plate (l.c. t. 23), but distinct from the type and description. Imperfectly known species.

11. OREOSYCE

Hook. f.—F.T.A. 2: 548.

- 1 A slender climber, 3–4 m. high; tendrils slender, simple; leaves ovate, rather narrowly cordate at the base, very acute, 5–7 cm. long, slightly lobulate and acutely dentate, setose-scabrid with bulbous-based hairs; petiole slender, often longer than the leaf; flowers monoecious, about 3–4 in the leaf-axils, shortly pedicellate, small; male calyx-tube setulose, 5 mm. long, with subulate lobes 2–3 mm. long; corollalobes setulose outside; ovary densely hispid [africana](#)

Oreosyce africana Hook. f. in F.T.A. 2: 548 (1871); Cogn. in Engl. Pflanzenr. Cucurbit. 1: 68. Petals yellow.

APD: Synonym of Cucumis oreosyce H. Schaefer.

Br. Cam.: Cam. Mt., 7,000 ft. (Dec.–Mar.) Mann 1285! 2025! Richards & Brenan 9527! **F. Po:** Mann! El Pico, 5,000 ft. (Dec.) Boughey 176!

12. KEDROSTIS

Medic.—F.T.A. 2: 563, as *Rhynchocarpa* Schrad.

- 1** A slender twiner; stems weakly pilose; leaves ovate or ovate-triangular, deeply cordate at base, subacute at apex, up to 10 cm. long and 6 cm. broad, sinuate-dentate, scabrid-pubescent; petiole about 1/3 as long as the leaf; flowers axillary, the males pedicellate on a short common peduncle, the female solitary and subsessile; fruits about 1.5 cm. long, ovoid-ellipsoid, beaked by the persistent style, long-pilose*foetidissima*

Kedrostis foetidissima (Jacq.) Cogn. in DC, Monogr. 3: 634 (1881); Engl. Pflanzenr. Cucurbit. 1: 140.
APD acc

Trichosanthes foetidissima Jacq. (1788).

Rhynchocarpa foetida Schrad.—F.T.A. 2: 564; Chev. Bot. 297.

A climber, up to 8 ft. high, with an unpleasant smell; flowers small, yellowish; fruit scarlet or crimson when ripe.

Sen.: Perrottet. Walo (Apr.) Leprieur! Richard Tol Lelievre. **Fr. Sud.:** Macina (Sept.) Chev. 24824! Gao (Feb., Sept.) De Wailly 4955! 5217! **G. C.:** Achimota (fr. July) Milne-Redhead 5115! **Fr. Nig.:** Zinder (fl. & fr. Nov.) Hagerup 615! **N. Nig.:** Katagum (Sept.) Dalz. 116!

Extends to Abyssinia and Somaliland, East and South Africa and **Angola**.

[Dalziel 128 from Katagum, Nigeria, cited in Edition 1 as this species, has very much longer fruits and appears to be a species of *Toxanthera* Hook. f. Further material is required to identify this plant with certainty.]

13. DIMORPHOCHLAMYS

Hook. f.—F.T.A. 2: 549.

- 1** A slender climber 4–5 m. high; branches glabrous; leaves ovate to ovate-orbicular widely and shortly cordate at base, acutely acuminate, 10–13 cm. long, denticulate, closely reticulate, scabrid; petiole with a large leathery gland in the axil, slightly twining, about 1.5 cm. long, becoming verrucose; male flowers several on a short peduncle; bracts imbricate; pedicels short and with broad decurrent wings from the calyx; calyx-lobes ovate, subacute, about 4 mm. long; corolla campanulate, tube 1.5 cm. long, lobes ovate, about 1 cm. long; fruit spherical, about 6–7 cm. in diam., crowned by the reflexed appressed long-spathulate persistent calyx-lobes*mannii*

Dimorphochlamys mannii Hook. f. in F.T.A. 2: 550 (1871); Hoot. Ic. Pl. t. 1322; Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 170, t. 19; Chev. Bot. 293.

APD: Synonym of Momordica cabrae (Cogn.) C. Jeffrey

Flowers white; ripe fruits orange with pale yellow spots, dark green with pale spots when unripe, rough in texture.

Iv. C.: Bingerville Chev. 15242. Bouroukrou Chev. 16960. Haute-Sassandra Chev. 21582; 21617. **G. C.** Atewa Range (Feb.) Vigne 4437! **S. Nig.:** Lagos Dawodu 30! Ibadan South F.R. (fr. Feb.) Keay & Meikle FHI 25664! Calabar (Feb.) Mann 2312! Thomson 34! **Br. Cam.:** Amba Bay Mann! **F. Po:** (fr. Jan., Nov.) T. Vogel 61! Mann 161!

Also in **French Cameroons**, **Spanish Guinea**, **Cabinda** and **Belgian Congo**.

14. TELFAIRIA

Hook. f.—F.T.A. 2: 523.

- 1 A dioecious climber; branches puberulous when young; leaves pedately 3–5-foliolate; leaflets shortly stalked, obliquely elliptic or ovate, shortly acuminate, up to 15 cm. long and 10 cm. broad, dentate in the upper 2/3, very slightly scabrid beneath, 3-nerved from the base; tendrils branched, spirally coiled above the fork; male racemes about 15 cm. long, flowering in the upper half; bracts subrhomboid, petiolate, leafy; pedicels about 0.5 cm. long; calyx-lobes tomentellous, crenate; corolla lobes obovate, about 2 cm. long, pectinate in the upper part, puberulous outside, nervose, glandular inside[occidentalis](#)

Telfairia occidentalis Hook. f. in F.T.A. 2: 524 (1871); Cogn. in Engl. Pflanzenr. Cucurbit. 1: 267; Chev. Bot. 288. *APD acc*

A perennial climber, attaining 100 ft. in length; corolla creamy-white with a red-purple eye; fruit pale glaucous green, about 2 ft. long and 10 in. diam. with broad ridges; seeds over 1 in. across; [often cultivated](#).

S. L.: (May) Barter! Freetown Welwitsch 823. Njala (Sept.) Deighton 1763! **Iv. C.:** Indénié (Dec.) Chev. 22628. **Dah.:** Zagnanado (Feb.) Chev. 23089! **S. Nig.:** Lagos Colony Moloney 13! Millen 16! 198! Abeokuta (Feb.) Irving! Sapoba Kennedy 1732! Ezi (Feb.) Thomas 2355! Obuampa (Jan.) Thomas 2222! Calabar (Feb.) Mann 2324! **F. Po:** (Jan.) Mann 233!

15. MOMORDICA

Linn.—F.T.A. 2: 534.

- 1 Leaves 3–5-foliolate; flowers subtended by a leafy bract, male subumbellate, female solitary on a long peduncle:2
- Leaves simple, entire, angled or lobed:3
- 2 Bract of male inflorescence large, suborbicular, more or less toothed, 2–4 cm. diam.; peduncle 4–7 cm. long; pedicels densely villose; sepals lanceolate, long-acuminate, 7–8 mm. long; leaflets elliptic or obovate, rounded or acute at base, rather distantly mucronate-dentate, glabrous or nearly so; tendrils simple or branched[1. cissoides](#)
- Bract of male inflorescence small, coriaceous; peduncle 12–13 cm. long; pedicels glabrous; sepals ovate, subrotundate at apex, 2.5 mm. long; leaflets elliptic or ovate-oblong, cuneate at base with setose teeth on the margin, minutely scabrid; tendrils simple[2. gilgiana](#)
- 3 Male flowers solitary, with a conspicuous bract on the peduncle:4
- Male flowers several, more or less corymbose or umbellate:5
- 4 Bract closely subtending the flower; leaves lobed up to about the middle, lobes coarsely lobulate-dentate; fruits becoming smooth with age, warted when young[3. balsamina](#)
- Bract below or near the middle of the peduncle; leaves usually lobed to beyond the middle; lobes more or less sinuate; fruits muricate when young, at length with irregular lines of warts[4. charantia](#)
- 5 Male peduncle with a large broadly ovate-cordate bract at the apex, 1.5–2.5 cm. long, 2–2.5 cm. broad; sepals lanceolate, much larger than the receptacle; branches glandular-puberulous, grooved; leaves broadly ovate to 3- (or rarely 5-) lobed, margin often coarsely and acutely dentate, rarely subentire, cordate with a decurrent base, scabrid-puberulous on both surfaces; tendrils unequally branched[5. angustisepala](#)
- Male peduncle with a small (less than 1 cm. long) obovate or lanceolate bract, or ebracteate:6
- 6 Male sepals acute; leaves ovate-cordate, not lobed, deeply cordate at base, acuminate, minutely and remotely denticulate, sparsely and minutely scabrid on both surfaces:7
- Male sepals rounded at apex; male flowers numerous, racemose or subcorymbose; leaves broadly ovate-cordate, not lobed, deeply cordate at base with the lamina decurrent on the petiole, acute at apex, repand-dentate or denticulate, 8–15 cm. long, 6–12 cm. broad, scabrid-puberulous or pubescent beneath[8. foetida](#)
- 7 Male flowers 3–4, subtended by a leafy obovate bract, 6–10 mm. long, attenuate at base; leaves 5–7.5 cm. long, 3–5 cm. broad[6. cordata](#)
- Male flowers numerous, racemose or subcorymbose; bracts minute or absent; leaves 8–16 cm. long, 5–13 cm. broad[7. multiflora](#)

1. **Momordica cissoides** Planch. ex Benth.—F.T.A. 2: 535; Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 1 (1924); Chev. Bot. 290. *APD acc*

A tall graceful climber; flowers white, with a large black-purple spot at the base of each petal; fruit fleshy, 11/2 in. long, prickly, orange-yellow, with red seeds.

Fr. G.: Fouta Djallon (Apr.) Chev. 13466. **S. L.:** Sc. Elliot 5896! Pendembu (July) Thomas 708! Rowala (fl. & fr. July) Thomas 1070! 1191! Mabonto (July) Deighton 3268! Kasasa, Tonko Limba (Sept.) Extends to **Angola** and A.–E. **Sudan**.

[Specimens from the western part of our area are more slender and have smaller bracts; they may prove to be distinct.—R.W.J.K.]

2. **Momordica gilgiana** *Cogn.* in Bull. Jard. Bot. Brux. 4: 221 (1914); *Cogn. & Harms* l.c. 16. *APD acc*

Momordica cognauxiana *Gilg* (1904), not of De Wild. (1903); F.W.T.A., ed. 1, 1: 181.

A twining herb with grooved stems and forked tendrils.

Br. Cam.: Buea Deistel 486. Also in **French Cameroons**.

3. **Momordica balsamina** *Linn.*—F.T.A. 2: 537; *Cogn. & Harms* l.c. 28; Chev. Bot. 290. *APD acc*

A climber, wild, and often planted and growing over native huts; flowers yellow (sometimes white) with a dark centre; fruit orange-yellow, beaked, 1–2½ in. long, bursting and exposing red-brown seeds; **in drier regions**.

Sen.: Tivaouane (Dec.) Chev. 2991! Sousoun (May, June) Chev. 3501; 3503. **Fr. Sud.:** Timbuktu (fl. & fr. June, July) Hagerup 99! 229! Chev. 1255! **N. Nig.:** Katagum (fl. & fr. Sept.) Dalz. 131! Karasuwa, Nguru (fl. & fr. June) Onochie FHI 23355!

Common in the drier parts of the tropics.

4. **Momordica charantia** *Linn.*—F.T.A. 2: 537; *Cogn. & Harms* l.c. 24; Chev. Bot. 290. *APD acc*

Climber, flowers yellow; fruit ripening orange, 2–3 in. long, bursting in 3 valves to expose the carmine red seeds; **extending into moister regions**.

Sen.: Farmar 32! **Gam.:** Boteler! **Fr. Sud.:** Féréibo (Aug.) Chev. 2992. Djenné (Sept.) Chev. 2993. **S. L.:** Falaba (Apr.) Sc. Elliot 5446! Njala (fl. & fr. May) Deighton 1902! Thomas 2012! **Br. Cam.:** Mimbria (fl. & fr. Apr.) Hutch. 99! **F. Po.:** (Dec.) Mann 58!

Widespread in the warmer parts of the world.

5. **Momordica angustisepala** *Harms* in Engl. Bot. Jahrb. 58: 239 (1923); *Cogn. & Harms* l.c. 41. *APD acc*

Momordica bracteata *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 181 (1927); Kew Bull. 1928: 215.

A climber; calyx black, corolla cream; stem used as a sponge; sometimes cultivated; fruit not known.

G. C.: Irvine 635! Owabi (Apr.) Andoh FH 4186! **S. Nig.:** Ibadan (July) Jones FHI 18837! Ohe, Benin (Apr.) Chizea FHI 8286! Asaba (Dec.) Chizea FHI 8251! Eket Talbot 3133!

Also in **French Cameroons**.

6. **Momordica cordata** *Cogn.* in Engl. Bot. Jahrb. 21: 208 (1895); *Cogn. & Harms* l.c. 39.

APD: *Synonym of Momordica multiflora* Hook. f. *var. multiflora*

A glabrous, slender climber.

Br. Cam.: Victoria (Mar.) Preuss 1203.

7. **Momordica multiflora** Hook. f. in F.T.A. 2: 540 (1871); Cogn. & Harms l.c. 47. *APD acc*

A slender climber; flowers yellow.

F. Po: (Nov.) T. Vogel 173!

Also in **Gabon** and **Angola**.

[Cogn. & Harms l.c. 50 also record *M. gabonii* Cogn. from the British Cameroons (Victoria Preuss 1204; Barombi Preuss 156; Johann-Albrechtshöhe Staudt 788). I have not been able to see these specimens, but specimens from other areas cited as *M. gabonii* Cogn. (1881) by Cogn. & Harms do not appear distinct from the type of *M. multiflora* Hook. f. (1871), so it seems possible that the specimens from the British Cameroons do in fact belong to the latter species.—R.W.J.K.]

8. **Momordica foetida** Schum. & Thonn.-Cogn. & Harms l.c. 41, t. 4. *APD acc*

Momordica morkorra A. Rich.—F.T.A. 2: 538; Chev. Bot. 291.

Momordica mannii Hook. f. in F.T.A. 2: 539; Cogn. & Harms l.c. 43; F.W.T.A., ed. 1, 1: 182.

A climber from a stout perennial root; calyx blackish-green; corolla white, sometimes yellowish; fruit about 3 in. long, yellow or pale orange when ripe, covered with soft prickles, bursting and exposing seeds in a red pulp.

S. L.: Bumba (Sept.) Thomas 1956! **Lib.:** Gbanga (Sept.) Linder 468! **Iv. C.:** Soubré (June) Chev. 19146! Baoulé-Nord (July) Chev. 22024. **G. C.:** Asuansi (Feb.) Williams 28! Ankobra Junction (fr. Jan.) Kitson 1018! Bobiri F.R. (Oct.) Andoh FH 4917! **Togo:** Bismarckburg Büttner 656. **N. Nig.:** Bauchi Plateau (fl. & fr. July) Lely 423! P. 363! **S. Barombi Preuss 378. **F. Po:** (Nov.–Jan.) T. Vogel 33! 170! Mann 170! 627!

Widespread in tropical Africa.

16. CUCUMIS

Linn.—F.T.A. 2: 542.

Several of the specimens cited lack fruits and their identification must therefore be regarded as provisional. Fruits are a crucial character in this genus and should always be collected.

- 1 Stems and branches setose with long stiff jointed bristles; leaves not or rarely divided beyond the middle:2
Stems and branches more or less shortly scabrid; leaves often divided below the middle:4
- 2 Fruits smooth or at most green-lined or hairy; a ground-trailer; leaves broadly ovate, widely cordate at base, 5-lobed to about 1/3 their length or hardly lobed, denticulate, up to about 10 cm. long, scabrid; petiole nearly as long as the leaf; flowers monoecious, the male few in the leaf-axils, the female solitary; young fruits villous 1. melo var. agrestis
Fruits echinate or tuberculate:3
- 3 Fruits with very numerous dense slender bristles; leaves rounded, obscurely toothed or the lobes subentire, scabrid; fruit broadly ovoid, 10–12 cm. long, stalk not more than about 1 cm. long 2. dipsaceus
Fruits with fewer stout scattered tubercles; leaves acute, sharply dentate, bristly-setose on both surfaces; fruit 10–12 cm. long, stalk 4–5 cm. long 3. metuliferus
- 4 Fruits with stout short tubercles, oblong-ellipsoid, 6–8 cm. long; leaves thick, rarely divided beyond the middle, the lobes not again divided, canescent, very harshly scabrid 4. pustulatus
Fruits with rather slender or short soft bristles; leaves divided nearly to the base, the lobes often lobulate:5
- 5 Plants green, laxly scabrid; fruits with long slender bristles, oblong-ellipsoid, about 4 cm. long 5. ficifolius
Plants canescent, densely scabrid; fruits with very short bristles, usually more or less globose, 3–4 cm. long ... 6. prophetarum

1. **Cucumis melo var. agrestis** Naud.—F.T.A. 2: 546; Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 120 (1924); Chev. Bot. 292. *APD acc*

Fruit globose, obovoid or oblong, longitudinally striped with green.

Gam.: Kuntaur Ruxton 34! **Fr. Sud.:** Djenné (Sept.) Chev. 2982! **G. C.:** Achimota Irvine 778! 1819! Tamale (fl. & fr. Feb.) Williams 485! **Dah.:** Cotonou (Jan., Apr.) Debeaux 191! Chev. 22685! **N. Nig.:** Borgu Barter 748! Sokoto Dalz. 349! Katagum (fl. & fr. Sept.) Dalz. 117! **S. Nig.:** Obu Thomas 575!

Widespread in the tropics.

2. **Cucumis dipsaceus** *Ehrenb. ex Spach*—F.T.A. 2: 543; Cogn. & Harms l.c. 147; Chev. Bot. 292. *APD acc*

APD: *Synonym of Cucumis melo L. subsp. melo*

A slender annual climber with pale green stem.

Gam.: Ingram! Genieri (July) Fox 176! **Fr. Sud.:** Kabara (Aug.) Hagerup 286! **Iv. C.:** Bingerville Chev. 15241.

Widespread in the drier parts of tropical Africa.

3. **Cucumis metuliferus** *E. Mey. ex Naud.*—F.T.A. 2: 543; Cogn. & Harms l.c. 146; Chev. Bot. 292. *APD acc*

A yellow-flowered annual climber, with foliage like that of the cucumber; fruit pendulous, scarlet when ripe, with stout spines.

Fr. G.: Fouta Djallon (Sept.) Chev. 18605. **N. Nig.:** Borgu Barter 1527! Lokoja (Oct.) Parsons 46! Zaria (fr. Dec.) Meikle 855! Katagum (Oct.) Dalz. 125!

Extends to **Angola**, Abyssinia, East and South Africa.

4. **Cucumis pustulatus** *Hook. f.* in F.T.A. 2: 544 (1871); Cogn. & Harms l.c. 141; Chev. Bot. 293.

APD: *Synonym of Cucumis ficifolius A. Rich.*

A ground-trailer from a perennial base; flowers yellow; fruit uniformly grey-green in colour.

Fr. Sud.: Gourma (July) Chev. 24472! **N. Nig.:** Katagum (Oct.) Dalz. 129! Kukawa (fl. & fr. Jan.) E. Vogel 40!

Extends to Eastern **Sudan**, Abyssinia, Somaliland, **Tanganyika** and S.W. Africa.

5. **Cucumis ficifolius** *A. Rich.*—Cogn. & Harms l.c. 138. *APD acc*

APD: *Synonym of Cucumis prophetarum L. subsp. prophetarum*

APD: *Synonym of Cucumis meeusei C. Jeffrey*

Cucumis figarei *Del. ex Naud.*—F.T.A. 2: 543.

A ground-trailer from a perennial base; flowers yellow.

Sen.: Boivin 428. Cape Verde Waura 406. **N. Nig.:** Sokoto Dalz. 348!

Extends to Eastern **Sudan**, Abyssinia and **Arabia**; also in **Angola**.

6. **Cucumis prophetarum** *Linn.*—F.T.A. 2: 545; Cogn. & Harms l.c. 140; Chev. Bot. 292.

APD: *Synonym of Corallocarpus boehmii (Cogn.) C. Jeffrey*

A ground-trailer from a perennial base; flowers yellow; fruit somewhat resembling a gooseberry, with longitudinal coloured stripes.

Fr. Sud.: Timbuktu (June, Sept.) Chev. 1252! Hagerup 114! **N. Nig.:** Katagum (fl. & fr. July) Dalz. 123!

Extends to Abyssinia, Somaliland, **Arabia** and India; also to **Angola** and **E. Africa**.

Cucumis sativus *Linn.*

The Cucumber is widely cultivated.

17. COLOCYNTHIS

APD: Synonym of Citrullus Schrad.

Mill. Gard. Dict. Abridg., ed. 4 (1754).

Citrullus Schrad. (1836)—F.T.A. 2: 548.

- 1 Stems villous with soft woolly hairs; leaves thin, glabrous or pilose, at most only slightly scabrid, more or less triangular in outline, pinnately partite, denticulate, usually about 15 cm. long [1. citrullus](#)
 Stems scabrid with short hairs; leaves thicker, roughly scabrid, more or less ovate in outline, deeply and variously divided, about 10 cm. long or less [2. vulgaris](#)

1. Colocynthis citrullus (Linn.) O. Ktze. *Rev. Gen. Pl.* 1: 256 (1891).

APD: Synonym of Citrullus lanatus (Thunb.) Matsum. & Nakai

Cucurbita citrullus Linn. (1753).

Citrullus vulgaris Schrad. (1836)—F.T.A. 2: 549; Chev. Bot. 293; Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 103; F.W.T.A., ed. 1, 1: 183.

The Water Melon.

Sen.: Heudelot 541. **Gam.:** Ingram! Kuntaur Ruxton 22! 64! **Fr. Sud.:** Timbuktu (June) Hagerup 133! **S. L.:** Roruks (July) Deighton 1328! **iv. C.:** fide Chev. l.c. **G. C.:** Irvine 799! Atuabo, W.P. (Jan.) Dept. Agric.! **Togo:** Lome Warnecke 354! **Dah.:** Cotonou (Jan., Mar.) Debeaux 172! Chev. 22701! **Fr. Nig.:** Niamey (Oct.) Hagerup 518! **N. Nig.:** Nupe Barter 1521! Katagum Dalz. 126! **S. Nig.:** Agulu Thomas 207! Calabar Johnson!

Native of tropical and S. Africa; cultivated in all warm regions.

2. Colocynthis vulgaris Schrad. *Index Semin. Hort. Götting.* 2 (1833).

APD: Synonym of Citrullus colocynthis (L.) Schrad.

Cucumis colocynthis Linn. (1753).

Citrullus colocynthis (Linn.) Schrad. (1838)—F.T.A. 2: 548; Chev. Bot. 293; Cogn. & Harms l.c. 2: 109; F.W.T.A., ed. 1, 1: 183.

Prostrate or climbing herb; fruit globose, about 2 1/2 in. diam., intensely bitter.

Fr. Sud.: Timbuktu (July) Chev. 1253. L. Faguibine (Aug.) Chev. 2979! Ras-el-Ma (Aug.) Chev. 2978.

Cultivated in the Mediterranean region, the Sahara and other dry parts of tropical Africa and western Asia.

18. CUCUMEROPSIS

Naud.—F.T.A. 2: 533, incl. *Cladosicyos* Hook. f.

- 1 Leaves smooth or nearly so on the lower surface, with a broad sinus and distant lobes at the base, 3–5-angled or more or less lobed, up to 15 cm. long and broad, acute, remotely denticulate; male flowers umbellate on a distinct long peduncle; fruit about 30 cm. long, 10 cm. in diam. [1. edulis](#)
 Leaves scabrid, thicker, with very narrow sinus and almost contiguous lobes at the base, often shortly lobed, about 12 cm. long, repand-denticulate; male flowers capitate on a rather short peduncle 3–4 cm. long; fruit about 8–6 cm. long [2. mannii](#)

1. Cucumeropsis edulis (Hook. f.) Cogn. in DC. Monogr. 3: 518 (1881); Engl. Pflanzenr. Cucurbit. 1: 249, t. 58.

APD: Synonym of Cucumeropsis mannii Naudin

Cladosicyos edulis Hook. f. in F.T.A. 2: 534 (1871).

Cucumeropsis mannii of Chev. Bot. 293, not of Naud.

Momordica procera of Chev. Bot. 291, name only.

A strong climber; flowers yellow; fruit smooth, edible.

S. L.: Daniel. Matru (Nov.) Deighton 2379! **Lib.:** Peáhtah (Oct.) Linder 1060! **Iv. C.:** Bouaké (July) Chev. 21123! Tébo (July) Chev. 19424! Bouroukrou (Jan.) Chev. 16795. Agboville (Nov.) Chev. 22387. **Dah.:** Abomey Chev. **N. Nig.:** Barter 1752! Abinsi Dalz. 738! **S. Nig.:** Lagos Dawodu 307! Aboh Barter 483! Aguku Thomas 672!

Also in **French Cameroons**, **Belgian Congo**, **Spanish Guinea** and **Angola**.

2. **Cucumeropsis mannii** *Naud.*—F.T.A. 2: 534; Cogn. in Engl. Pflanzenr. Cucurbit. 1: 249. *APD acc*

Like the preceding.

S. Nig.: Calabar Mann (Hort. Paris)!

Also in **Gabon**.

19. PHYSEDRA

Hook. f.—F.T.A. 2: 552.

- 1 Petiole pilose with long jointed hairs; nerves and veins pilose beneath; leaves digitately 6–7-lobed almost to the base, lobes more or less lanceolate, acutely acuminate, the middle one up to 17 cm. long; male flowers racemose on axillary peduncles, pedicels 5–15 mm. long; calyx lobes subulate 4–5 mm. long; corolla deeply lobed, nervose, lobes ovate, acute up to 5 cm. long and 3 cm. broad *1. eglandulosa*

Petiole, and nerves and veins beneath, glabrous; leaves digitately 3–5-lobed to well beyond the middle or rarely a few quite entire, lobes long-tailed-acuminate, the middle one up to 14 cm. long, basal lobes almost contiguous; male flowers racemose on axillary peduncles, pedicels slender, 1.5–2 cm. long; calyx lobes subulate, up to 1 mm. long; corolla lobed almost to base, lobes lanceolate, up to 2 cm. long and 5 mm. broad *2. longipes*

1. **Physedra eglandulosa** (*Hook. f.*) *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 183 (1927); Kew Bull. 1928: 216.

APD: Synonym of Ruthalicia eglandulosa (Hook. f.) C. Jeffrey

Adenopus eglandulosus *Hook. f.* in F.T.A. 2: 529 (1871); Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 231.

Physedra elegans *Harms & Gilg*, partly, as to male specimens.

Physedra macrantha *Gilg* (1904).

Physedra djaloni of Chev. Bot. 294–5

Physedra ivorensis of Chev. Bot. 294–5

Physedra sylvatica of Chev. Bot. 294–5

Cephalandra ivorensis of Chev. Bot. 294–5

C. sylvatica, of Chev. Bot. 294–5.

A climber, up to 20 ft. or so; flowers yellow with purplish markings; fruit spherical, about 2 in. diam., bright red with yellow spots.

Fr. Sud.: Timbuktu Chev. **Fr. G.:** Kouria (July) Chev. 14942. **S. L.:** Morson! Port Loko (Sept.) Addison! Njala (fl. July, fr. Oct.) Deighton 1962! 2801! Mano (July) Deighton 2521! Also in **French Cameroons**, **Gabon** and **Spanish Guinea**.

20. BRYONOPSIS*Arn.*—F.T.A. 2: 556.

- 1 Slender, much-branched, leafy twiner, glabrous or nearly so; leaves very membranous, pedately lobed, 8–12 cm. diam., scabrid above, petiole 3–6 cm. long; male and female flowers in axillary fascicles, sometimes both sexes together; calyx lobes subulate, corolla about 1 cm. long; ovary glabrous; fruit globose 14–17 mm. diam., with longitudinal pale stripes [*laciniosa*](#)

Bryonopsis laciniosa (Linn.) Naud.—F.T.A. 2: 185; Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 160, t. 16 *Bryonia lociniosa* Linn. (1753).

APD: *Synonym of Diplocyclos palmatus* (L.) C. Jeffrey

Flowers yellow; ripe fruits red with silvery white stripes.

F. Po: Mildbr. 7026.

Also in **S. Tomé**, and widely distributed in tropical Africa, Asia and Australasia.

21. PEPONIUM

Engl. in E. & P. Pflanzenfam. Nachtr. 318 (1897).

Peponia Naud. (1866), not of Grev. (1863)—F.T.A. 2: 526.

- 1 A monoecious climber; branches villous with jointed many-celled hairs; leaves digitately 5-lobed to about the middle, 5–10 cm. in diam., widely cordate at base, pilose on both surfaces, lobes ovate, sharply dentate; petiole 1.5–2 cm. long, pilose; tendrils branched, coiled above the fork; male peduncles 1–3-flowered, with conspicuous obovate bracts; calyx-lobes subulate, about 1 cm. long; corolla gamopetalous, deeply lobed, puberulous on both sides, lobes ovate-oblong, up to 3 cm. long, acute, entire, nervose; fruits ellipsoid, 7–8 cm. long, about 5 cm. thick, at length almost glabrous [*vogelii*](#)

Peponium vogelii (Hook. f.) Engl. in E. & P. Pflanzenfam. Nachtr. 318 (1897); Cogn. & Harms in Engl. Pflanzenr. Cucurbit. 2: 214. *APD acc*

Peponia vogelii Hook. f. in F.T.A. 2: 526 (1871); Chev. Bot. 289.

Flowers white or pale sulphur-yellow.

Dah.: Abomey (Feb.) Chev. 23163. **S. Nig.**: Lagos Barter 2169! MacGregor 336! **F. Po**: (Oct.) T. Vogel 8!

Also in **Belgian Congo**, **Tanganyika** and **Natal**.

22. RAPHIDIOCYSTIS

Hook. f.—F.T.A. 2: 553.

- 1 Sepals pinnatifid, segments subulate; branches glabrous; leaves more or less pentagonal in outline, deeply cordate at base with two short lateral lobes, acutely acuminate, 10–12 cm. long, slightly scabrid; petioles about 1/2 as long as the leaves, slender, with golden-brown setae on the upper surface; male and female flowers 2–3 in the leaf-axils; male flowers shortly pedicellate, female with pedicels 2–7 cm. long; ovary densely covered with stiff setae; fruit ellipsoid, about 3 cm. long, densely setose, on short or long, slender peduncles [*1. mannii*](#)
Sepals entire; branches pubescent; petioles only scabrid; otherwise similar to above [*2. caillei*](#)

1. **Raphidiocystis mannii** Hook. f. in F.T.A. 2: 554 (1871); Cogn. in DC. Monogr. 3: 527. *APD acc*

Female flowers yellow; male flowers dull orange; fruits densely covered with rich-golden-brown stiff setae.

S. Nig.: Usonigbe F.R. (Jan.) Richards 3901! Sapoba (Nov.) Ujor FHI 23932! **Br. Cam.**: Victoria (fl. Feb., fr. Oct.) Maitland 373! 763! Buea to Mayuko (Feb.) Dalz. 8211! **F. Po**: 2,000 ft. (fl. & fr. Dec.) Mann 636!

Also in **French Camerouns**.

2. *Raphidiocystis caillei* Hutch. & Dalz. F.W.T.A., ed. 1, 1: 180 (1927); Kew Bull. 1928: 215.

APD: *Synonym of *Raphidiocystis chrysocoma* (Schumach.) C. Jeffrey*

Raphidiocystis mannii of Chev. Bot. 295, not of Hook. f.

Fr. G.: Kouria (Aug.) Caille in Hb. Chev. 15006! Bilima (Sept.) Caille in Hb. Chev. 15063! Nzérékoné to Macenta (fr. Oct.) Baldwin 9742! **S. L.:** Mano (fl. & fr. Jan.) Deighton 2446! Gbeseou, Njala (fr. Feb.) Deighton 4709! **Lib.:** Gbanga (fl. & fr. Sept.) Linder 633! R. Cess, Tchien (fl. & fr. Aug.) Baldwin 9009!

23. CUCURBITA

Linn.—F.T.A. 2: 555.

- 1** Leaves distinctly lobed; petioles and nerves of the leaves beneath clothed with rigid setae; calyx-tube distinct, with linear not foliaceous lobes; fruit mostly ellipsoid or obovoid and longer than broad, variously ribbed, smooth or verrucose, mostly with a coloured reticulation outside; seeds with thickened margins [1. *pepo*](#)

Leaves often scarcely lobed; petioles and nerves beneath at most roughly scabrid; calyx-tube short with linear or linear-lanceolate but not foliaceous lobes; fruit often very large and depressed, globose, grooved; seeds scarcely thickened on the margin [2. *maxima*](#)

1. *Cucurbita pepo* Linn.—F.T.A. 2: 556; Cogn. in DC. Monogr. 3: 545. *APD acc*

A large prostrate annual, with more or less angular stems; flowers rich yellow.

The Pumpkin, Vegetable Marrow, etc.

S. L.: Njala (July) Deighton 2782! Pendembu (July) Thomas 728! **G. C.:** Achimota Irvine 547! **N. Nig.:** Nupe Barter 1526! Katagum (Sept.) Dalz. 119! **S. Nig.:** Obu Thomas 362!

Cultivated in all tropical and subtropical countries.

2. *Cucurbita maxima* Duchesne—F.T.A. 2: 555; Cogn. l.c. 544; Chev. Bot. 296. *APD acc*

Annual, like the preceding, with more or less terete stems. The Squash Gourd, Melon Pumpkin, etc.

Fr. Sud.: Mande Chev. 2986. **iv. C.:** Bouaké (July) Chev. 22137.

Cultivated in all hot countries.

24. COCCINIA

Wight & Arn.—Cogn. in DC. Monogr. 3: 528.

***Cephalandra* Schrad.**—F.T.A. 2: 550.

- 1** Flowers (male and female) solitary; calyx and corolla glabrous outside; leaves very variable, pentagonal and shortly lobed to deeply 3–5-lobed, 5–10 cm. diam.; fruit ellipsoid, about 5 cm. long and 2.5 cm. broad [1. *grandis*](#)

Flowers (male and female) racemose; calyx and corolla minutely puberulous outside; leaves very variable, more or less deeply 3–5-lobed, 10–16 cm. diam.; fruit ellipsoid, about 4 cm. long and 2 cm. broad [2. *barteri*](#)

1. *Coccinia grandis* (Linn.) J. O. Voigt Hort. Suburb. Calc. 59 (1845). *APD acc*

***Bryonia grandis* Linn.** (1767).

***Cephalandra indica* Naud.**—F.T.A. 2: 550; Chev. Bot. 295.

***Coccinia cordifolia* Cogn.** in DC. Monogr. 3: 529, partly; F.W.T.A., ed. 1, 1: 184, partly.

***Coccinia moghadd* (Forsk.) Asch.-Cogn.** in DC. Monogr. 3: 531.

Cephalandra quinqueloba of Chev. Bot. 295, not of Schrad.

Physedra gracilis of Chev. Bot. 294.

Sen.: Richard Tol Lelièvre. Sor Isl. Heudelot 528! **N. Nig.:** Lokoja Barter! Katagum (June, July, Nov.) Dalz. 113! 114! 115!

Widespread in tropical Africa; also in [Arabia](#) and abundant in India.

2. *Coccinia barteri* (Hook. f.) Keay in Kew Bull. 1953: 82. *APD acc*

Staphylosyce barteri Hook. f.—*F.T.A.* 2: 555.

Phyzedra barteri (Hook. f.) Cogn. in DC. Monogr. 3: 525; F.W.T.A., ed. 1, 1: 183.

Phyzedra elegans Harms & Gilg, partly (female specimen).

Phyzedra heterophylla of Chev. Bot. 294, partly, not of Hook. f.

A climber, 15–20 ft. high; flowers yellow.

S. L.: Falaba (Mar.) Sc. Elliot 5182! 5402! Yonibana (Oct., Nov.) Thomas 4280! 4979! Njala (fr. Nov.) Deighton 2410! Romeni, Kasse (Oct.) Jordan 359! **iv. C.:** Toura country (May) Chev. 21636! Brenan 9198! Oban Talbot 1419! **Br. Cam.:** Victoria (Feb.) Dalz. 8230! **F. Po:** Mann 199! 1166!

Also in [French Camerouns](#) and [Upper Congo](#).

1. *Coccinia* sp. A.

Slender climber; leaves deeply 3-lobed; male flowers racemose; calyx and corolla glabrous; sepals long, subulate, reflexed; female flowers and fruits not known.

S. L.: Moyamba (Aug.) Deighton 2217! Bumban (Aug.) Deighton 1221! Jigaya (Sept.) Thomas 2844! **Lib.:** Du R. (July) Linder 121!

Imperfectly known species.

2. *Coccinia* sp. B.

Herbaceous climber; leaves more or less deeply 3-lobed; male flowers racemose, calyx and corolla glabrous; sepals flattened, erect; fruit cylindrical "8-in. long and 1/2-in. diam."; female flowers not known.

G. C.: Nsuta (fl. & fr. May) Vigne 1735! **S. Nig.:** Grace Camp, Omo F.R. (May) Tamajong FHI 16938! A specimen from Liberia (Linder 576) may also belong here.

Imperfectly known species.

3. *Coccinia* sp. C.

Climbing or trailing herb; flowers apricot coloured.

N. Nig.: Jos Hill 53! Fiskin Mata (Apr.) Lely 105! Bichikki (May) Lely 175!

Imperfectly known species.

4. *Coccinia* sp. D.

Herbaceous climber; male flowers racemose.

S. Nig.: Ibadan Forest (Dec.) Punch 46!

Imperfectly known species.

BEGONIACEAE

Herbs or undershrubs, mostly succulent. Leaves alternate, simple, often unequal-sided or oblique; stipules free, deciduous. Flowers monoecious, actinomorphic or asymmetric, mostly in axillary cymes, showy. Male flower: sepals 2, opposite, rarely 5, valvate; petals imbricate or absent; stamens numerous, filaments free or connate, anthers 2-celled, continuous with the filament, opening lengthwise. Female flower: perianth more or less as in the male; staminodes absent or very small; ovary inferior, 2–4- (rarely 1-) celled, mostly angled or winged; styles 2–5, free or connate; stigmas often twisted, papillose all over; ovules very numerous, on axile projecting simple or lobed placentas. Fruit a capsule or berry. Seeds minute and very numerous, with reticulate testa, scanty or no endosperm and straight embryo.

A well-marked, mainly tropical family.

Herbaceous, mostly epiphytic, with stipulate often oblique leaves, unisexual flowers, inferior ovary and often winged fruit.

BEGONIA

Linn.—F.T.A. 2: 569. APD acc

- 1 Leaves peltate; stems short, nodes crowded: 2
 - Leaves not peltate: 9
- 2 Leaves bullate, with bristles on the upper surface: 3
 - Leaves not bullate, usually glabrous above: 5
- 3 Ovary densely pilose; leaves obliquely ovate-elliptic, very obtusely acuminate 7–12 cm. long, 5–7 cm. broad, serrulate and ciliate, with numerous radiating nerves; petiole 4–5 cm. long, densely setose; bracts broad, pectinate-ciliate; male pedicels up to 1.5 cm. long; stamens about 30 [1. lacunosa](#)
 - Ovary glabrous: 4
- 4 Petiole densely long-setose, 6–15 cm. long; leaves obliquely ovate-elliptic, 10–13 cm. long, 6–8 cm. broad; bracts broad, pectinate-ciliate [2. staudtii var. dispersipilosa](#)
 - Petiole glabrous, or nearly so, 4–11 cm. long; leaves obliquely ovate-elliptic, acuminate, 8–11 cm. long, 5–7 cm. broad; bracts small, pectinate-ciliate [3. ficicola](#)
- 5 Ovary and fruit not winged: 6
 - Ovary and fruit winged: 8
- 6 Leaves obovate, somewhat narrowed towards base, doubly crenate; peduncle shorter than the petioles; stigma deeply 2-cleft: 7
 - Leaves obliquely ovate, 10–20 cm. long, 4–10 cm. broad, sinuate-denticulate, slightly ciliate towards the tips; peduncle and petioles long; stigma not 2-cleft [6. scapigera](#)
- 7 Leaves not ciliate, subtruncate at base, oblong-elliptic, 6–13 cm. long, 3–7 cm. broad, prominently nervose beneath; female peduncle about 2 cm. long in young fruit, slender [4. schlechteri](#)
 - Leaves distinctly ciliate, rounded at base, broadly elliptic, 12–15 cm. long, 8–10 cm. broad; female peduncle stout; bracts persistent, ciliate [5. laporteifolia](#)
- 8 Body of fruit about as broad as long, up to 1 cm. long and broad, wings short triangular; leaves obliquely ovate, 8–13 cm. long, 4–6 cm. broad, obtuse at apex [7. cilio-bracteata](#)
 - Body of fruit much longer than broad, 1.5–2 cm. long, wings long and broadest at or above the middle; leaves ovate to suborbicular, acuminate or rounded at apex, up to 14 cm. long and 11 cm. broad [8. quadrialata](#)
- 9 Leaves digitately 3- or more-lobed: 10
 - Leaves not lobed: 11
- 10 Leaves mostly regularly 5-lobed, 10–16 cm. diam.; inflorescence shortly cymose, few-flowered; fruit ellipsoid, not winged [9. oxyloba](#)
 - Leaves irregularly 2–3-lobed, 3–5 cm. long, 2–4 cm. diam.; flowers 2–3 together; fruit fusiform, narrowly winged [10. prismatocarpa](#)
- 11 Stems short, nodes crowded, petioles long, leaves in a rosette: 12
 - Stems long; internodes long, or if short then leaves not in a rosette: 14
- 12 Leaves glabrous above: 13
 - Leaves long-setose above, obliquely ovate, triangular acuminate, 5–7 cm. long, 4–6 cm. broad; petiole 3–12 cm. long; ovary fusiform, narrowly winged [12. pseudoviola](#)
- 13 Body of fruit about as broad as long, up to 1 cm. long and broad, wings short and triangular; for other characters see above [7. cilio-bracteata](#)
 - Body of fruit much longer than broad, about 1.5 cm. long, wings long and broadest at or above the middle; leaves obliquely ovate, obtusely acuminate at apex, cordate at base, 7–11 cm. long, 6–9 cm. broad [11. salisburyana](#)
- 14 Flowers in heads subtended by and partially enclosed in 2 large bracts forming a conical cup; leaves scaly beneath: 15
 - Flowers not in heads subtended by 2 large cupular bracts: 16
- 15 Leaves very obliquely ovate with the 1–6 cm. long petiole apparently on one side of the lamina, acutely acuminate, not cordate, 12–18 cm. long, 6–11 cm. broad [13. poculifera](#)

- Leaves broadly ovate-orbicular, subequally cordate at base, abruptly caudate-acuminate, 15–20 cm. diam.; petiole 12–20 cm. long [14. ampla](#)
- Leaves subobliquely elliptic, rounded at base, obtuse or subacute at apex, 9–16 cm. long, 3–6 cm. broad; petiole 1–3 cm. long [15. rhopalocarpa](#)
- 16** Flowers with 2 sepals (perianth segments): **17**
- Flowers with 3–6 sepals (perianth segments), usually with 4: **19**
- 17** Petiole short, less than 3 cm. long, leaves more or less elliptic; fruits broadly winged: **18**
- Petiole 4–12 cm. long; leaves more or less ovate-triangular, 3–5 cm. long, 2–4 cm. broad; fruit narrowly winged [10. prismatocarpa](#)
- 18** Petiole less than 5 mm. long, leaves unequally sided at base, 7–12 cm. long, 2.5–5 cm. broad, denticulate [16. sessilifolia](#)
- Petiole 1–2.5 cm. long, leaves obliquely cordate at base, 8–13 cm. long, 4–7 cm. broad, slightly dentate [17. macrocarpa](#)
- 19** Fruit not fusiform, up to 1.5 cm. long, with 3 or 6 triangular wings; leaves very obliquely ovate, cordate at base, acuminate at apex, margin rather coarsely and doubly serrate, up to 17 cm. long and 9 cm. broad; petiole with a ring of setose hairs at the top: **20**
- Fruit fusiform, exceeding 1.5 cm. long, not winged, or with 3 narrow subequal wings; mostly scandent perennial herbs with long stout stems: **21**
- 20** Fruit with 3 wings, one 1–2.5 cm. long and triangular, the other two much shorter; body of fruit 1–1.5 cm. long; annual plant [18. rostrata](#)
- Fruit with 6 wings, 3 shortly triangular and about 3 mm. wide, the other 3 narrower, body of fruit about 6 mm. long [19. annobonensis](#)
- 21** Leaves linear-lanceolate, cuneate or obtuse at base, gradually acutely acuminate at apex, 5–10 cm. long, 7–17 mm. broad, entire, glabrous; ovary glabrous; fruit fusiform, sometimes narrowly winged [20. polygonoides](#)
- Leaves mostly ovate, or ovate-lanceolate, rarely lanceolate, exceeding 2 cm. broad, usually rounded or cordate at base at least on one side, often hairy beneath, margin often notched; ovary glabrous or hairy: **22**
- 22** Ovary and fruit 3-winged, glabrous; styles 3; leaves oblong-ovate, obliquely cordate at the base, 9–11 cm. long, 3–4 cm. broad, margin denticulate, lamina rather thin [21. fusialata](#)
- Ovary and fruit not winged, usually hairy, often densely so: **23**
- 23** Leaves lanceolate, 9–18 cm. long, 2–3.5 cm. broad, margin irregularly serrate, petiole up to 1 cm. long [22. furfuracea](#)
- Leaves ovate or ovate-lanceolate, exceeding 3.5 cm. broad: **24**
- 24** Leaves not cordate at base, petiole often very long; flowers and leaves often clustered towards the end of the creeping and rooting stem: **25**
- Leaves cordate at base; flowers and leaves not clustered towards the end of the stems: **26**
- 25** Male flowers densely clustered; leaves oblong-elliptic, acuminate, 16–23 cm. long, 4–11 cm. broad, petiole 4–25 cm. long [23. squamulosa](#)

- 26** Styles 2–3: **27**
- Styles 4; outer sepals 14–17 mm. long, 4–7 mm. broad; female flowers usually 3 together on a common peduncle about 1 cm. long; fruit 3–3.5 cm. long; leaves ovate to oblong-ovate, gradually and acutely acuminate, cordate at base, often more or less obliquely so, 9–18 cm. long, 4–8 cm. broad, petiole 1–4 cm. long [27. mannii](#)
- 27** Outer sepals 8–11 mm. long, 5–6 mm. broad; male peduncle and pedicels very short; female flowers usually solitary, ovary densely hairy; fruit about 3.5 cm. long; leaves ovate to oblong-ovate, obliquely cordate at base, 7–13 cm. long, 3–6 cm. broad, petiole 2–4 cm. long [25. oxyanthera](#)
- Outer sepals 5–8 mm. long, 3–4 mm. broad; male peduncle and pedicels well developed; female flowers usually 3 together; fruit 2–3 cm. long; leaves ovate to oblong-ovate, obliquely cordate at base, 8–14 cm. long, 3–7 cm. broad, petiole 3–8 cm. long [26. eminii](#)

1. *Begonia lacunosa* Warb. in Engl. Bot. Jahrb. 22: 42 (1895); Engl. Pflanzenw. Afr. 3, 2: 617 (1921).
APD acc

APD: Synonym of Begonia susaniae Sosef

A creeping herb; flowers white, pink at base.

S. Nig.: Oban Talbot! **Br. Cam.:** Barombi Preuss 183!

2. *Begonia staudtii* var. *dispersipilosa* *Irmsch.* in Engl. Bot. Jahrb. 76: 214 (1954).

APD: Synonym of Begonia staudtii Gilg

Leaves pale green, bullate; flowers bright yellow.

S. Nig.: Bende (Apr.) Carpenter 50a! British Obokum waterfall (Dec.) Keay FHI 28279!

Typical *B. staudtii* occurs in French Cameroons.

3. *Begonia ficicola* *Irmsch.* l.c. 213 (1954).

APD: Synonym of Begonia microsperma Warb.

Flowers yellow except for outside of one sepal, which is reddish-yellow.

Br. Cam.: Ekumbe Ndene waterfall, R. Meme (Dec.) Dundas FHI 2035!

4. *Begonia schlechteri* *Gilg* in Engl. Bot. Jahrb. 34: 93 (1904); Engl. l.c. 617.

APD: Synonym of Begonia laportefolia Warb.

A low herb with short stem, creeping and ascending, and numerous fibrous roots.

Br. Cam.: between Mafura and Mundame (Jan.) Schlechter 12915!

5. *Begonia laportefolia* *Warb.* l.c. 22: 41 (1895); Engl. l.c. 618. *APD acc*

A creeping herb; flowers white, pink at base.

Br. Cam.: Barombi Preuss 157; 563!

Also in **French Cameroons**.

6. *Begonia scapigera* *Hook. f.* in F.T.A. 2; 572 (1871); Engl. l.c. 618. *APD acc*

APD: Synonym of Begonia pulcherrima Sosef

Stemless, with a creeping woody rootstock; flowers borne on long leafless scape.

Br. Cam.: Rio del Rey Johnston! Buea Preuss 952! Cam. Mt., 4,000 ft. (Dec.) Mann 1946!

7. *Begonia cilio-bracteata* *Warb.* l.c. 22: 40 (1895); Engl. l.c. 616 (as *B. ciliato-bracteata* Warb.). *APD acc*

APD: Synonym of Begonia hirsutula Hook. f.

Herb with short creeping stem; leaves sometimes peltate; inflorescences shorter than petioles; sepals white, one with red markings inside.

G. C.: Prestea (July) Vigne 1263 (partly)! Mamiri F.R. (Apr.) Andoh FH 5020! **Br. Cam.:** Mungo Ndaw to Ntale, Kumba (Oct.) Dundas FHI 15325!

Also in **French Cameroons** and **Spanish Guinea**.

8. *Begonia quadrialata* *Warb.* l.c. 22: 43 (1895); Engl. l.c. 617. *APD acc*

APD: Synonym of Begonia mildbraedii Gilg

APD: Synonym of Begonia atroglandulosa subsp. tshelaensis Sosef

APD: Synonym of Begonia quadrialata subsp. nimbaensis Sosef

APD: Synonym of Begonia quadrialata var. pilosa Sosef

APD: Synonym of Begonia zairensis Sosef var. zairensis

Begonia whytei Stapf (1905); Engl. l.c.; Chev. Bot. 299.

Begonia calabarica Stapf (1906); Engl. l.c.; F.W.T.A., ed. 1, 1: 187.

Begonia modesta Stapf (1908); F.W.T.A., ed. 1, 1: 187.

Herb with short stem; petiole and peduncles pink; leaves pale green, rather darker above, with pink or reddish margin; upper sepal orange-red outside, yellow streaked orange-red within, lower sepal yellow sometimes slightly tinged red; **in forest, by streams.**

Fr. G.: foot of Mt. Nzo (Mar.) Chev. 21082. **S. L.:** Kenema (Jan.) Bowden! Gola Forest (Jan.) King 117b! **Lib.:** Gola Forest (May) Bunting! Sinoe Basin Whyte! Duo, Sinoe (Mar.) Baldwin 11351! CARICACEAE

Small trees or shrubs with a terminal cluster of leaves and milky juice; leaves alternate, often variously digitately lobed or foliolate; stipules absent; flowers hermaphrodite and unisexual, racemose; male flower: calyx 5-lobed, small; petals united into a slender tube; lobes contorted or valvate; stamens 10, inserted on the corolla; filaments free or connate at the base; anthers 2-celled, opening lengthwise; rudimentary ovary present or absent; female flower: calyx of the male; petals at first connivent, at length free; no staminodes; ovary superior, sessile, 1-celled or spuriously 5-celled, with parietal placentas; ovules numerous; style short or absent; fruit a pulpy berry; seeds with fleshy endosperm and straight embryo.

A small family, mainly of tropical America, with only one genus in Africa.

Carica papaya Linn.

The Pawpaw, is very widely cultivated in our area and is sometimes subsontaneous.

CYLICOMORPHA

Urb. in Engl. Bot. Jahrb. 30: 115 (1901).

Trees with very soft wood and copious milky juice, stem prickly; leaves in a cluster at the top of the stem, palmately lobed, petioles long; inflorescences axillary; male flowers numerous, paniculate; female flowers solitary or in short few-flowered inflorescences; stamens connate into a tube at the base; corolla lobes alternating with the calyx teeth; fruit a 5-gonous berry.

- 1 Straight tree with hollow stem; leaves and stem glabrous; petioles 12–45 cm. long; lamina deeply 5-lobed, 7–9-nerved at base, 20–46 cm. diam., lobes more or less obovate, acuminate, 6–10 cm. broad, basal lobes oblique and sometimes themselves lobed; male flowers densely puberulous, in puberulous panicles made up of several 3–9-flowered cymes; calyx of male flower campanulate, 5–6 mm. long, 4.5–5 mm. diam., subtruncate at apex and remote from the corolla tube; corolla 4.5–5 cm. long, with lobes about 1.5 cm. long; female flowers not known; fruit ovoid, 5-gonous, 3–4.5 cm. long, about 2 cm. diam.; seeds numerous, ellipsoid, about 5 mm. long, with ruminant markings[solmsii](#)

Cylicomorpha solmsii (*Urb.*) *Urb.* in Engl. Bot. Jahrb. 30: 115 (1901). *APD acc*

Jacartia? *solmsii* *Urb.* in Engl. Bot. Jahrb. 15: 158 (1892).

Tree, to 80 ft. high, resembling the Pawpaw but with short sharp conical prickles on the stem; flowers yellow or cream; fruit yellow.

Br. Cam.: Buea Road (Jan.) Maitland 1281! Bulifambo, Buea (Mar.) Maitland 574! Elephant Lake, Kumba (Sept.) Preuss 489! Tingo, by R. Ife, Wum (fr. July) Ujor FHI 30469!

CACTACEAE

Succulent herbs and shrubs of diverse habit, often very spiny, and usually with much reduced leaves. Flowers hermaphrodite, actinomorphic, often handsome, but very small in the African species (*Rhipsalis*). Calyx-tube adnate to the ovary and often produced beyond; lobes few to many, or reduced to minute teeth. Petals 6 or more. Stamens numerous, free or adnate to the base of the petals. Ovary inferior, 1-celled, with parietal many- or rarely few-ovuled placentas; stigma usually radiate. Fruit baccate, many-seeded. Seeds mostly without endosperm.

Exclusively an American family except for *Rhipsalis*.

Recognized by the habit and epigynous flowers. Besides *Rhipsalis* some species of *Opuntia* are naturalized in the coast regions.

RHIPSALIS

Gaertn.—F.T.A. 2: 581.

Calyx-teeth very short, 3 or more. Petals 6–10, spreading, oblong. Stamens about 20. Ovary inferior, glabrous. Seeds without endosperm.

- 1 An epiphytic shrub or on rocks; branches cylindrical, fleshy, articulated and sometimes rooting at the nodes, dichotomously branched or subverticillate, glabrous; leaves scale-like, soon falling off; flowers white, small, sessile; calyx minute; berries yellowish-white like mistletoe, with viscous pulp and black shining seeds [cassutha](#)

***Rhipsalis cassutha* Gaertn.**—F.T.A. 2: 581, including var. *tenuior* Oliv.

APD: Synonym of Rhipsalis baccifera (J.S. Muell.) Stearn subsp. baccifera

Rhipsalis guineensis of Chev. Bot. 299.

S. L.: Benduma, Mongeri Deighton 2222! Keyeima (Mar.) Deighton 3222! **iv. C.:** various localities fide Chev. l.c. **G. C.:** Koforedua (fr. Apr.) Vigne 4379! **S. Nig.:** Uregin (July) Unwin 116! Akure F.R. Jones FHI 19530! Sapoba Kennedy 1365! **Br. Cam.:** Nyasaso, Tombel Thorold 73! **F. Po:** Mann 1419.

Widely distributed in the tropics.

OCHNACEAE

Trees or shrubs with watery juice, rarely herbs. Leaves alternate, simple, very rarely pinnate, often with numerous pinnate nerves; stipules present, sometimes lacinate. Flowers hermaphrodite, actinomorphic, mostly racemose or paniculate. Sepals 4–5, rarely 10, free, imbricate or rarely contorted. Petals free, 4–10, subsessile, contorted or imbricate. Stamens few to many, free; staminodes sometimes present, subulate or petaloid, sometimes connate into a tube; filaments persistent; anthers linear, basifixed, opening lengthwise or by terminal pores. Ovary entire to deeply lobed, 1–10-celled; ovules 1 to many, axile or parietal or attached to the intrusive placentas; style simple or divided at the apex. Fruiting carpels often becoming quite separate on the enlarged torus and drupaceous, or elongated capsular and septicidal. Seeds 1 to many, with or without endosperm; embryo usually straight.

Mostly a tropical family.

With stipulate leaves usually with prominent numerous lateral nerves; ovary usually very deeply lobed with a simple style; fruiting carpels often quite separate on the enlarged torus; calyx persistent in fruit.

- 1 Trees, shrubs or undershrubs, without pectinate stipules; staminodes absent: **2**
Herbs with persistent pectinate stipules; stamens 5, accompanied by staminodes in two rows, the inner petaloid, the outer filiform; ovary entire with parietal placentation; fruit a 3-valved septicidal capsule [5. Sauvagesia](#)
- 2 Fruiting carpels becoming separate, black and drupaceous, on an enlarged torus; sepals persistent and often red or pink in fruit: **3**
Fruit a nut or capsule: **4**
- 3 Stamens numerous; filaments often as long as or longer than the anthers, the latter dehiscing longitudinally or by pore-like slits [1. Ochna](#)
Stamens 10; filaments much shorter than the anthers, the latter opening by apical pores [2. Ouratea](#)
- 4 Sepals unequally enlarged and wing-like in fruit, the latter a nut; ovary 1-celled with a basal placenta; stamens numerous [3. Lophira](#)
Sepals caducous after flowering; fruit a dehiscent capsule with numerous winged seeds; ovary 5-celled with axile placentation; stamens 5 [4. Fleurydora](#)

1. OCHNA

Linn.—F.T.A. 1: 316.

- 1 Inflorescence (leafless part above bud-scale scars) branched, composed of few-flowered cymes on the central axis; anthers opening by pores; leaves elliptic to oblanceolate, acuminate at apex, 5–12 cm. long, 1·5–4·5 cm. broad [1. membranacea](#)
- Inflorescence simple, racemose or fasciculate; anthers opening by pores or longitudinal slits: **2**
- 2 Inflorescence racemose with the axis more than 1·5 cm. long; anthers opening by longitudinal slits: **3**
- Inflorescence fasciculate, or racemose with the axis less than 1·5 cm. long, often only 1–3 mm.: **4**
- 3 Pedicels articulated at the very base, or within 2 mm. from the base, leaving very short "pegs" on the axis after falling; style divided at the apex [2. mannii](#)
- Pedicels articulated 2–6 mm. from the base, leaving long "pegs" on the axis after falling [3. multiflora](#)
- 4 Sepals in fruit 2–3 cm. long; carpels ellipsoid, about 1 cm. long; flowers solitary or paired; leaves elliptic-lanceolate, acutely acuminate, 12–18 cm. long, 3–6 cm. broad; lateral nerves not very numerous, rather distant, equally prominent on both surfaces [4. kibbiensis](#)
- Sepals in fruit less than 1·5 cm. long: **5**
- 5 Pedicels articulated more than 2 mm. from the base; anthers opening by pores; leaves oblong-elliptic to ovate, 1·5–4 cm. long, 1–2 cm. broad [5. ovata](#)
- Pedicels articulated less than 2 mm. from the base; anthers opening by longitudinal slits; leaves much exceeding 4 cm. long: **6**
- 6 Branchlets dark brown with conspicuous lenticels; leaves elliptic to oblanceolate, acute at apex or shortly and obtusely acuminate, 6–12 cm. long, 2–3·5 cm. broad; flowers white [6. afzelii](#)
- Branchlets grey or pale brown with exfoliating bark; leaves obovate to oblanceolate, rounded or emarginate at apex; flowers yellow: **7**
- 7 Small tree; leaves 8–15 cm. long, 3–7 cm. broad; pedicels 2·5–3 cm. long in fruit [7. schweinfurthiana](#)
- Low shrub; leaves 4–10 cm. long, 1·2–3·5 cm. broad; pedicels 1·2–2·5 cm. long in fruit [8. rhizomatosa](#)

2. OURATEA

Aubl.—Gil in Engl. Bot. Jahrb. 33: 248 (1903).

Gomphia Schreb.—F.T.A. 1: 319.

- 1 Leaves sessile or subsessile, often very large, elongate-oblongate or elongate-obovate, gradually narrowed to a cordate or subcordate base (see Fig. 88, A), or if cuneate, then densely crowded at the top of the stem: **2**
 Leaves mostly distinctly petiolate and obtuse or cuneate, rarely rounded, at the base: **8**
- 2 Peduncle of inflorescence flattened, 15–30 cm. long below the first flower; inflorescences axillary; leaves up to about 60 cm. long and 16 cm. broad, crowded at the top of the stem: **3**
 Peduncle not flattened, less than 15 cm. long; inflorescence compound, or at least the pedicels in clusters on the main axis of the raceme: **4**
- 3 Peduncle and inflorescence axis continuous, unbranched, without leafy bracts; pedicels solitary, rarely clustered, articulated at the base; leaves cordate or sub-cordate at base, very shortly petiolate [1. *elongata*](#)
 Peduncle with 2–3 leafy bracts immediately below the 1–3 racemes; pedicels clustered, articulated 1–3 mm. from the base; leafy bracts 6–20 cm. long, 2–8 cm. broad, cordate or subcordate at base; leaves cuneate at base, sessile (see Fig. 89) [2. *subcordata*](#)
- 4 Inflorescence a dense raceme, usually unbranched, with clusters of flowers on the main axis: **5**
 Inflorescence a lax terminal panicle, with usually well-developed long lateral branches; leaves cordate and amplexicaul at base, sessile or nearly so: **7**
- 5 Flowers in short subcorymbose racemes, 3–4 cm. long, each raceme subtended by two leafy bracts at the top of a 2–4 cm. long woody peduncle; racemes axillary in the uppermost leaves; leafy bracts cordate or subcordate at base; leaves up to about 40 cm. long and 12 cm. broad, cuneate at base, very shortly petiolate [3. *duparquetiana*](#)
 Flowers in an oblong terminal raceme: **6**
- 6 Peduncle 7–15 cm. long, flowering axis 4–16 cm. long; pedicels densely clustered in groups of 5 or more, the clusters somewhat separated; buds obtuse; sepals in fruit 12–16 mm. long, 5–6 mm. broad, obtuse, fleshy, nervose; leaves up to about 55 cm. long and 15 cm. broad, cordate or subauriculate at base, subsessile [4. *mannii*](#)
 Peduncle 1–3 cm. long, flowering axis 5.5–6 cm. long; flowers dense, but pedicels in clusters of only 2 or 3; buds acute; sepals in fruit about 7 mm. long and 2 mm. broad, acute, chartaceous, not strongly nervose; leaves up to about 27 cm. long and 8 cm. broad (in only specimen seen), subcordate at base, subsessile [5. *oliveri*](#)
- 7 Sepals obtuse, 10–12 mm. long and 5–6 mm. broad in fruit, coriaceous; pedicels about 1 mm. diam.; leaving stout "pegs"; leaves up to 30 cm. long and 9 cm. broad [6. *amplectens*](#)
 Sepals acute, about 5 mm. long and 2 mm. broad in fruit, chartaceous; pedicels about 0.5 mm. diam., leaving slender, usually short "pegs"; leaves up to 25 cm. long and 7 cm. broad [7. *schoenleiniana*](#)
- 8 Lateral nerves of the leaves not very numerous, rather distant and quite distinct from the tertiary nerves (see Fig. 88, B): **9**
 Lateral nerves of the leaves very numerous and close, more or less parallel (see Fig. 88C): **27**
- 9 Flowers in pairs, axillary, or at leafless nodes, towards the end of the shoot but below the uppermost buds and leaves; leaves with long, stiff setae on the margin, acutely acuminate: **10**
 Flowers in terminal racemes or panicles, leaf-margins without stiff setae: **11**
- 10 Leaves 6–13 cm. long, 2–5 cm. broad [8. *morsonii*](#)
 Leaves 12–22 cm. long, 3.5–7.5 cm. broad [9. *axillaris*](#)
- 11 Inflorescence a laxly branched panicle; stipules and scale-like bracteoles caducous or persistent: **12**
 Inflorescence a simple raceme, rarely slightly branched at the base; stipules and bracteoles persistent: **23**
- 12 Leaves conspicuously and rather closely spinulose-serrate, lamina elongate-elliptic to oblong-oblongate, 10–30 cm. long, 2.5–10 cm. broad; stipules caducous; pedicels usually 3–6 together; sepals 5–8 mm. long [10. *flava*](#)
 Leaves subentire or serrulate, not spinulose; stipules caducous or persistent: **13**

- 13** Leaves very large, elongate-elliptic, 20–40 cm. long, 5–9 cm. broad, minutely denticulate in the upper half or two-thirds; stipules caducous; inflorescence widely paniculate, as long as or longer than the leaves [11. *calantha*](#)
 Leaves smaller, up to 20 cm. long, rarely more, stipules caducous or persistent:..... **14**
- 14** Flowers very small, probably not more than 5 mm. long; inflorescence branched from the base; pedicels very short, articulated at the base [12. *micrantha*](#)
 Flowers larger; pedicel 5–15 mm. long:..... **15**
- 15** Inflorescence ample, with long branches, exceeding the leaves, or if shorter then pedicels only 1–3 together; stipules caducous or persistent: **16**
 Inflorescence usually shorter than the leaves, pedicels usually 3 or more together; stipules and bracteoles broadly triangular, early caducous, leaving a conspicuous scar as wide as the stem or rhachis; leaves narrowly elliptic to broadly oblanceolate: **22**
- 16** Stipules persistent; inflorescence often with a cluster of scale-like bracteoles at the base: **17**
 Stipules early caducous: **21**
- 17** Stipules subulate or long-triangular, 2.5–8 mm. long, leaves acutely acuminate: **18**
 Stipules shortly triangular, about 1–1.5 mm. long, aristate; leaves acute, lateral nerves and midrib prominent above [17. *squamosa*](#)
- 18** Leaves abruptly acuminate, 8–23 cm. long, 4–8 cm. broad; inflorescence with long branches, pedicels 1–5 in isolated clusters: **19**
 Leaves gradually acuminate, oblong-elliptic, 8–18 cm. long, 2–6 cm. broad:..... **20**
- 19** Leaves obovate to obovate-elliptic, narrowed to a cuneate base; bracteoles at base of inflorescence numerous and up to 15 mm. long [13. *nigroviolacea*](#)
 Leaves oblong to obovate-oblong, broad and rounded or obtuse at the base; bracteole at base of inflorescence few and up to 5 mm. long [14. *macrobotrys*](#)
- 20** Leaves subcoriaceous, tertiary nerves distinct; inflorescence with long branches; pedicels 1–6 in isolated clusters [15. *turnerae*](#)
 Leaves membranous, tertiary nerves obscure; inflorescence with short lateral branches, lax; pedicels solitary or paired, not clustered, borne at right angles to the axis [16. *leroyana*](#)
- 21** Leaves thinly papery, narrowly oblong-lanceolate, long-cuneate at base, acutely pointed at apex, 6–15 cm. long, 1.5–3.5 cm. broad, midrib rounded and raised above [18. *reticulata*](#)
 Leaves coriaceous, oblong-lanceolate, cuneate to rounded at base, acute at apex, 7–22 cm. long, 3–7 cm. broad, midrib flattened and scarcely raised above [19. *latepaniculata*](#)
- 22** Leaves coriaceous, midrib flattened and only slightly prominent beneath, margin entire or subserrulate, 8–18 cm. long, 2–5.5 cm. broad, shining on both surfaces [20. *vogelii*](#)
 Leaves papery, midrib rounded and prominent beneath, margin serrulate, sometimes markedly so, 8–24 cm. long, 2–8 cm. broad, surfaces more or less matt [21. *monticola*](#)
- 23** Flowers lax; stipules and bracteoles triangular, 1–3 mm. long:..... **24**
 Flowers dense; stipules and bracteoles lanceolate, 3–8 mm. long:..... **25**
- 24** Leaves narrowly elliptic-lanceolate, acute at each end, 4–6 cm. long, 6–12 mm. broad [22. *dusenii*](#)
 Leaves broadly elliptic-lanceolate to elliptic, cuneate at base, acute to obtuse at apex, 7–17 cm. long, 2–5.5 cm. broad [23. *glaberrima*](#)
- 25** Peduncle less than 4 cm. long, much shorter than the leaves: **26**
 Peduncle 9–11 cm. long, about half as long as the leaves; leaves oblanceolate, cuneate at base, acutely acuminate, 12–26 cm. long, 3–7 cm. broad, lateral nerves 15–22 on each side of the midrib, equally prominent on each surface [26. *ambacensis*](#)
- 26** Lateral nerves 8–11 on each side of the midrib, slightly prominent above, but usually sunken in grooves of the lamina and thus appearing impressed; leaves obovate-elliptic, cuneate at base, acuminate at apex, 8–16 cm. long, 2–6 cm. broad [24. *sulcata*](#)
 Lateral nerves 12–20 on each side of the midrib, very prominent on the upper surface and not sunken in grooves of the lamina, impressed beneath; leaves narrowly elliptic, acute at each end, 9–20 cm. long, 2.5–6.5 cm. broad [25. *congesta*](#)
- 27** Leaves coriaceous, elongate-obovate, 10–20 cm. long, 4–8 cm. broad:..... **28**
 Leaves thin, lanceolate-elliptic, oblong-elliptic, or oblong, or slightly obovate; not more than 12 cm. long and 5 cm. broad:..... **30**
- 28** Pedicels articulated at the base or almost at the base; inflorescence much shorter than the leaves . [27. *calophylla*](#)
 Pedicels articulated well above the base:..... **29**

- 29** Inflorescence rather stout, nearly as long as the subtending leaf; pedicels not more than 1 cm. in fruit[28](#).
[calophylloides](#)
- Inflorescence very slender, longer than the subtending leaf; pedicels already over .1 cm. in flower[29](#).
[stenorrhachis](#)
- 30** Pedicels articulated at the base or almost at the base:..... **31**
Pedicels articulated well above the base; inflorescence long-pedunculate, several-flowered; leaves oblong to oblong-elliptic [34. myrioneura](#)
- 31** Petiole 5–6 mm. long; bracts at the base of the inflorescence caducous[30. staudtii](#)
Petiole very short, about 1–2 mm. long; bracts at the base of the inflorescence persistent: **32**
- 32** Pedicels 14–22 mm. long in flower; inflorescence 1–3-flowered, shortly pedunculate; leaves linear-lanceolate, gradually acuminate, 10–12 cm. long, up to 2.5 cm. broad [31. pauciflora](#)
Pedicels 15 mm. long or less in flower:..... **33**
- 33** Leaves linear-lanceolate, acute, but hardly acuminate, up to 8 cm. long and 2.5 cm. broad[32. acutissima](#)
Leaves oblanceolate-elliptic, rather abruptly acuminate, 7–10 cm. long, 3–3.5 cm. broad[33. affinis](#)

1. *Ouratea elongata* (Oliv.) Engl. Bot. Jahrb. 17: 80 (1893); Gilg in Engl. Bot. Jahrb. 33: 258 (1903).

APD: Synonym of Campylospermum elongatum (Oliv.) Tiegh.

Gomphia elongata Oliv. F.T.A. 1: 321 (1868).

Sparingly branched shrub or small tree, to 20 ft. high; inflorescence pendulous, peduncle and sepals green, petals bright yellow; fruiting calyx and carpels red.

S. Nig.: Omo F.R. (Feb.) Jones FHI 14735! Okomu F.R. (fl. Dec., fr. Feb.) Brenan 8425! 9177! Akure F.R. (fr. Oct.) Adekunle FHI 24225! Afi River F.R. (Dec.) Keay FHI 28194! Cam.:** Abonando, Mamfe (Mar.) Rudatis 7!

Widespread in tropical Africa, Madagascar and America.

ANCISTROCLADACEAE

Scandent shrubs with hook-like branchlets. Leaves alternate, simple, entire, leathery; indumentum absent; stipules inconspicuous or caducous. Flowers hermaphrodite, actinomorphic, small, soon falling off, in terminal panicles, the branches of which are recurved. Calyx-tube at first short, at length adnate to the base of the ovary, with imbricate lobes; tube adnate to the fruit, with spreading wing-like unequal lobes. Petals 5, unequal, contorted, slightly connate at the base. Stamens perigynous, 5 or 10; anther-cells slightly unequal, with a shortly produced connective. Ovary 1-celled; ovule solitary; style thick and fleshy, with 3 stigmas. Fruit turbinate, surrounded by the wing-like calyx-lobes, with a leathery indehiscent pericarp. Seed subglobose; testa intruding between the folds of the embryo; cotyledons strikingly folded.

A small family with a discontinuous distribution, i.e. the tropical West African rainforest, [Kenya](#) and Indo-Malaya.

Distinguished by the hooked branches, accrescent calyx and remarkable seeds.

ANCISTROCLADUS

Wall.—F.T.A. 1: 174. *APD acc*

- 1 Inflorescence very short and congested, 1–2 cm. long; fruit obconic, 1.5 cm. long, with short, thick, erect wings; leaves oblong-oblancheolate to spatulate-oblancheolate, 13–30 cm. long, 5–12 cm. broad; leaf-margin at base revolute [1. abbreviatus](#)
- Inflorescence loosely cymose, with elongate branches: **2**
- 2 Leaves small, elliptic, 6–8 cm. long, 3–4 cm. broad, abruptly contracted at base into a "pseudo-petiole"; leaf-margin at base revolute; fruit unknown [2. uncinatus](#)
- Leaves large, oblancheolate, 10–30 cm. long, gradually narrowed to base: **3**
- 3 Leaf-margin at base involute (i.e. inrolled on upper surface); venation less strongly reticulate; lamina 4.5–8 cm. broad; fruit subglobose, under 1 cm. long, with 3 long spatulate (up to 4.5 cm.) and 2 shorter obovate-oblong, thin, spreading wings [3. guineensis](#)
- Leaf-margin at base revolute (i.e. inrolled on lower surface); venation more strongly reticulate; fruit unknown: **4**
- 4 Leaves contracted at base into narrow "pseudo-petiole"; venation very lax, lateral nerves about 7–8 pairs; intramarginal nerve absent; lamina 5.5–11.5 cm. broad; inflorescence-branches relatively short and slender; flowers small, crowded towards the tips [4. barteri](#)
- Leaves uniformly narrowed to base, without "pseudo-petiole"; venation crowded, lateral nerves about 20 pairs; intramarginal nerve distinct; lamina 3–7 cm. broad; inflorescence-branches very long and rather thick; flowers relatively large, arranged rather distantly along most of the length of the branches [5. pachyrrhachis](#)

DIPTEROCARPACEAE

Trees with resinous wood. Leaves alternate, entire, penninerved; indumentum often of two kinds, of stellate hairs or rarely of peltate scales; stipules mostly small and deciduous, sometimes very large and enclosing the young bud, rarely persistent, leaving an annular scar after falling away. Flowers hermaphrodite, actinomorphic, fragrant, in axillary panicles. Calyx-tube short or well developed, free or adnate to the ovary; lobes 5, imbricate or valvate, mostly greatly enlarged, wing-like, and ascending in fruit and then strongly nervose, rarely small and reflexed or spreading. Petals 5, much contorted, free or slightly connate at the base, often hairy and inconspicuous. Stamens rarely definite, hypogynous or subperigynous; filaments short, often dilated at the base; anthers 2-celled, opening lengthwise; connective mucronate or aristate or club-shaped. Ovary inserted on the broad torus or slightly immersed in it, 3-celled; style subulate or variously thickened, entire or 3-lobed; ovules 2 in each cell. Fruit free from or included in the enlarged calyx-tube, rarely closely adnate to it, indehiscent, usually 1-seeded. Seeds without endosperm; cotyledons thick and equal or variously contorted.

A family mostly found in Indo-Malaya, very rare in Africa.

Distinguished mainly by the enlarged wing-like calyx-lobes in fruit.

MONOTES

A. DC. Prod. 16, 2: 623 (1868).

Calyx-lobes 5. Petals 5, hairy. Stamens numerous; anthers with produced connective. Calyx-lobes equally enlarged in fruit.

- 1 A shrub or small tree; branchlets pubescent; leaves elliptic or oblong-elliptic, slightly cordate at the base, rounded and emarginate at the apex, 7–12 cm. long, 4–7 cm. broad, glabrescent above and finely reticulate, softly tomentose beneath, with about 14–16 pairs of prominent lateral nerves; petiole 1.5–2.5 cm. long; flowers greenish, in short axillary cymes, the whole inflorescence densely and softly tomentose; fruit ovoid-globose, about 1.5 cm. in diam., pilose, surrounded by the dry reticulate obovate-oblong accrescent calyx-lobes about 4 cm. long[kerstingii](#)

Monotes kerstingii Gilg in Engl.Bot.Jahrb. 41: 288 (1908); Chev. Bot. 56; Aubrév. Fl. For. Soud.-Guin.

MYRTACEAE

Trees or shrubs. Leaves simple, mostly entire, opposite or rarely alternate, glandular-punctate; stipules 0 or rarely very small. Flowers mostly actinomorphic, hermaphrodite or polygamous by abortion. Calyx-tube more or less adnate to the ovary; lobes 3 or more, imbricate or valvate or irregularly split. Petals 4–5, rarely 6 or 0, inserted on the margin of the disk lining the calyx-tube, imbricate or connivent in a mass. Stamens numerous, rarely few, inserted on the margin of the disk, 1- or more-seriate, indexed in bud or twice folded or straight; filaments free or connate at the base into a short tube or in bundles opposite the petals; anthers small, 2-celled, opening lengthwise by slits or rarely by apical pores, the connective often tipped by a gland. Ovary inferior, syncarpous, 1- to many-celled, with mostly axile, rarely parietal placentas; ovules rarely solitary or few. Fruit inferior, loculicidally dehiscent or indehiscent. Seeds with no (or very little) endosperm; embryo straight, incurved, circular or spiral.

- 1 Flowers solitary or fasciculate, axillary; sepals distinct; petals falling off separately [1. *Eugenia*](#)
 Flowers in terminal cymes; calyx more or less truncate; petals more or less calyprate and falling off together [2. *Syzygium*](#)

1. EUGENIA

Linn.—F.T.A. 2: 436.

- 1 Stems short and simple from an underground rhizome, puberulous; leaves elliptic-lanceolate, obtuse at apex, subacute at base, 7–10 cm. long, 3–4.5 cm. broad, closely gland-dotted, puberulous beneath; flowers axillary, solitary, pedicels 2–3 cm. long [1. *subherbacea*](#)
 Stems much-branched; shrubs or trees: [2](#)
 2 Leaves narrowly lanceolate, 2–4 cm. long, 2–4 mm. broad; internodes very short; flowers few, almost sessile in the axils of the upper leaves [2. *dusenii*](#)
 Leaves not narrowly lanceolate, at least 5 mm. broad, usually much more: [3](#)
 3 Leaves cordate at base, more or less ovate: [4](#)
 Leaves rounded to acute at base: [5](#)
 4 Pedicels about 15 mm. long; branchlets glabrous; leaves shortly acuminate, 4–5 cm. long [3. *uniflora*](#)

- Pedicels very short, up to 4 mm. long; branchlets softly pubescent; leaves not acuminate, 2.5–4 cm. long[4. *nigerina*](#)
- 5** Calyx-lobes 6–8 mm. long and broad, suborbicular; flower buds just before opening 6–9 mm. in diam.; pedicels 5–20 mm. long:**6**
- Calyx-lobes less than 4 mm. long and broad; flower-buds just before opening less than 5 mm. in diam.:**7**
- 6** Leaves thickly coriaceous, elliptic-obovate, shortly acuminate, 5–8 cm. long, 2–4.5 cm. broad, with 4–5 pairs of lateral nerves slightly prominent on both surfaces; pedicels stout, nearly 2 cm. long, solitary or paired in each axil, bracteoles broadly ovate, 2 mm. long; calyx-lobes coriaceous, 7–8 mm. diam., like the pedicels sparingly pubescent [5. *calycina*](#)
- Leaves thin, elliptic, more or less distinctly acuminate or long-acuminate, 6–10 cm. long, 2.5–3.5 cm. broad, with 10–13 pairs of lateral nerves rather obscure on each surface; pedicels 5–15 mm. long, often clustered towards the ends of the shoots; calyx-lobes thin, 6–7 mm. diam., like the pedicels densely rusty-tomentose [6. *elliottii*](#)
- 7** Leaves rounded or very obtuse at apex, not acuminate:**8**
- Leaves more or less distinctly acuminate: **11**
- 8** Pedicels 5–35 mm. long, fasciculate:**9**
- Pedicels less than 4 mm. long; flowers in very short racemes with the central bracteate axis up to 4 mm. long, mostly borne below the leafy parts of the shoots; leaves elliptic, obtuse at each end, 6–10 cm. long, 3–5.5 cm. broad [10. *gilgii*](#)
- 9** Pedicels up to 2 cm. long: **10**
- Pedicels 3–4.5 cm. long; branchlets, petioles and midrib beneath shortly white pilose when young; leaves subsessile, oblong, 8–13 cm. long, 4–5 cm. broad; lateral nerves 6–7 on each side of the midrib, prominent, forming a distinct intramarginal nerve [9. *togoensis*](#)
- 10** Branchlets pubescent; pedicels solitary or paired, slender, up to 1.5–2 cm. long; leaves thin, elliptic, up to 6 cm. long and 3 cm. broad, closely dotted beneath [7. *kerstingii*](#)
- Branchlets glabrous; pedicels up to 1 cm. long, several in each cluster; leaves thickly coriaceous, elliptic or ovate-elliptic, up to 9 cm. long and 5 mm. broad, closely dotted beneath [8. *coronata*](#)
- 11** Ovary glabrous; pedicels glabrous or shortly and rather sparsely pubescent: **12**
- Ovary and pedicels densely pilose: **17**
- 12** Pedicels 4 mm. or more long: **13**
- Pedicels less than 4 mm. long: **15**
- 13** Leaves 2–8 cm. long, 1–4 cm. broad; elliptic-lanceolate: **14**
- Leaves 7–12 cm. long, 3–6 cm. broad, oblong-elliptic; young shoots pubescent, woody branchlets with scaly bark; pedicels 4–6 mm. long [13. *pobeguinii*](#)
- 14** Pedicels 4–6 mm. long; stems glabrous or very shortly puberulous [11. *salacioides*](#)
- Pedicels 8–15 mm. long; stems densely rusty-pubescent [12. *leonensis*](#)
- 15** Leaves with a very strong marginal nerve about 5 mm. from each margin, almost as prominent as the midrib; leaves elliptic or obovate-elliptic, long-cuneate at base, gradually acuminate, 12–16 cm. long, 6–8 cm. broad, petiole 8–12 mm. long [14. *talbotii*](#)
- Leaves with the lateral nerves looped near the margin, but with the loops much less prominent than the midrib; leaves oblong-elliptic, very shortly cuneate at base, obtuse and gradually acuminate, 8–12 cm. long, 3–4.5 cm. broad: **16**
- 16** Leaves rather long-petiolate; branchlets glabrous [15. *whytei*](#)
- Leaves subsessile; branchlets shortly pilose [16. *afzelii*](#)
- 17** Leaves up to 10 cm. long and 4 cm. broad; flowers subsessile; calyx-lobes more or less densely pubescent: ... **18**
- Leaves more than 10 cm. long and 4 cm. broad; minutely pubescent beneath; calyx-lobes glabrous: **19**
- 18** Leaves narrowly oblong-elliptic, rather gradually acuminate, 5–10 cm. long, 2–4 cm. broad, lateral nerves about 8–10 pairs; flowers several in each axil [17. *obanensis*](#)
- Leaves ovate, long-acuminate or subcaudate, 5–6 cm. long (including the approx. 1 cm. long acumen), 2.5–3 cm. broad; lateral nerves about 5–6 pairs; flowers apparently solitary [18. *buchholzii*](#)
- 19** Pedicels 4–10 mm. long: **20**
- Pedicels very short, not more than 2 mm. long; leaves oblong-elliptic, rounded or shortly cuneate at the base, 10–20 cm. long, 4–7 cm. broad, firmly chartaceous, with about 10 pairs of lateral nerves; branchlets rusty-tomentellous [22. *calophylloides*](#)
- 20** Leaves broadly elliptic, very obtusely and shortly acuminate, with about 10 or more straight nerves which loop and form a nearly straight marginal nerve, 9–15 cm. long, up to 9 cm. broad [19. *fernandopoana*](#)

Leaves elongate-elliptic, with nerves as above, subcoriaceous, 9–15 cm. long, 4–5.5 cm. broad, obtuse at base; fruits depressed-globose, over 1 cm. broad[20. memecyloides](#)
 Leaves oblong-lanceolate, with about 6 ascending nerves widely looped and not forming a definite marginal nerve[21. kalbreyeri](#)

1. **Eugenia subherbacea** A. Chev. in Bull. Soc. Bot. Fr. 58, Mém. 8D: 170 (1912). *APD acc*

Eugenia herbacea A. Chev. in Bull. Soc. Bot. Fr. 55, Mém. 8B: 36 (1908), not of Berg (1859).

A plant of the dry bush, throwing up annual stems after burning; flowers fairly large, white, fragrant; fruit succulent.

G. C.: Salaga (Apr.) Dalz. 12! Wabila (Feb.) Kitson! **Togo:** Yendi (Apr.) Akpabla 513!

Also in **Ubangi-Shari-Chad**.

2. **Eugenia dusenii** Engl. in Notizbl. Bot. Gart. Bert. 2: 289 (1899). *APD acc*

Small shrub, on rocks by waterfall, flowers white.

Br. Cam.: Dusen. Ndian waterfall, Kumba (Mar.) Smith 84/36!

3. **Eugenia uniflora** Linn. Sp. Pl. 1: 470 (1753). *APD acc*

Eugenia michelii Lam.—F.T.A. 2: 437; Chev. Bot. 267.

A shrub or small tree; fruit ridged, with smooth red skin.

Introduced from Brazil and cultivated in gardens as the "Pitanga Cherry."

4. **Eugenia nigerina** A. Chev. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 199 (1927); Kew Bull. 1928: 219; Aubrév. Fl. For. Soud.-Guin. 85; Chev. Bot. 268, name only. *APD acc*

A shrub, up to 20 ft. or more, often in clumps; flowers white, fragrant.

Fr. Sud.: Dialiba to Langana (Jan.) Chev. 260! San (June) Chev. 1075. Koulikoro (Oct.) Chev. 3010. **Iv. C.:** dunes of R. Comoé, Bettié (Mar.) Chev. 17556. Tienfalla Aubrév. 3073.

5. **Eugenia calycina** Benth.—F.T.A. 2: 437.

APD: Synonym of Eugenia liberiana Amshoff

A shrub with coriaceous leaves and fairly large, white flowers 1 in. or more across; fruits globose, about 3/4 in. diam., crowned by the large persistent calyx; in coastal vegetation.

S. L.: Yoni, Bonthe Isl. Deighton 2463! **Lib.:** Monrovia (fl. Jan-Mar., fr. Aug.) Whyte! Baldwin 12533! Sinoe Basin Whyte! Grand Bassa (July) T. Vogel 85! Sinkor (July) Barker 1383!

6. **Eugenia elliotii** Engl. & v. Brehm. in Engl. Bot. Jahrb. 54: 331 (1917); Aubrév. Fl. For. Soud.-Guin. 87. *APD acc*

Eugenia djalonensis A. Chev. Bot. 267, name only.

A shrub or small tree; young branches rusty-tomentose; flowers fairly large, white.

Fr. G.: Ditinn to Diaguissa (Apr.) Chev. 12853! Dalaba (Mar.) Dalz. 8388! Rio Pongo Heudelot 901! **S. L.:** Mt. Gonkwi, Talla Hills (Feb.) Sc. Elliot 4832! Rokupr, Magbema (Mar.) Jordan 419! Nyungeru Thomas 7269!

7. **Eugenia kerstingii** Engl. & v. Brehm. l.c. 333 (1917). *APD acc*

Eugenia coronata of F.T.A. 2: 437; of F.W.T.A., ed. 1, 1: 199, partly (Barter 876); of Aubrév. l.c. 85, 87, partly (Nigerian spec.); not of Schum. & Thonn.

A shrub, 10–12 ft., with shining leaves and white flowers.

Togo: Sokodé-Basari plateau on rocky open ground (May) Kersting 742. **N. Nig.:** Wuru, Borgu Barter 876! Nupe Barter 1318! Abinsi (Mar.) Dalz. 765! Yola (Dec.) Dalz. 83! **S. Nig.:** Umueze, Onitsha (Feb.) Jones FHI 5021!

8. *Eugenia coronata* Schum. & Thonn. Beskr. Guin. Pl. 230 (1827); Aubrév. l.c. 85, 87, partly (Dalz. 8276). *APD acc*

Eugenia myrtooides G. Don (1832).

Eugenia littorea Engl. & v. Brehm. l.c. 335.

A shrub or small tree, up to 20 ft. high, in savannah and fringing forest of the coastal plains; flowers white; fruits ovoid, about 1/2 in. long, green, turning black when ripe.

G. C.: Axim. (Feb.) Irvine 2304! Cape Coast to Elmina (Mar.) Dalz. 8276! Accra (Aug.) Don! Dalz. 123! Achimota Irvine 1007! Prang (Jan.) Vigne 1555! Aframsu, Kwahu (Dec.) Chipp 593! **Togo:** Lome (Apr.) Warnecke 119! 378!

9. *Eugenia togoensis* Engl. in Notizbl. Bot. Gart. Berl. 2: 288 (1899). *APD acc*

A shrub, pale-pilose on young branchlets and petioles; in savannah.

Togo: near Bismarckburg (Feb.) Buettner 413.

10. *Eugenia gilgii* Engl. & v. Brehm. l.c. 334 (1817). *APD acc*

Shrub, or small tree, to 25 ft. high, on edge of forest in montane area.

Br. Cam.: Lakom, Bamenda, 6,000 ft. (fr. Apr.) Maitland 1486! 1661! Belo, Bamenda, 4,500 ft. (Apr.) Maitland 1705! [Identified from description-type not seen.]

Also in **French Cameroons**.

11. *Eugenia salacioides* Laws. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 200 (1927) and in Kew Bull. 1928: 219, partly (Mann 842 only).

APD: *Synonym of Eugenia leonensis* Engl. & Brehmer

Eugenia salicifolia Laws. in F.T.A. 2: 437, not of DC. or Berg.

A shrub or small tree; flowers white.

S. L.: Bagroo R. (Apr.) Mann 842! Njala (Apr.) Deighton 2633! **Lib.:** Du R. (July) Linder 186!

12. *Eugenia leonensis* Engl. & v. Brehm. l.c. 329 (1917); Aubrév. l.c. 87. *APD acc*

Eugenia salacioides Laws. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 200 (1927) and in Kew Bull. 1928: 219, partly (excl. Mann 842).

Eugenia rupestris Engl. & v. Brehm l.c. 330; F.W.T.A., ed. 1, 1: 199.

Eugenia coronata (incl. var. *macrophylla*) of A. Chev. Bot. 266, 267, not of Schum. & Thonn.

Eugenia coronata of F.W.T.A., ed. 1, 1: 199, partly (French Guinea spec.).

A shrub, with small white flowers; often on rocky hills; stunted and with very small leaves, resembling the European Box, in exposed sites.

Fr. G.: Kindia Chev. 13205! Labé (Apr.) Chev. 12345! **S. L.:** Afzelius! Sugar Loaf Mt. (Dec.–Apr.) Barter! Sc. Elliot 3963! 5770; Dalz. 933! Limba country (Apr.) Sc. Elliot 5542! 5476! 5483! 5622! Dou Aubrév. 1068. **G. C.:** Kumasi Vigne 1933!

13. *Eugenia pobeguinii* Aubrév. Fl. For. C. Iv. 3: 66, t. 266B (1936), French descr. only; Aubrév. Fl. For. Soud.-Guin. 87. *APD acc*

Eugenia calophylloides of F.W.T.A., ed. 1, 1: 200, partly (Pobéguin 819).

Eugenia whytei of Chev. Bot. 269, partly; F.W.T.A., ed. 1, 1: 199 partly (French Guinea spec.).

Shrub or small tree, on mountains; flowers white.

Fr. G.: Kouroussa (Sept.) Pobéguin 819! **S. L.:** Bintumane Peak, 5,400 ft. (Jan.) T. S. Jones 136! **Iv. C.:** Mt. Dou Aubrév. 1062.

14. *Eugenia talbotii* Keay in Kew Bull. 1953: 288. *APD acc*

Memecylon bakerianum Hutch. & Dalz. F.W.T.A., ed. 1, 1: 215 (1927) and in Kew Bull. 1928: 222, not of Cogn. (1891).

Memecylon machairacme of Bak. f. in Cat. Talb. 128, not of Gilg.

A shrub.

S. Nig.: Oban Talbot 203!

15. **Eugenia whytei** *Sprague* in J. Linn. Soc. 37: 98 (1905); Stapt in Johnston Lib. 604; Chev. Bot. 269, partly (Ivory Coast spec.); Aubrév. Fl. For. C. Iv. 66, t. 266A. *APD acc*

A glabrous shrub or small tree, **by seashore, or in forest.**

S. L.: Boma (Apr.) Deighton 3705! **Lib.:** Monrovia Whyte! Sinoe Basin Whyte! Beach at mouth of Junk K. (Feb.) Cooper 188! **Iv. C.:** Cavally estuary (Aug.) Chev. 19903; 19999.

16. **Eugenia afzelii** *Engl.* in Notizbl. Bot. Gart. Berl. 2: 290 (1899). *APD acc*

A shrub with slender pilose branchlets; leaves smooth above.

S. L.: Afzelius.

17. **Eugenia obanensis** *Bak. f.* in Cat. Talb. 30 (1913). *APD acc*

Eugenia buchholzii of F.W.T.A., ed. 1, 1: 200, partly (Talbot 1722).

Shrub, young parts with pale pinkish indumentum; flowers white.

G. C.: Assuansi (Mar.) Irvine 1565! Adeibeba, Kumasi (Jan.) Darko 512! **S. Nig.:** Lagos (Feb.) Barter 2192! Moloney 26! Dalz. 1397! Ibadan (Jan.) Meikle 940! Mt. Orosun, Idanre (Jan.) Brenan & Keay 8683! Umuahia (Mar.) Cousens FHI 3832! Awgu (Nov.) Jones FHI 4823! Eket Talbot 3234! Oban Talbot 1651! 1722! **F. Po:** Mann 263!

18. **Eugenia buchholzii** *Engl.* in Notizbl. Bot. Gart. Berl. 2: 291 (1899). *APD acc*

A shrub; branchlets, petioles and flowers densely rusty-pilose; fruit subglobose.

Br. Cam.: Mungo (young fr. Apr.) Buchholz.

19. **Eugenia fernandopoana** *Engl. & v. Brehm.* l.c. 337 (1917). *APD acc*

A shrub or tree; up to 25–30 ft., with slender branchlets; fruits subglobose on pedicels of 1/2 in.

F. Po: Mann 1439! On the beach Mann 269! Bokoko (Oct.) Mildbr. 6921.

20. **Eugenia memecyloides** *Benth.*—F.T.A. 2: 437; Chev. Bot. 267; Aubrév. Fl. For. C. Iv. 3: 66. *APD acc*

A shrub, apparently with simple straight stems from the ground, about 4 ft. long; leaves coriaceous.

Lib.: Grand Bassa (fr. July) T. Vogel 96! R. Cess (Mar.) Baldwin 11274!

21. **Eugenia kalbreyeri** *Engl. & v. Brehm.* l.c. 337 (1917). *APD acc*

Eugenia dawei *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 200 (1927); Kew Bull. 1928: 219.

Shrub, 10 ft. high; flowers white, **in open spaces.**

S. L.: Mata Kahun (Mar.) Dawe 454! Njala (Feb.) Deighton 2618! Naiawama, Njala (Apr.) Deighton 3734! Segbwema (Apr.) Deighton 3666! **Br. Cam.:** Mapanya, 2,000 ft. (Mar.) Kalbreyer 157!

22. **Eugenia calophylloides** *DC.* Prod. 3: 272 (1828); F.T.A. 2: 437, partly (Smeathmann spec. only); Chev. Bot. 266; Aubrév. Fl. For. C. Iv. 3: 64. *APD acc*

A shrub, sometimes half scrambling, with rusty-downy twigs, coriaceous leaves, and small white flowers in dense axillary clusters; fruit about 1/2 in. diam., densely covered with glandular warts.

Fr. G.: Konianké country (Feb.) Chev. 20831! **S. L.:** Smeathmann! Freetown (May) Lane-Poole 273! Limba, near Bafodeya (Apr.) Sc. Elliot 5465! Falaba (Apr.) Sc. Elliot 5548! Aylmer 53! Bonthe, Sherbro (Feb.) Dalz. 1010! Njala (Mar.) Deighton 1941! Yonibana (Nov.) Thomas 5219! **Lib.:** Monrovia (Nov.) Whyte! Linder 1519! Greenville (Mar.) Baldwin 11565! 11559! **Iv. C.:** Aubrév. 1639!

Eugenia jambos *Linn.*

The Rose Apple from tropical America has been introduced and is cultivated in our area.

***Eugenia malaccensis* Linn.**

The Malay Apple from tropical Asia has been introduced and is cultivated in our area.

1. *Eugenia kameruniana* Engl. in Notizbl. Bot. Gart. Berl. 2: 291 (1899).

Eugenia hankeana H. Winkl. in Engl. Bot. Jahrb. 41: 283 (1908).

Br. Cam.: Dusen 9, Bibundi to Debundscha (Feb.) Winkler 1110.

Imperfectly known species.

2. *Eugenia ledermannii* Engl. & v. Brehm. in Engl. Bot. Jahrb. 54: 332 (1917).

Br. Cam.: Bagangu, Bamenda (Dec.) Ledermann 1877. Kumbo, Bamenda (Dec.) Ledermann 1997.

Also in **French Cameroons**.

Imperfectly known species.

3. *Eugenia dinklagei* Engl. & v. Brehm. l.c. 338 (1917).

Lib.: Jenneh (Apr.) Diklage 2565.

Imperfectly known species.

4. *Eugenia tabouensis* Aubrév. in Fl. For. C. Iv. 3: 66, t. 266B (1936), French descr. only.

Shrub or small tree of sea coast; very close to *E. calophylloides* DC.

Iv. C.: Tabou Chev. 19965. Aubrév. 1281. Sassandra Chev. 17972.

Imperfectly known species.

5. *Eugenia* sp. A.

Eugenia calophylloides of F.W.T.A., ed. 1, 1: 200, partly (Nigerian spec.), not of DC.

Shrub or small tree.

N. Nig.: Patti Lokoja (Apr.) Elliott 53! Jamata (Dec.) Elliott 220!

Imperfectly known species.

6. *Eugenia* sp. B.

Leaves oblanceolate, 8–14 cm. long, 2–3.5 cm. broad; flowers apparently solitary.

S. Nig.: Kwa Falls (Mar.) Brenan 9234!

Imperfectly known species.

7. *Eugenia* sp. C.

S. Nig.: Eket Talbot!

Imperfectly known species.

2. SYZYGIUM

Gaertn. Fruct. 1: 166, t. 33 (1788).

- 1** Leaves oblong-ovate, broadest below the middle, rounded or obtuse at base, long-acuminate, 7–17 cm. long; 4–7 cm. broad; margin inrolled; lateral nerves usually rather obscure beneath, more prominent above; petiole 4–8 mm. long; flowers 3–4 mm. diam., in small, crowded, terminal inflorescences; fruit subglobose, about 1.2 cm. diam.; in swamp forest *I. owariense*

Leaves broadest at or above the middle, cuneate or rarely obtuse at the base; nerves more or less prominent beneath: **2**

- 2 Flowers 5–6 mm. diam.; inflorescence terminal, with stout square branches; young stems square and slightly winged; leaves oblong-obovate, cuneate at base, rather abruptly long-acuminate, 7–18 cm. long, 3·5–9 cm. broad; lateral nerves prominent above and beneath; petiole 6–8 (–12) mm. long; fruit 2 cm. long and 1·6 cm. broad, or more; by rivers in forest regions [2. rowlandii](#)
- Flowers usually 3–4 mm. diam., if more than branches of inflorescence and young stems not winged (see No. 4a): **3**
- 3 Branches of inflorescence and young stems square and slightly winged; leaves obovate-elliptic or elliptic, cuneate at base, shortly and obtusely acuminate (more longly acuminate in Ivory Coast and Liberian specimens), 4–9 cm. long, 1·5–4 cm. broad; petiole 6–12 mm. long; flowers 3–4 mm. diam.; in montane forest [3. staudtii](#)
- Branches of inflorescence and young stems, not winged, more or less terete: **4**
- 4 Tree usually in fringing forest and on stream banks in savannah regions, usually with tall stem; flowers 3–4 mm. diam., in laxly branched terminal inflorescences with long peduncles; leaves narrowly elliptic to oblong-elliptic, cuneate at base; acute to acuminate at apex, 6–16 cm. long, 2–7 cm. broad; petiole 0·5–2 cm. long; fruit ellipsoid, about 1 cm. long [4. guineense var. guineense](#)
- Savannah shrub or small tree, fire-tolerant; flowers 4–5 mm. diam., usually in lateral, as well as in terminal, well-branched inflorescences, often on leafless stems; leaves broadly elliptic to obovate-elliptic, long-cuneate at base, shortly acuminate, 7–15 cm. long, 3·5–7·5 cm. broad; petiole 1–4 cm. long; fruit subglobose, about 1·5 cm. long [4a. guineense var. macrocarpum](#)
- Tree of low spreading habit, or shrub, on the sea coast; flowers 3–4 mm. diam. in rather small, crowded, terminal inflorescences; leaves very coriaceous, broadly elliptic to obovate-elliptic or suborbicular, obtuse or cuneate at base, rounded or obtuse at apex or very shortly and obtusely acuminate, 7–11 cm. long, 4–6 cm. broad; margin markedly inrolled; petiole 3–6 (–10) mm. long; fruit ellipsoid, about 1 cm. long [4b. guineense var. littorale](#)

1. *Syzygium owariense* (P. Beauv.) Benth. in Fl. Nigrit. 359 (1849). *APD acc*

Eugenia owariensis P. Beauv. Fl. Owari 2: 20, t. 70 (1810); F.T.A. 2: 438, partly.

Jambosa owariensis (P. Beauv.) DC. Prod. 3: 287 (1828).

Syzygium guineense of F.W.T.A., ed. 1, 1: 201, partly.

Syzygium cumini (Linn.) Skeels

Eugenia jambolana Lam.

Has been introduced into cultivation.

LECYTHIDACEAE

Trees or shrubs; leaves simple, alternate, not gland-dotted but sometimes with large glands on the margin; stipules absent. Flowers usually rather large and showy, actinomorphic or zygomorphic,

hermaphrodite. Calyx 4–6-lobed, lobes valvate or imbricate. Petals 4–6, free or united into a campanulate tube and then with many ribs. Stamens numerous, in several series, sometimes the outer ones modified into staminodes and resembling a corona; filaments mostly united; anthers basifixed or rarely adnate, opening at the side by slits; staminal disk sometimes lobed. Ovary inferior or semi-inferior, 2- or more-celled; style mostly simple; ovules 1 to many on axile placentas, sometimes pendulous from near the apex of the cells. Fruit woody, fibrous or fleshy, indehiscent or operculate at the apex. Seeds without endosperm; embryo divided or entire.

- 1 Petals 4, free from each other; fruits with large membranous wings; anther-cells divergent . [1. Combretodendron](#)
Petals united into a broad campanulate many-ribbed often spreading tube; fruits not winged; anther-cells parallel: [2](#)
- 2 Corona absent; stamens very numerous, in several series; filaments filiform; ovary nearly superior [2. Crateranthus](#)
Corona present (probably formed of staminodes), in 2 series, the outer linear or threadlike, spreading, the inner ascending or erect, of broader petaloid segments; fertile stamens in a single series, with broad flat filaments; ovary inferior; leaves with small marginal glands or a pair at the base; fruit like a pomegranate . [3. Napoleona](#)

1. COMBRETODENDRON

A. Chev. Vég. Util. 5: 151 (1909).

Petersia Welw. ex Benth. & Hook. f. (1867); F.T.A. 2: 438; F.W.T.A., ed. 1, 1: 204; not of Klotzsch (1861).

- 1 A tree, up to 40 m. high; leaves obovate, acutely acuminate, long-cuneate at base, 10–16 cm. long, 5–7.5 cm. broad, thin, obscurely toothed, glabrous, often with large pits in the axils of the lateral nerves; petiole short, puberulous; flowers several in a short panicle; pedicels about 2 cm. long, jointed below the middle; calyx-lobes rounded and shortly ciliate; petals 4, glabrous; fruit almost orbicular, emarginate, 4–5 cm. broad, 4-winged, wings membranous and reticulately veined, the principal nerves spreading at a right angle [africanum](#)

Combretodendron africanum (*Welw. ex Benth. & Book. f.*) *Exell* in *J. Bot.* 68: 182 (1930); *Knuth* in *Engl. Pflanzenr. Barringtoniac.* 60 (1939).

APD: Synonym of Petersianthus macrocarpus (P. Beauv.) Liben

Petersia africana Welw. ex Benth. & Hook. f. Gen. Pl. 1: 721 (1867); F.T.A. 2: 439; F.W.T.A., ed. 1, 1: 202; Aubrév. Fl. For. C. Iv. 3: 35.

Combretodendron viridiflorum A. Chev. Vég. Util. 5: 150 (1909).

Petersia viridiflora (A. Chev.) A. Chev. l.c. 5: 301 (1909).

Petersianthus africanus (Welw.) Merr. in Philipp. Journ. Sci. 11: 201 (1916).

Rain forest tree with tall straight bole; bark with anastomosing fissures.

Also in **French Cameroons, Gabon, Belgian Congo and Angola.**

2. CRATERANTHUS

Bak. f. in Cat. Talb. 35, t. 5 (1913).

- 1 A tree, up to 36 m. high; branchlets with broad foliaceous wings between the leaves; leaves elongate-oblong-ovate, shortly and obtusely acuminate, unequally cordate at base, up to 40 cm. long and 12 cm. broad, thinly coriaceous, glabrous; lateral nerves 10–18 pairs, looped and forming a crenate intramarginal nerve; veins scarcely evident; petiole very short and thick; flowers axillary, subsessile, showy; bracts in 2 series, leathery; calyx deeply 3-partite, segments broadly obovate, very concave, about 2.5 cm. long, glabrous; corolla widely campanulate, with numerous strong projecting ribs outside, about 3.5 cm. long [talbotii](#)

Crateranthus talbotii *Bak. f. in Cat. Talb. 36, t. 5 (1913); Knuth in Engl. Pflanzenr. Barringtoniac. 65*

(1939). *APD acc*

A tall tree; in swamp forest; flowers showy; calyx leathery, with membranous margins; corolla crimson with paler margin.

S. Nig.: Oban Talbot 5! 5a! 1643! Calabar-Mamfe Road, Oban (fr. Apr.) Ejiofor FHI 21878!

Baker distinguishes two varieties: var. *parvifolius*, with smaller, more obtuse leaves and rose-pink flowers; and var. *multibracteatus*, with more series of bracts.

3. NAPOLEONA

P. Beauv.—F.T.A. 2: 439.

- 1 Trees and erect shrubs, much branched: 2
 Lianes or scandent shrubs, sparingly branched: 11
- 2 Flowers not paniculate: 3
 Flowers paniculate on the older wood; calyx warted outside and tomentellous; leaves obovate, abruptly and very acutely acuminate; subacute at base, up to 18 cm. long and 7–8 cm. broad, shining above, laxly reticulate beneath, with about 5 pairs of lateral nerves [10. egertonii](#)
- 3 Fruits deeply 5–10-lobed, 3·5–4·5 cm. diam., about 2 cm. long, deeply depressed at the apex (not known in No. 4); corolla unequally and rather deeply divided into several segments: 4
 Fruit not, or only slightly, lobed, and not, or only slightly, depressed at the apex; corolla mostly undivided, or shortly toothed on the margin; flowers mostly on leafy shoots and sometimes also on the older branches and trunk: 7
- 4 Flowers borne in fascicles on the old wood; calyx puberulous: 5
 Flowers axillary: 6
- 5 Flowers 5–10 in a cluster, 4–5 cm. diam., pale cream, mauve at the base of the inner corona; leaves narrowly oblong-lanceolate, rather oblique, rather abruptly long-acuminate, unequal at base, 12–20 cm. long, 3·5–5 cm. broad, with about 10 pairs of lateral nerves looped and forming a double marginal nerve; fruits about 10-lobed [1. talbotii](#)
 Flowers 10–30 in a cluster, 3–3·5 cm. diam., cream with mauve markings at the base of the inner corona; leaves oblong or oblong-oblong-lanceolate, acuminate, 25–26 cm. long, about 6 cm. broad, with 7–9 pairs of looped lateral nerves; fruits about 5-lobed [2. gascoignei](#)
- 6 Calyx glabrous; corolla about 4 cm. diam.; leaves rather abruptly acuminate, oblong or oblong-oblong-lanceolate, cuneate at base, 18–24 cm. long, 5–7 cm. broad, with about 8–9 pairs of lateral nerves; fruits 3·5–4 cm. diam., deeply lobed [3. megacarpa](#)
 Calyx puberulous and slightly rugose; corolla about 2·5 cm. diam.; leaves abruptly acuminate, rounded at base, 15–25 cm. long, 6–10 cm. broad; lateral nerves about 10 or more pairs, tertiary nerves numerous and parallel [4. manni](#)
- 7 Calyx glabrous: 8
 Calyx puberulous: 9
- 8 Outer linear rays of corona much shorter than the inner cup-shaped part; corolla deep red-purple with apricot-yellow edges, 3–4 cm. diam.; leaves with marginal glands near the petiole only; leaves oblong-elliptic to oblong-obovate, generally rather narrowly cuneate at base, 10–18 cm. long, 3·5–8 cm. broad; fruit depressed subglobose, 4·5–6 cm. diam., 3·5–4 cm. long [5. heudelotii](#)
 Outer linear rays of corona about as long as the inner cup-shaped part; corolla cream-yellow with purple lines, dark red at the base within, 4–5·5 cm. diam.; leaves with marginal glands and sometimes teeth on each side below the acumen, as well as near the petiole; leaves oblong-elliptic to obovate-oblong, generally rather broadly cuneate or obtuse at base, 14–28 cm. long, 3·5–12 cm. broad; fruit depressed subglobose, about 4–4·5 cm. diam., 3–3·5 cm. long [6. imperialis](#)
- 9 Calyx warted; leaves long-caudate-acuminate; acumen 1·5 cm. long, rather spatulate at apex; lamina oblong, shortly cuneate at base, about 12 cm. long and 4 cm. broad; laxly reticulate; lateral nerves looped well within the margin; corolla 2·2–2·5 cm. diam.; fruits smooth, about 4·5 cm. diam. and 3·5 cm. long [7. parviflora](#)
 Calyx not warted; acumen not spatulate; corolla 3–4·5 cm. diam.; fruit rugose: 10
- 10 Leaves abruptly rather long-acuminate, oblong, 10–15 cm. long, 4–6 cm. broad, laxly reticulate beneath; lateral nerves prominently looped within the margin, with a secondary marginal nerve outside; corolla about 3 cm. diam. [8. leonensis](#)

Leaves shortly acuminate, broadly elliptic, shortly cuneate at base, 8–12 cm. long, 4–6 cm. broad, rather closely reticulate beneath; lateral nerves ascending within the margin; corolla about 4 cm. diam. [9. vogelii](#)

- 11** Calyx glabrous; flowers axillary; leaves obovate-elliptic, obtuse at base, 15–20 cm. long, 6–9 cm. broad, with 2 small glands towards the base of the acumen; fruit depressed subglobose, up to 5 cm. diam. and 3·8 cm. long [11. lutea](#)

Calyx puberulous; flowers in dense clusters on the older branchlets; leaves oblong-elliptic, rounded at base, 15–20 cm. long, 5–8 cm. broad. [12. reptans](#)

- 1. *Napoleona talbotii* Bak. f.** in Cat. Talb. 32, t. 4, 1–2 (1913); Knuth in Engl. Pflanzenr. Barringtoniac. 72 (1939). *APD acc*

A tree with slightly angled branchlets.

S. Nig.: Oban (Aug.) Talbot 190! 195! 198!

Also in **French Cameroons**.

- 2. *Napoleona gascoignei* Bak. f.** l.c. 33 (1913); Knuth l.c. 73.

APD: *Synonym of *Napoleonaea talbotii* Baker f.*

A tree; fruit about 1 1/2 in. diam.

S. Nig.: Obutong Road, Oban Talbot 1223.

- 3. *Napoleona megacarpa* Bak. f.** l.c. 31 (1913); Knuth l.c. 69.

APD: *Synonym of *Napoleonaea talbotii* Baker f.*

Apparently a tree, with angled branchlets; flowers sometimes in the older axils.

S. Nig.: Oban Talbot 194! 197! **Br. Cam.:** Barombi (Sept.) Preuss 560! Ossidinge Rudatis 110.

Also in **French Cameroons** and **Gabon**.

10. **Napoleona egertonii** *Bak. f.* l.c. 33, t. 4, 3–4 (1913); Knuth l.c. 73. *APD acc*

A tree, to 40 ft. high; flowers white.

S. Nig.: Rosevear 11/30! Oban Talbot 997! **Br. Cam.:** Atolo, Mamfe (Jan.) Jeme FHI 2019!

11. **Napoleona lutea** *Bak. f. ex Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 204 (1927); Kew Bull. 1928: 220; Knuth l.c. 70. *APD acc*

Liane, stems to 60 ft. long; with whorls of 5–6 radiating twigs at intervals along the stem; corolla apricot-yellow, not split, rays of corona very short, pistil bright mauve.

S. Nig.: Eket Talbot 3173!

12. **Napoleona reptans** *Bak. f. ex Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 204 (1927); Kew Bull. 1928: 220; Knuth l.c. 72. *APD acc*

Scandent shrub or liane, stems to 20 ft. long; corolla pale-apricot and white; pistil pale mauve.

S. Nig.: Eket Talbot 3175!

MELASTOMATACEAE

Herbs, shrubs or trees; branches opposite. Leaves simple, opposite or verticillate, mostly with 3 to 9 longitudinally parallel nerves; stipules 0. Flowers hermaphrodite, mostly very showy, actinomorphic. Calyx tubular, free or adnate to the ovary, or sometimes connected to it by septa-like strands; lobes imbricate or rarely valvate. Petals imbricate, free, rarely united at the base. Corona sometimes present. Stamens the same to double the number of the petals; filaments free, often geniculate, inflexed; anthers 2-celled, opening by a pore at the apex or rarely by a slit (Memecylon), connective often appendaged at

the base. Ovary mostly inferior, 1- to many-celled; style simple; ovules numerous, axile, or rarely basal or parietal. Fruit a capsule or berry. Seeds minute, without endosperm.

A large tropical family.

Easily recognized by the opposite exstipulate leaves often with very marked parallel main nerves, geniculate stamens, anthers opening by pores and usually inferior ovary.

Excluded genus: *Ditinnia rupicola* A. Chev. Bot. 279 = *Remusatia vivipara* Schott (Araceae).

- 1 Ovary 3–5-celled with numerous ovules; fruit with numerous small seeds; flowers usually fairly large and showy; anthers opening by a pore and mostly fairly long; mostly herbaceous or shrubby:.....2
- Ovary 1-celled, completely adnate to the calyx-tube; seeds large and solitary or few; anthers very short, opening by a longitudinal slit; trees and shrubs[20. *Memecylon*](#)
- 2 Stamens with equal and similar anthers, or slightly unequal in size only but not in structure:.....3
- Stamens with very unequal anthers, the connective of the larger ones always long-produced at the base and with 1–2 basal appendages:.....17
- 3 Stems well-developed:4
- Acaulescent herb with rounded tuber; leaves 3–6, broadly ovate to ovate-lanceolate, on long slender petioles; flowers solitary on long slender pedicels[14. *Bourdaria*](#)
- 4 Ovary completely free from the calyx-tube[1. *Nerophila*](#)
- Ovary partially or wholly adnate to the calyx-tube:5
- 5 Ovary without a ring of bristles or scales on the top:6
- Ovary with a ring of bristles or scales on the top:10
- 6 Anther-connective without an appendage[2. *Guyonia*](#)
- Anther-connective with one or two appendages:.....7
- 7 Calyx with distinct and persistent lobes[3. *Tetraphyllaster*](#)
- Calyx subtruncate:.....8
- 8 Flowers very numerous in dense globose heads borne on the woody stem below the leaves; calyx-tube constricted above the ovary[4. *Myrianthemum*](#)
- Flowers in terminal, relatively lax, cymes; calyx-tube campanulate or funnel-shaped, not constricted above the ovary:9
- 9 Ovary half-adherent, calyx-tube campanulate[5. *Phaeoneuron*](#)
- Ovary completely adherent to the funnel-shaped calyx-tube[12. *Preussiella*](#)
- 10 Ovary with a ring of bristles on the top; calyx-lobes well-developed:11
- Ovary with a cup or ring of scales on the top; calyx-tube truncate or undulately lobed:.....15
- 11 Calyx-lobes with alternating supplementary lobes:12
- Calyx-lobes without alternating supplementary lobes:13
- 12 Flowers 4-merous; connective with two adhering short but well-marked appendages; flowers capitate[6. *Antherotoma*](#)
- Flowers 5-merous; connective without appendages; flowers paniculate, or capitate[7. *Osbeckia*](#)
- 13 Flowers in many-flowered lax panicles, not enclosed by bracts; connective long-produced[8. *Sakiersia*](#)
- Flowers solitary or capitate, surrounded by bracts; connective not produced:14
- 14 Ovary completely adhering to the calyx-tube; anthers with short anterior appendage only; seeds rounded with a flattened side[9. *Tristemma*](#)
- Ovary adhering to the calyx-tube only at the base; anthers with short dorsal appendage as well as 2 linear anterior appendages; seeds elongate[10. *Cailliella*](#)
- 15 Calyx-tube and fruit strongly 5–10-angled; anther-connective with a single anterior appendage only [11. *Calvoa*](#)
- Calyx-tube terete, anther-connective with a dorsal as well as one or two anterior appendages:.....16
- 16 Leaves long-petiolate; connective with single appendage[12. *Preussiella*](#)
- Leaves subsessile; connective with 2 appendages[13. *Medinilla*](#)
- 17 Ovary with a cup of scales on the top, which crown the fruit[15. *Amphiblemma*](#)
- Ovary without a cup of scales on the top:.....18
- 18 Calyx-tube subtruncate, lobes not well-developed:19
- Calyx-lobes well-developed:.....20

- 19 Flowers in congested racemes; fruit angled or winged at the top; connective of the larger stamens with 2 anterior appendages and a short dorsal spur [16. *Dicellandra*](#)
 Flowers in lax panicles; fruit ellipsoid, smooth, fleshy; connective of the larger stamens without a dorsal spur [17. *Dinophora*](#)
- 20 Ovary 3-celled, linear [18. *Adamea*](#)
 Ovary 4–5 celled, with the calyx-tube, more or less campanulate, not linear [19. *Dissotis*](#)

1. NEROPHILA

Naud.—F.T.A. 2: 441.

- 1 Herb, about 15–20 cm. high, with few scattered leaves; leaves sessile, ovate, obtuse, about 1 cm. long, crenulate, sparingly setose on the upper surface, faintly 3-nerved; flowers 1–3 in a head surrounded by 4 leaves; calyx-tube glabrous; lobes lanceolate, ciliate, with alternate setose teeth; petals obovate; anthers 3 mm. long [gentianoides](#)

Nerophila gentianoides *Naud.*—F.T.A. 2: 441; Gilg in Engl. Monogr. Afr. Melastom. 4, t. 1A; Chev. Bot. 271.

APD: *Synonym of Chaetolepis gentianoides (Naudin) Jacq.-Fél.*

A herb **chiefly of damp places**, with small yellow flowers; petals 4.

Sen.: in marshes of R. Senegal Heudelot 668! **Fr. G.:** Kindia (Sept.) Farman 214! Mt. Loura, 4,500 ft. Jac.-Fel. 2006. Dinguiraye Jac.-Fel. 1470. **S. L.:** Bintumane Peak, 5,400–6,390 ft. (Jan.) T. S. Jones 83! 101!

2. GUYONIA

Naud.—F.T.A. 2: 443; Jac.-Fel. in Bull. Soc. Bot. Fr. 97: 225 (1950).

Afzeliella *Gilg* in Engl. Monogr. Afr. Melastom. 4; F.W.T.A., ed. 1, 1: 205.

- 1 Stems, leaves and calyx quite glabrous; stems creeping with ascending branches; leaves obovate, finely crenulate, 8–13 mm. long and almost as broad, narrowed to the 4–6 mm. long petiole; flowers 5-merous, terminal or axillary, solitary; calyx-lobes lanceolate, subacute, quite glabrous; petals ovate-oblong, 4 mm. long; ripe fruit 3 mm. long [1. *tenella*](#)
- Stems, leaves and calyx setose; stems creeping, rooting at the nodes; leaves ovate-rhomboid, subacute, 10–15 mm. long, nearly 10 mm. broad, crenulate, petiole nearly as long as the blade, slender; flowers 4–5-merous, terminal or terminating short lateral leafy branchlets, subsessile; receptacle glabrous, calyx-lobes filiform with long setose hairs; petals up to 8 mm. long; ripe fruit 5–6 mm. long [2. *ciliata*](#)

1. **Guyonia tenella** *Naud.*—F.T.A. 2: 443; Gilg in Engl. Monogr. Afr. Melastom. 4, t. 1B; Jac.-Fel. in Bull. Soc. Bot. Fr. 97: 225 (1950). *APD acc*

Slender annual, **in moist places by streams**.

Fr. G.: Fouta Djallon Heudelot 858.

2. **Guyonia ciliata** *Hook.f.* in F.T.A. 2: 443 (1871); Jac.-Fel. l.c. *APD acc*

Afzeliella ciliata (*Hook.f.*) *Gilg* l.c. 5; Chev. Bot. 272; F.W.T.A., ed. 1, 1: 205.

Guyonia intermedia *Cogn.* in De Wild. & Th. Dur. Pl. Thonner 30, t. 16 (1900); Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 7: 367 (1935).

Afzeliella intermedia (*Cogn.*) *Gilg* in Meck. Deuts. Zent. Afr. Exp. 582 (1913).

Guyonia gracilis A. Chev. Bot. 272.

Afzeliella sp. aff. ciliata of E. Guinea in Bol. Real. Soc. Esp. Hist. Nat. 49: 185, 186 (1951).

Weak annual, petals mauve; **by streams, in shade, or epiphytic**.

Fr. G.: Dalaba Plateau (Oct.) Chev. 18737. Kissi (Feb.) Chev. 20756. Kindia Jac.-Fel. 179. Macenta Jac.-Fel. 6S7. **S. L.:** Waterloo Burbridge 153! Yetaya (Sept.) Thomas 2392! York Pass (Dec.) Deighton 3308! Lowoma (Apr.) Deighton 3678! Baoma, Koya (Apr.) Deighton 3665! **Lib.:** Gbanga (Sept.) Linder 584! Kolubanu (Oct.) Linder 1119! **Iv. C.:** Sassandra

Basin (May) Chev. 16363; 17987. Cavally Basin (Apr., July) Chev. 19553; 21345. **Br. Cam.:** above Buea, 4,000 ft. (Nov.) Migeod 26! **F. Po:** Balachá (Jan.) Guinea 1457! Moka (Dec.) Boughey 66!

Also in **French Cameroons**, **Belgian Congo** and **Uganda**.

3. TETRAPHYLLASTER

Gilg in E. & P. Pflanzenfam. Nachtr. 266 (1897).

- 1 Herb; leaves long-petiolate, ovate, shortly acuminate, acute, 4–6.5 cm. long, 1.5–3 cm. broad, more or less densely hairy beneath, 5-nerved; flowers solitary, terminal, sessile; bracts broadly ovate, ciliate, 7–8 mm. long; receptacle smooth; sepals ovate, persistent [rosaceum](#)

Tetraphyllaster rosaceum *Gilg* in E. & P. Pflanzenfam. Nachtr. 266 (1897); Engl. Monogr. Afr. Melastom. 34, t. 8A.

APD: Synonym of Tristemma leiocalyx Cogn. var. leiocalyx

An erect hairy herb, with fairly large rose flowers.

Br. Cam.: Buea, 3,000–5,000 ft. (Jan., Sept.) Preuss 702; Dundas FHI 15308!

4. MYRIANTHEMUM

Gilg in E. & P. Pflanzenfam. Nachtr. 266 (1897).

- 1 A glabrous climbing shrub; branches terete; lower leaves alternate, upper verticillate, obovate-elliptic, acute or shortly acuminate, entire, 15–30 cm. long, 5–13 cm. broad, 5-nerved at base, nerves impressed above and prominent beneath; flowers very numerous in a globose head up to 13 cm. in diam.; pedicels slender, 3.5 cm. long; calyx truncate, constricted above the ovary; petals 4, obovate [mirabile](#)

Myrianthemum mirabile *Gilg* in Engl. Monogr. Afr. Melastom. 33, t. 7 (1898). Including var. *dertatum* Bak. f. in Cat. Talb. 128.

APD: Synonym of Medinilla mirabilis (Gilg) Jacq.-Fél.

Slender liane; cauliflorous with globose bunches of very numerous flowers; pedicels and ovaries red.; petals pink.

S. Nig.: Oban Talbot 587! 1325! **Br. Cam.:** Maune River F.R., Mamfe (May) Tamajong FHI 22144! **F. Po:** St. Isabel Peak, 2,000–2,500 ft. Mildbr. 6292.

Also in **French Cameroons** and **Gabon**.

5. PHAEONEURON

Gilg in E. & P. Pflanzenfam. Nachtr. 267 (1897).

- 1 Leaves oblong-lanceolate, obtuse or slightly rounded at base, acutely acuminate, 5–10 cm. long, 2–3 cm. broad, slightly puberulous on the 3 main parallel nerves; tertiary nerves almost at right angles; inflorescence nearly glabrous; stamens unequal [1. setosum](#)
- Leaves ovate or ovate-elliptic, rounded or cordate at base, subacute at apex, up to 16 cm. long and 9 cm. broad, puberulous on the 5 main parallel nerves; inflorescence rusty-tomentose; stamens subequal [2. dicellandroides](#)

1. **Phaeoneuron setosum** (*Hook.f.*) *Stapf* in J. Linn. Soc. 34: 492 (1900).

APD: Synonym of Ochthocharis setosa (Hook. f.) Hansen & Wickens

Dicellandra ? setosa *Hook. f.* in F.T.A. 2: 459 (1871).

D. liberica Gilg in Engl. Monogr. Afr. Melastom. 33.

Phaeoneuron libericum (Gilg) Gilg in Engl. Pflanzenw. Afr. 3, 2: 762.

A shrub or undershrub, of moist places, the older branches stout, terete, longitudinally fissured; petals 5, rose, up to 17 mm. long.

S. L.: Afzelius! **Lib.:** Grand Bassa (Nov.) Dinklage 1767; 2056!

2. **Phaeoneuron dicellandroides** Gilg in Engl. Monogr. Afr. Melastom. 35 (1898).

APD: *Synonym of Ochthocharis dicellandroides (Gilg) Hansen & Wickens*

Phaeoneuron moloneyi Stapf in Bot. Mag. t. 7729 (1900).

Phaeoneuron gracile Hutch. & Dalz. F.W.T.A., ed. 1, 1: 206, partly; Kew Bull. 1928: 220, partly.

Dicellandra gracilis A. Chev. Bot. 276 (name only), partly; Bull. Mus. Hist. Nat. Sér. 2, 4: 679 (1932), partly.

Herb or undershrub, to 5 ft. high; older branches terete; petals 5, pink, 10–12 mm. long; **in moist places.**

Fr. G.: Nzérékoré Jac.-Fel. 1121. **S. L.:** Moselele (fr. Nov.) Deighton 2390! Near Roruks (fr. July) Deighton 4673! **Lib.:** Linder! **Iv. C.:** Dyolas country, Danané (Apr.) Chev. 21206! **S. Nig.:** Lagos Moloney 28! Okomu F.R. (Dec., Feb.) Brenan 8478! 9005!

Also extends through French Cameroons and Shari to **Angola**, Congo and E. **Sudan**.

6. ANTHEROTOMA

Hook. f.—F.T.A. 2: 444. *APD acc*

- 1 An annual herb; stems appressed-setose; leaves few, shortly petiolate, lanceolate, acute, 3–4 cm. long, 0.5–1.2 cm. broad, crenate, setose above and only on the nerves beneath, 3-nerved; flowers in a close terminal cluster subtended by leaves; pedicels about 3 mm. long; calyx-tube laxly setose, lobes narrowly lanceolate, stellately bristly at the top, with alternating narrower lobes; anther-connective produced at the base into 2 short lobes; ovary bristly at apex. [naudini](#)

Antherotoma naudini *Hook. f.* in F.T.A. 2: 444 (1871); Gilg in Engl. Monogr. Afr. Melastom. 9, t. 1F. *APD acc*

Annual, to 1 ft. high; petals 4, pink or mauve. Very similar to *Osbeckia decandra* (Sm.) DC. but distinguished by the 4-merous flowers and connectives with well-developed appendages.

Fr. G.: Farana Jac.-Fel. 2086! Dalaba (Nov.) Jac.-Fel. 573 bis! **N. Nig.:** Bauchi Plateau: Naraguta (Aug.) Lely 536! Vom Dent Young 93! Panyam (Sept.) Lely 728! Sho (Nov.) Keay FHI 21450! **Br. Cam.:** Jua, Bamenda (Apr.) Maitland 1497!

Widespread in tropical Africa and in Natal and Madagascar.

7. OSBECKIA

Linn.—F.T.A. 2: 441.

- 1 Calyx-tube elongated above after anthesis into a tube, reaching 3.5–5 mm. long; calyx-lobes broadly lanceolate, caducous; lower part of calyx about 8 mm. in fruit, densely covered with long-stalked stellate hairs; flowers in flexuous cymes, shortly pedicellate; petals 4–6 mm. long; leaves ovate, distinctly petiolate, rounded at base, acute at apex, 1.5–7 cm. long, 0.7–3.2 cm. broad, crenulate, 5-nerved, long-pilose on both surfaces [1 tubulosa](#)
Calyx-tube not elongated above after anthesis: **2**
- 2 Anthers short, thick, truncate at apex, connective scarcely produced below the anther; sepals persistent, triangular: **3**
Anthers linear, acuminate, connective produced below the anther: **4**
- 3 Leaves ovate to elliptic-oblong, sparsely pilose; anthers straight, 1 mm. long, shorter than the filaments [2. decandra](#)
Leaves lanceolate, densely villous; anthers twisted, 2.5 mm. long, almost as long as the filaments [3. praviantha](#)

- 4 Sepals persistent in fruit:5
 Sepals caducous in fruit, bristly at the tips; leaves about 3 cm. long, 1 cm. broad, 3-nerved, setulose-pubescent beneath; fruit contracted below the top, 10-ribbed and finely setose6. [senegambiensis](#)
- 5 Petals mauve or pink, about 6 mm. long and 4 mm. broad; stems, leaves and calyx long-setose; leaves narrowly oblong-elliptic, about 2–5 cm. long and 1 cm. broad; fruits subglobose, setose-pilose4. [congolensis](#)
 Petals yellow, 18 mm. long and 8 mm. broad; calyx glandular pubescent; stems sparsely appressed pilose; leaves ovate, 2–2.2 cm. long, 1–1.2 cm. broad, shortly petiolate, appressed strigose pubescent5. [porteresii](#)

1. **Osbeckia tubulosa** Sm.—F.T.A. 2: 442; Gilg in Engl. Monogr. Afr. Melastom. 9, t. 1E; Chev. Bot. 271. *APD acc*

Erect annual, to 18 in. high, with 4-angled reddish stems; petals mauve or pink.

Fr. Sud.: Koulikoro (Oct.) Chev. 2078! **Fr. G.:** Farmar 167! Dalaba-Diaguissa Plateau, 3,000–4,000 ft. (Oct.) Chev. 18701. Grand Chutea (Dec.) Chev. 20235. **S. L.:** Afzelius! Don! T. Vogel 4! Barter! Sc. Elliot 3828! Sherbro Isi. (Nov.) Hunter! Masingbi (Feb.) Deighton 4064! **Lib.:** Kakatown Whyte! **Togo:** Misahöhe (Nov.) Mildbr. 7313! **N. Nig.:** Patti Lokoja (Nov.) Dalz. 84! Panshanu (Sept.) Lely 606! jos (Nov.) Keay FHI 21434! **S. Nig.:** Idanre (Oct.) Keay FHI 22680!

2. **Osbeckia decandra** (Sm.) DC. Prod. 3: 143 (1828); Gilg l.c. 7; Keay in Kew Bull. 1952: 164. *APD acc*

Osbeckia zeylanica var. **decandra** Sm. (1813).

Osbeckia afzelii (Hook. f.) Cogn. in DC. Monogr. 7: 300 (1891); Gilg l.c. 6, t. 1C. Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 7: 370 (1935).

Antherotoma afzelii Hook. f. in F.T.A. 2: 444 (1871).

Slender herb 4–8 in. high; petals 5, pink-mauve. Very similar to *Antherotoma naudini* Hook. f. but distinguished by the 5-merous flowers and connectives without appendages.

Fr. G.: Kindia Jac.-Fel. 190. Pita Jac.-Fel. 669. Macenta Jac.-Fel. 1089. **S. L.:** Afzelius! Tower Hill, Freetown (Oct.) Deighton 2514! Near Mapaki, N.P. (Aug.) Deighton 1296! Bumbuna to Farangbaia (Sept.) Deighton 5147! Rokupr (Nov.) Jordan 153! Sasa (Sept.) Jordan 321!

3. **Osbeckia praviantha** Jac.-Fel. in Bull. I.F.A.N. 15: 973, fig. 1 (1953). *APD acc*

Erect herb, to 18 in. high; flowers light pink; **on rock outcrops.**

Fr. G.: Macenta (Oct.) Jac.-Fel. 1238! Adam 6747! **Lib.:** Kolahun, W. Prov. (Nov.) Baldwin 10147!

4. **Osbeckia congolensis** Cogn. ex Büttner in Verh. Bot. Brand. 31: 95 (1889); Gilg l.c. 6; Chev. Bot. 270–1.

APD: Synonym of Dissotis congolensis (Cogn. ex Büttner) Jacq.-Fél.

Osbeckia senegambiensis of Chev. l.c., not of Guill. & Perr.

In damp sand or marshy places, to 18 in. high; flowers mauve.

Fr. Sud.: Tabacco (Jan.) Chev. 139. Gourma (July) Chev. 24313. **Fr. G.:** Kollangui (Mar.) Chev. 12879! Farana (Jan.) Chev. 20507! **S. L.:** Falaba (Mar.) Sc. Elliot 5172! Yetaya (Sept.) Thomas 2321! Kabala (Feb., June) Deighton 3739! 4155! **Iv. C.:** Orodougou, Sassandra (June) Chev. 21811.

Also in **Gabon, Congo, Uganda, Tanganyika** and **Angola**.

5. **Osbeckia porteresii** Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 10: 630 (1938). *APD acc*

Bushy herb, woody at the base, to 1 ft. high.

Fr. G.: Nimba Mt., 4,800–5,800 ft. (Nov.) Portères 3175! Jac.-Fel. 1933!

6. **Osbeckia senegambiensis** Guill. & Perr.—F.T.A. 2: 443; Gilg l.c. 8.

APD: Synonym of Antherotoma senegambiensis (Guill. & Perr.) Jacq.-Fél.

Osbeckia saxicola of Chev. Bot. 271, not of Gilg.

Stems erect from a woody rootstock, branched, stout, 4-angled, 12–18 in. high.

Sen.: near Cape Verde (Mar.) Döllinger! Casamance, Zinguinchor (Jan.) Chev. 3015. **Fr. G.:** Gaoual Jac.-Fel. 709!

8. SAKERSIA

Hook. f.—F.T.A. 2: 458.

- 1 Branches of the inflorescence glabrous except for a few bristles at the nodes; panicle lax-flowered; flowering when leafless; calyx-tube glabrous outside, except for the ciliate broad lobes; petals ciliate; branches with very thick long-bristly nodes; leaves elliptic, slightly cuneate at base, about 11 cm. long and 4.5 cm. broad, petiole 1.5 cm. long [1. *echinulata*](#)
- Branches of the inflorescence densely bristly; panicle many-flowered; petals glabrous; flowering when leafy: ..2
- 2 Calyx-tube glabrous outside except at the base; branches shortly bristly; leaves elliptic or oblong-elliptic, rounded at base, subacutely acuminate, 6–12 cm. long, 3–6 cm. broad, sparingly setose, petiole about 1 cm. long [2. *africana*](#)
- Calyx-tube densely bristly all over; branches densely brown setose; leaves ovate to ovate-elliptic, rounded to deeply cordate at base, obtuse at apex, 6–16 cm. long, 3–7 cm. broad, shortly setose on both surfaces, petiole 1–2 cm. long [3. *calodendron*](#)

1. **Sakersia echinulata** *Hook. f.* in F.T.A. 2: 458 (1871); Gilg in Engl. Monogr. Afr. Melastom. 32, t. 5F; Chev. Bot. 276.

APD: Synonym of Dichaetanthera echinulata (Hook. f.) Jacq.-Fél.

Sakersia mirabilis A. Chev.

Tree, to 20 ft. high, producing mass of pink blossom when leafless.

Fr. G.: Conakry (Jan.) Dalz. 8379! Between Mamou and Dalaba (Mar.) Dalz. 8380! Labé (Apr.) Chev. 12393! **S. L.:** Afzelius. Kofu Mt., Scarcies (Jan.) Sc. Elliot 4599!

2. **Sakersia africana** *Hook. f.* in F.T.A. 2: 458 (1871); Gilg l.c. 32; Chev. Bot. 276.

APD: Synonym of Dichaetanthera africana (Hook. f.) Jacq.-Fél.

Tree, to 50 ft. high. in moist places; flowers produced in great quantity, with the leaves; petals rose-pink.

S. L.: Dodo Hills (Jan.) Sawyerr FHK 13596! **iv. C.:** Tabou (Apr.) Aubrév. 1666! Grabo (July) Chev. 19651! **S. Nig.:** Oban Talbot 1347! Netim, Calabar (Jan.) Espley 13! Ikom Catterall 16! **Br. Cam.:** Cameroons R. (Jan.) Mann 2205!

Also in **French Cameroons**, **Spanish Guinea**, **Gabon** and **Cabinda**.

3. **Sakersia calodendron** *Gilg & Ledermann* in Engl. Pflanzenw. Afr. 3, 2: 759 (1921).

APD: Synonym of Dichaetanthera corymbosa (Cogn.) Jacq.-Fél.

Tree, to 30 ft. high, by streams; flowers very numerous, with the leaves; petals magenta-pink.

Br. Cam.: Bamenda: Bum, 4,000 ft. (May) Maitland 1520! Ndop Plain (Dec.) Collier FHI 22208! Bambui, 4,500 ft. (Jan.) Keay FHI 28422!

Also in **French Cameroons**.

9. TRISTEMMA

Juss.—F.T.A. 2: 445.

- 1 Calyx-tube glabrous outside; branches sparingly setose, glabrescent below; leaves ovate-elliptic, rounded or subacute at base, 5–15 cm. long, 4–6 cm. broad, shortly appressed-setose above, almost glabrous beneath, 5-nerved [1. *littorale*](#)
- Calyx-tube with hairs outside in the upper half:2

- 2 Hairs on the calyx-tube scattered, not in rings; stems long pilose-setose; leaves ovate or ovate-elliptic, somewhat rounded at base, acutely acuminate, 6–8 cm. long, 3–4 cm. broad, longly and shortly setose above and beneath, 5-nerved; petiole shaggy, 1–2 cm. long [2. involucreatum](#)
- Hairs on the calyx-tube in one or more distinct rings, the rings sometimes discontinuous, especially as the ovary enlarges in fruit: [3](#)
- 3 Calyx-tube with 3 rings of bristly-hairs, or less: [4](#)
- Calyx-tube with 4–6 rings of bristles; flowers solitary, or few together; stem and petiole shortly setose, leaves ovate-elliptic, somewhat rounded at base, subacute, 6–10 cm. long, 4–7 cm. broad, setulose on both surfaces, 5-nerved; petiole slender, 1.5–2 cm. long [7. coronatum](#)
- 4 Leaves 3-nerved, up to 4 cm. long and 2 cm. broad, ovate-elliptic, delicate, with long-silky petiole and lamina; stems procumbent below, ascending above; flowers 1–3 together; calyx-tube with a single ring of bristles ... [3. radicans](#)
- Leaves 5-nerved, usually well over 4 cm. long and 2 cm. broad, rather stiff: [5](#)
- 5 Stems and petioles shortly and often sparingly setose; petiole slender: [6](#)
- Stems and petioles densely bristly-pilose with long shaggy hairs; leaves ovate-elliptic, rounded at base, acutely acuminate, 8–12 cm. long, 4–6 cm. broad, longly and shortly setose on both surfaces; petiole 1.5–3 cm. long, flattened; bracts pilose-setose, calyx-tube with 2–3 rings of bristles [6. hirtum](#)
- 6 Calyx-tube with only one complete ring of bristles and with a second incomplete ring, or rarely with a single incomplete ring only; leaves broadly ovate-elliptic, rounded or shortly cuneate at base, 10–15 cm. long, 5–8 cm. broad, appressed-setose above, nearly glabrous beneath [4. incompletum](#)
- Calyx-tube with two complete rings of bristles, and sometimes a third, or parts of a third, ring; leaves broadly ovate-elliptic, shortly cuneate at base, 7–15 cm. long, 3–8 cm. broad, appressed-setulose on both surfaces ... [5. mildbraedii](#)

1. **Tristemma littorale** Benth. in Fl. Nigrit. 353 (1849); Gilg in Engl. Monogr. Afr. Melastom. 25. *APD acc*

APD: Synonym of Tristemma albiflorum (G. Don) Benth.

Tristemma papillosum Gilg.

Tristemma oreophilum Gilg.

Tristemma schumacheri var. **littorale** Hook. f.—F.T.A. 2: 446.

A prostrate or suberect undershrub, 3–5 ft. or more, stems obtusely angled, often wiry; flowers pink to bluish-purple; [in wet places](#).

G. C.: Begoro, Akim (Apr.) Irvine 1359! **S. Nig.:** Lagos Rowland! Olokemeji Foster 297! Ibadan (Feb., Apr.) Meikle 1143! 1409! Ilesha Foster 174! Ajebandele (Mar.) Jones FHI 17203! Enugu (Aug.) Extending to Congo and Upper Shari.

7. Tristemma coronatum Benth.—F.T.A. 2: 446; Gilg l.c. 25, t. 1L; Chev. Bot. 272. *APD acc*

APD: Synonym of Tristemma hirtum P. Beauv.

APD: Synonym of Tristemma mauritianum J.F. Gmel. var. mauritianum

Half-prostrate herb, or undershrub, 1–3 ft. high; flowers rose or white.

Fr. G.: Macenta Jac.-Fél. 1042. **S. L.:** Don! Gola Forest (Nov.) Deighton 373! **Lib.:** Nana Kru, Sinoe (Mar.) Baldwin 11587! **Iv. C.:** fide Chev. l.c. **G. C.:** S. Fomang Su (Oct.) Brown 351! Axim Burton! Kumasi Cummins 150! Akim Irvine 550! **Togo:** Amedjope (Mar.) Williams 80!

10. CAILLIELLA

Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 10: 637 (1938).

- 1 Much-branched shrub; branchlets terete, strigose; leaves lanceolate, acute, 5–6 cm. long, 1.3–1.6 cm. broad, densely strigose on both surfaces, strongly 5-nerved, petiole 7–8 mm.; flowers 5-merous, terminal, solitary, sessile, surrounded by the upper leaves and 2–3 pairs of bracts; calyx-tube glabrous, 15 mm. long, with oblong, 7–8 mm. long, persistent lobes; ovary half-adnate to calyx-tube; petals obovate-truncate, 2 cm. long, 1.6 cm. broad; stamens equal; connective not produced, with two well-developed anterior appendages; seeds curved at apex, cuneate at base [praerupticola](#)

Cailliella praerupticola *Jac.-Fel.* in Bull. Mus. Hist. Nat. Sér. 2, 10: 637 (1938). *APD acc*

Shrub to 5 ft. high, flowering as the leaves fall.

Fr. G.: Benna massif, 2,900 ft. (Dec.) *Jac.-Fel.* 2139!

11. CALVOA

Hook. f.—F.T.A. 2: 457.

- 1 Stem and leaves densely hirsute; leaves with 5 main nerves, ovate-elliptic, subcordate, not acuminate, 4–6 cm. long, 2–3.5 cm. broad, petiole up to 2 cm. long; flowers subsessile, solitary to clustered; calyx-tube strongly ribbed, subtruncate; stamens 10, unequal; ovary crowned with 5 persistent leathery broad scales projecting beyond the calyx; fruit crowned by the scales [1. hirsuta](#)
- Stem and leaves glabrous; leaves with 3 main nerves: **2**
- 2 Scales of the ovary projecting well above the calyx in fruit, venose, widely emarginate; capsule obconical, 6–7 mm. long (including the projecting scales), 10-ribbed; leaves elliptic to obovate, unequally sided at base, shortly acuminate, setose-denticulate on margin, 3.5–7 cm. long, 2–4.5 cm. broad; flowers sessile on one side of the axis [2. monticola](#)
- Scales of the ovary included within the calyx-tube, even in fruit; capsule long and narrowly obconical, 12 mm. long, strongly 5-angled with fainter intermediate ribs; leaves ovate-elliptic, with a single seta at the obtuse apex and one seta on each margin in the upper half; inflorescence a terminal scorpioid cyme with 5–7 flowers [3. trochainii](#)

1. **Calvoa hirsuta** *Hook. f.* in F.T.A. 2: 457 (1871); Gilg in Engl. Monogr. Afr. Melastom. 32, t. 5E. *APD acc*

Annual herb 5–10 in. high, **in wet places in forest, on fallen trees, etc.**; petals white.

G. C.: Ankasa F.R., 200 ft. (Dec.) Vigne 3187! **F. Po:** 6,000 ft. Mann 285! Musola (Jan.) Guinea 1111! Mildbr. 6384; 7040.

2. **Calvoa monticola** *A. Chev. ex Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 209 (1927); Kew Bull. 1928: 221; Chev. Bot. 275, name only. *APD acc*

Epiphyte, or terrestrial, **in moist forest**; leaves fleshy, petals pink.

Fr. G.: Nzérékoré, 1,900 ft. (June) Collenette 37! Macenta *Jac.-Fel.* 900. **S. L.:** Gola Forest, Gaura (Dec.) King 91b! **Lib.:** Gola Forest (June) Bunting! Kassa Ta (Sept.) Linder 829! **Iv. 3. **Calvoa trochainii** *Jac.-Fel.* in Bull. Mus. Hist. Nat. Sér. 2, 10: 639 (1938), with fig. *APD acc*

Branched epiphyte, 6–8 in. high; leaves fleshy, petals pink.

Fr. G.: Ziama Forest, Macenta, *Jac.-Fel.* 1151.

[An incomplete specimen from Fernando Po (Guinea 930 bis) appears to be close to *C. trochainii*, but has been given a provisional, and therefore invalid, name by E. Guinea in Bol. Real. Soc. Esp. Hist. Nat. 49: 179, 182 (1951).]

Calvoa sp.

Possibly new.

Br. Cam.: Mamfe (Sept.) Savory 650!

Imperfectly known species.

12. PREUSSIELLA

Gilg in E. & P. Pflanzenfam. Nachtr. 267 (1897).

- 1 Ovary with a small cup on the top within the calyx; flowers in short terminal cymes; receptacle (including calyx-tube) about 5 mm. long; petals 6–8 mm. long and 3–5 mm. broad; leaves long-petiolate, ovate, slightly cordate and 5-nerved at base, shortly and gradually acuminate, 6–11 cm. long, 3·5–5 cm. broad. [1. kamerunensis](#)

Ovary without a cup on the top within the calyx; flowers in dense terminal cymes of 40–80 flowers; receptacle (including calyx-tube) about 7 mm. long; petals about 12 mm. long and 8 mm. broad; leaves long-petiolate, ovate, rounded and 5-nerved at base, acuminate, 9–17 cm. long, 5–9 cm. broad [2. Chevalieri](#)

1. **Preussiella kamerunensis** *Gilg* in E. & P. Pflanzenfam. Nachtr. 267 (1897); Engl. Monogr. Afr. Melastom. 36, t. 9. *APD acc*

Woody epiphyte, to 1 ft. high; petals pale pink.

Lib.: Dukwia R., Monrovia (Apr.) Cooper 74! **Br. Cam.:** Elephant Lake, Barombi (Aug.) Preuss 442.

2. **Preussiella chevalieri** *Jac.-Fel.* in Bull. Mus. Hist. Nat. Sér. 2, 10: 641 (1938).

APD: *Synonym of Preussiella kamerunensis Gilg*

Woody plant to 21/2 ft. high. **epiphytic or on rocks**; petals pink.

Fr. G.: Zيام Forest, Macenta, 2,500 ft. (Sept.) Jac.-Fel. 1152! **iv. C.:** Mt. Tonkui, 3,200 ft. (Oct.) Jac.-Fel. 1277!

13. MEDINILLA

Gaud.-F.T.A. 2: 460.

- 1 A glabrous shrubby plant; branches subterete, with thickened nodes; leaves sub-sessile, lanceolate, rounded at base, long-acuminate, 7–11 cm. long, 1·5–2·5 cm. broad, 3-nerved, entire, glabrous; cymes very small, few-flowered; petals 4, white [mannii](#)

Medinilla mannii *Hook. f.* in F.T.A. 2: 460 (1871). *APD acc*

Epiphyte, 4 ft. high.

F. Po: Mann 302!

14. BOURDARIA

A. Chev. in Bull. Mus. Hist. Nat. Sér. 2, 4: 681 (1932); Brenan in Kew Bull. 1953: 86.

- 1 Small herb with round tuber and short stem bearing 3–6 leaves; petioles slender, 1·5–4·5 cm. long; lamina broadly ovate to ovate-lanceolate, acute to subobtuse at apex, rounded or cordate at base, 2·5–6 cm. long, 1·2–3·8 cm. broad, crenulate to serrulate margins, 3-nerved, sparingly setose above, glabrous beneath; pedicels slender, 5–22 on each rosette, shorter than leaves when flowers open, but elongating and reaching 5–9 cm.; flowers 4-merous, petals 6–7 mm. long, calyx about 2 mm. long, shortly lobed, adnate to the ovary, sparingly pubescent or glabrescent; capsule 4-angled, 3–4 mm. long and broad [felicis](#)

Bourdaria felicis *A. Chev.* in Bull. Mus. Hist. Nat. Sér. 2, 4: 682 (1932).

APD: *Synonym of Cincinnobotrys felicis (A. Chev.) Jacq.-Fél.*

Begonia-like herb, epiphytic and on rocks with moss, in moist shaded situations; petals pale pinkish-white.

Fr. G.: Kalifayagbé, Conakry, and Taouli, Kindia Jac.-Fel. 163. Benna massif, Kindia (June) Jac.-Fel. 1744! **S. L.:** Bumban, 1,200 ft. (June) Glanville 435!

15. AMPHIBLEMMA

Naud.—F.T.A. 2; 455. *APD acc*

- 1** Fruiting cymes secund; infructescence composed of 3–6 simple or sparingly branched more or less straight branches borne in a single whorl, with the fruits arranged secundly along the whole length of the branches; young inflorescences compact, cymose, 3–5 cm. in diam., the branches elongating in fruit; calyx-tube 4–5 mm. long, sparingly puberulous; fruit 6–8 mm. long, reddish-brown; stems puberulous, glabrescent; leaves ovate, cordate at base, subacutely acuminate, 8–18 cm. long, 5–13 cm. broad, slightly setulose, 7–9-nerved at base, petiole up to half as long as the lamina *l. cymosum*

Fruiting cymes not secund; infructescence richly branched with the fruits borne towards the tips of the branches; inflorescence a panicle of cymes, with 2–4 whorls of laxly branched branches, 5–7 cm. in diam. when young, but greatly elongating in fruit; calyx-tube 6–7 mm. long, densely puberulous; fruit 8–11 mm. long, yellowish-brown; leaves similar to above, 8–14 cm. long, 4–12 cm. broad, densely puberulous on the nerves beneath .. *2. mildbraedii*

- 1. Amphiblemma cymosum (Schrad. & Wendl.) Naud.**—F.T.A. 2: 456; Gilg in Engl. Monogr. Afr. Melastom. 30. *APD acc*

Melastoma cymosum Schrad. & Wendl. in Sert. Hannov. t. 10 (1796).
Calvoa superba A. Chev. Bot. 275.

Herb to 4 ft. high, sometimes epiphytic; in moist places; petals pink.

Fr. G.: Fouta Djallon (Sept.) Chev. 18501! 18528! Macenta Jac.-Fel. 1078. **S. L.:** Barter! Regent (Apr.) Sc. Elliot 5825! Mayoso (Aug.) Thomas 1407! Njala (fr. Aug.) Deighton 3225! **Lib.:** Peahtah (Oct.) Linder 1015! **Iv. C.:** Zagoué to Soucourala (May) Chev. 21575!

Extends to Gabon and Congo.

18. ADAMEA

Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 23: 661 (1952). *Adamia* Jac.-Fel. (1951), non Wall. (1824). *APD acc*

- 1 Sparsely branched glabrous herb, woody at base; petiole up to 5 cm. long, lamina broadly ovate-elliptic, rounded to subcordate at base, apex obscurely acuminate, margin crenate, up to 5 cm. long and 3.5 cm. broad; flowers in lax, few-flowered cymes, to 13 cm. long; flowers sessile, with linear 3-celled ovary adnate to the calyx-tube except for the filiform apex within the upper part of the calyx-tube; petals 4 mm. long; larger stamens with 2 anterior and a single posterior appendage, smaller stamens without appendages *stenocarpa*

Adamea stenocarpa (*Jac.-Fel.*) *Jac.-Fel.* in Bull. Mus. Hist. Nat. Sér. 2, 23: 661 (1952).

APD: *Synonym of Feliciadamia stenocarpa* (*Jacq.-Fél.*) *Bullock*

Adamia stenocarpa *Jac.-Fel.* l.c. 23: 448, with fig. (1951).

Herb, to 1 ft. high in moist places among rocks, with purple flowers.

Fr. G.: Mt. Konosso, 4,300 ft. (July) Adam 5579!

19. DISSOTIS

Benth.—F.T.A. 2: 447.

- 1 Flowers solitary to paniculate with inconspicuous or early deciduous bracts:2
 Flowers several in a head usually surrounded by large persistent membranous bracts, or solitary and surrounded by large persistent bracts:32
- 2 Calyx-tube glabrous outside except sometimes for bristle-tipped processes between the calyx-lobes; rarely with a few bristles near the base:3
 Calyx-tube pubescent or bristly outside:8
- 3 Calyx with accessory linear lobes between the sepals:4
 Calyx without accessory lobes; leaves sessile or subsessile:7
- 4 Leaves more or less densely setose-pilose on both surfaces with a distinct setose-pilose petiole:5
 Leaves glabrous except for the ciliate margin, subsessile, lanceolate, up to 7 cm. long and 3 cm. broad, 5-nerved, paler beneath; stems glabrous, flowers in paniculate cymes; calyx with very fine bristle-like accessory lobes; petals about 3 cm. long[4. pobeguinii](#)
- 5 Calyx with 5 accessory long-setose linear lobes between the sepals, but without accessory lobes behind (i.e. outside) the sepals; stems creeping, rooting at the nodes; lamina elliptic to lanceolate, cuneate at base, acuminate at apex, about 8.5 cm. long and 3 cm. broad; petiole 1.5–1.8 cm. long, closely pubescent and sparingly long-ciliate; inflorescence terminal, 2–4-flowered, pedicels very short; petals 2.2–2.4 cm. long[1. sylvestris](#)
 Calyx with 10 accessory long-setose linear lobes, one behind (i.e. outside) each sepal as well as between the sepals:6
- 6 Petiole broad, flattened, densely covered with long setose cilia; stems sub-woody ascending, up to 50 cm. high; lamina lanceolate or elliptic-lanceolate, acute at each end, 6–10 cm. long, 1.5–4 cm. broad; inflorescence terminal, distinctly branched, up to 7-flowered, pedicels about 2 mm. long[2. antennina](#)
 Petiole only slightly flattened, sparsely pilose; stems very slender, creeping, rooting at the nodes; lamina ovate-lanceolate, acute at each end, 3–7 cm. long, 1.5–3.5 cm. broad; inflorescence terminal, 3–8-flowered [3. humilis](#)
- 7 Calyx-lobes 1.5–2 cm. long; leaves oblong-lanceolate, or linear-oblong, broad at base, obtuse or subacute, 3–8 cm. long, 0.6–1.3 cm. broad, glabrous except for the sparingly ciliate margin, midrib conspicuous beneath, two lateral nerves obscure; flowers solitary, pedicels 1 cm. long; fruit about 2 cm. long, crowned by the persistent calyx-lobes[5. cinerascens](#)
 Calyx-lobes less than 1 cm. long; leaves lanceolate, shortly narrowed at base, up to 3 cm. long, about 0.8 cm. broad, sparingly setose-ciliate on margin and midrib beneath; very obscurely nerved but with conspicuous midrib; flowers solitary or 2–3 in terminal cymes, pedicels 2–3 mm. long; fruit about 1 cm. long, with persistent calyx-lobes[6. glauca](#)
- 8 Flowers solitary, or up to 3 together:9
 Flowers more or less paniculate:13
- 9 Leaves glabrous on both surfaces except for sparse appressed setose-hairs on the midrib beneath and petiole, broadly ovate, cuneate at base, triangular acute at apex, 2–3 cm. long, 1.5–2.5 cm. broad, 3–5-nerved, rather long-petiolate; stems sparingly setose, decumbent, rooting at the nodes; calyx-tube rather sparsely pubescent with simple bristles[7. decumbens](#)
 Leaves setose on both surfaces:10
- 10 Petals not exceeding 2.5 cm. long:11
 Petals 4 cm. long; calyx-tube 5–6 mm. long, silky-tomentose with simple hairs, lobes 12–18 mm. long; stems woody and sarmentose, tomentose; leaves ovate-lanceolate to oblong, 3–8 cm. long, 1.5–3.5 cm. broad, densely pilose[11. jacquesii](#)
- 11 Stems very slender, decumbent or ascending, 2–10 cm. tall; hairs on stem, leaves and calyx very long (3–5 mm.); leaves ovate-lanceolate, 0.8–3.5 cm. long, 0.6–2 cm. broad; calyx-tube up to 5 mm. long, densely covered with long simple hairs; seeds smooth[8. pygmaea](#)
 Stems stouter and generally taller than above, hairs not exceeding 3 mm. long; calyx-tube 5 mm. or more long, usually with plumose hairs; seeds ridged or papillose:12
- 12 Herb with decumbent pilose stems rooting at the nodes; leaves varying from ovate-suborbicular to ovate-lanceolate, 1.5–6 cm. long, 1–2.5 cm. broad, petioles with long spreading hairs or with short hairs; calyx-tube more or less densely covered with simple and/or plumose bristles; larger stamens with connectives 4–7 mm.

- long and anthers 5.5–10 mm. long; seeds with concentric ridges, pitted in centre [9. *rotundifolia*](#)
- Shrub, to 1.5 m. high, much-branched with erect woody stems, leaves lanceolate to elliptic-lanceolate, 1.5–6.3 cm. long, 0.5–1.8 cm. broad, densely setose-pubescent on both surfaces, petiole up to 2 cm. long, shortly pubescent; calyx-tube sparingly covered with plumose bristles; larger stamens with connectives 1.5–2 mm. long and anthers 4–4.5 mm. long; seeds minutely papillose [10. *fruticosa*](#)
- 13** Leaves with stellate hairs, more or less closely tomentose beneath: **14**
- Leaves with simple hairs or bristles: **19**
- 14** Calyx-tube warty, covered with short stellate hairs; calyx-lobes early caducous; flowers produced before the leaves; lamina elliptic, acute at apex, rounded at base, about 5 cm. long and 3 cm. broad, prominently 5-nerved, petiole about 1 cm. long, densely tomentose [12. *leonensis*](#)
- Calyx-tube not warty, lobes persistent; petiole up to 2 mm. long, or leaves sessile; flowers produced on leafy shoots: **15**
- 15** Leaves linear, 2–4 cm. long, 2–3 mm. broad, with the two lateral nerves very close to the margin, densely woolly-tomentose beneath; internodes usually less than 2 cm [13. *linearis*](#)
- Leaves not linear, much exceeding 3 mm. broad, 5–9-nerved: **16**
- 16** Indumentum of calyx-tube predominantly of stellate hairs; leaves sessile, amplexicaul, 7–9-nerved: **17**
- Indumentum of calyx-tube predominantly of simple hairs; leaves very shortly petiolate, not amplexicaul, 5–7-nerved: **18**
- 17** Stem shortly stellate-tomentose; leaves ovate to ovate-lanceolate, 2–6 cm. long, up to 1.5 cm. broad; calyx-tube very shortly and sparingly stellate pubescent [14. *amplexicaulis*](#)
- Stem thickly pubescent with long spreading plumose or simple hairs as well as the shorter felt of stellate hairs; leaves broadly ovate and markedly amplexicaul, up to 5 cm. long and 4 cm. broad; calyx-tube densely stellate-tomentose [15. *sessilis*](#)
- 18** Calyx-tube sparingly pubescent with short simple hairs; stem stellate-tomentose; leaves narrowly ovate to lanceolate, up to 7 cm. long and 1.5 cm. broad [16. *canescens*](#)
- Calyx-tube densely hairy with long simple setose-hairs and short stellate hairs; stem with long spreading simple or plumose hairs, sometimes glandular, and with scattered short stellate hairs; leaves ovate or elliptic, up to 3.5 cm. long and 1.4 cm. broad [17. *bambutorum*](#)
- 19** Calyx-lobes setose, often densely so, on the outer surface as well as on the margins and tips: **20**
- Calyx-lobes glabrous outside, except for the ciliate margins and crest of long bristles at the tip; rarely with a few hairs on the midrib: **28**
- 20** Calyx-lobes lanceolate to oblong, not subulate: **21**
- Calyx-lobes subulate, long-bristly, caducous; calyx-tube 6–8 mm. long, 4–5 mm. broad, covered with simple bristles and bristle-tipped scales; petals up to 1 cm. long; leaves elliptic, cuneate to obtuse at base, usually 5-nerved, 4.5–10 cm. long, 1.5–5.5 cm. broad, petiole 1–3 cm. long [25. *multiflora*](#)
- 21** Tips of calyx-lobes and body of calyx-tube adorned with star-like clumps of large radiating bristles; lobes about 1 cm. long, obliquely oblong, tube about 1.3 cm. long, densely long-setose; leaves ovate, deeply cordate, 7–9-nerved with prominent venation, 4–11 cm. long, 2–6 cm. broad, densely hairy on both sides, strigose above, softer beneath [18. *graminicola*](#)
- Tips of calyx-lobes without star-like clumps of large bristles: **22**
- 22** Calyx-tube covered with round stalked processes covered with white hairs; calyx-tube 1.5–1.8 cm. long; petals about 4 cm. long; stems 4-angled with winged corners; petioles 1.5–4 cm. long, lamina oblong-ovate, rounded to cordate at base, 5–7-nerved, 7–15 cm. long, 3.5–6 cm. broad, glabrous except for closely appressed hairs on the nerves beneath and on the upper surface [19. *splendens*](#)
- Calyx-tube with simple or forked hairs, or with flat, bristle-tipped, scale-like projections: **23**
- 23** Stems more or less densely covered with simple hairs, leaves 5–7-nerved: **24**
- Stems glabrous or scabrid with short bristly scales; leaves lanceolate, 3–5-nerved, up to 20 cm. long and 6 cm. broad, petiole up to 6 cm. long; calyx-tube and lobes densely setose: **27**
- 24** Leaves much less than 15 cm. long; ovate to ovate-lanceolate: **25**
- Leaves 15–30 cm. long, 3.5–6 cm. broad, lanceolate, rounded at base, densely hirsute beneath, petiole 2–5 cm. long; stems very densely pilose, with long internodes 15–20 cm.; calyx-tube densely covered with long simple and shorter branched hairs and lanceolate scales [23. *pulcherrima*](#)
- 25** Stems and petioles with long shaggy hairs; bracts glabrous except for the ciliate margins; leaves ovate to ovate-lanceolate, rounded at base, gradually acute at apex, 4–9 cm. long, 1–4 cm. broad, lamina on both surfaces long-pilose, 5-nerved; calyx-tube setose with long and short simple hairs [20. *bamendae*](#)
- Stems with shorter appressed hairs; bracts pubescent all over: **26**
- 26** Calyx-tube about 1 cm. long and broad, with numerous imbricate bristle-tipped scales, densely bristly; calyx-

- lobes obliquely oblong-lanceolate, about 1 cm. long, densely pubescent; petals about 3 cm. long; bracts broad, rounded; leaves ovate to ovate-lanceolate, 5–8 cm. long, 1.5–4 cm. broad, obtuse or rounded at base [21. *perkinsiae*](#)
- Calyx-tube 6–8 mm, long and 4–5 mm. broad, with bristle-tipped scales only at apex and caducous with the lobes, shortly setose with simple hairs beneath; calyx-lobes narrowly lanceolate up to 3 mm. long; petals up to 1 cm. long; bracts acute; stems sharply 4-angled; leaves ovate, cordate at base, 7–9-nerved, up to 12 cm. long and 7 cm. broad, petiole about 5 mm. long [22. *brazzae*](#)
- 27** Stem glabrous between the nodes, with denticulate scales in the inflorescence region only; leaves with closely appressed setae fused to both surfaces [24. *elliottii* var. *elliottii*](#)
- Stem scabrid with numerous denticulate scales throughout its length; leaves densely long-setose with the setae fused to the surface for only a part of their length [24a. *elliottii* var. *setosior*](#)
- 28** Erect shrub to 3 m. high; stems appressed setulose, long-setose at nodes; leaves ovate-elliptic to oblong 5–9.5 cm. long, 2.5–5 cm. broad, softly pilose on both surfaces, petiole 1–1.5 cm.; calyx-tube 8–9 mm. long with long bristle-tipped scales, otherwise glabrous; calyx-lobes lanceolate, 1.5 cm. long, with bristles at tip, margins very sparsely ciliate; petals 2.5–3 cm. long [26. *idanreensis*](#)
- Herbs; stems with spreading hairs; leaves subsessile, or petiole up to 6 mm. long; calyx-lobes strongly ciliate: **29**
- 29** Calyx-tube at least 12 mm. in diam., densely covered with long bristles which completely hide the surface of the tube; calyx-lobes oblong about 1 cm. long, strongly ciliate with long bristles and with a large crest of bristles at the tip; petals about 3 cm. long; inflorescences rather few-flowered; stems and leaves with numerous long stiff bristles; leaves broadly lanceolate, subsessile, or with petiole up to 4 mm. long, 3–5-nerved .. [27. ? *longisetosa*](#)
- Calyx-tube less than 7 mm. in diam., with the surface clearly visible between the scales and bristles: **30**
- 30** Petals 2–4 cm. long; calyx-tube 8–10 mm. long; leaves lanceolate, 4–13 cm. long, 1–3 cm. broad, petiole up to 6 mm. long: **31**
- Petals 1–1.5 cm. long; calyx-tube up to 6 mm. long; flowers very numerous; stems densely covered with long spreading rather slender hairs; leaves linear to lanceolate, 4–10 cm. long, 0.5–2 cm. broad, pilose with long slender hairs [29. *irvingiana*](#)
- 31** Stems densely setose between the nodes [28. *grandiflora* var. *grandiflora*](#)
- Stems sparingly setulose between the nodes, with long bristles at the nodes [28a. *grandiflora* var. *lambii*](#)
- 32** Petals 4; bracts inconspicuous; calyx-tube short and becoming subglobose in fruit; leaves subsessile, lanceolate, subacute, 4–6 cm. long, 1–2 cm. broad, 3-nerved, pilose; flowers small in dense heads, surrounded by the uppermost leaves; calyx-tube glabrescent in the lower part; lobes lanceolate, 3 mm. long, alternating with bristle-tipped appendages [30. *phaeotricha*](#)
- Petals 5; bracts large and conspicuous, becoming dry in fruit: **33**
- 33** Calyx-tube with bristly hairs around the middle or all over the surface: **34**
- Calyx-tube glabrous except at base: **35**
- 34** Leaves broadly lanceolate, acute, rounded at base, shortly petiolate, 4–6 cm. long, 2 cm. broad, 5-nerved, slightly appressed-setulose; bracts 2 cm. long; no glandular hairs [31. *cornifolia*](#)
- Leaves broadly ovate, acutely acuminate, sometimes cordate at base, rather long-petiolate, 5–8 cm. long, 3–5 cm. broad, 5-nerved, long-pilose; bracts pilose and ciliate; stems densely shaggy with usually gland-tipped hairs [32. *paucistellata*](#)
- 35** Flowers single, each surrounded by an involucre of bracts about 1 cm. long; leaves broadly lanceolate, subacute, rounded at base, 6–10 cm. long, 2–4 cm. broad, 5-nerved, appressed-pilose on both surfaces, distinctly petiolate [33. *segregata*](#)
- Flowers several in a head with a common involucre of bracts: **36**
- 36** Stem glabrous, or with simple, not glandular, hairs: **37**
- Stems densely covered with soft gland-tipped hairs; leaves, etc., more or less as in *D. erecta* but calyx-lobes with a line of hairs up the middle [37. *lecomteana*](#)
- 37** Leaves lanceolate or linear-lanceolate, subsessile, or with petiole not exceeding 5 mm.; bracts membranous in fruit: **38**
- Leaves ovate, acute, rounded to cuneate at base, 5–13 cm. long, 3–6.5 cm. broad, 5-nerved, petiole 0.5–2.5 cm. long, strigose or pubescent on both surfaces, stems hirsute or strigose; bracts not membranous in fruit, calyx-lobes not hairy in the middle [36. *erecta*](#)
- 38** Stem glabrous or nearly so, quadrangular, almost white; petals blue or purple; bracts becoming membranous and almost hyaline in fruit; leaves 4–8 cm. long, 1–1.5 cm. broad, 3–5-nerved, sparingly setulose [34. *theifolia*](#)
- Stem hispid with long spreading hairs; petals white; leaves 4–5 cm. long, 6–10 mm. broad; leaves sparsely appressed-pilose above, shortly setulose beneath [35. *controversa*](#)

APD: Synonym of Heterotis sylvestris (Jacq.-Fél.) Jacq.-Fél.

Herb with long creeping stems rooting at the nodes, with erect branches; **in moist shady places**; petals pink.

Fr. G.: Ziama Forest, Macenta (Oct.) Jac.-Fel. 2088!

2. **Dissotis antennina** (Sm.) Triana in Trans. Linn. Soc. 28: 58 (1871); F.T.A. 2: 451; Gilg in Engl. Monogr. Afr. Melastom. 15; Jac.-Fel. l.c. 635.

APD: Synonym of Heterotis antennina (Sm.) Benth.

Osbeckia antennina Sm. (1813).

Lignieria alpestris A. Chev. Bot. 279.

Herb with ascending stems, to 18 in. high; perennating with tubers in the dry season.

Fr. G.: Kinsan, 2,500 ft. Jac.-Fel. 2087. Bilima Mt. Jac.-Fel. 1831. Ziama Mt., 2,500 ft., Macenta (Oct.) Jac.-Fel. 2089! Dalaba (Oct.) Chev. 18781! **S. L.:** Don! Sugar Loaf Mt., 1,000 ft. (Nov.) Deighton 5623!

3. **Dissotis humilis** A. Chev. & Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 4: 684 (1932); Jac.-Fel. op. cit. 10: 635 (1938). *APD acc*

Creeping herb; similar to above.

Fr. G.: Gangan Mt., Kindia (Nov.) Jac.-Fel. 220. Diaguissa (Oct.) Jac.-Fel. 2054!

4. **Dissotis pobeguinii** Hutch. & Dalz. F.W.T.A., ed. 1,1: 211 (1927); Kew Bull. 1928: 221.

APD: Synonym of Heterotis pobeguinii (Hutch. & Dalziel) Jacq.-Fél.

Erect unbranched herb, to 2 ft. high. with pale stem and large red-purple flowers.

Fr. G.: Baffing R., Douné (Aug.) Pobéguin 1695! Bilima Jac.-Fel. 2145!

5. **Dissotis cinerascens** Hutch. in Kew Bull. 1921: 372.

APD: Synonym of Heterotis cinerascens (Hutch.) Jacq.-Fél.

Erect glaucous herb, to 18 in. high, stems somewhat fleshy; petals magenta.

N. Nig.: Birnin Gwari (June) Keay FHI 25878! Bauchi Plateau: Naraguta (June) Lely 259! P. 331! Vom Dent Young 94!

Also in **French Camerouns** and **French Congo**.

6. **Dissotis glauca** Keay in Kew Bull. 1952: 545 (1953).

APD: Synonym of Heterotis rupicola (Gilg ex Engl.) Jacq.-Fél.

Dissotis ruficola Hutch. & Dalz. F.W.T.A., ed. 1, 1: 211 (1927); Kew Bull. 1928: 221; not of Gilg ex Engl. (1921).

Stem prostrate, rooting at the nodes; **in dry places amongst rocks**.

S. L.: Hart! Sugar Loaf Mt., (Dec.) Sc. Elliot 3977! **Lib.:** Zwedru, Tchien (Aug.) Baldwin 7065! Tawata, Boporo (Nov.) Baldwin 10351!

7. **Dissotis decumbens** (P. Beauv.) Triana l.c. 58 (1871); Gilg l.c. 15.

APD: Synonym of Heterotis decumbens (P. Beauv.) Jacq.-Fél.

Melastoma decumbens P. Beauv. (1806).

Dissotis laevis (Benth.) Hook. f.—F.T.A. 2: 451.

Stems creeping with erect branches; flowers rose, 1/2-3/4 in. diam.

S. Nig.: Nun R. (Aug.) T. Vogel 36! Degema Talbot! **F. Po:** (Dec.) Guinea 258!

Also in **French Cameroons**, **Gabon**, **Congo** and **Angola**.

8. **Dissotis pygmaea** A. Chev. & Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 4: 685 (1932).

APD: Synonym of Heterotis pygmaea (A. Chev. & Jacq.-Fél.) Jacq.-Fél.

A delicate herb, sometimes growing in clumps; on moist shaded rocks.

Fr. G.: Mt. Gangan, Kindia, (Nov.) Jac.-Fel. 195. Benna massif (Nov.) Jac.-Fel. 2108!

[This is possibly the same as *D. rupicola* Gilg ex Engl. Pflanzenw. Afr. 3, 2: 748 (1921), described from Sinoe Basin, Liberia.]

9. **Dissotis rotundifolia** (Sm.) Triana l.c. 58 (1871); Gilg l.c. 15. *APD acc*

APD: Synonym of Heterotis prostrata (Thonn.) Benth.

Osbeckia rotundifolia Sm. (1813).

Dissotis plumosa (D. Don) Hook. f.—F.T.A. 2: 452; Chev. Bot. 274.

Dissotis prostrata (Thonn.) Hook. f.—F.T.A. 2: 452; Chev. Bot. 274.

Dissotis deistellii Gilg ex Engl. Pflanzenw. Afr. 3, 2: 748 (1921).

A common and variable decumbent herb, often in damp places; flowers pink or mauve, about 2 in. diam.

Fr. G.: Mamou (Jan.) Chev. 20386. Beyla (Mar.) Chev. 20870. Macenta Jac.-Fel. 839. **S. L.:** Afzelius! T. Vogel 152! 154! Lester Peak (Dec.) Sc. Elliot 3874! Njala (Sept.) Deighton 2101! Musaia (Apr.) Deighton 5389! **Lib.:** Kakatown Whyte! Dukwia R. (Oct., Nov.) Cooper 23! **Iv. C.:** Mankono (June) Chev. 21932! **G. C.:** Aburi (Oct.) Johnson 461! Bonpata (Dec.) Dalz. 137! Essiama, W.P. (Apr.) Williams 438! **Togo:** Misahöhe (Nov.) Mildbr. 7390! **N. Nig.:** Patti Lokoja (Sept.) T. Vogel 184! Bauchi Plateau (May) Lely P. 289! **S. Nig.:** Abeokuta Irving 55! Lagos (Oct.) Dalz. 1187! **Br. Cam.:** Buea (Nov.) Migeod 7! **F. Po:** Musola (Jan.) Guinea 1259!

Widespread in tropical Africa.

10. **Dissotis fruticosa** (Brenan) Brenan & Keay in Kew Bull. 1952: 547 (1953). *APD acc*

Dissotis rotundifolia var. **fruticosa** Brenan in Kew Bull. 1950: 227.

Erect shrub of spreading habit, to 5 ft. high. on rocky hills; young stems, petioles and nerves pink; petals pale pink, opening in the morning and soon falling.

S. Nig.: Ondo (Sept.) Keay FHI 22569! Idanre Hills (Oct.) Keay FHI 25503! 25512!

11. **Dissotis jacquesii** A. Chev. in Bull. Mus. Hist. Nat. Sér. 2, 4: 686 (1932); Jac.-Fel. in Bull. Soc. Bot. Fr. 82: 284, with fig. (1935).

APD: Synonym of Heterotis jacquesii (A. Chev.) Aké Assi

Plant with woody sarmentose branches, growing in clumps and reaching several metres; petals violet.

Fr. G.: Mt. Gangan, Kindia Jac.-Fel. 240. Ditinn Jac.-Fel. 586. Pita Jac.-Fel. 679! Benna Jac.-Fel. 2097. **S. L.:** Picket Hill (Sept.) T. S. Jones 196! **Iv. C.:** Tonkouli Jac.-Fel. 1270.

12. **Dissotis leonensis** Hutch. & Dalz. F.W.T.A., ed. 1,1: 211 (1927); Kew Bull. 1928: 222. *APD acc*

Shrub, to 6 ft. high; flowers purple, produced before the leaves.

Fr. G.: Pita Jac.-Fel. 743. Kindia Jac.-Fel. 2142. Fouta Djallon Pobéguin 2281. **S. L.:** Kessewe Hill (Apr.) Lane-Poole 126! Sankon Biriwa (Feb.) Deighton 3507! Loma Mts. (Nov.) Jaeger 661!

13. **Dissotis linearis** Jac.-Fel. in Bull. I.F.A.N. 15: 980, fig. 2 (1953). *APD acc*

Dissotis incana of Chev. Bot. 273 and of F.W.T.A., ed. 1, 1: 212, partly (Chev. 13322), not of (E. Mey. ex Hochst.) Triana.

Erect herb in marshy soil.

Fr. G.: Dinguiraye (Dec.) Jac.-Fel. 1467! Timbo (Apr.) Chev. 13322; 13599. Labé to Mali Chev. 34391. Bouria to Ditinn Pobéguin 1416.

14. *Dissotis amplexicaulis* Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 8: 108 (1936).

*APD: Synonym of *Heterotis amplexicaulis* (Jacq.-Fél.) Aké Assi*

Dissotis gilgiana Hutch. & Dalz. F.W.T.A., ed. 1, 1: 212 (1927); Kew Bull. 1928: 222; not of De Wild.

Dissotis incana var. *gilgiana* A. Chev. Bot. 274.

Plant 2–3 ft. high; flowers a fine red; in moist ground.

Fr. Sud.: Sicoro (Jan.) Chev. 228! **Fr. G.:** Toukan to Bouria (Apr.) Chev. 12924! Douné (Dec.) Chev. 14634! **S. L.:** Erimakuna Sc. Elliot 5218! **Iv. C.:** Mankono circle (July) Chev. 21997!

15. *Dissotis sessilis* Hutch. ex Brenan & Keay in Kew Bull. 1952: 545 (1953). *APD acc*

Shrubby perennial herb, 2–4 ft. high; flowers cerise.

S. L.: Bintumane Peak, 5,000–6,000 ft. (Nov., Jan.) Glanville 386! 464! T. S. Jones 80! 93! Nichols 9! Loma Mts. (Nov.) Jaeger 491!

16. *Dissotis canescens* (Graham) Hook. f. in F.T.A. 2: 453 (1871).

*APD: Synonym of *Heterotis canescens* (E. Mey. ex Graham) Jacq.-Fél.*

Osbeckia canescens Graham (1840).

Osbeckia incana E. Mey. ex Hochst. (1845–6).

Dissotis incana (E. Mey. ex Hochst.) Triana; Gilg l.c. 17; F.W.T.A., ed. 1, 1: 212, partly.

Erect herb 3–4 ft. high in wet places; flowers pink or purple.

N. Nig.: Kontagora (Dec.) Dalz. 82! Bauchi Plateau: Naraguta (Nov.) Lely 720! Vom Dent Young 97! Ropp (Dec.) Savory UCI 121!

[These specimens have the calyx-tube sparsely covered with simple instead of stellate hairs as in other forms of the species which is widespread in tropical and southern Africa; our form has been described as var. *sudanensis* Jac.-Fel. in Bull. I.F.A.N. 15: 980 (1953).]

17. *Dissotis bambutorum* Gilg & Ledermann ex Engl. Pflanzenw. Afr. 3, 2: 750 (1921).

*APD: Synonym of *Heterotis angolensis* var. *bambutorum* (Gilg & Ledermann ex Engl.) Jacq.-Fél.*

Erect herb, to 3 ft. high, at edge of forest and by streams; flowers bright pink.

Br. Cam.: Lakom, Bamenda, 6,000 ft. (Apr.) Maitland 1679! Near L. Bambulue, 6,200 ft. (Jan.) Keay FHI 28370! Near Bamenda, 6,000–7,500 ft. (Jan.) Migeod 382! 422!

Also in French Cameroons.

18. *Dissotis graminicola* Hutch. in Kew Bull. 1921: 371. *APD acc*

Erect shrubby herb, to 6 ft. high; flowers about 2 1/2 in. diam., bluish purple or magenta.

N. Nig.: between Abuja and Kagarko (Dec.) Meikle 1588! Dogon Kurmi, Jemaa (Nov.) Keay FHI 21734! Naraguta (Aug., Jan.) Lely 543! P. 126! Jos (Nov.) Keay FHI 21027!

19. *Dissotis splendens* A. Chev. & Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 4: 686 (1932). *APD acc*

Perennial, to 6 ft. high with 4-winged stems and large mauve flowers.

Fr. G.: Gangan Mt., Kindia Jac.-Fel. 207. Pita Jac.-Fel. 1960. Dalaba Jac.-Fel. 2053. Benna Jac.-Fel. 2098.

20. *Dissotis bamendae* Brenan & Keay in Kew Bull. 1952: 546 (1953).

*APD: Synonym of *Dissotis princeps* (Kunth) Triana var. *princeps**

Stout herb to 6 ft. high; flowers about 2 in. diam., deep pink or violet.

Br. Cam.: Bamenda, 5,400–7,000 ft. (Jan.) Migeod 392! Keay FHI 28344! Nchan, Bamenda, 5,000 ft. (June) Maitland 1734!

Also in **French Cameroons**.

21. *Dissotis perkinsiae* Gilg in Engl. Monogr. Afr. Melastom. 21 (1898). *APD acc*

Shrub, 3–5 ft. high; flowers about 2 1/2 in. diam., reddish-violet or deep mauve-purple.

Togo: Bismarckburg (Feb.) Büttner 385! Misahöhe (Nov.) Mildbr. 7254! **S. Nig.:** Unya, Obudu (Dec.) Keay & Savory FHI 25020! **Br. Cam.:** Tinta, Mamfe (Jan.) Jeme FHI 2033! Bamenda, 5,000 ft. (Apr.) Maitland 1429!

Also in **French Cameroons**.

22. *Dissotis brazzae* Cogn. in DC. Monogr. 7: 372 (1891); Exell in J. Bot. 67, Suppl. 1: 179 (1929). *APD acc*

Dissotis multiflora of Gilg l.c. 18, partly; of F.W.T.A., ed. 1, 1: 212, partly; not of Triana.

Shrubby herb, to 8 ft. high; flowers mauve or purple.

Fr. G.: Macenta (Oct.) Jac.-Fel. 1090! Baldwin 9834! Nzérékoré (Oct.) Baldwin 9701! Mt. Nimba (Sept.) Schnell 3589! **S. L.:** Benikoro (Oct.) Thomas 2889! **Togo:** Misahöhe (Nov.) Mildbr. 7201! **Br. Cam.:** Bamenda, 7,000 ft. (Oct.) Johnstone 242/31!

Also in **Congo, Uganda** and **Angola**.

23. *Dissotis pulcherrima* Gilg l.c. 20 (1898).

APD: *Synonym of Dissotis thollonii Cogn. ex Büttner var. thollonii*

"A 9–12-ft. high, stiff, erect, unbranched shrub which only after flowering produces adventitious shoots; flowers lilac, about 1 1/2 in. diam."

Togo: Misahöhe Baumann 387. Bismarckburg (Jan., Feb.) Büttner 369.

24. *Dissotis elliotii* Gilg var. *elliotii*-Gilg l.c. 19 (1898). *APD acc*

Dissotis thollonii A. Chev. Bot. 275, not of Cogn.

Dissotis floribunda A. Chev. Bot. 273.

Stout herb or undershrub to 8 ft. high; flowers red- or blue-purple, about 1 1/2 in. diam.

Fr. Sud.: Koundian (Feb.) Chev. 417! **Fr. G.:** near Mamou (Mar.) Dalz. 8378! **S. L.:** Kukuna (Jan.) Sc. Elliot 4513! Likuru (Feb.) Sc. Elliot 4996! Kamalo (Feb.) Deighton 3497! Bintumane Peak, 4,500–5,400 ft. (Jan.) T. S. Jones 89! 96! **Lib.:** Mao R. (Feb.) Bequaert 54! **N. Nig.:** Vom Dent Young 99! **Br. Cam.:** Lakom, Bamenda (Apr.) Maitland 1677! Near Batibo (Jan.) Keay FHI 28329! Bamenda (May) Maitland 1444!

24a. *Dissotis elliotii* var. *setosior* Keay & Brenan in Kew Bull. 1950: 342 (1951).

APD: *Synonym of Dissotis thollonii Cogn. ex Büttner var. thollonii*

Similar to above, but with scabrid stem and more densely setose leaves.

S. Nig.: Balleghete, Obudu (Jan.) Rosevear 4/30! Koloishe, 5,000–5,400 ft. (Dec.) Keay & Savory FHI 25080! Ikwetete (Dec.) Keay & Savory FHI 25236!

25. *Dissotis multiflora* (Sm.) Triana l.c. 58 (1871); Gilg l.c. 18 (excl. syn. *D. brazzae* Cogn.); Chev. Bot. 274. *APD acc*

Osbeckia multiflora Sm. (1813)—F.T.A. 2: 442.

Osbeckia liberica Stapf in J. Linn. Soc. 37: 98 (1905); F.W.T.A., ed. 1, 1: 208.

Shrubby herb, to 4 ft. high, **usually in moist places**; flowers pink, about 1 in. diam.

Fr. G.: Nzérékoré (June) Jac.-Fel. 954! 1103! **S. L.:** Don! Sherbro Sc. Elliot 5788! Kenema (Jan.) Thomas 7684! Njala (Sept.) Deighton 2122! Peri, Gaura (Oct.) Deighton 5209! **Lib.:** Monrovia Whyte! Sinoe Basin Whyte! Du R. (July) Linder 118! **Iv. C.:** fide Chev. l.c. **S. Nig.:** Onitsha Barter 1796! Eket Talbot 3358! Oban Talbot! **Br. Cam.:** Rio del Rey Johnston!

Also in **French Camerouns** and **Congo**.

26. **Dissotis idanreensis** *Brenan* in Kew Bull. 1950: 214. *APD acc*

Erect shrub to 10 ft. high, on rocky hills where it flowers when leafless, and in swampy grassland; petals magenta.

S. Nig.: R. Oshun, Ibadan (Nov.) Keay FHI 28139! Idanre Hills (Jan.) Brenan & Keay 8694!

27. **Dissotis? longisetosa** *Gilg & Ledermann ex Engl.* Pflanzenw. Afr. 3, 2: 752 (1921). *APD acc*

Erect, sparingly branched herb with rough brown bristles; flowers purple-pink.

S. Nig.: Koloishe Mt., Obudu, 5,000–5,400 ft. (fl. & fr. Dec.) Keay & Savory FHI 25084! **Br. Cam.:** L. Bambulue, Bamenda, 7,000 ft. (Oct.) Johnston 220/31!

Also in **French Camerouns**.

[These specimens agree perfectly with specimens from the type locality—the Bambuto Mts.—but differ from Engler's description in having asymmetrical calyx lobes.]

28. **Dissotis grandiflora** (*Sm.*) *Benth. var. grandiflora*—F.T.A. 2: 455; Gilg l.c. 21; Chev. Bot. 273. *APD acc*

Osbeckia grandiflora *Sm.* (1813).

Dissotis djaloni *A. Chev.* Bot. 273.

Stem 1–2 ft. from a woody tuberous base; flowers purple, 2 in. or more in diam.

Fr. G.: (Sept.) Farmar 261! Fouta Djalon Heudelot 779! Mali Jac.-Fel. 1979. Dalaba Jac.-Fel. 2051. **S. L.:** Don! Sc. Elliot 4490! Hastings Dawe! Mange Bureh (Jan.) Deighton 1046! Musaia (Apr.) Deighton 5416! **Lib.:** Pandamai (Mar.) Bequaert 96! **Iv. C.:** fide Chev. l.c.

28a. **Dissotis grandiflora var. lambii** (*Hutch.*) *Keay* in Kew Bull. 1952: 545 (1953). *APD acc*

Dissotis lambii *Hutch.* in Kew Bull. 1916: 230; F.W.T.A., ed. 1, 1: 212.

Stem 4–5 ft., simple or sparingly branched; flowers mauve or blue-purple, about 3 in. diam.

Fr. G.: (July) Collenette 77! **G. C.:** Wanki, Ashanti (June) Chipp 483! **N. Nig.:** Kaduna (Oct.) Lamb 58! Naraguta (June) Lely 285! 484! P. 578!

29. **Dissotis irvingiana** *Hook.*, Bot. Mag. t. 5149 (1859); F.T.A. 2: 453; Gilg l.c. 20; Chev. Bot. 274. *APD acc*

Osbeckia calotricha of Chev. Bot. 274, partly, not of Gilg.

Stems erect, branched, 4-angled, 3–4 or more ft. high; flowers rose-purple. Flourishing in moist places, but abundant also in dry bush.

Gam.: Brown-Lester 21! **Port. G.:** Pussubé (Mar.) Esp. Santo 1143! **Fr. Sud.:** Sicoro (Jan.) Chev. 230. **Fr. G.:** Timbo Pobéguin 1697! Kankan Jac.-Fel. 496. Macenta Jac.-Fel. 1308. **S. Olokemeji Foster 302! **Br. Cam.:** Bamenda to Kentu (June) Maitland 1551!

Also in **French Camerouns** and **Ubangi-Shari-Chad**.

30. **Dissotis phaeotricha** (*Hochst.*) *Triana* in Trans. Linn. Soc. 28: 58 (1871); F.T.A. 2: 451; Gilg l.c. 14. *APD acc*

Osbeckia phaeotricha *Hochst.* (1844).

Dissotis villosa *Hook. f.* in F.T.A. 2: 450 (1871).

Osbeckia postpluvialis Gilg.

Herb 6–18 in. high; petals 4, mauve or purple; in moist places and cultivated fields.

Gam.: Dawe 31! **Fr. G.:** Youkounkoun Jac.-Fel. 702. Gaoual Jac.-Fel. 712. Dinguiraye Jac.-Fel. 1456. **N. Nig.:** Nupe Barter 895! 1315! Kontagora (Nov.) Dalz. 84! Anara F.R., (Oct., Nov.) Keay FHI 5448! 28119! Vom Dent Young 100! Ropp (July) Lely 447! Abinsi (Apr.) Dalz. 755!

Widespread in tropical Africa and in S. Africa.

31. *Dissotis cornifolia* (Benth.) Hook. f. in F.T.A. 2: 448 (1871); Gilg l.c. 13.

APD: Synonym of Melastomastrum cornifolium (Benth.) Jacq.-Fél.

Heterotis cornifolia Benth. (1849).

Herb, to 3 ft. high. in moist places; petals mauve to purple.

S. L.: Afzelius! Ronietta (Nov.) Thomas 5326! 5444! Benikoro (Oct.) Thomas 2892! Njala (June) Deighton 1745! Rhombe (Mar.) Adames 152! **Lib.:** Grand Bassa (July) T. Vogel 80! Monrovia (July) Linder 30!

32. *Dissotis paucistellata* Stapf in J. Linn. Soc. 37: 99 (1905).

APD: Synonym of Melastomastrum afzelii var. *paucistellatum* (Stapf) Jacq.-Fél.

A hirsute herb, 2–3 ft. high; flowers rose, about 2 in. diam., in involucrate heads. Very similar to and easily mistaken for *Tristemma hirtum* but distinguished by the usually gland-tipped hairs, by the calyx being bristly all over, and the unequal stamens.

Fr. G.: Mamou Jac.-Fel. 776. **S. L.:** Kabusa, Limba (Apr.) Sc. Elliot 5478! Rowala (July) Thomas 1042! Bumbuna (Oct.) Thomas 3764! Njala (Oct.) Deighton 1418! **Lib.:** Monrovia Whyte! Kakatown Whyte! Kolubanu (Oct.) Linder 1133! Mt. Barclay (Jan.) Dalz. 8092! **G. C.:** Axim Joly.

[M. Jacques-Félix informs me that Dr. Joly's specimen, cited by Cogniaux l.c. 364 as *D. afzelii* Hook f., is *D. paucistellata* Stapf. If Joly's specimen is in fact identical with Afzelius s.n. type of *D. afzelii* (a specimen which has not been seen either by Hutchinson, Jacques-Félix or myself), then *D. paucistellata* Stapf must, as would appear likely from the descriptions, be regarded as a synonym of *D. afzelii* Hook. f.—F.T.A. 2: 449—R.W.J.K.]

33. *Dissotis segregata* (Benth.) Hook. f. in F.T.A. 2: 448 (1871); Gilg l.c. 12.

APD: Synonym of Melastomastrum segregatum f. *segregatum*

Heterotis segregata Benth. (1849).

Stem 4-angled, with bristles at the nodes, shrubby below; 2–3 ft. high; at edges of swamps, etc.; flowers red- or blue-purple, about 1 1/2 in. diam.

N. Nig.: Nupe Barter 1311! Lokoja Ansell! **S. Nig.:** Lagos (Apr.) Dalz. 1185! Nun R. (Aug.) T. Vogel 12! Ibo country (Aug.) T. Vogel 9! Calabar (Sept.) Holland 131!

Widespread in tropical Africa, reaching S. Rhodesia and Angola.

34. *Dissotis theifolia* (G. Don) Hook. f. in F.T.A. 2: 449 (1871); Gilg l.c. 13, t. 2A; Chev. Bot. 275.

APD: Synonym of Melastomastrum theifolium (G. Don) A. Fern. & R. Fern. var. *theifolium*

Shrubby herb, 2–6 ft. high; branches 4-angled, white, with bristles at the nodes; flowers red- to blue-purple, 1–1 1/2 in. diam. Often in dry rocky places.

Fr. G.: Fouta Djallon (Sept.–Oct.) fide Chev. l.c. **S. L.:** Don! Hills above Freetown (Nov., Dec.) Sc. Elliot 3840! Deighton 232! Mamunta (Nov.) Deighton 4935! **Togo:** Agome Mts. (Oct.) Keay & Savory FHI 25016! **Br. Cam.:** Bambui, Bamenda (Apr.) Maitland 1627!

Also in French Cameroons.

35. **Dissotis controversa** (A. Chev. & Jac.-Fel.) Jac.-Fel. in Bull. Mus. Hist. Nat. Sér. 2, 7: 372 (1935).

APD: *Synonym of Melastomastrum theifolium var. controversum* (A. Chev. & Jacq.-Fél.) Jacq.-Fél.

Tristemma controversa A. Chev. & Jac.-Fel. in op. cit. 4: 681 (1932).

Erect herb, to 3 ft. high, with tuberous roots; flowers pure white.

Fr. G.: Gangan Mt., Kindia (Oct.) Jac.-Fel. 194!

36. **Dissotis erecta** (Guill. & Perr.) Dandy in F. W. Andr. Fl. Pl. A.—E. Sudan 1: 192 (1950).

APD: *Synonym of Melastomastrum capitatum* (Vahl) A. Fern. & R. Fern. var. *capitatum*

Tristemma erectum Guill. A. Perr. Fl. Seneg. 312 (1833).

Heterotis capitata Benth. (1849).

Dissotis capitata (Benth.) Hook. f. in F.T.A. 2: 449 (1871); Gilg l.c. 13; F.W.T.A., ed. 1, 1: 213.

Dissotis hirsuta Hook. f. in F.T.A. 2: 450 (1871).

? **D. radicans** Hook. f. in F.T.A. 2: 450 (1871).

Shrubby herb to 4 ft. high, in dry situations as well as by streams; flowers purple, red, pink or rarely white.

Fr. Sud.: Sikasso (May) Chev. 791. **Fr. G.:** Heudelot 826! Macenta (Oct.) Baldwin 9819! Diaguissa (Apr., Sept.) Chev. 13469; 13464; 18583. **S. L.:** Don! T. Vogel 175! Kaballa (Sept.) Darko 389! **Togo:** Misahöhe (May) Baumann 302, and other localities fide Gilg l.c. **N. Nig.:** Nupe Barter 1312! Anara F.R. (Oct.) Keay FHI 5450! Vodni, 4,600 ft. (July) Lely 425! Bauchi Plateau (July, Oct.) Lely P. 380! P. 797! Abinsi (June) Dalz. 762! **S. Nig.:** Lagos Colony MacGregor 36! Sapoba (Mar.) Jones FHI 6112! Bateriko (June) Jones FHI 18985!

Extends to **Uganda** and **Angola**.

37. **Dissotis lecomteana** Hutch. & Dalz. F.W.T.A., ed. 1, 1: 215 (1927); Kew Bull. 1928: 222.

APD: *Synonym of Melastomastrum afzelii var. lecomteanum* (Hutch. & Dalziel) Jacq.-Fél.

Habit of the preceding; about 3 ft. high; flowers red.

Fr. G.: Dindea (Sept.) Pobéguin 1699! Kindia (May) Jac.-Fel. 1643! Fouta Djallon Jac.-Fel. 553; 747. **S. L.:** near Falaba Sc. Elliot 5174! Erimakuna (Mar.) Sc. Elliot 5241!

1. **Dissotis afzelii** Hook. f.—F.T.A. 2: 449.

See under *D. paucistellata* Stapf above.

Imperfectly known species.

2. **Dissotis rupicola** Gilg ex Engl. Pflanzenw. Afr. 3, 2: 748 (1921), not of Hutch. & Dalz. (1927).

Near *D. decumbens* (P. Beauv.) Triana, with simple hairs on calyx-tube, but with smaller leaves; in rocky places. Quite possibly the same as *D. pygmaea* A. Chev. & Jac.-Fel.

Lib.: Sinoe Basin—no spec. cited.

Imperfectly known species.

3. **Dissotis conrauii** Gilg ex Engl. l.c. 752.

Shrub about 5 ft. high, with long-petioled, lanceolate, 5-nerved leaves, in grassland. Near *D. pulcherrima* Gilg and *D. elliotii* Gilg.

Br. Cam.: Bali—no spec. cited.

Imperfectly known species.

4. **Dissotis kerstingii** Gilg ex Engl. l.c. 752.

Near *D. irvingiana* Hook., but with very long internodes and narrowly lanceolate, distinctly serrate leaves.

Togo: Basari-no spec. cited.

Imperfectly known species.

5. *Dissotis* sp.

Probably new. Herb to 6 ft. high; flowers red-purple.

Lib.: Mt. Bili, Sanokwele (Dec.) Barker 1148!

Imperfectly known species.

20. MEMECYLON

Linn.—*F.T.A.* 2: 460.

- 1 Leaves without well-marked lateral ascending nerves, only the midrib prominent on lower surface; flowers axillary in compound umbels:2
- Leaves with well-marked lateral ascending nerves prominent on lower surface: 11
- 2 Calyx not reaching more than halfway up the bud, thus leaving the corolla largely exposed well before it opens; fruits ellipsoid or subglobose:3
- Calyx reaching well beyond halfway up the bud, thus covering most of the corolla until just before it opens; fruits subglobose:..... 10
- 3 Inflorescence up to 3 cm. long with branches not exceeding 1 cm. long:.....4
- Inflorescence 4–7 cm. long, lateral branches (sometimes themselves branched) 1–2 cm. long, usually 4 together in 2 or 3 whorls; leaves elliptic to oblong, 9–17 cm. long, 3–7 cm. broad, caudate-acuminate; transverse and intra-marginal nerves just visible; fruits oblong-ellipsoid, about 6 mm. broad and 12 mm. long[8. obanense](#)
- 4 Flowers 1–2 mm. diam.:.....5
- Flowers up to 1 mm. diam., very numerous in well-branched cymes; fruits subglobose, 5–7 mm. diam.; leaves elliptic, long-acuminate, 5–8 cm. long, 1.5–4 cm. broad[7. dasyanthum](#)
- 5 Receptacle cupuliform; fruits ellipsoid or subglobose:.....6
- Receptacle patelliform; fruits subglobose; cymes lax:9
- 6 Corolla acute in bud; calyx subtruncate; fruit ellipsoid:7
- Corolla rounded at apex in bud; fruit ellipsoid or subglobose:8
- 7 Cymes usually well-developed, peduncle more than 5 mm. long, pedicels at least 4 mm. long; often with more than 5 fruits in each cyme; leaves elliptic-lanceolate, gradually long-acuminate, 5–12 cm. long, 1.5–5 cm. broad, petiole generally swollen at base; fruits about 7 mm. broad and 10 mm. long[1. afzelii](#)
- Cymes contracted, peduncle up to 5 mm. long, pedicels 1–2 mm. long (up to 3 mm. in fruit); rarely with more than 2 or 3 fruits in each cyme; leaves oblong-elliptic, rather abruptly long-acuminate, 8–14 cm. long, 3–6 cm. broad; fruits about 8 mm. broad and 12 mm. long[2. aylmeri](#)
- 8 Cymes lax, with peduncle up to 3 cm. long; calyx sinuate-dentate; fruits oblong-ellipsoid, about 6 mm. broad and 13 mm. long; leaves lanceolate to oblong-lanceolate, gradually acuminate, about 15 cm. long and 6 cm. broad; a sarmentose shrub[3. adamii](#)
- Cymes dense, with peduncle less than 2 mm. long, flowers glomerate; fruits subglobose; leaves oblong-elliptic, rather abruptly long- or caudate-acuminate (acumen about 2 cm. long), 10–14 cm. long, 3–5 cm. broad [4. viride](#)
- 9 Corolla acute in bud; leaves elliptic, obtuse, acute, or obtusely acuminate at apex, 6–14 cm. long, 2.5–5.5 cm. broad; cymes often borne on leafless parts of the stem below the leaves; fruits about 8 mm. diam. [5. normandii](#)
- Corolla rounded at apex in bud; leaves oblong-elliptic, rather abruptly long-acuminate, 8–14 cm. long, 3–6 cm. broad; fruits about 10 mm. diam. [6. candidum](#)
- 10 Calyx about 2 mm. long, subtruncate or very shortly and irregularly lobed; cymes well-branched, many-flowered; leaves elliptic, long-acuminate, 6–12 cm. long, 2.5–6 cm. broad, drying greyish-green; fruits about 8 mm. diam. [9. polyanthemus](#)
- Calyx 3–4 mm. long, with distinct broadly triangular lobes; leaves oblong or oblong-lanceolate, rather abruptly acuminate, 6–20 cm. long, 3–7 cm. broad; leaves thickly coriaceous with inrolled margins, drying reddish-brown; fruits 13–17 mm. diam. [10. lateriflorum](#)

- 11 Flowers in lax inflorescences; pedicels at least 2 mm. long; peduncles and pedicels both well-developed: **12**
 Flowers in dense sessile or pedunculate glomerules or fascicles; flowers sessile or subsessile, or if pedicels well-developed then peduncle very short and flowers fasciculate; bracts and bracteoles persistent:..... **21**
- 12 Inflorescences densely puberulous, bracteoles at the base of the pedicels and not immediately below the calyx-tube; inflorescences terminal as well as axillary, at least 5 cm. long:..... **13**
 Inflorescences glabrous: **14**
- 13 Branchlets, petioles and main nerves beneath quite glabrous; flowers very numerous in fairly long-pedunculate cymes, sometimes nearly as long as the leaves; leaves ovate or ovate-elliptic, obtuse at base or becoming rounded or cordate, with short flattened petioles, shortly acuminate, 12–18 cm. long, 6–10 cm. broad; transverse nerves more or less conspicuous beneath; leaves often purplish-brown when dry; fruits globose, 6 mm. in diam. [11. blakeoides](#)
 Branchlets, petioles and main nerves beneath puberulous; inflorescences 5–7 cm. long; petiole 8–11 mm. long, lamina elliptic-lanceolate, cuneate at base, acuminate at apex, 10–14 cm. long, 4.5–5 cm. broad, transverse nerves visible, except near the base [12. fleuryi](#)
- 14 Bracteoles immediately below the calyx-tube; transverse nerves inconspicuous: **15**
 Bracteoles at the base of the pedicels; inflorescences mostly of pedunculate umbels or compound umbels:..... **16**
- 15 Leaves 4–6.5 cm. broad, 7–12 cm. long, coriaceous, ovate to ovate-elliptic, obtuse to cuneate at base, strongly 3-nerved, main nerves impressed above; flowers in axillary cymes up to 2 cm. long [13. dinklagei](#)
 Leaves 2–4.5 cm. broad, 5–9 cm. long, papery, elliptic, cuneate at the base, gradually acuminate, 3-nerved, with lateral ascending nerves considerably weaker than the midrib, impressed above; flowers in axillary cymes up to 2 cm. long; fruit 5 mm. in diam. [14. barteri](#)
- 16 Lateral nerves equally prominent with the transverse nerves and looped with them almost from the base: **17**
 Lateral nerves considerably more prominent than the transverse nerves, more or less straight and not bowed to loop with the transverse nerves except near the leaf apex: **18**
- 17 Nerves impressed above; pedicels 4–5 mm. long; leaves oblong-elliptic to broadly ovate, rounded or slightly cuneate at base, acutely acuminate, with 6–15 pairs of transverse nerves prominent beneath, looping with the prominent ascending laterals; inflorescence of 1–3 axillary pedunculate umbels, with long pedicels [15. zenkeri](#)
 Nerves slightly prominent above; pedicels 1–2 mm.; leaves oblong-elliptic, obtuse to cuneate at base, acuminate, with 8–12 pairs of transverse nerves looping with the rather weaker ascending laterals; inflorescence a 2–3-times branched compound umbel, with short pedicels; fruits ellipsoid, about 1 cm. long [16. englerianum](#)
- 18 Pedicels 3–5 mm. long, inflorescences of simple pedunculate 2–3-flowered umbels; leaves cuneate at base, up to 9 cm. long and 4.5 cm. broad;..... **19**
 Pedicels 5–8 mm. long, inflorescences simple or branched, several-flowered; leaves broadly elliptic to ovate, obtuse, rounded or sometimes cuneate at base, shortly acuminate, usually over 6.5 cm. long and 3 cm. broad; **20**
- 19 Leaves thin, elliptic to ovate, gradually long-acuminate, acumen about 1/3 as long as the blade, 4–7 cm. long, 1.8–3 cm. broad; peduncles about 5 mm. long, like the pedicels, very slender [17. golaense](#)
 Leaves coriaceous, elliptic, shortly and gradually acuminate, narrowed to the acutely cuneate base, 4–9 cm. long, 3–4.5 cm. broad; inflorescence of several pedunculate 2–3-flowered umbels at the nodes of older branchlets below the leaves; peduncles and pedicels similar to above but stouter [18. fosteri](#)
- 20 Inflorescences in axils of leafy shoots; leaves obtuse to cuneate at base, 6.5–11 cm. long, 3–7 cm. broad, main lateral nerves diverging from the midrib right at the base of the lamina [19. cinnamomoides](#)
 Inflorescences mainly on older branchlets below the leaves; leaves always rounded at base, 7–18 cm. long, 4.5–10 cm. broad, main laterals diverging from the midrib well above the base of the lamina [20. memecyloides](#)
- 21 Inflorescences pedunculate, peduncle 5–12 mm. long, 4-winged; flowers sessile or subsessile, 6–16 together in a glomerule; branchlets 4-winged; leaves rather shortly petiolate, ovate, or ovate-elliptic, cordate at base, gradually acuminate, 5.5–13.5 cm. long, 3–6 cm. broad, strongly 3-nerved with 6–10 pairs of prominent transverse nerves [21. meikleii](#)
 Inflorescences sessile or subsessile (peduncle up to 2 mm. long) in the leaf-axils:..... **22**
- 22 Leaves cordate or subcordate at base, shortly petiolate, ovate-lanceolate, rather long-acuminate, 5–15 cm. long, 2.5–6 cm. broad; flowers 2–3, sessile in the leaf axils; fruits 6–8 mm. diam., sessile, or on pedicels 1–2 mm. long [22. guineense](#)
 Leaves cuneate or obtuse, rarely rounded, at base:..... **23**
- 23 Lateral nerves more or less straight and not bowed to loop with the transverse nerves except near the leaf apex: **24**
 Lateral nerves bowed to loop with the 6–15 pairs of strong transverse nerves, both types of nerves impressed above and prominent beneath; for other characters see above [15. zenkeri](#)
- 24 Flowers 2–3 in each axil, subsessile; leaves membranous, nerves not prominent above, distinctly petiolate,

elliptic or ovate-elliptic, rather long-acuminate, 3-nerved, with rather faint transverse nerves[23. membranifolium](#)

Flowers several to numerous in dense axillary, sessile or very shortly pedunculate fascicles; pedicels up to 3–5 mm. long in mature flowers, bracts and bracteoles persistent and conspicuous; leaves leathery, ovate to ovate-elliptic, shortly and obtusely acuminate, 5–12 cm. long, 2–6 cm. broad, lateral and transverse nerves prominent above, with conspicuous transverse venation prominent on both surfaces[24. fasciculare](#)

1. **Memecylon afzelii** *G. Don* Gen. Syst. 2: 655 (1832); Keay in Kew Bull. 1952: 162 (excl. syn. *M. polyanthemos* Hook. f.); Jac.-Fel. in Bull. I.F.A.N. 15: 988, figs. 4–5, (1953). *APD acc*

Memecylon polyanthemos Hook. f. in F.T.A. 2: 463, partly (spec. Afzelius).

Memecylon polyanthemos of F.W.T.A., ed. 1, 1: 214, partly.

Understorey tree or shrub, in [forest](#), to 20 ft. high; petals mauve.

APD: Synonym of Lijndenia barteri (Hook. f.) K. Bremer

Shrub on sandy ground.

S. L.: Yonibana (Nov.) Thomas 4816! **Lib.:** Grand Bassa (Sept.) Dinklage 2032! **Iv. C.:** Port Bouët Aubrév. 1652!

14. **Memecylon barteri** *Hook. f.* in F.T.A. 2: 462 (1871); Gilg l.c. 41.

APD: Synonym of Lijndenia barteri (Hook. f.) K. Bremer

Memecylon dinklagei of Chev. Bot. 277, not of Gilg (fide Hutch.).

A much-branched evergreen shrub, about 8 ft. or more high; flowers small white, very fugacious; berries black-purple.

Fr. G.: Kouria (Sept.) Chev. 14777. **S. Nig.:** Lagos (Mar.) Barter 2152! Moloney! Dalz. 1056! 1233! Ovim, Okigwi (Dec.) Jones FHI 6201!

15. **Memecylon zenkeri** *Gilg* in Engl, Monogr. Afr. Melastom. 43, t. 10 D (1898). *APD acc*

Memecylon zenkeri var. **parvifolium** *Bak. f.* in Cat. Talb. 38 (1913).

Memecylon johnstonii *Gilg ex Engl.* Pflanzenw. Afr. 3, 2: 766 (1921).

Shrub to 12 ft. high with 4-angled branches; petals white; stamens blue.

S. Nig.: Oban Talbot 1723! 1739! Calabar (Feb.) Mann 2285! **Br. Cam.:** Preuss 1373! Mopanya (Mar.) Kalbreyer 174! Rio del Rey Johnston!

Also in **French Cameroons**.

16. **Memecylon englerianum** *Cogn.* in DC. Monogr. 7: 1194 (1891); Gilg. l.c. 43. *APD acc*

Memecylon nigrescens *Engl.* Bot. Jahrb. 7: 338 (1884), not of Hook. & Arn. (1833).

Shrub, to 12 ft. high, with violet-blue flowers.

S. Nig.: Usonigbe F.R. (fr. Nov.) Keay FHI 25576! **Br. Cam.:** Likomba (Dec.) Mildbr. 10757! S. Bakundu F.R. (fr. Mar.) Brenan 9480! Mungo (Oct.) Buchholz.

17. **Memecylon golaense** *Bak. f.* in J. Bot. 49: 320 (1911); Aubrév. l.c. 3: 80, t. 272 D.

APD: Synonym of Warneckea golaensis (Baker f.) Jacq.-Fél.

Shrub or small tree to 30 ft. high, with yellow-green bark; petals dark ultramarine colour at base, shading off to white.

S. L.: Gola Forest (Apr.) Small 634! **Lib.:** Gola Forest (Apr.) Bunting! **Iv. C.:** Mt. Momi (Apr.) Aubrév. 1173!

18. **Memecylon fosteri** *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 215 (1927); Kew Bull. 1928: 223.

APD: Synonym of Warneckea fosteri (Hutch. & Dalziel) Jacq.-Fél.

Shrub or small tree, to 15 ft. high, petals pale blue.

S. Nig.: (Oct.) Foster 359! Idanre Hills (Oct.) Keay FHI 21564! 22654! Brenan 8666!

19. **Memecylon cinnamomoides** *G. Don* Gen. Syst. 2: 655 (1832); Keay in Kew Bull. 1952: 162; Gilg l.c. 39.

APD: Synonym of Warneckea cinnamomoides (G. Don) Jacq.-Fél.

Memecylon vogelii of Aubrév. l.c. 3: 78, t. 271 A, not of Naud.

Shrub or spreading tree, to 30 ft. high; flowers blue.

S. L.: Afzelius. Talla Hills (Feb.) Sc. Elliot 4916b! Magbile (fr. Dec.) Thomas 5918! 6200! 9849! **iv. C.:** Rasso Aubrév. 1697! And other localities. **G. C.:** Kumasi (Mar.) Vigne 1645! **Togo:** Kpandu (Mar.) Robertson 107!

20. *Memecylon memecyloides* (Benth.) Exell in Cat. S. Tomé 181 (1944).

*APD: Synonym of *Warneckea memecyloides* (Benth.) Jacq.-Fél.*

Spathandra memecyloides Benth. in Fl. Nigrit. 357 (1849).

Memecylon vogelii Naud. (1852); F.T.A. 2: 462; Gilg l.c. 41; F.W.T.A., ed. 1, 1: 215.

Memecylon cinnamomoides of F.W.T.A., ed. 1, 1: 215, partly.

Spreading tree of **swamp forest**, to 50 ft. high; petals pale blue; fruit deep blue.

G. C.: Ancobra R. (young fr. Dec.) Johnson 920! Afram Plains (May) Kitson 1127! Cape Coast Brass! **S. Nig.:** Oni, Epe Dist. Thompson 4! Shasha F.R. (Jan., Apr.) Ross 241! Richards 3014! Degema Talbot 3768! **F. Po:** T. Vogel 149! Barter!

Also in **Principe**.

[The areas of this species and of *M. cinnamomoides* G. Don overlap in the Gold Coast where several specimens which appear to be intermediate between the two species have been collected.]

21. *Memecylon meikleii* Keay in Kew Bull. 1952: 163.

*APD: Synonym of *Warneckea guineensis* (Keay) Jacq.-Fél.*

Spreading shrub, about 10 ft. high; petals mauve-pink, filaments and style bright blue.

S. Nig.: Ibadan (Mar.) Meikle 1253!

22. *Memecylon guineense* Keay l.c. 163 (1952).

*APD: Synonym of *Warneckea guineensis* (Keay) Jacq.-Fél.*

Memecylon sessile A. Chev. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 215 (1927), not. of Wall, ex Wight & Arn. (1834); Chev. Bot. 278, name only; Chev. in Bull. Mus. Hist. Nat. Sér. 2, 4: 687 (1932); Aubrév. l.c. 3: 76, t. 271 C.

Slender-stemmed shrub, 3–9 ft. high (or tree to 36 ft., fide Richards) in **dense forest**; flowers blue, fruits purple.

Lib.: Dukwia R. (Feb.) Cooper 251! **iv. C.:** between the Sassandra and Cavally (July) Chev. 19243! 19283! Sanvi (fr. Mar.) Chev. 17836! Yapo Aubrév. 598! **S. Nig.:** Okomu F.R. (fl. & fr. Dec.-Feb.) Brenan 8422! 8753! 9142! 9159! Shasha F.R., (fl. & fr. May) Richards 3475!

23. *Memecylon membranifolium* Hook. f. in F.T.A. 2: 462 (1871); Gilg l.c. 41.

*APD: Synonym of *Warneckea membranifolia* (Hook. f.) Jacq.-Fél.*

Memecylon longicauda Gilg l.c. 40, t. 10 E (1898).

Memecylon leucocarpum Gilg l.c. (1898).

Memecylon nanum A. Chev. Bot. 278, name only.

Shrub to 10 ft. high, in **forest**, calyx-tube blue-violet, lobes red-violet, petals and filaments vivid blue; fruits deep blue.

iv. C.: fide Chev. l.c. **G. C.:** Begoro (fl. & fr. Nov.) Vigne 4276! **Togo:** Amedzofwe (Feb.) Irvine 153! Alavanyo (fl. Sept., fr. Oct.) St. Clair Thompson 3570! **S. Nig.:** Okomu F.R. Also in **French Cameroons**.

24. *Memecylon fasciculare* (Planch. ex Benth.) Naud.—F.T.A. 2: 463; Gilg l.c. 41; Chev. Bot. 277; Aubrév. l.c. 3: 78, t. 271 B.

*APD: Synonym of *Warneckea fascicularis* (Planch. ex Benth.) Jacq.-Fél.*

Memecylon cinnamomoides of Chev. Bot. 277, not of Don.

A shrub, to 10 ft. high, flowers pinkish, fruits black when ripe.

Fr. G.: Heudelot 909! Farmar 289! Various localities fide Chev. l.c. **S. L.:** Afzelius! Don! Talla Hills (fl. & fr. Feb.) Sc. Elliot 4830! 4916a! Bonthe (Feb.) Dalz. 997! Sussex (Apr.) Deighton 4124! York (May) Deighton 5518! **Iv. C.:** Mt. Dou Aubrév. 1071.

1. **Memecylon polyneuron** *Gilg* in Engl. Monogr. Afr. Melastom. 41 (1898). Type specimen not seen by Hutch. & Dalz. and presumably now destroyed.

S. L.: Afzelius (Hb. Berlin).

Imperfectly known species.

2. **Memecylon fernandianum** *Gilg ex Engl.* Pflanzenw. Afr. 3, 2: 765 (1921); Mildbr. in Wiss. Ergebn. 1910–11: 188, name only.

Possibly the same as *M. membranifolium* Hook. f.

F. Po: Bokoko, 2,000 ft. Mildbr. 6824.

Imperfectly known species.

3. **Memecylon liberiae** *Gilg ex Engl.* l.c. 3, 2: 768 (1921).

No specimen cited; description very inadequate.

Lib.: Monrovia.

Imperfectly known species.

4. **Memecylon sp. A.**

Tree, 30–35 ft. high; leaves lanceolate, 17–27 cm. long, 6–7.5 cm. broad, not 3-nerved; flowers not known. Possibly this may prove to be *M. liberiae* Gilg ex Engl.

Lib.: Dukwia R. (fr. May) Linder 414!

Imperfectly known species.

COMBRETACEAE

Trees or shrubs, often scandent. Leaves opposite, alternate or rarely verticillate, simple, exstipulate. Flowers spicate or racemose, mostly small, hermaphrodite, rarely unisexual. Calyx-tube adnate to the ovary; limb 4–8-fid or -lobed, lobes valvate. Petals 4–5 or none, rarely many, small, imbricate or valvate. Stamens 4–10, rarely more; filaments inflexed in bud; anthers versatile, didymous, opening lengthwise by slits. Disk epigynous. Ovary inferior, rarely half-inferior, 1-celled; style simple; ovules 2–6, suspended from the apex of the ovary by slender funicles. Fruit often winged, rarely dehiscent. Seed pendulous, without endosperm; embryo with convolute, plicate or contorted cotyledons and small radicle.

Mainly tropics and subtropics.

Recognized by the exstipulate simple leaves, inferior ovary, and often winged fruits. +

|---|---|--------------------------------|
| 1 | Petals present:..... | 2 |
| | Petals absent:..... | 6 |
| 2 | Ovary half-superior; fruits not winged, 5–8 cm. diam., succulent, drupaceous; leaves alternate .. | 1. Strephonema |
| | Ovary completely inferior; fruits usually winged, or at least ridged: | 3 |
| 3 | Upper receptacle (calyx-tube) and calyx-lobes deciduous before the fruit ripens, fruit winged, or at least ridged, not linear: | 4 |
| | Upper receptacle and calyx-lobes persistent at the time of fruiting; fruit linear 3–4 cm. long, densely silky-villous; flowers in small, often bracteate heads; whole plant covered with small black glands | 5. Guiera |
| 4 | Style free from the upper receptacle:..... | 5 |
| | Style adnate to the upper receptacle, at least at the base | 4. Quisqualis |

- 5 Flowers all hermaphrodite; fruit 4–5-winged or ridged [2. *Combretum*](#)
 Flowers hermaphrodite and male in the same inflorescence; fruit 2–4-winged [3. *Pteleopsis*](#)
- 6 Receptacle without adnate bracteoles; fruits 2-winged (except the exotic *Terminalia catappa*); leaves alternate, rarely sub-verticillate: [7](#)
 Receptacle with two adnate bracteoles; fruits elongate-obovoid, ribbed, but scarcely winged; flowers in spikes; leaves opposite, glabrous, coriaceous; in mangrove swamps [9. *Laguncularia*](#)
- 7 Flowers in spikes, or spike-like racemes, never in heads [6. *Terminalia*](#)
 Flowers and fruits crowded into dense heads: [8](#)
- 8 Petiole with a pair of glands, leaves glabrous, coriaceous; stamens 5, fruits not beaked; in mangrove-swamps and other coastal habitats [7. *Conocarpus*](#)
 Petiole without glands, leaves pubescent, chartaceous; stamens 10; fruits distinctly beaked [8. *Anogeissus*](#)

1. STREPHONEMA

Hook. f.—F.T.A. 2: 484, under Lythraceae.

- 1 Leaves elliptic, rounded at base, shortly acuminate, 12–17 cm. long, up to 7 cm. broad, with about 6 pairs of lateral nerves, glabrous and almost veinless beneath; inflorescence axillary, very short and subumbellate; pedicels glabrous, about 0.5 cm. long; calyx glabrous [1. *mannii*](#)
 Leaves oblong, rounded at base, acutely acuminate, about 25 cm. long, 6–8 cm. broad, pilose in the axils of the nerves beneath; lateral nerves 9–11 pairs, with slender parallel tertiary nerves beneath; inflorescence raceme-like, about 6 cm. long, everywhere brown-tomentose [2. *pseudocola*](#)

1. *Strephonema mannii* *Hook. f.*—F.T.A. 2: 484; Engl. & Diels Monogr. Afr. Combretac. 1. *APD acc*

A glabrous shrub, to 20 ft. high; **by rivers**.

S. Nig.: Eket Talbot! Old Calabar R. (Feb.) Mann 2293! **Br. Cam.:** Muyuku, Victoria (May) Maitland 1145!

Also in **Gabon**.

2. *Strephonema pseudocola* *A. Chev.* in Bull. Soc. Bot. Fr. 58, Mém. 8: 172 (1912); Aubrév. Fl. For. C. Iv. 3: 60, t. 265. *APD acc*

Strephonema apolloniense *J. J. Clark* in Kew Bull. 1913: 76.

A **forest** tree, up to 70 ft.; flowers white; fruit 2–3 in. broad, nearly 2 in. long, rough, verrucose with a long acute beak; seed solitary, with 2 cotyledons somewhat resembling those of a kola nut.

S. L.: Baiima (Sept.) Deighton 3055! **Lib.:** Gbanga (Sept.) Linder 767! Dukwia R. (Nov.) Cooper 121! Kitoma (fr. Apr.) Harley 1124! Tappita (Aug.) Baldwin 9116! Browntown, Tchien (Aug.) Baldwin 7083! Loffa R. (fr. Dec.) Baldwin 10947!

2. COMBRETUM

Loefl.—F.T.A. 2: 419

- 1 Suffrutices with short, erect stems, usually herbaceous, arising from a woody rootstock, appearing in savannah soon after grass fires and flowering within a few weeks: [2](#)
 Trees, shrubs and lianes: [5](#)
- 2 Stem and leaves glabrous, glutinous when young: [3](#)
 Stem and leaves (at least on the lower surface) densely tomentellous, or silky-tomentose: [4](#)
- 3 Leaves with petiole 1–2 cm. long, lamina lanceolate, acute at both ends, 5–11 cm. long, 1–4 cm. broad; flowers in spikes, up to 15 cm. long, borne towards the base of the stems [1. *bauchiense*](#)
 Leaves subsessile, linear, 6–7 cm. long, 3–5 mm. broad; flowers clustered towards the ends of 1–3 cm. long peduncles, borne at the ends of the branches [2. *lineare*](#)
- 4 Upper receptacle cup-shaped; disk with a free margin; petals clawed, spreading; leaves ovate, obtuse at base,

- acute at apex, 8–11 cm. long, 3.5–6.5 cm. broad, very shortly tomentellous beneath [3. *relictum*](#)
- Upper receptacle campanulate; disk wholly adnate; petals not clawed, incurved; leaves obovate-elliptic to narrowly elliptic, rounded or obtuse at each end, mucronate at apex, 4–12 cm. long, 0.8–5 cm. broad, more or less densely silky-tomentose and very prominently reticulate beneath [4. *sericeum*](#)
- 5** Flowers 4-merous; fruits 4-winged: **6**
- Flowers 5-merous; fruit 5-winged; scandent shrubs and lianes: **36**
- 6** Petals and filaments white, cream or yellow: **7**
- Petals and filaments red or crimson; upper receptacle (including calyx-lobes) 3.5–8 mm. long; flowers clustered in short glomeruliform or umbel-like spikes arranged in a large panicle: **33**
- 7** Stamens shorter than the petals; filaments about 1 mm. long; upper receptacle very shallowly cup-shaped; disk well-developed, glabrous: **8**
- Stamens longer than the petals; filaments much exceeding 1 mm. long: **9**
- 8** Leaves rounded at base, truncate to very slightly acuminate at apex, densely tomentose beneath; lamina broadly elliptic, 3.5–8 cm. long, 2–5 cm. broad [5. *tomentosum*](#)
- Leaves deeply cordate to auriculate at base, distinctly acuminate, puberulous to glabrescent beneath; lamina oblong, 8–28 cm. long, 5–12.5 cm. broad (see fig. 103 A) [6. *excelsum*](#)
- 9** Trees and erect shrubs, always in savannah: **10**
- Lianes and scandent shrubs, mainly in forest country (but see Nos. 16 and 17): **20**
- 10** Petals ciliate around the margin (see fig. 103 B): **11**
- Petals glabrous on the margin: **13**
- 11** Undersurface of leaves clothed with white scales, usually concealed on young leaves by a dense indumentum of long silky hairs; venation very prominent beneath, not prominent above; lamina more or less elliptic or ovate, acute or acuminate at apex, 6–18 cm. long, 3–10 cm. broad; flowers densely hairy; fruits 1.5–2 cm. long; leaves and fruits never reddish-brown; bark of bole and older branches dark grey, deeply fissured [7. *molle*](#)
- Undersurface of leaves sometimes glandular beneath but without white scales, puberulous or glabrous; venation equally prominent above and beneath; lamina more or less elliptic or ovate-elliptic, or obovate-elliptic, obtuse at apex, 6–14 cm. long, 2.5–5 cm. broad; fruits 1.8–2.5 cm. long; leaves and fruits usually reddish-brown when mature and dry; bark of bole and older branches pinkish-brown, finely reticulate: **12**
- 12** Stem and mature leaves beneath densely and softly puberulous [8. *nigricans* var. *nigricans*](#)
- Stem and mature leaves beneath glabrous or nearly so-(see fig. 103 B) [8a. *nigricans* var. *elliottii*](#)
- 13** Upper receptacle (including calyx-lobes) 1 mm. long or less, very shallowly cup-shaped: **14**
- Upper receptacle (including calyx-lobes) at least 2 mm. long, deeply cup-shaped or funnel-shaped; fruit at least 2.5 cm. long: **15**
- 14** Plant with abundant red scales; leaves and fruit drying reddish-brown; for other characters see below [16. *micranthum*](#)
- Plant with white scales; leaves drying greenish; fruit pale brown; for other characters see below ... [17. *nioroense*](#)
- 15** Young shoots, inflorescences and fruits glutinous; scales absent; inflorescences usually on woody shoots and often branched; bark of older branches grey, finely muricate, not peeling in stringy fibres: **16**
- Young shoots, inflorescences and fruits not glutinous; scales mostly present (but see No. 15); inflorescences usually unbranched, axillary on young leafy shoots: **17**
- 16** Venation strongly reticulate and markedly prominent beneath; upper surface of leaves smooth, puberulous, green and glutinous when fresh, midrib usually prominent above; lower surface white when fresh, more or less densely tomentose; lamina very thick and leathery, very variable in shape; flowers densely hairy; fruits about 3.5 cm. long, pale brown from the start [9. *glutinosum*](#)
- Venation conspicuous on both surfaces but not markedly prominent beneath; both surfaces of similar colour when fresh; lamina thinly coriaceous, glabrous or pubescent on both surfaces, very variable in shape; flowers densely or sparsely hairy; fruits up to 3.5 cm. long, red and very glutinous when young, becoming pale brown, glabrous [10. *ghasalense*](#)
- 17** Flowers 5–6 mm. long (lower receptacle or "ovary," and upper receptacle including calyx-lobes, each about 3 mm. long); stem and leaves glabrous or very sparsely pubescent, undersurface of leaves densely covered with white scales; leaves elliptic, ovate-elliptic, oblong-elliptic, or rarely broadly lanceolate, 6–14 cm. long, 3–6 cm. broad, petiole 1.5–3 cm. long: **18**
- Flowers 3.5–4 mm. long (lower receptacle or "ovary," and upper receptacle including calyx-lobes, each about 2 mm. long); stem and leaves pubescent or tomentose at least when young; bark of bole and older branches peeling in stringy fibres to expose reddish-brown powdery under-bark; petiole 1–2 cm. long; fruits tomentellous: **19**
- 18** Lower receptacle with reddish scales, almost without hair; fruit deep crimson or purple, with red scales on the

- body; bark of bole and older branches dark grey, fissured-(see fig. 103 D) [11. binderianum](#)
- Lower receptacle with whitish or brownish scales and with numerous hairs; fruit brown, tomentose, without red scales [12. crotonoides](#)
- 19** Undersurface of young leaves densely covered with white scales, densely puberulous on midrib, petiole and nerves, but only sparsely puberulous on the lamina; mature leaves with scattered white scales beneath, and glabrous except for a few hairs on the midrib; lamina ovate-elliptic to oblong-lanceolate, 8–14 cm. long, 4–6 cm. broad-(see fig. 103 C) [13. lamprocarpum](#)
- Undersurface of young leaves densely covered with white scales and with coarse, soft tomentum on both nerves and lamina; mature leaves densely covered with white scales; lamina elliptic to ovate-elliptic, 4–8 (–12) cm. long, 2–5 cm. broad [14. geitonophyllum](#)
- Undersurface of young leaves densely and closely tomentellous, brown when dry, with or without visible scales; mature leaves tomentellous, scales usually becoming more obvious but never dense and almost contiguous as in Nos. 13 and 14; lamina elliptic to oblong-elliptic, 7–17 cm. long, 3.5–7.5 cm. broad [15. hypopilinum](#)
- 20** Upper receptacle (including calyx-lobes) 1.5 mm. long or less: **21**
- Upper receptacle (including calyx-lobes) 2.5–6 mm. long: **28**
- 21** Flower spikes up to 3 cm. long, dense, usually solitary in the leaf-axils; mature leaves usually less than 6 cm. long (rarely up to 9 cm.), cuneate at base; plants of savannah: **22**
- Flower spikes in branched panicles; mature leaves usually more than 6 cm. long; plants of forest vegetation: . **23**
- 22** Inflorescence-axes, flowers, fruits, young shoots and petioles densely covered with red scales; leaves drying reddish-brown; fruits reddish-brown, up to 1.5 cm. long [16. micranthum](#)
- Inflorescence-axes and flowers with white scales; stem, leaves and petiole more or less glandular; plant without red scales; leaves drying greenish; fruits pale brown, up to 2 cm. (rarely to 3.5 cm.) long [17. nioroense](#)
- 23** Upper receptacle very shallowly cup-shaped, so that the disk is easily visible; inflorescence-axes and/or flowers with scales: **24**
- Upper receptacle deeply cup-shaped, concealing the disk; inflorescence and flowers without scales: **26**
- 24** Flower spikes up to 5 cm. long; leaves glabrous and glandular beneath, with pits in the axils of the main nerves, lamina elliptic, coriaceous, 8–12 cm. long, 3.5–5.5 cm. broad, main lateral nerves prominently looped; lower receptacle with abundant whitish scales [18. obanense](#)
- Flower spikes usually exceeding 5 cm. long: **25**
- 25** Flowers viscid, glabrous, red scales sparse on inflorescence-axes only; leaves glabrous, shining, with pits in the axils of the main nerves; lamina broadly ovate, 10–16 cm. long, 6–9 cm. broad [19. homalioides](#)
- Flowers and inflorescence-axes with abundant red scales; leaves pubescent on the midrib beneath and on petiole, without pits; lamina oblong-elliptic, 8–16 cm. long, 4–8 cm. broad [20. demeusei](#)
- 26** Fruits 1–1.2 cm. long, very light and papery; leaves pubescent beneath, neither glandular nor scaly, oblong or oblong-oblancoate, 6–12 cm. long, 2.5–5 cm. broad, the upper ones gradually becoming smaller and bract-like; inflorescence softly tomentellous, with very numerous flowers [21. smeathmannii](#)
- Fruits 2–4.5 cm. long; leaves closely and minutely impressed-punctate and with white scales beneath: **27**
- 27** Fruit orbicular, emarginate at apex, 2–3.5 cm. long, yellow-brown, with wide papery wings; leaves chartaceous, drying pale brown or dull green, tertiary nerves almost at right angles to the main laterals; lamina oblong-elliptic to ovate-elliptic, 10–21 cm. long, 5–10 cm. broad [22. insulare](#)
- Fruit ovate with a long beak, about 4.5 cm. long, dark brown, with thick narrow wings; leaves coriaceous, drying dark brown, grey or black, tertiary nerves at an acute angle to the main laterals; lamina broadly elliptic, 9–18 cm. long, 4.5–8 cm. broad [23. cuspidatum](#)
- 28** Flowers and inflorescence-axes densely covered with reddish scales, otherwise glabrous; upper receptacle (including calyx-lobes) 4–5 mm. long, attenuate to base, hence funnel-shaped; flowers crowded in glomeruliform spikes; leaves oblong to oblong-obovate, 8–17 cm. long, 3.5–7.5 cm. broad [24. fulvum](#)
- Flowers and inflorescence-axes without reddish scales, usually pubescent, sometimes with whitish scales: **29**
- 29** Leaves with numerous minute reddish scales beneath; upper receptacle (including calyx-lobes) 5–6 mm. long, funnel-shaped; petals about 2.5 mm. long; flowers in simple axillary spikes; leaves oblong-ovate to ovate, 8–22 cm. long, 3.5–11 cm. broad [25. bipindense](#)
- Leaves without red scales; petals 1–2 mm. long: **30**
- 30** Upper receptacle attenuate to base, hence funnel-shaped, 4.5–5 mm. long; flowers crowded in glomeruliform spikes; leaves broadly ovate to ovate-elliptic, 10–17 cm. long, 7–10 cm. broad [26. batesii](#)
- Upper receptacle rounded at base, hence campanulate; flowers in simple spikes or panicles of spikes: **31**
- 31** Upper receptacle (including calyx-lobes) 3–5 mm. long, densely tomentose or tomentellous: **32**
- Upper receptacle (including calyx-lobes) about 2.5 mm. long, sparingly pubescent or glabrous; margin of disk free for 1 mm.; leaves elliptic to oblong-elliptic, 7–16 cm. long, 3–8 cm. broad [29. oyemense](#)

- 32 Margin of disk adnate; upper receptacle (including calyx-lobes) 4–5 mm. long (see fig. 103E), shortly tomentose; leaves coriaceous, mostly rounded at base; main lateral nerves brown-bearded in axils, tertiary venation not conspicuous above; lamina ovate-elliptic to oblong-elliptic, 11–19 cm. long, 5–8 cm. broad [27. fuscum](#)
- Margin of disk free for 1 mm.; upper receptacle (including calyx-lobes) 3–4 mm. long, closely tomentellous; leaves rigidly papery, mostly broadly cuneate at base; main laterals not bearded in axils; tertiary transverse venation close, subparallel, conspicuous above; lamina oblong-elliptic, 9–16 cm. long, 3.5–6.5 cm. broad. [28. sordidum](#)
- 33 Inflorescences with conspicuous white or pink bract-like leaves subtending the flower-clusters; petals pilose outside, not incurved; leaves elliptic to ovate, acute at apex, 5–10 cm. long, 3–5 cm. broad, pubescent on the nerves: 34
- Inflorescences without white or pink bract-like leaves, flowers often produced before the leaves; petals glabrous or sparsely pubescent outside, incurved: 35
- 34 Upper receptacle glabrous [30. racemosum](#)
- Upper receptacle shortly pubescent [31. cinereipetalum](#)
- 35 Upper receptacle markedly swollen at base (see fig. 103 F), 5–8 mm. long, densely pilose; leaves oblong-elliptic, rounded at base, emarginate and conspicuously mucronate at apex, 8–12 cm. long, 4–5 cm. broad, strongly reticulate and pubescent beneath [32. lecardii](#)
- Upper receptacle not, or scarcely, swollen at base, 3.5–5 mm. long, sparingly to densely pilose; flowers in very large panicles; leaves broadly elliptic, to nearly orbicular, 7–20 cm. long, 4–10 cm. broad, densely pubescent or nearly glabrous beneath [33. paniculatum](#)
- 36 Stamens subsessile, together with the style, completely included in the campanulate 3.5–4.5 mm. long upper receptacle; petals white; fruit ovoid, woody, 5-angled but only very narrowly winged, 4–5.8 cm. long, 2.5–3 cm. broad; leaves oblong-elliptic to narrowly elliptic, rounded or obtuse at apex, 4–13 cm. long, 2–6 cm. broad, very minutely impressed-punctate beneath [34. acutum](#)
- Stamens with filaments longer than the petals and, together with the style, well exerted from the receptacle: 37
- 37 Leaves up to 4.5 cm. long and 3 cm. broad; flowers in short axillary racemes, scarcely as long as the leaves; upper receptacle about 5 mm. long; petals spatulate, well exerted, cream coloured; lamina elliptic, petioles usually becoming spines; scandent shrub in the drier savannah regions [35. aculeatum](#)
- Leaves exceeding 5 cm. long and 3 cm. broad; flowers in long spikes, or in panicles of spikes or of globose heads, or if in short racemes or clusters, then petals red: 38
- 38 Flowers in panicles of globose heads about 1 cm. diam.; subtended by conspicuous whitish bract-like leaves; petals and filaments cream; fruits about 12 mm. long, apiculate; leaves oblong-elliptic, 8–15 cm. long, 4–7 cm. broad; softly pubescent beneath [36. zenkeri](#)
- Flowers not in panicles of globose heads about 1 cm. diam.; usually in long spikes, but if in short racemes or clusters, then petals red: 39
- 39 Upper receptacle straight, up to 15 mm. long, or if more then funnel-shaped and glabrous or sparsely pubescent outside; disk without a free edge: 40
- Upper receptacle curved, 15–32 mm. long, tubular, rounded at base, densely puberulous, tomentose or velutinous; disk with a free edge: 49
- 40 Flowers in short dense, terminal, simple racemes, 3–5 cm. long and broad; upper receptacle funnel-shaped above, narrowly tubular in the middle, and swollen at the base (see fig. 103 I), 12–15 mm. long (including the broadly ovate calyx-lobes); petals scarlet; leaves elliptic or obovate, 7–10 cm. long, 3–5 cm. broad [37. constrictum](#)
- Flowers in long spikes or spike-like racemes, often arranged in large panicles, or if in short dense clusters then upper receptacle campanulate and 5–7 mm. long: 41
- 41 Flowers in dense clusters, upper receptacle campanulate, 5–7 mm. long, petals deep scarlet; leaves elliptic to obovate-elliptic, 7–14 cm. long, 3–7.5 cm. broad, glabrous [38. confertum](#)
- Flowers in long spikes or spike-like racemes; often arranged in large panicles: 42
- 42 Upper receptacle rounded at base, hence campanulate, 3.5–5 mm. long (including the calyx-lobes); petals incurved, always red; bracts mostly small; leaves subcordate or rounded at base: 43
- Upper receptacle, attenuate at base, hence funnel-shaped, 5–22 mm. long; petals, long exerted, not incurved; bracts often large: 45
- 43 Stems with stiff dark-brown, spreading, gland-tipped hairs, about 2 mm. long; flowers in long, lax, mostly simple, spike-like racemes; leaves oblong, 7–13 cm. long, 2.5–5 cm. broad [39. tarquense](#)
- Stems shortly pilose or puberulous: 44
- 44 Flowers in long, lax, mostly simple, spike-like racemes, 10–15 cm. long; leaves glabrous or sparsely pubescent beneath; lamina obovate-oblong, 6–15 cm. long, 3–7 cm. broad; petiole 5–8 mm. long [40. calobotrys](#)
- Flowers in spike-like racemes up to 10 cm. long, arranged in a branched panicle; leaves hirsute on the nerves beneath; lamina ovate-oblong, 8–13 cm. long, 4–7 cm. broad; petiole 2–3 mm. long [41. mannii](#)

- 45** Upper receptacle (including calyx-lobes) 12–22 mm. long, glabrous or sparsely pubescent within and without (see fig. 103 H); petals spatulate, 10–15 mm. long, red; leaves oblong, 8–15 cm. long, 4–9 cm. broad [42. *grandiflorum*](#)
- Upper receptacle (including calyx-lobes) 5–12 mm. long, pubescent, often densely so, within and without:.... **46**
- 46** Bracts as long as, or longer than, the flowers and often hiding them, persistent; petals lanceolate, 12–16 mm. long, usually yellow streaked with crimson; inflorescence-axes and flowers with long spreading hairs (brown when dry) usually conspicuous amongst shorter hairs, not glandular; fruits densely and softly hairy, usually very numerous; leaves oblong-elliptic to oblong-obovate, up to 20 cm. long and 12 cm. broad-(see fig. 103 G) [43. *dolichopetalum*](#)
- Bracts seldom as long as the flowers and never hiding them, often early deciduous; petals 6–12 mm. long, usually pink or red, with paler margins and outer surfaces; inflorescence-axes and flowers without long spreading hairs, sometimes glandular:..... **47**
- 47** Flowers densely crowded in the upper half of the spike-like racemes, peduncle and floriferous part each 2.5–5 cm. long; racemes usually borne in whorls of 3 in the large panicles; inflorescence and outside of flowers shortly pubescent, without long gland-tipped hairs; upper receptacle (including the broadly triangular calyx-lobes) 5–7 mm. long, densely pilose within right up to the mouth; petals red or crimson; bracts usually persistent, coloured, with a broad blade; leaves usually in threes, oblong-elliptic, 10–18 cm. long, 4.5–8 cm. broad [44. *comosum*](#)
- Flowers in larger spike-like racemes with the floriferous part up to 20 cm. long; usually more laxly arranged racemes in opposite pairs, or alternate; upper receptacle (including the long-triangular calyx-lobes) 7–9 mm. long, pilose within but only very sparsely so towards the mouth; petals usually pink; leaves in pairs; bracts not strongly coloured:..... **48**
- 48** Inflorescence and flowers without (or with only few) long gland-tipped hairs, but sometimes with short gland-tipped hairs; flowers more or less crowded in the upper part of the raceme; bracts often persistent [45. *rhodanthum*](#)
- Inflorescences and flowers with numerous long gland-tipped hairs; flowers in long, lax, spike-like racemes; bracts usually early caducous; leaves oblong-elliptic, 10–25 cm. long, 5–11 cm. broad [46. *hispidum*](#)
- 49** Stems and flowers without gland-tipped hairs; upper receptacle 16–22 cm. long: **50**
- Stems and flowers densely covered with short gland-tipped hairs; upper receptacle 30–32 mm. long; inflorescence usually well-branched; fruit orbicular, with wide, papery wings; leaves ovate or ovate-oblong, subcordate at base, 10–15 cm. long, 6–8 cm. broad, glabrous-(see fig. 103 J) [49. *bracteatum*](#)
- 50** Flowers densely but shortly puberulous; fruits orbicular, with wide, papery wings; inflorescence usually well-branched; leaves oblong-elliptic, rounded or cuneate at base, 9–15 cm. long, 3.5–6.5 cm. broad, glabrous [47. *platypterum*](#)
- Flowers very densely long-velutinous; fruits fusiform, with thick, narrow wings; inflorescence usually a simple spike; leaves oblong-elliptic, cordate or subcordate at base, 6–13 cm. long, 3–6.5 cm. broad, pubescent on the midrib beneath [48. *mooreanum*](#)

1. *Combretum bauchiense* Hutch. & Dalz. F.W.T.A., ed. 1, 1: 220 (1927); Kew Bull. 1928: 224. *APD acc*

Combretum ghasalense var. *pobeguini* Aubrév. Fl. For. Soud.-Guin. 112 (1950).

Stems to 3 ft. high; petals, filaments and style cream; probably closely related to trees of the *C. ghasalense* group.

Combretum dalzielii Hutch in F.W.T.A., ed. 1, 1: 222 (1927); Kew Bull. 1928: 225.

Savannah tree, to 25 ft. high; petals and filaments cream or yellow; young fruits red and very glutinous, becoming pale brown. At least four forms occur in our area, but they appear to be connected by intermediates and cannot be separated satisfactorily, even as varieties. They are: (A) leaves pubescent,

broadly elliptic, broadest at or slightly above the middle, obtuse at apex, petiole relatively short, flowers densely hairy; (B) leaves glabrous, broadly lanceolate, broadest below the middle, acute or acuminate at apex, margin markedly undulate, petiole relatively long; flowers densely hairy; (C) leaves as in B, but flowers sparsely pubescent; (D) leaves as in A, but glabrous except for conspicuous tufts in the axils of the main lateral nerves, flowers sparsely pubescent.

Also in **French Cameroons**, **Gabon** and **Cabinda**.

1. **Combretum fruticosum** (*Loefl.*) *Stuntz* in U.S. Dept. of Agric. Bur. Pl. Ind. Invent. Seeds & Pl. Import 31: 86 (1914); *Exell* in J. Bot. 67: 143 (1929).

A specimen in the Paris Herbarium (Heudelot 45) purporting to be from Senegal is this S. American species. It seems however that labels have become confused as there is no sheet of this species bearing Heudelot's own label and the species is not otherwise recorded from Africa. Imperfectly known species.

2. **Combretum macrocarpum** *P. Beauv.* Fl. Oware 90, t. 118, fig. 2.

Described only from detached fruits; referred by most authors to *C. racemosum* P. Beauv., but probably not a *Combretum* at all. Imperfectly known species.

3. **Combretum etessei** *Aubrév.* Combret. des Sav. Bois. A.O.F. 19 (1944), French descr. only; Fl. For. Soud.-Guin. 108.

Savannah tree; flowers not known; evidently related to *C. glutinosum* Perr. ex DC.

Sen.: Fouladou Etesse 42! Bignona Aubrév. 59! **Port. G.:** Xime to Bambadinca (fr. June) Esp. Santo 2271!

Imperfectly known species.

4. **Combretum maclaudii** *Aubrév.* Combret. des Sav. Bois. A.O.F. 40 (1944), French descr. only; Fl. For. Soud.-Guin. 122.

Savannah tree; fruits not known.

Fr. G.: boundary of Portuguese Guinea Maclaud!

Imperfectly known species.

5. **Combretum simulans** *Portéres* in Bull. Soc. Bot. Fr. 97: 179 with fig. (1951).

Suffrutex; probably a form of *C. sericeum* G. Don; type specimen not traced.

Fr. G.: Mali, Fouta Djallon (Nov.) Portières.

Imperfectly known species.

6. ***Combretum dolichopodum* Gilg ex Engl.** in Pflanzenw. Afr. 3, 2: 700 (1921); Exell in J. Bot. 67: 140 (1929).

Type from French Cameroons; also recorded from Togoland, but specimens not traced.

Imperfectly known species.

7. ***Combretum* sp. A.**

Flowers in bud only; evidently distinct from all other species in our area.

S. Nig.: Oban Talbot 500!

Imperfectly known species.

8. ***Combretum* sp. B.**

Habit not known; fruits not known.

S. L.: Yonibana (Nov.) Thomas 4164! 4248! 4657! 4785! 5260! Mamoka Thomas 4360!

Imperfectly known species.

3. **PTELEOPSIS**

Engl.—Engl. & Diels Monogr. Afr. Combretac. 2 (1900).

1 Fruits 3- or 4-winged; trees or shrubs of savannah: **2**

Fruits 2-winged; a tree of rain forest; leaves appearing after the flowers, opposite or subopposite, with appressed silky hairs when young, glabrescent, but still slightly pilose even when adult; lamina broadly oblong to obovate-oblong, rarely broadly lanceolate, obtuse or acute at base, acuminate at apex, 5–8 cm. long, 2–3.5 cm. broad; lateral nerves 10–12 pairs; petiole 10–15 mm. long; flowers in 1–2 cm. long, capituliform, many-flowered, corymbose-racemes; fruits broadly elliptic, 1.5–1.7 cm. long, 1–1.2 cm. broad [3. *hylodendron*](#)

2 Leaves 4–11 cm. long, 2–4 cm. broad, lamina ovate-elliptic, or oblong-elliptic, or narrowly oblong, narrowed at base, acuminate, thinly pilose beneath; lateral nerves 6–8 pairs; petiole 5–15 mm. long; fruits 3- or 4-winged, broadly obovate, 1.6–2 cm. long, 1.5–2.5 cm. broad, borne on slender pedicels about 1 cm. long; a small tree [1. *suberosa*](#)

Leaves up to 3 cm. long and 1.5 cm. broad, lamina ovate, obtuse or rounded at base, obtuse or very obtusely acuminate at apex, glabrous or slightly pubescent; petiole short; fruits 3-winged, about 1 cm. long and 0.7 cm. broad, borne on very slender pedicels 7–9 mm. long; low straggling shrub [2. *habeensis*](#)

1. ***Pteleopsis suberosa* Engl. & Diels** in Engl. Bot. Jahrb. 39: 509 (1907); Chev. Bot. 265; Aubrév. Fl. For. Soud.-Guin. 139, t. 21, 1–2. **APD acc**

Savannah tree, to 30 ft. high.

Fr. Sud.: Balani (fr. Jan.) Chev. 143. Kolokeni (Nov.) Aubrév. 65-S! Bougouni to Sikasso (Nov.) Aubrév. 66-S! **Fr. G.:** Dara (fl. & fr. Feb.) Maclaud 93! Kinsam Maclaud 215! Siguiri (Nov.) Shrub with habit of *Combretum micranthum* with which it is found in **low thickets**.

Fr. Sud.: Bandiagara (fr. Sept.) Aubrév. 1776! Bandiagara to Mopti Chev. 24914! Ségou Vuillet.

3. *Pteleopsis hylodendron* *Mildbr.* in Notizbl. Bot. Gart. Berl. 8: 61 (1921); Aubrév. Fl. For. C. Iv. 3: 61, t. 264, 1–4. *APD acc*

Pteleopsis suberosa of F.W.T.A., ed. 1, 1: 222, partly (Gold Coast specimens), not of Engl. & Diels.

Rain forest tree, to 12 ft. girth, without buttresses, flowers white.

Iv. C.: Danané Aubrév. 1117! Banco (Jan.) Aubrév. 1774! 1775! **G. C.:** Wiawosa, W. Ashanti (Feb.) Chipp 104! Owabi, Ashanti (Feb.) Andoh FH 4293! Dunkwa (Mar.) Vigne 987! Kumasi (Feb.) Vigne 1814! **S. Nig.:** Ukon F.R. (fl. Feb., fr. Mar.) Catterall 2!

Also in **French Cameroons**.

Pteleopsis kerstingii *Gilg ex Engl.* Pflanzenw. Afr. 3, 2: 717 (1921).

In savannah and gallery-forest.

Togo: Sokodé Kersting.

Imperfectly known species.

4. QUISQUALIS

Linn.—F.T.A. 2: 435; Exell in J. Bot. 69: 117 (1931).

- 1 Upper receptacle up to 2 cm. long; petals 3–4 mm. long, inconspicuous:2
 Upper receptacle 4–8 cm. long, glabrous or shortly pubescent; petals about 15 mm. long, conspicuous; leaves obovate-elliptic, rounded at base, shortly acuminate, 3.5–14 cm. long, 2.5–8 cm. broad; fruits narrowly elliptic, with narrow, thick wings, about 3 cm. long [3. indica](#)
- 2 Upper receptacle 8–10 mm. long, pubescent; leaves oblong, rounded or rarely subcordate at base, obtuse at apex, 7–12 cm. long, 3–5 cm. broad, with 4–6 main lateral nerves on each side of the midrib; fruit broadly elliptic, with wide wings about 3 cm. long and 2–2.5 cm. broad [1. latialata](#)
- Upper receptacle about 2 cm. long, purple, velutinous; leaves ovate-oblong to ovate-lanceolate, obtuse to subcordate at base, acuminate, 5–8 cm. long, 2–3 cm. broad, with 7–8 main lateral nerves on each side of the midrib; fruit oblong, winged, about 3 cm. long and 2 cm. broad [2. pellegriniana](#)

1. *Quisqualis latialata* (*Engl. ex Engl. & Diels*) *Exell* in J. Bot. 69: 121 (1931).

APD: *Synonym of Combretum latialatum Engl. ex Engl. & Diels*

Combretum latialatum *Engl. ex Engl. & Diels* Monogr. Afr. Combretum 86, t. 25C (1899); F.W.T.A., ed. 1, 1: 221.

Scandent shrub, with pale bract-like leaves; petals red or purplish.

S. Nig.: Brass Barter 288! Sapoba Kennedy 347! 2627! Degema Talbot! **Br. Cam.:** Victoria (June) Maitland 57! Victoria to Bimbila (Aug.) Preuss 1322!

Also in **French Cameroons, Spanish Guinea, Gabon, Belgian Congo** and **Angola**.

2. *Quisqualis pellegriniana* (*Exell*) *Exell* in J. Bot. 69: 121 (1931).

APD: *Synonym of Combretum falcatum (Welw. ex Hiern) Jongkind*

Combretum pellegrinianum *Exell* in J. Bot. 67: 177 (1929).

Shrub with purple-velutinous flowers; upper leaves purplish when dry and probably coloured and bract-like when fresh.

S. Nig.: Oban Talbot 498!

Also in **Gabon**.

3. *Quisqualis indica* *Linn.*—F.T.A. 2: 435; Engl. & Diels Monogr. Afr. Combretac. 5, fig. 3; Chev. Bot. 265; Exell in J. Bot. 69: 124.

APD: Synonym of Combretum indicum (L.) DeFilipps

Scandent shrub, **often on river banks**; petals often white outside and red inside, or white and turning red first on the outside, later turning entirely red; commonly cultivated.

Fr. Sud.: Ouagadougou Chev. 2468! **S. L.:** Freetown (May) Deighton 2 727! **Iv. C.:** various localities fide Chev. l.c. **G. C.:** Karega (Apr.) Williams 113! R. Volta, Yeji (Apr.) Bally 180! **Togo:** Kratchi Anderson 8! **Dah.:** Zagnanado Chev. 23084. **N. Nig.:** Nupe Barter 1118! R. Kaduna (Apr.) Dalz. 433! R. Benue, Lokoja (Oct.) Parsons 158! **S. Nig.:** Abeokuta Rowland! Calabar R. (Feb.) Mann 2289! **Br. Cam.:** Cameroons R. (Jan., June) Mann 20! 426! 2212! Victoria (Apr.) Hutch. & Metcalfe 166!

Widespread in tropical Africa and Asia; cultivated throughout the Tropics.

5. GUIERA

Juss., Gen. Pl. 320 (1789); F.T.A. 2: 418.

- 1 A small shrub, with scattered black dots; branchlets softly tomentellous; leaves opposite or subopposite, oblong-elliptic, rounded or slightly cordate at base, mucronate at apex, 3–5 cm. long, 1.5–3 cm. broad, softly tomentose on both surfaces with scattered black glands beneath; petiole without a pair of glands; flowers in dense shortly pedunculate involucre heads, the latter about 1 cm. in diam.; bracts enclosing the flowers in bud, ovate, about 7 mm. long; petals very narrow; fruits linear, radiating, 3–4 cm. long, crowned by the persistent perianth, densely silky-villous [senegalensis](#)

Guiera senegalensis *J. F. Gmel.* in Linn. Syst. Nat. ed. 13, 2: 675 (1791); F.T.A. 2: 418; Engl. & Diels Monogr. Afr. Combretac. 2, fig. 2; Chev. Bot. 259; Aubrév. Fl. For. Soud.-Guin. 90. *APD acc*

APD: Synonym of Guiera senegalensis J.F. Gmel.

Grey foliage and yellowish flowers. **Abundant in sandy wastes and semi-desert areas of the north.**

Sen.: Döllinger! Kayes (Dec.) Chev. 2. Samandiniéry (Feb.) Chev. 2152! **Gam.:** Brown-Lester! Genieri (fl. & fr. Feb.) Fox 44! **Fr. Sud.:** various localities. **Port. G.:** Pussubé (fl. & fr. Feb.) Esp. Santo 1132! **Fr. G.:** Kouroussa Pobéguin 817! Boké Chiliou! **Fr. Nig.:** Niamey (fl. & fr. Oct.) Hagerup 469! **N. Nig.:** Sokoto (fl. & fr. Dec.) Dalz. 434! Katagum Dalz. 134! Bornu (fl. & fr. Apr.) E. Vogel 84! Zaria Baikie! Bauchi Plateau (fl. & fr. July) Lely P. 561!

Extends to A.–E. **Sudan.**

6. TERMINALIA

Linn.—F.T.A. 2: 415.

- 1 Fruits broader than long, with wide wings; coastal and forest species: **2**
Fruits longer than broad; mostly savannah species (but see Nos. 3 and 7): **3**
- 2 Fruits rhomboid, about 2.5 cm. long and 3.5 cm. broad; ovary densely rusty-tomentose; leaves subverticillate, obovate, subacute, 7–14 cm. long, 4–6 cm. broad, slightly pubescent mainly on the nerves beneath, often very densely so when young; coastal species [1. scutifera](#)
Fruits transversely oblong, about 2 cm. long and 5 cm. broad; ovary shortly tomentellous; leaves crowded, long-petiolate, with a pair of subopposite glands on the sides of the petiole, lamina obovate, subacute, 10–17 cm. long, 6–10 cm. broad, glabrous; tall tree of forest [2. superba](#)
- 3 Fruit fleshy, not or scarcely winged, ellipsoid, 4–6.5 cm. long, 2.5–3.5 cm. broad; leaves obovate, narrowed to the rounded or cordate base, 15–25 cm. long, 10–15 cm. broad; introduced species [3. catappa](#)
Fruits dry, broadly winged; savannah species (except No. 7): **4**
- 4 Leaves elongate-obovate, gradually attenuate to the normally sessile or subsessile base, rarely with a distinct petiole, 15–35 cm. long, 6–12 cm. broad, lateral nerves numerous and prominent on both surfaces; young and mature shoots glabrous; flowers glabrous or sparsely pubescent; fruits oblong, 8–13 cm. long, 3–4 cm. broad, glabrous [4. macroptera](#)
Leaves always distinctly petiolate, usually pubescent or tomentose, at least on the young shoots: **5**
- 5 Fruits glabrous, at least when mature; flowers glabrous outside, or pubescent: **6**

- Fruits densely puberulous or tomentellous all over; flowers densely tomentellous or tomentose outside:7
- 6 Fruits oblong, lanceolate, or narrowly elliptic, 5–9 cm. long, 2–3.5 cm. broad; leaves variable, oblong, or narrowly to broadly elliptic, 10–30 cm. long, 3–11 cm. broad, glabrous, or pubescent and then glabrescent beneath [5. laxiflora](#)
- Fruits broadly elliptic, 3–5 cm. long, 2–3.5 cm. broad; leaves obovate-elliptic, 7–11 cm. long, 2.5–7.5 cm. broad, puberulous or glabrescent beneath [6. brownii](#)
- 7 Forest species, with tall straight bole; leaves obovate, narrowed from above the middle to the base, abruptly and shortly acuminate, 7–12 cm. long, 3–5.5 cm. broad, with very prominent lateral nerves, almost glabrous; fruits oblong, 7–10 cm. long, 2–2.5 cm. broad [7. ivorensis](#)
- Savannah species, with short gnarled boles; leaves hairy, often densely so:8
- 8 Leaves up to 20 cm. long and 7 cm. broad; fruits up to 7 cm. long and 3 cm. broad:9
- Leaves 20–35 cm. long, 10–18 cm. broad, very broadly oblong-elliptic, with a long stout petiole; densely tomentose beneath, becoming less so with age; venation very strongly reticulate beneath; fruits 7–10 cm. long, 2.5–4 cm. broad [11. mollis](#)
- 9 Mature leaves pubescent only on the nerves beneath with the glaucous surface of the lamina clearly visible between the hairs, or almost glabrous; lamina more or less elliptic, 9–15 cm. long, 3–8 cm. broad; fruits oblong, 5–7 cm. long, 1.5–2.5 cm. broad [8. glaucescens](#)
- Mature leaves densely tomentose or silky all over the lower surface: 10
- 10 Leaves closely appressed-silky and silvery beneath, upper surface shining; lamina lanceolate or elliptic, acute or obtuse at apex, 7–10 cm. long, 3–4.5 cm. broad; fruits 5.5–6.5 cm. long, 2–3 cm. broad, densely white-silky [9. albida](#)
- Leaves loosely tomentose with curly hairs beneath, drying brown, upper surface matt; lamina elongate-oblong or oblong-elliptic, obtuse at apex, 9–20 cm. long, 3–7 cm. broad; fruits 5–6 cm. long, 2–3 cm. broad, tomentose [10. avicennioides](#)

1. **Terminalia scutifera** *Planch. ex Laws.* in F.T.A. 2: 417 (1871); Engl. & Diels Monogr. Afr. Combretac. 25, t. 14 A; Chev. Bot. 258. *APD acc*

Tree of [sea shore](#), to 45 ft. high, gnarled and branching from the base; deciduous.

Port. G.: Bolama Carvalho 316. Formosa (young fr. Apr.) Esp. Santo 1989! Pefiné, Bissau Esp. Santo 1703! **Fr. G.:** Heudelot 907! Conakry (Feb.) Debeaux 141! Chev. 13045. **S. L.:** Afzelius. Lumley Beach (Feb.) Deighton 534! Hamilton (Dec.) Lane-Poole 87! Kent (Dec.) Dawe 419!

2. **Terminalia superba** *Engl. & Diels* l.c. 26, t. 14 B (1900); Chalk & Burtt Davy, For. Trees & Timbers Brit. Emp. 2: 30; Aubrév. Fl. For. C. Iv. 3: 58, t. 263, 5–8. *APD acc*

Terminalia altissima *A. Chev.* Vég. Util. 5: 151 (1909); Chev. Bot. 256.

Forest tree, to 150 ft. (rarely to 200 ft.) high, with large thin buttresses, clean straight bole and rather flat crown; bark ashy grey.

Fr. G.: Kissidougou (Feb.) Chev. 20702! **S. L.:** Bandama (Feb.) Aylmer 579! Hangha (Feb.) Lane-Poole 146! **Iv. C.:** Azaguié Chev. 22307b! Bouroukrou Chev. 16104. **G. C.:** Kwahu (young fr. Apr.) Also on the coasts of other parts of tropical W. Africa and of tropical and subtropical America.

8. ANOGEISSUS

(DC.) Wall.—F.T.A. 2: 417. *APD acc*

- 1 Branchlets tomentose, leaves alternate, elliptic to ovate-lanceolate, obtuse and mucronate, or acute at apex, 2–8 cm. long, 1.2–3.5 cm. broad; at first densely silky, then laxly pubescent beneath; receptacle above the ovary consisting of a narrow tubular lower portion, and a cup-shaped upper portion; fruits in subglobose cone-like heads; each fruit broadly winged, beaked by the persistent tubular portion of the receptacle [leiocarpus](#)

Anogeissus leiocarpus (DC.) Guill. & Perr.—F.T.A. 2: 418; Engl. & Diels Monogr. Afr. Combretac. 31; Chev. Bot. 259; Aubrev. Fl. For. Soud.-Guin. 135. *APD acc*

Conocarpus leiocarpus DC. Prod. 3: 16 (1828).

Anogeissus schimperi Hochst. ex Hutch. & Dalz. F.W.T.A., ed. 1, 1: 227 (1927); Aubrev. Fl. For. C. Iv. 3: 60.

Anogeissus leiocarpus var. **schimperi** (Hochst. ex Hutch. & Dalz.) Aubrev. Fl. For. Soud.-Guin. 135 (1950).

A tree to 70 ft. high, with grey bark (becoming blackish in old trees) and light green or ashen foliage, often with drooping branches; flowers greenish-yellow, with a reddish disk with white hairs.

There are several ecological forms of this species which extends from the driest savannah to the borders of the forest zone, usually in moist situations but also in relatively dry situations in some northern areas. Specimens from the drier areas tend to have smaller leaves and more hairy flowers but there are too many intermediates for varieties or species to be distinguished.

RHIZOPHORACEAE

Trees or shrubs, frequently on maritime shores; branches swollen at the nodes. Leaves opposite and stipulate, rarely alternate and exstipulate, leathery, simple; stipules interpetiolar, caducous. Flowers hermaphrodite, in axillary inflorescences. Calyx-tube adnate to the ovary or free; lobes 3–14, persistent, valvate. Petals usually small, often notched, bifid or laciniate, convolute or inflexed in bud. Stamens equal to or usually more than the petals in number, often in pairs opposite the petals on the edge or at the base of a perigynous disk; anthers 2– or many-celled. Ovary mostly inferior, 2–6-celled or 1-celled by suppression of the septa; style simple or rarely styles several; ovules 2 in each cell, rarely more, inserted towards the apex on the inner angle of the cell. Fruit mostly indehiscent, usually 1-seeded or the cells 1-seeded. Seeds with or without fleshy endosperm; cotyledons terete or connate.

A small family, often partial to maritime shores.

Leaves usually opposite and with interpetiolar stipules; flowers small and inconspicuous.

- 1 Leaves apparently alternate, anisophyllous, with normally developed and small, usually caducous, leaves at each node, exstipulate; ovary inferior, with 3–4 styles; flowers small, spicate; petals laciniate:[2](#)
Leaves opposite or whorled, stipulate; stipules interpetiolar; style simple:[3](#)
- 2 Leaves oblique, with 1–3 strong longitudinal nerves on each side of the midrib; inflorescence of solitary axillary spikes, or of 2–4 spikes borne near the base of lateral leafy shoots; drupe 1-seeded [1. Anisophyllea](#)
Leaves pinnately nerved; inflorescence a panicle of catkin-like spikes on leafless shoots; drupe with 3–4 seeds [2. Poga](#)
- 3 Flowers in clusters on simple pedicels; petals laciniate[3. Cassipourea](#)
Flowers in pedunculate cymes; petals entire or nearly so:[4](#)
- 4 Filaments free, very short; stipules large and enclosing the young buds; seed germinating in the fruit on the tree; calyx glabrous [4. Rhizophora](#)
Filaments united into a long tube; stipules small; seed not germinating on the tree; calyx tomentellous[5. Anopyxis](#)

1. ANISOPHYLLEA

R. Br. ex Sabine—F.T.A. 2: 412. *APD acc*

- 1 Leaves cuneate or obtuse at base:[2](#)
Leaves cordate or subcordate at base:[4](#)
- 2 Spikes usually 2–4, borne at different levels near the base and below the leaves of young leafy lateral shoots which are themselves normally borne directly in the axils of older leaves; inflorescence-axes and flowers on the outside puberulous, not glandular; leaves acute or gradually acuminate at the apex:[3](#)
Spikes solitary, supra-axillary, with 1–3 superposed buds between the spike and the petiole of the older leaf which subtends it; inflorescence-axes and flowers on the outside densely hirsute and glandular; branchlets with a few long spreading hairs, or glabrescent; leaves obliquely rhomboid-elliptic or obovate-elliptic, rather abruptly long-acuminate, 4–8.5 cm. long (excluding the 5–15 mm. long acumen), 2–3.5 cm. broad, usually with only 1 strong longitudinal nerve on each side of the midrib[3. sp. A](#)
- 3 Young branchlets puberulous; inflorescence-axes, bracts and outside of flowers more or less densely puberulous; laciniae of petals without glandular swollen apices; fruits oblong to obovoid-ellipsoid, 4–5 cm. long, 2.5–3 cm. diam.; leaves varying from obliquely lanceolate-elliptic or ovate-lanceolate and about 7 cm. long by 2.5 cm. broad, to ovate and about 15 cm. long by 7 cm. broad; secondary nerves nearly at right angles to the midrib, rather markedly parallel, main longitudinal nerves 1–2 on each side of the midrib [1. laurina](#)
Young branchlets long-hirsute; inflorescence-axes, bracts and outside of flowers very sparsely puberulous; bracts and calyx-lobes ciliate at the margins; laciniae of petals with glandular swollen apices; fruits subglobose to oblong, 2.5–3 cm. long, about 2 cm. diam.; leaves obliquely ovate, 7–15 cm. long, 3–6 cm. broad; secondary nerves forming an acute angle with the midrib, not markedly parallel; main longitudinal nerves 1–2 on each side of the midrib [2. meniaudi](#)

- 4 Inflorescence-axes and flowers on the outside loosely pilose, the former very slender and only about 2 cm. long; spikes solitary, slightly supra-axillary; leaves ovate-oblong, acutely long-acuminate, 6–8 cm. long, 2.5–3 cm. broad, silky-pilose and rose-purplish when young; 1–2 strong longitudinal nerves on each side of the midrib, arising from near the base of the leaf [4. *purpurascens*](#)

Inflorescence-axes and flowers on the outside glabrous or sparingly puberulous, the former rather stout and 7–12 cm. long; spikes probably borne in the same manner as species Nos. 1 and 2 above; leaves obliquely oblong-ovate or oblong-elliptic, acuminate, 7.5–15 cm. long, 3–7 cm. broad, pubescent when young but soon glabrous, margin inrolled; 2–3 strong longitudinal nerves on each side of the midrib, with at least one of the nerves arising 1–3 cm. above the base of the leaf [5. *sp. B*](#)

1. **Anisophyllea laurina** *R. Br. ex Sabine*—F.T.A. 2: 413; Chev. Bot. 256. *APD acc*

APD: Synonym of *Anisophyllea polyneura* Floret

Anisophyllea strychnoides Engl. & v. Brehm. in Engl. Bot. Jahrb. 54: 373 (1917).

Anisophyllea fissipetala Engl. & v. Brehm. l.c. 377 (1917).

Shrub or tree, 15–50 ft., or up to 70 ft. high; **locally abundant in secondary regrowth**; flowers yellow-green; fruits yellow, often peach-pink or reddish on the sunned side, fleshy, edible. "Monkey Apple."

A tree.

S. Nig.: Oban Talbot !

5. **Anisophyllea sp. B** . *APD acc*

Forest tree, to 120 ft. high, with clean straight bole.

S. Nig.: Okomu F.R. (young fr. Feb.) Brenan 9086! Ikom (Oct.) Catterall 46!

1. **Anisophyllea setosa** *Mildbr.* Wiss. Ergebn. 1910–11, 2: 188 (1922), name only.

F. Po: Bokoko Mildbr. 6836.

Imperfectly known species.

2. **Anisophyllea brachystila** *Engl. & v. Brehm.* in Engl. Bot. Jahrb. 54: 378 (1917).

Small shrub. Locality not traced, but possibly in our area.

"Südnigeria-Kamerun-Zone": Dolo (June) Schlechter 12450.

Imperfectly known species.

2. POGA

Pierre in Bull. Soc. Linn. Paris 2: 1254 (1896).

- 1 A tree; branches glabrous, purplish; leaves elliptic, rounded at base, obtuse and oblique at apex, 12–15 cm. long, 6–7 cm. broad, leathery, loosely gland-dotted beneath; lateral nerves numerous; petiole flat above, about 2 cm. long; flowers very small, arranged in panicles of catkin-like spikes on leafless shoots; axis becoming woody; sepals and petals 4; stamens 8; ovary inferior, 4-celled; ovules solitary in each cell, pendulous; fruit a large drupe, ellipsoid, about 6 cm. long, with fleshy exocarp and woody endocarp with numerous resinous lacunae; seeds without endosperm [oleosa](#)

Poga oleosa *Pierre* in Bull. Soc. Linn. Paris 2: 1254 (1896); Engl. in Notizbl. Bot. Gart. Berl. 5: 294–298, fig. 1 (1913); Holl. 2: 305; F.W.T.A., ed. 1, 2: 605; Kennedy For. Fl. S. Nig. 51. *APD acc*

A forest tree, to 100 ft. high; esteemed for its fruits, whose seeds yield a valuable oil.

S. Nig.: Oban Talbot 1636!

Also in *French Cameroons* and *Gabon*.

3. CASSIPOUREA

Aubl.—Alston in Kew Bull. 1925: 241–276 (1925).

Weihea Spreng.—F.T.A. 2: 410.

Dactylopetalum Benth.—F.T.A. 2: 411.

- 1 Calyx-tube shorter than the ovary, and much shorter than the 5 lanceolate calyx-lobes; calyx-lobes spreading or reflexed, glabrous within; leaves usually serrate or dentate: **2**
Calyx-tube generally longer than the ovary in the flower, as long, or longer than the erect triangular calyx-lobes: **3**
- 2 Ovary glabrous, depressed at the apex; leaves subentire or serrate, elliptic to oblong, cuneate to rounded at base, rounded or obtuse at apex, not acuminate, or only very shortly and obtusely so, 4–10 cm. long, 2–5.5 cm. broad [1. congoensis](#)
Ovary pubescent, ridged and conical at the apex; leaves coarsely dentate with 3–4 teeth in the upper half, lanceolate-elliptic, cuneate at base, rather long-acuminate, 5–15 cm. long, 2.5–6 cm. broad [2. adami](#)
- 3 Calyx within and ovary densely silky-hairy; calyx cup-shaped: **4**
Calyx glabrous or puberulous within, campanulate; ovary glabrous or pubescent: **6**
- 4 Calyx 10–12 mm. long, pedicel 15–25 mm. long, articulated towards the apex; flowers solitary; stamens much shorter than the calyx; leaves elliptic, acute at each end, 10–12 cm. long, 4–6 cm. broad [3. firestoneana](#)
Calyx 3–4 mm. long, pedicels 1–3 mm. long; stamens longer than the calyx: **5**
- 5 Flowers very numerous at each node, forming a dense cluster; leaves lanceolate or elliptic-lanceolate, 5–6 cm. long, not more than 3 cm. broad, entire or nearly so [4. eketensis](#)
Flowers few at each node, laxly arranged; leaves broadly oblong or elliptic, rather abruptly acuminate, 7–14 cm. long, 3–6 cm. broad, distinctly toothed [5. afzelii](#)
- 6 Leaves obovate, or oblanceolate, very gradually narrowed to the base, 7–17 cm. long, 3–6.5 cm. broad; flowers sessile in small clusters; ovary puberulous towards the apex [6. nialatou](#)
Leaves oblong, elliptic or ovate: **7**
- 7 Ovary tomentose, or pilose towards the apex; pedicels up to 2 mm. long: **8**
Ovary glabrous: **9**
- 8 Ovary tomentose all over; flowers in dense many-flowered fascicles at the thickened nodes of the older parts of the branchlets; leaves broadly elliptic, cuneate, or more rarely rounded, at base, 12–18 cm. long, 7–14 cm. broad; petiole 6–9 mm. long [8. barteri](#)
Ovary pilose towards the apex; flowers in rather few-flowered fascicles; leaves oblong, or oblong-elliptic, rounded, or more rarely cuneate, at base, 6–15 cm. long, 3–6 cm. broad; petiole 8–13 mm. long [7. ugandensis](#)
- 9 Venation of leaves rather lax and much less prominent than the main lateral nerves beneath; lamina elliptic, 10–15 cm. long, 5–6.5 cm. broad, margin not revolute; flowers distinctly pedicellate [9. glabra](#)
Venation of leaves strongly reticulate, almost as prominent as the main lateral nerves above and beneath; lamina

oblong-elliptic to ovate-elliptic, 6–10 cm. long, 2.5–6 cm. broad, margin revolute; flowers sessile or subsessile
 [10. paludosa](#)

1. **Cassipourea congoensis** *R. Br. ex DC.* Prod. 3: 34 (1828); Alston in Kew Bull. 1925: 259 (q.v. for full synonymy); Aubrév. Fl. For. C. Iv. 3: 46; Jac.-Fel. in Rev. Bot. Appliq. 1952: 266. *APD acc*

APD: Synonym of Cassipourea louisii Liben

APD: Synonym of Cassipourea malosana (Baker) Alston

Cassipourea africana *Benth.* in Hook. Fl. Nigrit. 341 (1849).

Weihea africana *Benth. ex Oliv.* F.T.A. 2: 410 (1871).

A shrub or small tree, sometimes half-scrambling, glabrous except on the young internodes and leaf- and flower-buds; flowers few in clusters or solitary.

Sen.: M'bidjem Thierry 25! **Fr. G.:** Farana (Mar.) Sc. Elliot 5369! Kouroussa Adam 4703. **S. L.:** Afzelius. **Iv. C.:** Lalirabah Aubrév. 666! **G. C.:** Volta R. Gorge, Tiase (May) Irvine 3001! HYPERICACEAE

Herbs, shrubs or rarely trees or climbers, with a resinous juice. Leaves opposite or verticillate, rarely alternate, simple, entire or glandular-dentate, rarely coriaceous, usually thin and marked with translucent or black dots, rarely small and scale-like; stipules absent; indumentum when present often stellate and ferruginous. Flowers terminal or rarely axillary, from solitary to cymosepaniculate or corymbose, usually yellow or white, hermaphrodite, actinomorphic. Sepals 4–5, imbricate. Petals 4–5, hypogynous, imbricate or contorted. Stamens numerous or rarely subdefinite, hypogynous, usually variously united into 3–5 or more bundles, rarely free; anthers 2-celled, opening by longitudinal slits. Ovary of 3–5 (rarely 1) carpels, 1-celled or imperfectly or perfectly 2–5-celled; styles the same number as the carpels, slender, free or rarely somewhat united, with a terminal capitate to clavate stigma; ovules axile or pendulous, numerous and 2-seriate, or few or solitary. Fruit a septicidal or rarely loculicidal capsule, or a berry or drupe. Seeds without endosperm; embryo straight or arcuate.

A widely dispersed family.

Recognized by the opposite often gland-dotted leaves and the stamens united into bundles.

- 1 Petals glabrous inside: **2**
 Petals hairy inside; fruit a berry or drupe; stamens united into 5 bundles: **3**
- 2 Fruit a capsule, or berry, with many seeds; stamens not united into a tube, but often united into bundles **1.**
 Hypericum
 Fruit a drupe with a single seed; stamens united into a tube above **2. Endodesmia**
- 3 Fruit a berry: **4**
 Fruit a drupe with a crustaceous pericarp enclosing the 5 pyrenes **5. Harungana**
- 4 Seeds numerous; ovules about 5 in each of the 5 cells of the ovary **3. Vismia**
 Seeds few; ovules solitary or paired in each of the 5 cells of the ovary **4. Psorospermum**

1. HYPERICUM

Linn.—F.T.A. 1: 154.

- 1 Trees or shrubs; ovary 5-celled; stigmas 5: **2**
 Herbaceous perennials; petals 6–8 (–14) mm. long: **3**
- 2 Leaves narrowly elliptic, 1–2 (–3.5) cm. long, 3–6 mm. broad, with translucent nerves and glandular lines; flowers solitary at the ends of the branches; sepals about 1 cm. long; petals obovate-oblong, 2–3 cm. long; style about 5 mm. long, with linear branches about 3 mm. long **1. lanceolatum**
 Leaves varying from elliptic to ovate or lanceolate, 3–8 cm. long, 0.8–3 cm. broad, with opaque nerves and translucent glandular dots and dashes; flowers in 1-several-flowered cymes; sepals 6–8 mm. long; petals oblanceolate, 2.5–3.5 cm. long; style about 1 cm. long, nearly entire **2. riparium**
- 3 Stems erect, up to 70 cm. high; internodes much longer than the leaves; leaves lanceolate or narrowly elliptic, 7–23 mm. long, 1–7 mm. broad; flowers in a loose dichotomous cyme; ovary 3-celled (rarely 4-celled); styles 3, free; fruit a dehiscent capsule **3. lalandii**
 Stems prostrate, procumbent or ascending, up to 60 (rarely 90) cm. long, sometimes rooting at the lower nodes; internodes rarely longer than the leaves; leaves elliptic or obovate, 6–15 mm. long, 3–11 mm. broad; flowers solitary, often appearing axillary; ovary 5-celled; styles 5, free; fruit fleshy and indehiscent **4. peplidifolium**

1. *Hypericum lanceolatum* Lam.—F.T.A. 1: 156; Hutch. in Kew Bull. 1923: 224.

APD: *Synonym of Hypericum revolutum Vahl subsp. revolutum*

Hypericum leucoptychodes Steud. ex A. Rich.—Good in J. Bot. 65: 330; Hutch. in Fl. Pl. S. Africa 20, t. 787 (1940).

Shrub or tree to 40 ft. high; flowers golden-yellow.

Br. Cam.: Cam. Mt., 4,000–10,000 ft. (Nov.–Apr.) Mann 1199! 2179! Maitland 302! 1099! Brenan 9556! Bangwa, Mamfe (Jan.) Lobe Babute 22/37! Besuako, Bamenda (fl. & fr. Mar.) Johnstone 86/31! Also in [French Cameroons](#), the highlands of eastern Africa from Abyssinia to S. Rhodesia, and in [Angola](#).

Hypericum sp.

Flowers not known, but leaves distinct from any of the above species.

F. Po.: El Pico, 7,300 ft. Boughey 137!

Imperfectly known species.

2. ENDODESMIA

Benth.—F.T.A. 1: 157.

- 1 A shrub or small tree; branchlets finely longitudinally lined, glabrous; leaves opposite, oblong-lanceolate, obtusely caudate-acuminate, more or less cuneate at the base, 6–10 cm. long, 2–3 cm. broad, with numerous close parallel lateral nerves, and scattered small blackish glands on the lower surface; petiole 3–4 mm. long; flowers cymose; sepals oblong-lanceolate, acute, shortly united at the base, coriaceous, 5 mm. long, keeled; petals yellow, contorted, about twice as long as the sepals; anthers apiculate; fruits about 1.5 cm. long, on thickened pedicels [calophylloides](#)

Endodesmia calophylloides Benth.—F.T.A. 1: 157. *APD acc*

In swamp forest, by rivers.

S. Nig.: Sapoba (fl. Feb., fr. Oct.) Kennedy 1787! A. F. Ross 213! Richards 3919! Calabar Chev. 13628! **Br. Cam.:** Cameroons R. (June) Mann 424!

Also in **French Cameroons**, **Gabon** and **Cabinda**.

3. VISMIA

Vand. Fl. Lusit. Brasil. 51 (1788); F.T.A. 1: 160.

- 1 Inflorescence paniculate, equalling or exceeding the leaves; flowers numerous, small, subumbellate on pedicels 1–2 mm. long; sepals 1.5–2 mm. long; stamens 4–6 in each bundle; leaves broadly ovate-elliptic, cordate at base, shortly acuminate, 6–12 cm. long, 3.5–7 cm. broad, puberulous then glabrescent beneath, with numerous opaque glands, drying a rich reddish-brown colour [1. rubescens](#)

Inflorescence a pair of pedunculate subumbellate cymes, shorter than the leaves, usually borne at the apex of short lateral shoots bearing two pairs of leaves, the lower pair much smaller than the upper pair which subtend and exceed the cymes; pedicels 6–10 mm. long; sepals about 4 mm. long; stamens 20–40 in each bundle; leaves elliptic or elliptic-lanceolate, cuneate or obtuse at base, acutely acuminate, stellate-puberulous beneath with black glands, not drying reddish [2. guineensis](#)

1. **Vismia rubescens** *Oliv.* F.T.A. 1: 160 (1871); Exell & Mendonca Consp. Fl. Ang. 1: 124. *APD acc*

A climbing shrub, attaining 20 ft.

S. Nig.: Eket Talbot 3296!

Also in **Spanish Guinea**, **Gabon**, **Belgian Congo** and **Cabinda**.

2. **Vismia guineensis** (*Linn.*) *Choisy* Monogr. Hyp. 36 (1821). *APD acc*

Hypericum guineense *Linn.* Diss. Hyp. 4, t. 8, fig. 1 (1776); Amoen. Acad. 8: 321 (1785).

Psorospermum guineense (*Linn.*) *Hochr.* in Ann. Conserv. Jard. Bot. Genève. 21: 57 (1919), partly (excl. syn. *P. senegalense* Spach, and ref. Guill. & Perr. Fl. Seneg. 1: 107).

Vismia leonensis *Hook. f.* in Fl. Nigrit. 243 (1849); F.T.A. 1: 161; Chev. Bot. 50; F.W.T.A., ed. 1, 1: 230.

Vismia leonensis var. **macrophylla** *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 230 (1927); Kew Bull. 1928: 227.

Vismia laurentii var. **polyandra** *Hochr.* l.c. 55.

A small tree, up to 50 ft. high in **secondary forest growth**; petals greenish-yellow with thin red markings.

Port. G.: Cacine (July) Esp. Santo 2117! **Fr. G.:** Conakry (June) Debeaux 422! Kaba to Haut-Mamou (May) Chev. 13265! Massadou, Macenta (May) Collenette 23! **S. L.:** Afzelius! Smeathmann! T. Also in **French Cameroons**.

4. PSOROSPERMUM

APD: *Synonym of Harungana Lam.*

Spach—F.T.A. 1: 158.

- 1 Lateral nerves not impressed above, leaves not bullate: **2**
Lateral nerves impressed above, leaves more or less bullate, elliptic, 3–7 cm. long, 1.5–3 cm. broad, strictly opposite; inflorescences often terminating short lateral shoots: **10**
- 2 Leaves alternate or subopposite, rarely some opposite, not subsessile and not or only slightly acuminate: **3**
Leaves always strictly opposite; inflorescences usually appearing terminal, or terminating short lateral shoots: **8**
- 3 Leaves coriaceous, oblong to obovate, 8–18 cm. long, 4–10.5 cm. broad; stem and leaves entirely glabrous; inflorescences appearing terminal and not usually exceeded by the lateral shoots; flowers numerous in large corymbose-cymes; petals pale purple [1. alternifolium](#)

- Leaves membranous or subcoriaceous, up to 14 cm. long and 6 cm. broad; stem and leaves often hairy; inflorescences usually exceeded by the lateral shoots; petals white or cream, with dark streaks:4
- 4 Suffrutex; sepals 5 mm. long; stems and leaves densely long-woolly tomentose; leaves elliptic, 5–14 cm. long, 2.5–6 cm. broad2. [lanatum](#)
- Erect shrubs and trees:.....5
- 5 Cymes appearing axillary, up to about 5 cm. diam., numerous, occurring at most of the nodes of the young shoots:6
- Cymes not appearing axillary, exceeding 5 cm. diam., corymbose, terminating the main shoots, most nodes not floriferous; peduncles exceeding 1 cm. long:7
- 6 Leaves obtuse at apex, midrib straight; mature branchlets and undersurface of leaves pubescent; internodes usually shorter than the leaves; cymes dense, subsessile or peduncles up to 1 cm. long3. [senegalense](#)
- Leaves acute at apex, midrib dorsiventrally arched; branchlets and leaves quite glabrous except when very young, internodes usually as long as, or longer than, the leaves; cymes lax, peduncle usually exceeding 1 cm. long4. [glaberrimum](#)
- 7 Inflorescence and outside of sepals densely woolly tomentose5. [corymbiferum](#) var. [corymbiferum](#)
- Inflorescence and outside of sepals sparingly pubescent or nearly glabrous5a. [corymbiferum](#) var. [kerstingii](#)
- 8 Leaves distinctly acuminate, membranous; petiole 4–8 mm. long; lamina elliptic, cuneate at base, 5–11 cm. long, 2–5 cm. broad, lower surface concolorous, laxly and not conspicuously reticulate, punctate all over; stems, leaves, inflorescences and outside of sepals glabrous6. [tenuifolium](#)
- Leaves scarcely acuminate, subcoriaceous, subsessile, or with petiole up to 3 mm. long, subcordate or rounded at base, sometimes cuneate; gland dots usually absent from lower surface of leaves, reticulation where not obscured by indumentum, conspicuous owing to the pallid surface between the veins:9
- 9 Inflorescence and outside of sepals sparingly pubescent or nearly glabrous; leaves glabrous or sparingly pubescent, with the reticulate venation on the pallid lower surface obvious (at least when dry); leaves usually more or less oblong.7. [febrifugum](#) var. [febrifugum](#)
- Inflorescence and outside of sepals woolly tomentose; lower surface of leaves covered with stellate indumentum tending to obscure the reticulation; leaves usually broadly ovate to orbicular7a. [febrifugum](#) var. [ferrugineum](#)
- 10 Lamina of adult leaves densely punctate beneath, sparsely pubescent on the midrib and lateral nerves8. [densipunctatum](#)
- Lamina of adult leaves densely ferruginous tomentose beneath9. [aurantiacum](#)

1. **Psorospermum alternifolium** *Hook.f.* in Fl. Nigrit. 243 (1849); F.T.A. 1: 159; Chev. Bot. 50; Aubrév. Fl. For. Soud.-Guin. 146, t. 23, 3. *APD acc*

Shrub, or small tree, to 12 ft. high, or suffrutescent; flowers pale purple, often galled.

5. HARUNGANA

Lam. Tab. Encyc. Méth. Bot. t. 645 (1797).

Haronga Thouars (1806)—F.T.A. 1: 159.

- 1 A tree or shrub, with orange-coloured sap, clothed everywhere with fine stellate hairs; leaves opposite, ovate or ovate-elliptic, rounded, or sometimes cuneate or subcordate at base, acute or shortly acuminate at apex, 10–20 cm. long, 6–10 cm. broad, with rather numerous lateral nerves prominent beneath; petiole 1.5–2 cm. long; flowers very small and numerous in a terminal corymbose cyme, its branches covered with coarse rusty indumentum *madagascariensis*

Harungana madagascariensis *Lam. ex Poir.* in *Lam. Encyc. Méth.* 6: 314 (1804); *Exell in J. Bot.* 68: 181 (1930). *APD acc*

APD: *Synonym of Vismia rubescens Oliv.*

Arungana paniculata *Pers.* (1809).

Haronga madagascariensis (*Lam. ex Poir.*) *Choisy* (1821)—F.T.A. 1: 160; Chev. Bot. 51.

Haronga paniculata *Lodd. ex Steud.* (1840)—F.W.T.A., ed. 1, 1: 233.

Flowers whitish, fragrant, dotted with black glands; drupes 2–4 seeded, 2.5–3.5 mm. diam.; **abundant on cleared ground in forest regions, also in fringing forest in the savannah regions.**

(June) Maitland 1719! **F. Po:** T. Vogel 100! Barter 1255! Mann 637! Moka (Dec.) Boughey 81!

Widespread in tropical Africa, Madagascar and the Mascarene Islands.

GUTTIFERAE

Trees or shrubs, with resinous juice. Leaves opposite, simple; stipules absent. Flowers actinomorphic, unisexual, polygamous or dioecious, rarely hermaphrodite. Sepals 2–6; rarely more, imbricate. Petals the same number, hypogynous, contorted or imbricate, very rarely subvalvate. Stamens mostly numerous, hypogynous, free or variously united in the lower part or into bundles opposite the petals; anthers 2-celled, opening lengthwise. Rudimentary ovary sometimes present in the male flower; staminodes often present in the female flower. Ovary sessile, superior, 1- to many-celled; ovules 1 to many, on the inner angle of the cells or erect from their base, rarely parietal (Allanblackia); stigmas various, sometimes radiating. Fruit dehiscent or not, sometimes large and globose. Seeds often with an aril, without endosperm; embryo large; cotyledons often minute.

A tropical family.

Recognized by the opposite entire leaves without stipules, unisexual flowers with the stamens mostly collected into bundles, imbricate calyx, and resinous juice.

- 1 Ovary 1-celled, with numerous ovules on 5 parietal placentas; stamens united into 5 cuneate-spathulate bundles opposite the petals; anthers sessile; flowers unisexual, large; fruit large, elongate [1. *Allanblackia*](#)
- Ovary 2- or more-celled with axile placentas: [2](#)
- 2 Flowers hermaphrodite; ovules 3 or more in each cell: [3](#)
- Flowers hermaphrodite or polygamous; ovary 2-celled with 2 ovules in each cell; stamens numerous, connate only near the base; filaments slender; stigma sessile, capitate [4. *Mammea*](#)
- 3 Flowers large, terminal, solitary; inner sepals nearly as large as the petals; stamens numerous, shortly connate into 5 bundles, and filaments free above: fruit large and ovoid or subglobose [2. *Pentadesma*](#)
- Flowers small, umbellate; sepals much smaller than the petals and exposing them in bud; stamens about 15, connate nearly to the anthers in 5 bundles; fruit a small berry [3. *Symphonia*](#)
- 4 Flowers polygamous or dioecious; ovary 2- or more-celled, with a solitary ovule in each cell; stamens free or variously united into bundles; fruits usually rather small; leaves often punctate or with resinous lines oblique to the lateral nerves [5. *Garcinia*](#)

Calophyllum inophyllum Linn.

Introduced into our area.

Mesua ferrea Linn.

Introduced into our area.

1. ALLANBLACKIA

Oliv.—F.T.A. 1: 162. *APD acc*

- 1 Fruit fusiform, 25–50 cm. long, 8–14 cm. diam., with 40–80 seeds about 2–4 cm. long and 1.5–2.5 cm. broad; flowers pink or red, the male crowded towards the apex of the branches, with pedicels 2.5–7 cm. long; disk of male flower pitted or pleated; leaves varying from broadly oblong-elliptic to oblong-oblancoate, cuneate or rounded at base, acutely acuminate, 10–25 cm. long, 3.5–8 cm. broad [1. *floribunda*](#)
- Fruit ovoid to subglobose, 12–16 cm. long, 10–12 cm. diam., with 10–12 seeds about 4.5 cm. long and 3–3.5 cm. broad; flowers white or pale pink, disk of male flower smooth or only slightly pleated; pedicels 3–6 mm. long; leaves obovate, oblanceolate or oblong-lanceolate, cuneate at base, cuspidate at apex, 6–12 cm. long, 2.5–5 cm. broad [2. *monticola*](#)

1. **Allanblackia floribunda** *Oliv.* F.T.A. 1: 163 (1868); Chev. Bot. 52; Staner in Bull. Jard. Bot. Brux. 13: 114 (1934). *APD acc*

APD: Synonym of Allanblackia parviflora A. Chev.

Allanblackia parviflora *A. Chev.* Vég. Util. 5: 163 (1909); Chev. Bot. 53; F.W.T.A., ed. 1, 1: 233; Aubrév. Fl. For. C. Iv. 2: 286, t. 240.

Evergreen tree of forest, to 100 ft. high.

S. L.: Jama (May) Lane-Poole 98! Banduma, Daru (Apr.) Deighton 3142! **Lib.:** Dukwia R. (Mar.) Cooper 325! Nyaake, Webo (young fr. June) Baldwin 6132! Ganta (fl. May, fr. Apr.) Also in **French Cameroons**, **Gabon**, **Belgian Congo**, **Cabinda** and **Uganda**.

2. **Allanblackia monticola** *Mildbr. ex Engl.* Pflanzenw. Afr. 3, 2: 509 (1921); Staner l.c. 111. *APD acc*

APD: Synonym of Allanblackia kisonghi Vermoesen

Forest tree.

F. Po: north side of St. Isabel peak, 1,900–2,900 ft. Mildbr. 6430.

Also in **Belgian Congo**.

Allanblackia sp.

Represented by only a poor specimen, but evidently distinct from *A. floribunda* Oliv., and probably also from *A. monticola* Mildbr. ex Engl. Better material required.

Br. Cam.: Bali-Ngemba F.R., Bamenda (May) Ujor FHI 30327!

Imperfectly known species.

2. PENTADESMA

Sabine—F.T.A. 1: 164.

- 1 Leaves oblong-obovate to oblong-oblancheolate, cuneate at base, shortly acuminate, 10–22 cm. long, 3.5–7 cm. broad, with numerous close parallel lateral nerves; glandular canals on undersurface visible by reflected light, glandular dots clearly visible in young and sucker leaves by transmitted light; pedicels about 2.5 cm. long, stout, flowers nodding; sepals very unequal, the inner as large as the petals, up to about 5 cm. long; ovary gradually narrowed into the elongated style which is divided into 5 linear spreading lobes; fruits broadly ellipsoid, pointed, about 15 cm. long and 10 cm. broad; seeds large with flattened sides *butyracea*

Pentadesma butyracea *Sabine*—F.T.A. 1: 164; Chev. Bot. 52; Aubrév. Fl. For. C. Iv. 2: 282, t. 237. *APD acc*

APD: Synonym of Pentadesma grandifolia Baker f.

APD: Synonym of Pentadesma butyracea Sabine

Pentadesma leucantha *A. Chev.* Vég. Util. 5: 166 (1909); Chev. Bot. 52.

Pentadesma nigrifolia *Bak. f.* in Cat. Talb. 7 (1913); F.W.T.A., ed. 1, 1: 235.

Pentadesma grandifolia *Bak. f.* l.c. 8 (1913); F.W.T.A., ed. 1, 1: 235.

Pentadesma kerstingii *Engl.* Bot. Jahrb. 55: 396 (1919); Chev. Bot. 52.

Forest tree, to 75 ft. high; flowers white, cream or greenish-white. [N.B.—there is no evidence of their ever being red as stated in ed. 1]; sepals persistent at the base of the fruit; seeds 3–10 embedded in a yellowish pulp. The yellow latex from the incised bark dries like gamboge.

Fr. G.: Conakry (cult.) Farmar 316! Nzérékoré (Oct.) Baldwin 9698! Kindia Chev. 13102. **S. L.:** Cole! Freetown Don! Rotomba Isl. (fr. Mar.) Kirk 14! Fulawun (Apr.) Deighton 1629! Njala (Sept.) Also in [Principé](#), [Cabinda](#) and [Belgian Congo](#).

Mammea americana *Linn.*

Has been introduced from tropical America and is cultivated in various localities within our area.

5. GARCINIA

Linn.—F.T.A. 1: 164.

- 1 Stamens free; leaves in whorls of 3, obovate or elliptic, cuneate to rounded at base, rounded and mucronate at apex, 5–12 cm. long, 2–6 cm. broad; flowers with pedicels 1–2 cm. long, in axillary fascicles on the older twigs [1. livingstonei](#)
- Stamens variously united in bundles; leaves in pairs: **2**
- 2 Branchlets winged or very sharply 4-angled; leaves with tertiary nerves and veins obscure beneath; flowers numerous in terminal umbellate racemes, the axis 1–4 cm. long, tetragonous, densely covered by the bracts, and, in later stages, by scars of fallen pedicels; stamens in 5 narrow bundles of 6–10 stamens; filaments shortly free above; fruits verrucose: **3**
- Branchlets terete or only slightly angular; fruits usually smooth, or rarely verrucose (*G. elliotii*); stamens in 4 bundles; flowers in few-flowered cymes or in axillary fascicles: **4**
- 3 Leaves rounded at base, broadly elliptic, abruptly acuminate, 10–15 cm. long, 6–8 cm. broad; lateral nerves about 8, spreading; fruit broadly ellipsoid, acute at each end, about 4 cm. long, 3 cm. broad [2. granulata](#)
- Leaves cuneate at base, oblong-elliptic gradually acuminate or acute, 12–24 cm. long, 4.5–9 cm. broad; lateral nerves 8–14, making an acute angle with the midrib towards the base; fruit obovoid or ellipsoid, up to 4.5 cm. long and 4 cm. broad; usually 2-seeded [3. gnetoides](#)
- 4 Sepals and petals densely puberulous outside; stamens in 4 narrow bundles of 15–20 stamens; anthers subsessile; fruits subglobose or ovoid, 5–9 cm. diam., with 2–4 ellipsoid seeds, 3–3.5 cm. long and about 1.5 cm. broad, embedded in copious pulp; leaves broadly elliptic, cuneate to rounded at base, acute or shortly acuminate, 6–14 cm. long, 2–6 cm. broad, shining on both surfaces; 10–15 pairs of lateral nerves prominent on both surfaces, with very obscure venation between; petiole puberulous [4. kola](#)
- Sepals and petals glabrous outside; petioles not puberulous: **5**
- 5 Filaments free above; anthers spherical or ovoid; flowers unisexual or hermaphrodite in axillary fascicles: **6**
- Filaments completely fused into 4 bundles, with oblong anthers sessile on the top of each bundle; flowers unisexual, in axillary and terminal few-flowered cymes: **9**
- 6 Leaves subsessile, subcordate and sometimes amplexicaul at base, oblong-elliptic, shortly acuminate, 15–25 cm. long, 6–10 cm. broad, with about 15 pairs of lateral nerves, laxly reticulate; male flowers in fascicles on the older branches; pedicels 2.5–5 cm. long [5. staudtii](#)
- Leaves distinctly petiolate, usually narrowed at base, not subcordate or amplexicaul: **7**
- 7 Fruits densely verrucose, ellipsoid, 2.5 cm. long, 1.5 cm. broad; flowers in axillary fascicles; stamens in bundles of 5–7 stamens; leaves oblong or oblong-elliptic, subacute at base, very shortly and obtusely acuminate, 9–16 cm. long, 3–6 cm. broad [6. elliotii](#)
- Fruits smooth: **8**
- 8 Stamens 6–10 (or more) in each bundle; flowers in axillary fascicles of 5–30 flowers; pedicels 1.5–4.5 cm. long; leaves oblong-elliptic, or oblong-ovate, or oblong-lanceolate, or oblanceolate, rounded to cuneate at base, acute or shortly acuminate at apex, 12–30 cm. long, 4.5–12 cm. broad, reticulate on both surfaces; fruits subglobose, about 2 cm. diam. [7. polyantha](#)
- Stamens 3 in each bundle; flowers in small dense axillary fascicles; pedicels up to 7 mm. long; leaves lanceolate to elliptic-lanceolate, gradually narrowed to an obtuse apex, 5–15 cm. long, 1.2–4.5 cm. broad, coriaceous, (elliptic to obovate-elliptic, distinctly acuminate, 6–15 cm. long, 2.5–5 cm. broad, papery-in a rain forest tree, see note below); fruits subglobose, about 1.5 cm. diam. [8. ovalifolia](#)
- 9 Leaves with glandular dots and dashes, lateral nerves very numerous and close without intermediate nerves; lamina oblong-elliptic, shortly cuneate at base, caudate and obtusely acuminate, 6–10 cm. long, 2–5 cm. broad; pedicels up to 1 cm. long; flower buds about 5 mm. long [9. punctata](#)
- Leaves with long glandular canals, but lacking glandular dots and dashes: **10**
- 10 Anthers transversely septate: **11**
- Anthers not septate; otherwise as above [13. epunctata](#)
- 11 Staminal bundles united at base, about equal to the rudimentary ovary in length; petals coriaceous; leaves elliptic, cuneate at base, abruptly caudate-acuminate, 7–12 cm. long, 2.5–6 cm. broad; lateral nerves very numerous and close [10. mannii](#)

Staminal bundles free, much longer than the rudimentary ovary; petals thin: **12**

- 12** Lateral nerves 10–15, with much less prominent secondary nerves and veins between; lamina obovate or obovate-oblong, cuneate at base, acuminate at apex, 9–14 cm. long, 3–6.5 cm. broad, bright green when dry, papery [11. brevipedicellata](#)

Lateral nerves very numerous and close, more or less equally prominent; lamina elliptic, cuneate at base; acuminate or acute at apex, 7–14 cm. long, 3–6 cm. broad [12. afzelii](#)

1. *Garcinia livingstonei* T. Anders.—F.T.A. 1: 165; Aubrév. Fl. For. Soud.-Guin. 148, t. 24. *APD acc*

Garcinia mangostana Linn.

Is cultivated in our area.

1. *Garcinia laurifolia* Hutch. & Dalz. F.W.T.A., ed. 1, 1: 236 (1927); Kew Bull. 1928: 228 (1928).

Flowers not known.

S. L.: Ninia, Talla Hills (young fr. Feb.) Sc. Elliot 4806!

Imperfectly known species.

2. *Garcinia conrauana* Engl. Bot. Jahrb. 40: 562 (1908), partly (excl. Zenker 2552); Staner l.c. 123.

Br. Cam.: Bangwa (Jan.) Conrau 54.

Imperfectly known species.

3. *Garcinia smeathmannii* (Planch. & Triana) Oliv. F.T.A. 1: 168 (1868).

Rheedia smeathmannii Planch. & Triana (1860).

Probably a form of *G. polyantha* (agg.) but as this group requires more thorough revision I have not replaced the well-known name.

S. L.: Smeathmann!

Imperfectly known species.

Garcinia nobilis *Engl.* Bot. Jahrb. 40: 566 (1908).

The specimen (Talbot 1385) cited as this species in F.W.T.A., ed. 1, 1: 236, is *Salacia alata* De Wild. Excluded species.

SCYTOPETALACEAE

Trees; branchlets sometimes winged. Leaves alternate, simple, exstipulate. Flowers hermaphrodite, actinomorphic, in terminal panicles or axillary racemes or fasciculate on the old wood. Calyx cupular, entire or toothed. Petals 3–10, valvate, free or shortly connate. Stamens numerous, in several series on the margin of or on the disk, free or united towards the base; anthers 2-celled, opening by a pore or slit at the side or towards the top. Ovary superior, 3–6-celled; ovules 2 to several in each cell, axile. Fruit woody. Seeds with ruminant or uniform copious endosperm and linear embryo.

A small family confined to tropical West Africa and the Congo region.

Closely allied to Tiliaceae.

- 1 Corolla furrowed in bud, subsequently splitting into 5–14 petals; anthers opening by longitudinal slits:[2](#)
Corolla not furrowed in bud, subsequently splitting into 3–5 petals; anthers opening by apical pores:[3](#)
- 2 Flowers in long, lax, axillary panicles; fruit a 1-seeded, oblong or globose capsule; endosperm uniform[1. *Oubangui*](#)
Flowers in short axillary racemes; fruit a 1-seeded, ovoid-conical drupe; endosperm ruminant ...[2. *Scytopetalum*](#)
- 3 Filaments much shorter than the anthers; fruit a 1-seeded, ellipsoid drupe; endosperm ruminant; flowers in very short axillary racemes[3. *Rhaptopetalum*](#)
Filaments longer than the anthers; fruit a several-seeded capsule; endosperm not ruminant; flowers in fascicles on the main stem and older branches[4. *Brazzeia*](#)

1. OUBANGUIA

Baill. in Bull. Soc. Linn. Paris 2: 869 (1890).

- 1 Branchlets with foliaceous wings, the wings expanded into an obtusely triangular blade beneath each node; leaves oblong-elliptic, subacute at base, obtusely long-caudate-acuminate, 18–25 cm. long, 7–8 cm. broad, slightly undulate on the margin, glabrous; lateral nerves about 8 pairs, very prominent beneath and looped; flowers small, in loose axillary panicles; calyx cupular, 3 mm. long; petals about 6, oblanceolate, about 8–10 mm. long; stamens numerous, connate at base; fruits oblong, glaucous, about 1.5 cm. long[1. *alata*](#)
Branchlets not winged, angular; leaves elliptic, cuneate at base, abruptly long-caudate-acuminate, 8–13 cm. long, 3.5–4.5 cm. broad, glabrous; lateral nerves 5–8 on each side of midrib, only slightly prominent beneath; inflorescence and flowers similar to above; fruits globose, about 1.5 cm. long[2. *laurifolia*](#)

1. *Oubangui* *alata* Bak. f. in Cat. Talb. 15 (1913). *APD acc*

A forest tree, to 60 ft. high; petals pink inside, white outside; anthers “bright aureolin.”

Imperfectly known species.

4. BRAZZEIA

Baill. in Bull. Soc. Linn. Paris 1: 609 (1886).

- 1 A glabrous shrub; branchlets narrowly winged; leaves obovate-elliptic or elliptic, narrowed to the unequal base, usually with one side more or less cuneate and the other rounded, rather long-acuminate, margin crenate to subentire, 6–17 cm. long, 2.7–6.2 cm. broad, with 4–7 main lateral looping nerves on each side of midrib prominent beneath; fascicles few-flowered; calyx shallowly cupular, subtruncate; corolla ovoid in bud, about 1 cm. long; capsules subglobose, up to 4 cm. long and broad, 4–8-valved; seeds adhering by sticky hairs to form a solid subglobose mass which becomes loose in the capsule [soyauxii](#)

Brazzeia soyauxii (*Oliv.*) Van Tiegh. in Ann. Sci. Nat. sér. 9, 1: 356 (1905). *APD acc*

Rhaptopetalum soyauxii *Oliv.* in Hook. Ic. Pl. t. 1405 (1883).

An erect forest shrub, to 6 ft. high; leaves deep green, glossy; flowers on older wood below leaves and down stem to the base; corolla pinkish-purple; stamens yellow; fruits red.

Br. Cam.: Banga, S. Bakundu F.R. (Mar.) Brenan & Onochie 9479!

Also in **French Cameroons** and **Gabon**.

TILIACEAE

Trees or shrubs, sometimes herbs, often clothed with stellate hairs. Leaves usually alternate, simple; stipules paired or absent. Flowers mostly cymose, actinomorphic, mostly hermaphrodite. Sepals valvate. Petals free or absent, contorted, imbricate or valvate. Stamens usually numerous, free or rarely connate into 5–10 bundles; anthers 2-celled. Ovary syncarpous or very rarely apocarpous, superior, 2–10-celled; style usually simple; ovules on axile placentas. Fruit baccate or drupaceous or variously dehiscent. Seeds sometimes hairy, mostly with copious endosperm and usually straight embryo.

A fairly large family well represented in tropical Africa.

Readily recognised by the stipulate leaves mostly with stellate hairs, valvate calyx, the numerous free stamens, and 2-celled anthers.

- 1 Carpels free, usually 2–5, rarely 1; sepals united into a campanulate 3–5-fid calyx; leaves large, cordate and 7-nerved at the base [1. *Christiana*](#)
- Carpels united, sepals free or nearly so: **2**
- 2 Fruits not prickly: **3**
- Fruits prickly: **7**
- 3 Trees or shrubs; leaves not tailed at the base: **4**
- Herbs; leaves often tailed-setose at the base; ovary 2–5-celled; fruit spindle-shaped [6. *Corchorus*](#)
- 4 Ovary 1–4-celled; fruits entire, or 1–4-lobed, not exceeding 3 cm. long; androgynophore usually present; stamens free [2. *Grewia*](#)
- Ovary 5–10-celled; fruits longitudinally grooved or ridged, exceeding 3 cm. long: **5**
- 5 Anthers short, much shorter than the filaments, without a sterile apical appendage; flowers sometimes enclosed in an involucre of 3 or 4 valvate bracts; fruit ellipsoid, often exceeding 2 cm. diam.: **6**
- Anthers long, as long as or longer than the filaments, with a sterile apical appendage; flowers not in an involucre of bracts; fruit spindle-shaped, 5–7 cm. long, 1–1.5 cm. diam., longitudinally ribbed [5. *Glyphaea*](#)
- 6 Androgynophore present; stamens free; flowers always enclosed in an involucre of bracts; fruit woody, 6–8-ribbed, about 4 cm. long [3. *Duboscia*](#)
- Androgynophore absent; stamens united into a short tube; flowers not always enclosed in an involucre of bracts (*D. subericarpa* and *D. dewevrei*); fruit fibrous, with 5–10 longitudinal grooves, 6–15 cm. long, 3–10 cm. diam. [4. *Desplatsia*](#)
- 7 Anthers short, very much shorter than the filaments; stamens free, not in bundles; herbs or undershrubs: **8**
- Anthers long; stamens united into 4 bundles; petals not glandular at base; sepals apiculate; androgynophore absent; fruits globose, 3–4 cm. diam.; a small tree [9. *Ancistrocarpus*](#)
- 8 Fruits globose or ovoid, up to 1.5 cm. long; petals mostly yellowish, glandular at base; androgynophore present [7. *Triumfetta*](#)
- Fruits cylindrical, 2–6 cm. long; petals purple to pink (or white), not glandular at base; androgynophore absent; outer stamens barren [8. *Clappertonia*](#)

***Berria cordifolia* (Willd.) Burret**

A native of tropical Asia, it has been introduced to several localities.

Schoutenia Korth.

Species of *Schoutenia* have also been introduced.

Elaeocarpus Linn.

Species of *Elaeocarpus* have also been introduced.

1. CHRISTIANA

DC. — F.T.A. 1: 241.

- 1 A tree; leaves broadly ovate, cordate and 7-nerved at the base, acuminate, about 20 cm. long and 15 cm. broad, entire, stellate-tomentellous and prominently nerved beneath; cymes lateral, stalked; bracts linear, deciduous; carpels 1–5, free, obovoid, about 1 cm. long, in fruit splitting into 2 boat-shaped valves, tomentose; seeds marbled [africana](#)

Christiana africana DC. — F.T.A. 1: 241; Chev. Bot. 86; Burret in Notizbl. Bot. Gart. Bert. 9: 611 (1926). Aubrév. Fl. For. C. Iv. 2: 212, t. 209. *APD acc*

Tree, to 40 ft. high, with spreading crown; often by streams, **mainly in the drier parts of the forest regions.**

Also in **Shari, A.-E. Sudan, Belgian Congo, Angola** and in eastern tropical S. America.

2. GREWIA

Linn. — F.T.A. 1: 242.

- 1 Flowers in terminal (and sometimes also axillary), several- to many-flowered panicles; ovary not lobed, bilocular; stigma not or scarcely lobed; fruit not lobed:2
- Flowers in axillary or lateral (and rarely terminal), usually few- to several-flowered cymes, or solitary; stigma always lobed:7
- 2 Lower surface of leaves clearly visible between the more or less laxly arranged stellate hairs, or glabrous:3
- Lower surface of leaves completely hidden by the soft felt of hoary indumentum; stipules linear-subulate, early caducous; leaves oblong-elliptic, rounded at base, acutely acuminate, 6–14 cm. long, 2–6 cm. broad; glabrous above; prominently 3-nerved at base, sepals about 5 mm. long; fruits ellipsoid, flattened, about 1.5 cm. long, softly tomentellous [6. malacocarpa](#)
- 3 Leaves glabrous beneath, obovate-elliptic, rounded or slightly cuneate and 3-nerved at base, long-caudate-acuminate, 15–30 cm. long, 6–14 cm. broad; fruits obovoid, shortly beaked, about 3 cm. long, glabrous [1. coriacea](#)
- Leaves stellate-pubescent or pilose beneath, up to 18 cm. long and 7 cm. broad; fruits pubescent:4
- 4 Primary bracts entire or digitately divided to the base:5
- Primary bracts pinnately divided; leaves narrowly oblong-elliptic, gradually acuminate, unequal-sided at base, 12–18 cm. long, 4–5.5 cm. broad, very minutely pubescent beneath and pilose on the midrib and petiole [5. oligoneura](#)
- 5 Primary bracts digitately divided to the base, with linear-filiform segments, persistent; leaves ovate or ovate-elliptic, rounded at base, rather gradually acuminate, 10–15 cm. long, 5–7 cm. broad, sparingly stellate-pubescent beneath; fruits spindle-shaped, acute at both ends, 3–3.5 cm. long, with scattered stellate hairs [2. barombiensis](#)
- Primary bracts entire, or 2-lobed, often early caducous; fruits obovoid, about 2 cm. long, scabrid-pubescent: ...6
- 6 Branchlets, petioles and lower surface of leaves shortly tomentellous with brown scaly hairs, sometimes with a few long white hairs; leaves elliptic, rounded at base, acuminate, 6–12 cm. long, 2.5–5 cm. broad [3. hookerana](#)
- Branchlets, petioles and lower surface of leaves rather densely clothed with long white hairs; leaves oblong-elliptic, rounded at base, rather long-acuminate, 8–14 cm. long, 4–7 cm. broad [4. brunnea](#)
- 7 Flowers 2 or more together:8
- Flowers solitary; leaves broadly ovate, acute at apex, rounded at base, dentate, 2–4 cm. long, up to 4 cm. broad, strongly 5-nerved at base, laxly stellate-pubescent beneath; pedicels stellate-tomentose; sepals linear-lanceolate, 1.5 cm. long; fruits 3–4-lobed, glabrous [17. tenax](#)
- 8 Leaves digitately 5–7-nerved and more or less cordate at base, very broadly ovate or reniform-orbicular, mostly as broad or nearly as broad as long:9
- Leaves 3-nerved and at the most rounded (or rarely subcordate) at base, ovate to elliptic or lanceolate, usually much longer than broad: 11
- 9 Cymes leaf-opposed; common peduncle solitary and shorter than the petiole, more or less branched above: ... 10
- Cymes axillary; common peduncles usually 2–3 in each leaf axil, longer than the petiole; leaves very broadly ovate to suborbicular, serrate, up to 13 cm. long and broad, softly tomentose on both surfaces; stipules narrowly lanceolate, about 1 cm. long; cymes 3–6-flowered; buds softly tomentose; fruits 1–3-lobed, shortly tomentose and pilose [9. barteri](#)
- 10 Pedicels slender, about 1.5 cm. long; stipules linear or filiform, 1 cm. long; leaves broadly ovate-elliptic, serrulate, up to 15 cm. long and 11 cm. broad, almost scabrid above, softly tomentose beneath; cymes with

- numerous flowers; buds bristly-tomentose; fruits with 3–4 almost free carpels, tuberculate [7. *cissoides*](#)
- Pedicels very short and stout; stipules broadly oblanceolate; leaves reniform or suborbicular, up to 12 cm. broad, denticulate and often lobulate; tertiary nerves parallel and conspicuous; flowers few and crowded; buds densely villous; fruits depressed-globose, scarcely lobed, tuberculate and pilose [8. *villosa*](#)
- 11** Lower surface of leaves completely hidden by the soft felt of hoary indumentum: **12**
- Lower surface of the leaves clearly visible between the more or less laxly arranged stellate hairs: **13**
- 12** Leaves distinctly dentate, with prominent lateral nerves on the lower surface; tertiary nerves numerous, parallel, distinct; blade oblong-lanceolate or oblong-elliptic, sometimes oblique at base, 5–10 cm. long, 2–5 cm. broad, with very minute stellate hairs on the upper surface; sepals nearly 1 cm. long [10. *mollis*](#)
- Leaves minutely crenate, with very obscure lateral nerves beneath; tertiary nerves scarcely visible; blade broadly lanceolate, very obtuse or slightly acuminate, 2–5 cm. long, 1–2 cm. broad, glabrous or nearly so above; sepals up to 8 mm. long [11. *bicolor*](#)
- 13** Sepals at length 2.5 cm. long; petals pale pinkish or white; peduncle 2–3 cm. long, pedicels 1–2 cm. long; fruits deeply 4-lobed, pilose in the grooves; stem, petioles, undersurface of leaves, inflorescence and outside of sepals rather long-pilose; leaves lanceolate-elliptic, rounded to cuneate at base, gradually acuminate, 8–17 cm. long, 2.5–8 cm. broad, denticulate, especially towards the base [12. *pubescens*](#)
- Sepals up to 1.8 cm. long; petals yellow to reddish-brown; peduncle up to 1 cm. long, pedicels up to 1 cm. long: **14**
- 14** Ovary stipitate above the glandular torus; fruit entire, with both long and short pubescence; leaves oblong-elliptic, rounded at both ends, 2.5–10 cm. long, 1.5–5.5 cm. broad, slightly stellate-pubescent above, shortly so beneath, closely serrate; peduncle 3–4 mm. long, pedicels 4–7 mm. long; sepals 8–12 mm. long [13. *lasiodiscus*](#)
- Ovary sessile above the glandular torus: **15**
- 15** Fruits not lobed (rarely obscurely 2-lobed), 8–12 mm. diam., scabrid-pubescent; flower-buds elongate, slightly constricted above the broad base, shortly stellate-pubescent; leaves oblong-ovate to oblong-obovate, 5–14 cm. long, 2.5–6.5 cm. broad, very laxly and minutely pubescent beneath [14. *carpinifolia*](#)
- Fruits 2–4-lobed (rarely some not lobed); flower-buds densely bristly tomentose: **16**
- 16** Fruits scabrid-pubescent, not deeply lobed; flower-buds elongate [115. *flavescens*](#)
- Fruits glabrous, deeply lobed; flower-buds globose [16. *megalocarpa*](#)

1. *Grewia coriacea* Mast. in F.T.A. 1: 252 (1868); Burret in Engl. Bot. Jahrb. 45: 162. *APD acc*

Microcos coriacea (Mast.) Burret in Notizbl. Bot. Gart. Berl. 9: 759 (1926).

Shrub or small tree in **understorey of rain forest**, to 50 ft. high; larger trees with stilt roots; sepals pink, petals yellow; fruits purplish when ripe; **sometimes in swamp forest**.

S. Nig.: Shasha F.R. (Feb.) Richards 3155! Okomu F.R. (Jan.) A. F. Ross 239! Sapoba (June–Nov.) Kennedy 363! Meikle 608! Oban Talbot 1660! **Br. Cam.:** Likomba Mildbr. 10608! S. Bakundu F.R. Ejiofor FHI 14065!

Also in **French Cameroons, Gabon, Spanish Guinea, Belgian Congo** and **Angola**.

2. *Grewia barombiensis* K. Schum. in Engl. Bot. Jahrb. 15: 124 (1892); Chev. Bot. 86. *APD acc*

Grewia africana of Burret in Engl. Bot. Jahrb. 45: 165, partly, not of (Hook. f.) Mast.

A shrub, up to 25 ft., sometimes scrambling; flowers white.

15. **Grewia flavescens** *Juss.* in Ann. Mus. Paris 4: 91 (1804); Burret in Engl. Bot. Jahrb. 45: 168; Aubrév. l.c. 154, t. 26, 6–7. *APD acc*

APD: Synonym of Grewia retinervis Burret

Vinticina flavescens (*Juss.*) Burret in Notizbl. Bot. Gart. Berl. 12: 715(1935).

Grewia pilosa of F.T.A. 1: 250, partly.

Grewia guazumifolia of Chev. Bot. 87.

A **savannah** shrub; flowers yellow; ripe fruits brown.

Sen.: Cape Verde Perrottet 120! Bakel Heudelot 283! **Fr. Sud.:** Gourma (July) Chev. 24376! **IV. C.:** Kaya Aubrév. 2177. **Fr. Nig.:** Niamey De Wailly 4920. **N. Nig.:** Sokoto (fr. Oct.) Dalz. 419! Katagum (fl. & fr. Sept.) Dalz. 84! Damaturu (fr. Oct.) Daggash FHI 22013! Mandara (Aug.) E. Vogel 23!

Widespread in the drier parts of tropical Africa and in **India**.

16. **Grewia megalocarpa** *Juss.* l.c. 4: 91 (1804); P. Beauv. Fl. Oware 2: 69, t. 102 (1818); F.T.A. 1: 245, partly (Beauvois spec.). *APD acc*

Grewia ferruginea of F.T.A. 1: 251, partly (Brass spec.).

Scandent shrub; sepals green outside, white within; petals greenish-yellow.

G. C.: Cape Coast (Apr.) Brass! Scholes 286! Achimota (fl. & fr. May, fr. July) Milne-Redhead 5093! Irvine 678!

[I suggest that Beauvois' specimen, a photograph of which I have seen, came from what is now the Gold Coast, and not from Oware. The species appears to be peculiar to the coastal scrub of the Cape Coast to Accra region. — R.W.J.K.]

17. **Grewia tenax** (*Forsk.*) *Fiori* in Agric. Colon. 5, Suppl. 23 (1912); Burret in Notizbl. Bot. Gart. Berl. 9: 689; Aubrév. l.c. 151, t. 25, 1–2.

APD: Synonym of Grewia picta Baill.

Chadara tenax *Forsk.* (1775).

Grewia chadara *Lam.* (1789).

Grewia populifolia *Vahl* (1790) — Burret in Engl. Bot. Jahrb. 45: 192; Chev. Bot. 88; Ic. Pl. Afr. 27.

Grewia betulaeifolia *Juss.* (1804) — F.T.A. 1: 246; F.W.T.A., ed 1, 1: 245.

Shrub, to 10 ft. high, in the **driest savannahs**; flowers white; fruits reddish.

Sen.: Sieber! Richard Tol (fl. Jan., fr. Sept.) Roger! Perrottet 117! Walo Heudelot! **Fr. Sud.:** Gao (fl. & fr. Sept.) Hagerup 366! **Fr. Nig.:** Niamey (Oct.) Hagerup 552!

From Mauritania throughout the drier parts of northern Africa to **Arabia**, Persia and India.

3. DUBOSCIA

Bocq. — F.T.A. 1: 265.

- 1 Involucre composed of 3 valvate bracts enclosing 3 flowers; leaves obliquely ovate or ovate-oblong, rounded or cordate at base, acutely acuminate, 8–16 cm. long, 4–8 cm. broad, denticulate, prominently 3-nerved at base, softly stellate-pubescent with a closer felt beneath; stipules early deciduous, subulate-lanceolate; inflorescence leaf-opposed; peduncle stout, 3–5 cm. long; fruits woody, 8-ribbed, ellipsoid-globose, 4 cm. long, tomentose [1. macrocarpa](#)

Involucre composed of 4 valvate bracts enclosing 2 flowers; leaves ovate or ovate-lanceolate, cordate at base, acutely acuminate, 8–17 cm. long, 3–5–7 cm. broad, denticulate, 3-nerved at base, hairy as above; stipules at length deciduous, linear-lanceolate, 1 cm. long; inflorescence as above but peduncle more slender and longer; fruits woody, 6–7-ribbed, 4 cm. long, tomentellous. [2. viridiflora](#)

1. *Duboscia macrocarpa* Bocq. — F.T.A. 1: 266; Burret in Notizbl. Bot. Gart. Berl. 9: 817. *APD acc*

A forest tree, to 30 ft. high; bracts pale green, petals pink with brown hairs.

S. Nig.: Oban (Jan.) Talbot 1293! Afi River F.R., Ikom (Dec.) Keay FHI 28256!

Also in **French Cameroons**, **Gabon**, **Spanish Guinea** and **Cabinda**.

[Chev. 22618 cited as this species in Chev. Bot. 89 is *Desplatsia dewevrei* (De Wild. & Th. Dur.) Burret (q.v.). The sterile specimen Chev. 22583 cited as this species in F.W.T.A., ed. 1, 1: 243 is probably also a *Desplatsia*.]

2. *Duboscia viridiflora* (K. Schum.) Mildbr. in Wiss. Ergebn. 1910–11, 2: 59 (1922); Burret l.c. 818; Hutch. & Dalz. in Kew Bull. 1928: 229; Aubrév. Fl. For. C. Iv. 2: 218, t. 212, 3–8. *APD acc*

Diplantheum viridiflorum K. Schum. (1897).

A forest tree, to 85 ft. high, with fluted bole and narrow buttresses; flowers greenish-white.

IV. C.: fide Aubrév. l.c. **G. C.:** Ofin Headwaters F.R. (Nov.) Vigne FH 3419! Damang Akpabla 928! **S. Nig.:** Sapoba Kennedy 2326! Oban Talbot 1729! Cross River North F.R. (June) Latilo FHI 31824! **Br. Cam.:** Buea (Mar.) Maitland 584! Victoria (Feb.) Winkler 1089. Mombo, S. Bakossi (fr. May) Olorunfemi FHI 30569!

Also in **French Cameroons** and **Belgian Congo**.

4. DESPLATSIA

Bocq. — F.T.A. 1: 266; Burret in Notizbl. Bot. Gart. Berl. 9: 818 (1926).

- 1 Bracts suborbicular, about 1 cm. long, forming an involucre which encloses the flowers in bud; inflorescence, bracts and outside of flowers densely villous; stem and petioles densely rusty villous; stipules deeply divided into linear, ciliate lobes, 5–15 mm. long; leaves oblong-oblong-elliptic, rather oblique, truncate to subcordate or sometimes obtuse at base, acuminate at apex, 15–35 cm. long, 5–13 cm. broad, irregularly and rather sharply toothed on the margin, long-stellate-pubescent beneath and on midrib above; fruit suborbicular, to about 10 cm. long and 8–9 cm. broad, 5–6-celled and rather obscurely longitudinally grooved [1. chrysochlamys](#)

Bracts linear or ovate-lanceolate, up to 5 mm. long, not forming an involucre, flowers not enclosed in bud; stem and petioles shortly pilose or pubescent: [2](#)

- 2 Bracts, bracteoles and lobes of stipules linear, ciliate; outside of flowers densely velutinous; leaves cordate on each side at base, oblong-ovate to oblong-obovate, acutely long-acuminate, 10–16 cm. long, 3–6 cm. broad, irregularly and rather sharply toothed on the margin, sparingly stellate-pubescent on nerves and veins beneath and on midrib above; fruit oblong-ellipsoid, 6–10 cm. long, 5–6-celled, longitudinally grooved [2. subericarpa](#)

Bracts, bracteoles and lobes of stipules ovate-lanceolate, puberulous; outside of flowers densely tomentose; leaves unequal-sided at base, rounded to subcordate on one side, obtuse to rounded on the other, oblong-elliptic, long-acuminate, 12–25 cm. long, 4–9 cm. broad, coarsely and irregularly toothed in the upper part, sparingly stellate-pubescent on nerves and veins beneath, glabrous on midrib above; fruit oblong-ellipsoid, 10–15 cm. long, 8–10 cm. broad, 6–10-celled, longitudinally grooved [3. dewevrei](#)

1. *Desplatsia chrysochlamys* (Mildbr. & Burret) Mildbr. & Burret in Notizbl. Bot. Gart. Berl. 9: 819 (1926). *APD acc*

Ledermannia chrysochlamys Mildbr. & Burret in Mildbr. Wiss. Ergebn. 1907–8, 2: 497 (1912); Aubrév. Fl. For. C. Iv. 2: 216, t. 211.
Pleianthemum macrophyllum K. Schum. ex A. Chev. Bot. 92, name only.

Forest tree or shrub, to 20 ft. high; flowers pinkish.

S. L.: Levuma, Koya (fr. Dec.) Deighton 3850! **Lib.:** (fl. Aug., fr. Nov.) Harley 995! Gbanga (Sept.) Linder 781! Diebla, Webo Dist. (July) Baldwin 6367! **Iv. C.:** San Pedro Thoiré! Widespread in tropical Africa.

6. CORCHORUS

Linn. — F.T.A. 1: 261.

- 1 Leaf-blade 0.5–2 cm. long, elliptic or obovate-elliptic, about as long as or shorter than the petiole, without basal hair-like auricles; prostrate woody perennial in dry regions; branches tortuous; flowers solitary or paired; fruits beaked, breaking into 4 valves, about 2 cm. long, subsessile [1. *depressus*](#)
 Leaf-blade much longer than the petiole; annuals or rarely perennials: **2**
- 2 Leaves without basal hair-like auricles, up to 10 cm. long, 0.5–1.5 cm. broad; fruits shortly beaked, about 1–1.5 cm. long, fasciculate; valves not septate within [2. *fascicularis*](#)
 Leaves usually with basal hair-like auricles: **3**
- 3 Capsule with 3 divergent beaks at the apex, the valves not or indistinctly transversely ridged inside: **4**
 Capsule with an entire beak, the valves with distinct transverse ridges inside: **5**
- 4 Leaves ovate or ovate-lanceolate, 3–6 cm. long, 2–3 cm. broad; pods acutely winged, 1.5–2.5 cm. long, fairly stout [3. *aestuans*](#)
 Leaves lanceolate or linear-lanceolate, 3–9 cm. long, 1–1.5 cm. broad; pods faintly ridged, slender, 2.5–3.5 cm. long [4. *tridens*](#)
- 5 Capsule usually 5-valved, stout, 3–6 cm. long, rather abruptly narrowed to the apex; leaves lanceolate or ovate-lanceolate, up to 20 cm. long and 7 cm. broad [5. *olitorius*](#)
 Capsule usually 3-valved, slender, 3–6 cm. long, gradually narrowed to the apex; leaves elliptic to oblong-lanceolate, 4–8 cm. long, 1–1.5 cm. broad [6. *trilocularis*](#)

1. *Corchorus depressus* (Linn.) C. Christensen in Dansk. Bot. Arkiv. 4, 3: 34 (1922); Chatterjee in Kew Bull. 1948: 372. *APD acc*

Antichorus depressus Linn. (1761).

Corchorus antichorus Raeschel (1797) — F.T.A. 1: 263; Chev. Bot. 91; F.W.T.A., ed. 1, 1: 241.

Branches prostrate, a few inches long, from a stout rootstock; flowers yellow; a plant of desert soils.

Fr. Sud.: Timbuktu (Aug.) Chev. 3529. Gao (Nov.) Hagerup 348!

From Cape Verde Islands and Teneriffe to N. Africa, **Arabia**, Central and N.W. India.

2. *Corchorus fascicularis* Lam. — F.T.A. 1: 263. *APD acc*

Annual or sometimes perennial; branches lax, up to 4 ft. high; flowers yellow.

Sen.: Roger 6! Walo Perrottet! **Fr. G.:** Kouroussa (July) Pobéguin 332! **S. L.:** Port Loko (fr. Dec.) Thomas 6659! Njala (Nov.) Deighton 1786! Musala (fr. Dec.) Deighton 4439! 5702! Mange, Bure (fl. & fr. Dec.) Jordan 727! **G. C.:** Red Volta R., Nangodi (fr. Dec.) Adams & Akpabla GC 4288! **N. Nig.:** Katagum Dalz. 85!

Widespread in tropical Africa, and in **Arabia**, **India** and **Australia**.

3. *Corchorus aestuans* Linn. Syst. Nat., ed. 10, 2: 1079 (1759). *APD acc*

Corchorus acutangulus Lam. (1786) — F.T.A. 1: 264; Chev. Bot. 90; F.W.T.A., ed. 1, 1: 241.

Annual or perennial, branched, erect or prostrate; flowers golden-yellow.

Sen.: Heudelot! **Fr. Sud.:** Macina (fl. & fr. Sept.) Chev. 24865! **Fr. G.:** Conakry (fr. May) Debeaux 313! **S. L.:** Njala (Sept.) Deighton 2120! Makene (fr. Mar.) Deighton 3900! Nig.**: Lagos Dodd 436! Cross R. (Mar.) Johnston!

Widespread throughout the tropics; also in **Australia**.

6. **Corchorus trilocularis** *Linn.* — F.T.A. 1: 262; Chev. Bot. 92. *APD acc*

Herbaceous or half-woody annual, 1–2 ft. high; flowers yellow.

Sen.: Niayes (Dec.) Chev. 3094. **Fr. Sud.**: Kabara (July) Chev. 1241! **G. C.**: Krobo Plains (fr. Dec.) Johnson 495! Achimota (fl. & fr. Oct.) Irvine 837! Prampram (fl. & fr. Dec.) Robertson 44! **N. Nig.**: Takwara (May) Lely 100! Kano Adelodun FHI 5417!

Widespread in the tropics of the Old World; also in **Australia**.

Corchorus urticifolius *Wight & Arn.* — F.T.A. 1: 263.

Recorded from Gambia (see Appendix, p. 97), but no specimen seen.

Doubtfully recorded species.

7. TRIUMFETTA

Linn. — F.T.A. 1: 254; Sprague & Hutch. in J. Linn. Soc. 39: 231–276 (1909).

- 1 Sepals lepidote outside; upper leaves oblanceolate, lower suborbicular and subtrilobed, up to 14 cm. in diam.; petiolar glands 2–4 on each side; stamens about 60; tubercles of the ovary pilose, terminated by several spinules [11. lepidota](#)
- Sepals not lepidote: **2**
- 2 Prickles of the ovary and fruit terminating in several small spines stellately arranged; fruits globose; leaves lanceolate or ovate-lanceolate, base subcuneate, acute at the apex, 3–9 cm. long, up to 3.5 cm. broad, serrate, stellate-pilose or tomentose beneath [2. dubia](#)
- Prickles of the ovary and fruit terminating in a single straight or curved but not hooked spine: **3**
- Prickles terminating in a single hooked or falcate spine: **4**
- 3 Prickles slender, dilated only at base; leaves mostly undivided, mostly ovate, subcordate at base, acute, 5–12 cm. long, 2.5–7 cm. broad, tomentose beneath; sepals 5–9 mm. long, horn 0.5 mm. long; stamens 8–10; fruit 1–1.5 cm. in diam., prickles pilose or nearly glabrous [3. tomentosa](#)
- Prickles stout, much widened at base; leaves very like T. tomentosa [4. heudelotii](#)
- 4 Fruit ovoid or globose, indehiscent, 4–10 mm. in diam. including the prickles: **5**

Fruit globose, dehiscent, 1–1.5 cm. in diam. including the prickles; stamens 10–12; leaves undivided or trilobed or sub-5-lobed [8. cordifolia](#)

5 Stamens 15; fruit globose or subglobose: **6**

Stamens 5–13; fruit ovoid, prickles ciliate; leaves rhomboid-orbicular to hexagonal, broadly cuneate or truncate at base, acute or subacute, undivided or 3-lobed, coarsely serrate, stellate-pubescent beneath [7. pentandra](#)

6 Fruit 4–5 mm. in diam. including the prickles, tomentose, the prickles glabrous; leaves very variable [5. rhomboidea](#)

Fruit 8–10 mm. in diam. including the prickles, tomentose, the prickles densely pilose; leaves ovate to lanceolate, undivided or 3-lobed, sharply serrate, setulose with oppressed simple hairs on both surfaces; stamens usually 15 [6. eriophlebia](#)

1. **Triumfetta lepidota** *K. Schum.* in Engl. Bot. Jahrb. 15: 127 (1892); Sprague & Hutch. in J. Linn. Soc. 39: 245. *APD acc*

Ancistrocarpus tomentosus *A. Chev.* Bot. 92.

Erect shrub, 3–5 ft.; flowers yellow; *in savannah*.

G. C.: Yeji Anderson 21! **Togo:** Yendi (May) Akpabla 509! **Dah.:** Djougou (June) Chev. 23915! **N. Nig.:** Sokoto Prov. (June) Dalz. 535! Funtua to Mahuta (Aug.) Keay FHI 25995! Nupe Barter! Gurara R., Gornapara (Dec.) Elliott 205! Nabardo (May) Lely 217!

Extends to A.-E. **Sudan**.

2. **Triumfetta dubia** *De Wild.* in Ann. Mus. Congo, sér. 5, 1: 54 (1903); Sprague & Hutch. l.c. 259, incl. var. *tomentosa*.

APD: *Synonym of Triumfetta setulosa* *Mast.*

An undershrub, 3–4 ft.; stem stellate-hirsute; flowers small, yellow.

Fr. G.: Kouroussa (Sept.) Pobéguin 450! **S. L.:** Kabala (Sept.) Thomas 2189! 2215! Jigaya (Sept.) Thomas 2746! Musaia (fr. Dec.) Deighton 5708! Warantamba (Oct.) Small 357! **G. C.:** Techiman (fr. Widespread in the moister parts of tropical Africa.

Triumfetta sp.

A low herb with pink hairs; possibly a new species.

S. Nig.: Idanre Hills (Oct.) Keay FHI 22652!

Imperfectly known species.

8. CLAPPERTONIA

Meisn. Pl. Vasc. Gen. tabl. diagn. 36, comm. 28 (1837).

Honckenya Willd. (1793) — F.T.A. 1: 260, not of Ehrh. (1788).

- 1 A small erect shrub; branches stellate-tomentose; leaves more or less broadly ovate in outline, rounded or cordate at base, variously 3–5-lobed or sometimes not lobed, serrate, up to about 13 cm. long and 7 cm. broad, stellate-pubescent or tomentose beneath; stipules persistent, lanceolate, about 1 cm. long; flowers few in terminal leafy racemes; fruits narrowly oblong, 4–6 cm. long, very bristly, bristles pilose *L. ficifolia*
- A prostrate woody herb; branches laxly pilose; leaves mostly 3–5-lobed, 2–5 cm. long, thin, serrate, pilose only on the nerves; stipules linear-subulate, about 0.5 cm. long; flowers 2–3 together; fruits ellipsoid, 2 cm. long,

densely bristly, bristles laxly pilose [2. minor](#)

1. **Clappertonia ficifolia** (Willd.) Decne. in Deless. Ic. Select. Pl. 5: 1, t. 1 (1846); Becherer in Fedde Rep. 28: 58 (1930). *APD acc*

Honckenya ficifolia Willd. — F.T.A. 1: 260; Chev. Bot. 90; Burret in Notizbl. Bot. Gart. Berl. 9: 862 (1926); F.W.T.A., ed. 1, 1: 241.

To 7 ft. high; usually in marshy places; flowers conspicuous red-purple, rarely white, 2–3 in. diam. when opened; fruits reddish-brown.

Also in **French Cameroons**, **Gabon**, **Belgian Congo** and **Cabinda**.

STERCULIACEAE

Trees or shrubs, often with soft wood, or very rarely herbs, mostly with stellate hairs. Leaves alternate, simple or digitately compound; stipules usually present. Flowers variously arranged, hermaphrodite or unisexual, actinomorphic. Sepals valvate, mostly partly connate or rarely spathaceous. Petals 5, or absent, contorted imbricate, often hooded. Stamens free or connate into a column, sometimes with staminodes; anthers 2-celled. Ovary superior, of 2–12 united carpels or of one carpel; ovules on axile placentas; style simple or rarely the styles free to the base. Fruit various. Seeds with or without endosperm and straight or curved embryo.

A large tropical family.

With the stamens often united into a column; indumentum mostly stellate or lepidote; petals sometimes absent.

-
- 1 Flowers with petals, hermaphrodite (rarely polygamous):2
 Flowers without petals, unisexual or sometimes polygamous; trees or shrubs: 12
- 2 Stamines present; mostly trees and shrubs:3
 Stamines absent; mostly herbs or undershrubs; androgynophore absent (or rarely very short): 10
- 3 Androgynophore well-developed; fruiting carpels free, with a terminal wing, samara-like; petaloid stamens present between the stamens and carpels:4
 Androgynophore absent or very short; fruit capsular:5
- 4 Calyx spatheous; stamens 10; leaves not lobed [1. *Mansonia*](#)
 Calyx 5-lobed; stamens 30 or more, filaments united at base in pairs; leaves digitately 5–7-lobed [2. *Triplochiton*](#)
- 5 Petals hooded over the androecium; anthers sessile on the staminal tube:6
 Petals not hooded:7
- 6 Petals with a long apical appendage; fruits spiny [4. *Byttneria*](#)
 Petals without a long apical appendage; fruits not spiny [5. *Scaphopetalum*](#)
- 7 Petals much shorter than the sepals, pilose towards margins; stamens in groups or phalanges with the fertile stamens; staminal tube short with small stamens within it and alternating with the phalanges, or absent; seeds conspicuously arillate [6. *Leptonychia*](#)
 Petals as long as or longer than the sepals:8
- 8 Bracteoles neither persistent nor enlarging in fruit:9
 Bracteoles persistent and enlarging in fruit, suborbicular [8. *Melhania*](#)
- 9 Petaloid stamens 5, inserted between the stamens and carpels; filaments much shorter than the anthers; staminal tube absent; petals falling off; seeds with a unilateral wing [3. *Nesogordonia*](#)
 Petaloid stamens between the stamens and carpels absent; staminal tube present, bearing the stamens and stamens usually with distinct filaments; petals persistent, often becoming dry or scarious [7. *Dombeya*](#)
- 10 Ovules numerous; capsule loculicidally 5-valved, apex often with horny appendages; carpels opposite the sepals [9. *Hermannia*](#)
 Ovules 2; carpels opposite the petals: 11
- 11 Ovary 5-celled; capsule loculicidally 5-valved; cells 1-seeded [10. *Melochia*](#)
 Ovary 1-celled; capsule 2-valved, 1-seeded [11. *Waltheria*](#)
- 12 Carpels numerous, multiseriate; calyx-lobes normally 8; anther-cells arranged in 1 whorl [12. *Octolobus*](#)
 Carpels up to 12, in a single whorl; calyx-lobes (3–) 4–5 (–6): 13
- 13 Fruiting carpels neither winged nor inflated and submembranous, usually 2-many-seeded, rarely 1-seeded: ... 14
 Fruiting carpels winged, or inflated and submembranous, normally 1-seeded: 16
- 14 Seeds with a large unilateral wing; anther-cells (in our species) arranged in 1 whorl; leaves simple [13. *Pterygota*](#)
 Seeds not winged: 15
- 15 Anther-cells arranged in an irregular mass; seeds usually with endosperm [14. *Sterculia*](#)
 Anther-cells arranged in 1 or 2 whorls, rarely at more than 2 levels owing to lobing of the cupshaped upper part of the synandrium (*C. digitata* and *C. megalophylla*); seeds usually without endosperm [15. *Cola*](#)
- 16 Fruiting carpels inflated, submembranous; calyx-tube long; leaves simple, broadly ovate-cordate, not densely lepidote beneath; anther-cells arranged in an irregular mass [16. *Hildegardia*](#)
 Fruiting carpels samara-like; calyx-tube short; leaves digitately 5–7-foliolate, or 1-foliolate, densely lepidote beneath; anther cells arranged in 1 whorl [17. *Tarrietia*](#)

- 1a. **Mansonia altissima** var. **kamerunica** *Jac.-Fél.* in Rev. Bot. Appliq. 25: 236 (1945); Chatterjee & Brenan in Hook. Ic. Pl., sub t. 3484. *APD acc*

Forest tree, to 100 ft. high.

Br. Cam.: Barombi Kotto, Kumba Div. (fr. Dec.) Smith 129/36! Boviongo, Kumba Div. (July) Smith 129/41!

Also in **French Cameroons**.

[Jacques-Félix in Rev. Bot. Appliq. 27: 516 (1947) suggests that this variety is the same as *M. nymphaeifolia* Mildbr. in Notizbl. Bot. Gart. Berl. 7: 489 (1921) from the French Cameroons. Brenan (ll.cc.), however, is doubtful of this. The type of *M. nymphaeifolia* has, presumably, been destroyed, but even if it does prove to be the same as Jacques-Félix suggests, it seems wiser to treat our plant as a variety.]

2. TRIPLOCHITON

K. Schum. in Engl. Bot. Jahrb. 28: 330 (1900).

Samba Roberty (1953).

- 1 A large tree, with glabrous branchlets and leaves; mature leaves 5–7-lobed, 5–7-nerved at base, lobes broadly ovate or triangular to oblong, obtusely acuminate, lamina averaging 10–15 cm. diam., leaves of seedlings larger and more deeply lobed; flowers hermaphrodite or polygamous in axillary cymose-panicles up to 7.5 cm. long; calyx 7–9 mm. long, deeply lobed, tomentellous outside; petals obovate or obcordate, about 1 cm. long and broad, densely pilose on both surfaces; androgynophore 3–3.5 mm. long; stamens 30–46, with filaments 2–3 mm. long, connate at the base in pairs; staminodes 5, broadly oblong-ovate, antisepalous, surrounding the 5 antipetalous carpels; fruiting carpels about 6 cm. long, including the obliquely oblong-obovate, membranous wing *scleroxylon*

Triplochiton scleroxylon *K. Schum.* in Engl. Bot. Jahrb. 28: 331 (1900); Chev. Bot. 75; Aubrév. Fl. For. C. Iv. 2: 260, t. 229; Kennedy For. Fl. S. Nig. 59. *APD acc*

Triplochiton johnsoni *C. H. Wright* in Hook. Ic. Pl. t. 2758 (1903); Chev. Bot. 75.

Triplochiton nigericum *Sprague* in Kew Bull. 1909: 212; F.W.T.A., ed. 1, 1: 248.

Samba scleroxylon (K. Schum.) Roberty (1953).

A large forest tree, to 200 ft. high, with large buttresses, deciduous; leaves and fruits maple-like; petals white, red-purple at base.

Fr. G.: Koulikoro Chev. 20649. **S. L.:** Koinadugu, Loma Mts. Frith 26! **Iv. C.:** Bouroukrou (Dec.–Jan.) Chev. 16105! Agboville Chev. 22341! Rasso Aubrév. 548! **G. C.:** Anum (Dec.) Johnson 813! 4. BYTTNERIA

Loefl. — F.T.A. 1: 239.

- 1 Branchlets not prickly, stellate-puberulous; leaves with petiole up to about 23 cm. long, lamina broadly ovate to suborbicular-ovate or ovate, widely truncate-cordate at base, acutely acuminate, up to about 18 cm. long and broad, thin, entire, 5-nerved at base, nearly glabrous; flowers small in slender leaf-opposed cymes, sometimes with an additional subaxillary smaller cyme; cymes about as long as the petiole; sepals lanceolate, about 6 mm. long, finely tomentellous; petals a little longer, obovate with a long linear-lanceolate appendage; body of fruit about 3 cm. diam., with numerous spines [1. catalpifolia subsp. africana](#)
- Branchlets prickly, puberulous with simple or fascicled hairs; leaves with petiole up to 9 mm. long, lamina oblanceolate-oblong, rounded at base, acuminate at apex, up to 6 cm. long and 2.3 cm. broad, margin markedly crenate in the upper part; flowers in small umbels or groups of umbels; calyx glabrous; petals with an incurved claw, 2 small lateral processes and a long ligulate appendage: [2](#)
- 2 Umbels 2 together, each with (1–) 2 (–3–4) flowers; petioles up to 5 mm. long, body of fruit about 1 cm. diam. with unequal-sized spines [2. guineensis](#)
- Umbels up to 6 together, each with 6–9 flowers; petioles up to 9 mm. long; fruit not known [3. sp. A](#)

1. *Byttneria catalpifolia subsp. africana* (Mast.) Exell & Mendonça in Conspectus Fl. Ang. 1: 197 (1951). *APD acc*

Buettneria africana Mast. in F.T.A. 1: 239 (1868); K. Schum. in Engl. Monogr. Afr. Sterculiac. 90, t. 5 B; F.W.T.A., ed. 1, 1: 249.

Scandent shrub or liane, mainly in [secondary forest](#); flowers white, sweet-scented; cut stem yielding water copiously.

G. C.: Agogo (fr. Dec.) Chipp 443! Irvine 874! Kumasi (July) Akwa FH 1766! Akroso (Aug.) Howes 947! Jimira F.R. (Aug.) Vigne FH 3997! Agona (Nov.) Darko 718! **S. Nig.:** Oban Talbot 438! 1388! **Br. Cam.:** Nkom-Wum, Bamenda Prov. (July) Ujor FHI 30465!

Also in [French Cameroons](#), [Belgian Congo](#), [Angola](#), [Uganda](#) and [A.-E. Sudan](#).

The subsp. *catalpifolia* is in tropical S. America.

2. *Byttneria guineensis* *Keay & Milne-Redhead* in Kew Bull. 1954: 263. *APD acc*

Prickly scrambling shrub; flowers red; fruits green with reddish tinge.

S. L.: Njala (fl. & fr. Apr.) Deighton 4740! 5030!

3. *Byttneria* sp. **A.** *APD acc*

Prickly climber, similar to *B. guineensis* but differing by the following characters as well as those shown in the key: (i) primary branches obscurely angled, hollow, with larger prickles, (ii) leaves with less hairy petioles and somewhat longer acumens, (iii) sepals apparently narrower. Better material of this plant is needed before making a decision about its taxonomical status.

S. Nig.: R. Addo, Igbessa, Lagos Colony (Dec.) Millen 194!

5. SCAPHOPETALUM

Mast. in J. Linn. Soc. 10: 28 (1869).

- 1 Sepals up to 8 mm. long, at anthesis usually adherent in two pairs with the fifth sepal free, calyx thus appearing 3-lobed, or rarely adhering 3 and 2 together, calyx thus appearing 2-lobed: **2**
 Sepals about 15 mm. long, quite separate at anthesis, subglabrous outside; petals about 10 mm. long, 3-toothed at apex; pedicels 1–2 cm. long; flowers on the old wood; branchlets puberulous; leaves oblong, abruptly long-caudate-acuminate at apex, margin more or less undulate, 10–22 cm. long, 4–8 cm. broad [5. talbotii](#)
- 2 Sepals entirely glabrous, more or less flat, elliptic, acuminate at apex about 7 mm. long and 2.5 mm. broad, rather thin, with a strong midrib; sepals or pairs of sepals separating to the base; petals glabrous, with broad lateral lobes; 3-cuspidate at apex, strongly veined; anthers at top of staminal tube; ovary glabrous; flowers generally solitary, with pedicels about 1.5 mm. long; branchlets minutely puberulous when very young, soon glabrous; leaves glabrous, oblong to elliptic, rounded to cuneate at base, caudate-acuminate, 9–17.5 cm. long, 3–6.7 cm. broad [1. parvifolium](#)
 Sepals distinctly pubescent or puberulous outside, concave, ovate to oblong, 5–8 mm. long, 3–3.5 mm. broad, united at base; petals not 3-cuspidate; ovary densely pubescent; flowers several together; branchlets distinctly hairy: **3**
- 3 Branchlets puberulous; leaves only sparsely puberulous beneath; flowers axillary and on bole, bracts not usually conspicuous: **4**
 Branchlets densely tomentellous; leaves oblong or oblong-lanceolate, rounded at base, shortly acuminate at apex, 16–35 cm. long, 5–12.5 cm. broad, finely puberulous with stellate and fascicled hairs beneath; flowers usually in axils of leaves, with numerous often conspicuous bracts; sepals densely puberulous outside, appearing distinct in bud; petals puberulous outside; anthers at top of staminal tube [4. letestui](#)
- 4 Petals glabrous outside except at the apex, attached to the staminal tube at the base only and thus easily detached; sepals puberulous outside, densely so on the margins thus making them distinct in bud; staminal tube with a second lower whorl of anthers (? always); leaves elliptic-lanceolate, to lanceolate, rounded or obtuse at base, gradually acuminate, 14–33 cm. long, 4–10.5 cm. broad [2. cf. zenkeri](#)
 Petals puberulous outside, firmly attached to the staminal tube for 1–1.5 mm.; sepals densely puberulous outside, margins not clearly marked in bud by lines of hairs, pairs of sepals firmly connate; anthers at top of staminal tube; leaves elongate-oblong-elliptic to oblong-oblong-lanceolate, obtuse to rounded (rarely cuneate) at base, shortly acuminate, 10–34 cm. long, 3.5–12.5 cm. broad [3. amoenum](#)

1. *Scaphopetalum parvifolium* *Bak. f.* in Cat. Talb. 14 (1913). *APD acc*

Small tree, to 30 ft. high; “flowers bright yellow, sepals bright palish green”; [in forest](#).

S. Nig.: Obutong Road, Oban Talbot 1264! Oban Talbot! Uwet — Budeng Road (Nov.) Rosevear C. 5! Between Ndiumo and Orora Road (Nov.) Rosevear C. 15!

2. **Scaphopetalum cf. zenkeri** *K. Schum.* in E. & P. Pflanzenfam. Nachtr. 1: 241 (1897); Engl. Monogr. Afr. Sterculiac. 93, t. 7 B. *APD acc*

Small **forest** tree, to 45 ft. high, or shrub; flowers on leafy shoots and on branches down to base of bole; sepals greenish-purple outside, very pale green inside; petals hyaline yellow at apex, with lines which are white outside and purple inside; staminal tube rich deep purple; fruits ellipsoid, knobbly and puberulous outside, about 2·8 cm. long and 1·5 cm. diam.

S. Nig.: Oban Talbot! **Br. Cam.:** S. Bakundu F.R., Kumba (fl. Mar., Apr., fr. Aug.) Brenan 9291! 9427! Ejiofor FHI 29314! Olorunfemi FHI 30704!

Also in **French Cameroons**.

[The duplicate of the type at Kew is not in a fit state to dissect so I cannot confirm that the androecium of *S. zenkeri* is as figured by Schumann. This figure does not show the second lower whorl of anthers which is present in our specimens from the British Cameroons which in other respects closely resemble the type material.]

3. **Scaphopetalum amoenum** *A. Chev.* in Bull. Soc. Bot. Fr. 61, Mém. 8: 255 (1917); Hutch. & Dalz. in Kew Bull. 1928: 296; Aubrév. Fl. For. C. Iv. 2: 262, t. 231, 1–7. *APD acc*

Forest tree, to 45 ft. high, bole usually leaning; sepals brownish-puberulous; petals yellowish-green with deep purple lines and markings; staminal tube deep purple or red; fruits ellipsoid, about 1·5 cm. long.

Lib.: Dukwia R. (Feb.–Mar.) Cooper 57! 237! 264! Moala (Nov.) Linder 1379! Truo (Mar.) Baldwin 12570! **Iv. C.:** Aubrév. 1690! Songan, Indénié (Mar.) Chev. 17788! Massa-Mé Aubrév. 138! 4. **Scaphopetalum letestui** *Pellegr.* in Bull. Mus. Hist. Nat. 27: 196 (1921); Fl. Mayombe 1: 31, fig. 1 (1924).

APD: *Synonym of Scaphopetalum blackii* var. *letestui* (Pellegr.) N. Hallé

Scaphopetalum blackii of F.W.T.A., ed. 1, 1: 250, not of Mast.

Forest shrub.

S. Nig.: Oban Talbot s.n.! 437! 476!

5. **Scaphopetalum talbotii** *Bak. f.* l.c. 14 (1913). *APD acc*

Scaphopetalum macranthum of F.W.T.A., ed. 1, 1: 249, not of K. Schum.

Small **forest** tree, to 30 ft. high; sepals dull pink outside, dull purplish-red on inside; petals ribbed, yellow; anthers cream; androecium deep wine-red at base; stigma pale dull pink.

S. Nig.: Oban Talbot 1562! **Br. Cam.:** Rio del Rey Johnston!

Several species have been described from the **French Cameroons** by Engler and K. Krause, but I have not been able to see material of them. The types have presumably been destroyed. With further material from the type localities it may be possible to prove that some of these species are the same as some of those described above.

6. LEPTONYCHIA

Turcz. — F.T.A. 1: 238.

- 1 Flowers axillary; leaves up to 25 cm. long; ovary (3–) 5-celled:.....2

Flowers in fascicles on the older wood well below the leaves which are usually over 25 cm. long; branchlets and leaves soon glabrous; sepals 6–8 mm. long, sparingly puberulous outside; petals suborbicular, pilose inside and

- towards the margins, nearly glabrous outside; staminal tube short but well-developed with a lanceolate staminode between each group of 2 fertile stamens and 1–2 filament-like staminodes; ovary 5-celled, densely pilose; style more or less pilose; fruits finely puberulous (? always):7
- 2 Staminal tube short but more or less well-developed, with 5 lanceolate or ovate-lanceolate staminodes inserted inside it so that one of them appears between each bundle or group of fertile stamens and filament-like staminodes; sepals 8 mm. or more long; ovary densely pilose; fruits densely hairy:3
- Staminal tube and inner whorl of lanceolate staminodes absent; fertile stamens 15, with 2 filament-like staminodes between every 3 fertile stamens and in the same whorl as them; sepals 7–8 mm. long, only sparingly puberulous outside; petals pilose towards the margins and also on both surfaces; ovary pubescent; style glabrous; fruits muricate, glabrous except for a few hairs on the tips of the warts; leaves narrowly oblong-lanceolate, long-caudate-acuminate, 13–23 cm. long, 3.5–6.5 cm. broad, very thin [6. sp. nr. echinocarpa](#)
- 3 Fertile stamens 15–20:4
- Fertile stamens 10; style pilose; petals not 2-lobed:6
- 4 Petals 2-lobed, pilose towards the margins; sepals 10–11 mm. long; filament-like staminodes 2 in each group of 4 fertile stamens; branchlets soon nearly glabrous; petioles sparingly puberulous; leaves elliptic to obovate-elliptic, gradually long-acuminate, 12–22 cm. long, 3–7 cm. broad [1. occidentalis](#)
- Petals not 2-lobed; sepals 13–18 mm. long:5
- 5 Petioles, rusty-pubescent; branchlets densely rusty-pubescent when young, glabrescent; sepals 13–15 mm. long; petals deltoid, long-pilose towards the margins; staminodes 4 in each group of 4 fertile stamens, only shortly united at base; style more or less glabrous; leaves broadly elliptic to obovate-elliptic, gradually long-acuminate, 9–19 cm. long, 3.5–7 cm. broad [2. pubescens](#)
- Petioles and branchlets sparingly whitish puberulous, soon nearly glabrous; sepals 15–18 mm. long; petals suborbicular-elliptic, pilose on both surfaces as well as towards the margins; staminodes 2–3 in each bundle of 3–4 fertile stamens, each bundle united at base into a common stipe above the staminal tube; style pilose in lower half; leaves obovate-elliptic, gradually long-acuminate, 14–23 cm. long, 4.5–8 cm. broad [3. batangensis](#)
- 6 Sepals about 15 mm. long, covered with greyish-brown hairs; petals suborbicular, densely pilose towards the margins, pilose inside and sparingly so outside; staminodes 3–5 in each bundle of 2 fertile stamens; leaves elliptic, acuminate, 9–18 cm. long, 4–7 cm. broad [4. macrantha](#)
- Sepals about 8–9 mm. long, covered with yellow-brown hairs; petals elliptic, densely pilose towards the margins only; staminodes 3 in each bundle of 2 fertile stamens; leaves more or less oblong, abruptly long-acuminate, 11–19 cm. long, 4.5–7.7 cm. broad [5. multiflora](#)
- 7 Leaves broadly oblong-elliptic, rounded at base, long-acuminate, 25–35 cm. long, 11–14 cm. broad, with 7–10 main lateral nerves on each side of midrib [7. pallida](#)
- Leaves elongate-oblong-oblong-lanceolate, slightly rounded at base, gradually acuminate, 27–32.5 cm. long, 6–7 cm. broad, with 6–7 main lateral nerves on each side of midrib [8. lanceolata](#)

1. *Leptonychia occidentalis* Keay in Kew Bull. 1954: 264. *APD acc*

Leptonychia urophylla of F.W.T.A., ed. 1, 1: 249, partly, not of Welw. ex Mast.

Shrub or small tree to 20 ft. high, rarely more; flowers greenish-white; in forest.

S. L.: Smythe 215! Thomas 9778! Hangha (Jan.) Thomas 7782! Njala (Feb.) Deighton 4702! Kambui F.R. (Mar.) Lane-Poole 187! Gola Forest (fr. Mar.) Small 540! **Lib.:** Dukwia R. (fr. Apr.) Cooper 406! Jones FHI 12159!

3. *Leptonychia batangensis* (C. H. Wright) Burret in Notizbl. Bot. Gart. Berl. 9: 728 (1926). *APD acc*

Grewia batangensis C. H. Wright in Kew Bull. 1896: 158.

Leptonychia urophylla of F.T.A. 1: 238 (1868), partly (Mann spec.); K. Schum. in Engl. Monogr. Afr. Sterculiac. 96, partly; F.W.T.A., ed. 1, 1: 249, partly; not of Welw. ex Mast., see Exell & Mendonça in Consp. Fl. Ang. 1: 198.

A small forest tree, 15–20 ft. high, with greenish flowers.

Br. Cam.: Amba Bay (Jan.) Mann 13! **F. Po.:** (Jan.) Mann 166!

Also in **French Cameroons**.

4. **Leptonychia macrantha** *K. Schum.* in E. & P. Pflanzenfam. Nachtr. 1: 241 (1897); Monogr. 96. *APD acc*

Shrub or small tree, in forest; flowers green.

S. Nig.: Ologdo, Ishan Dist. (Mar.) Ebuade FHI 22759! Ikom (Dec.) Rosevear 73/30a!

Also in **French Cameroons**.

5. **Leptonychia multiflora** *K. Schum.* in E. & P. Pflanzenfam. Nachtr. 1: 241 (1897); Monogr. 95, t. 8 C; Pellegr. in Mém. Soc. Bot. Fr. 1950–51: 49. *APD acc*

Small tree, in forest.

Br. Cam.: Abonando, Mamfe (Mar.) Rudatis 20!

Also in **French Cameroons** and **Belgian Congo**.

6. **Leptonychia sp. nr. echinocarpa** *K. Schum.* in E. & P. Pflanzenfam. Nachtr. 1: 241 (1897); Monogr. 95. *APD acc*

Erect shrub, to 15 ft. high; sepals green, stamens and petals cream; in forest.

S. Nig.: Oban Talbot 604! Afi River F.R. (Dec.) Keay FHI 28221! **Br. Cam.:** Korup F.R., Kumba Dist. (fr. June) Olorunfemi FHI 30641!

[This differs slightly from *L. echinocarpa* K. Schum., from **French Cameroons** and Gabon, as known to me from the description and the syntype Soyaux 216 in Kew Hb., but may well prove conspecific.]

7. **Leptonychia pallida** *K. Schum.* in E. & P. Pflanzenfam. Nachtr. 1: 241 (1897); Monogr. 98, t. 8 E. *APD acc*

Small tree, to 30 ft. high; cauliflorous; sepals green, filaments and petals cream; foliage drying pale green; fruits green with grey indumentum and seeds covered with bright orange aril; in forest.

S. Nig.: Afi River F.R. (fl. & young fr. Dec., fr. May) Keay FHI 28223! 28235! Jones & Onochie FHI 5836! **Br. Cam.:** Barombi (June, Sept.) Preuss 313! 483! Bambuko F.R., Kumba Div. (Sept.) Olorunfemi FHI 30759! **F. Po.:** Mildbr. 6354.

Also in **French Cameroons**.

8. **Leptonychia lanceolata** *Mast.* in F.T.A. 1: 239 (1868). *APD acc*

A shrub 12–15 ft. high, with pale leaves and glabrous branchlets.

F. Po.: (Jan) Mann 190!

Imperfectly known species.

1. **Leptonychia adolfi-friederici** *Engl. & K. Krause* in Engl. Bot. Jahrb. 48: 556 (1912). *APD acc*

Erect shrub.

The androecium is not sufficiently accurately described for this species to be included in the key; the type specimen has presumably been destroyed.

F. Po.: S.W. coast, near Bokoko (Oct.) Mildbr. 6958.

2. **Leptonychia densivenia** *Engl. & K. Krause* l.c. 557 (1912). *APD acc*

Small erect shrub.

F. Po.: Barter! S.W. coast, near Bokoko (Oct.) Mildbr. 6898.

Included in the first edition as a synonym of *L. urophylla* Welw. ex Mast., but a specimen collected by Barter in Fernando Po agrees reasonably well with the description and appears distinct from *L. urophylla* and all the above species. The androecium is not sufficiently well described for the species to be included in the key; the type has presumably been destroyed. The Barter specimen (cited by K. Schum. in Engl. Monogr. Afr. Sterculiac. 97 as *L. urophylla*) is not good enough for dissection.

3. **Leptonychia fernandopoana** Engl. & K. Krause ex Mildbr. Wiss Ergebn. 1910–11, 2: 187 (1922), name only. *APD acc*

F. Po: Bokoko Mildbr. 6823; 6862.

7. DOMBEYA

Cav. — F.T.A. 1: 226.

- 1 Flowers arranged in a subglobose rather dense subumbellate head, with a peduncle 6–22 cm. long; sepals lanceolate, about 1 cm. long, villous-pilose; petals about 1·6 cm. long and 1 cm. broad, not dry and hardened in fruit; ovary 5-celled, with about 5 ovules in each cell; branchlets, peduncles, petioles and nerves beneath coarsely pilose with simple hairs; leaves digitately lobulate, cordate at base, 10–25 cm. long and broad; stipules long-subulate-acuminate, loosely villous [1. buettneri](#)

Flowers in lax, well-branched cymes; sepals up to 6 (–8) mm. long; petals considerably longer than broad, becoming dry and papery in fruit; ovary 3-celled, with about 2 ovules in each cell; branchlets, peduncles and petioles glabrous, or puberulous to tomentose with stellate hairs:..... [2](#)

- 2 Flowers produced on woody branchlets before the leaves; young branchlets, petioles and inflorescence axes glabrous or whitish-puberulous to tomentellous; leaves rounded-ovate, cordate at base, irregularly dentate at margin, up to 17 cm. long and broad:..... [3](#)

Flowers terminal or axillary, produced after or with the leaves; young branchlets and petioles densely reddish-brown stellate-tomentose; inflorescence axes and outside of sepals woolly-tomentose; leaves ovate to suborbicular, cordate at base, 8–23 cm. long, 6·5–19 cm. broad, undersurface densely covered with a close felt of grey tomentellous indumentum beneath, also with larger brownish stellate hairs which are scattered over the lamina but become abundant on the nerves, upper-surface green, puberulous [3. cf. ledermannii](#)

- 3 Inflorescence axes, young branchlets and petioles densely stellate-puberulous; sepals woolly-tomentose outside [2. quinqueseta var. quinqueseta](#)

Inflorescence axes, young branchlets and petioles glabrous or sparingly pubescent; sepals puberulous-tomentellous outside [2a. quinqueseta var. senegalensis](#)

1. **Dombeya buettneri** K. Schum. in Engl. Bot. Jahrb. 15: 133 (1892); Engl. Monogr. Afr. Sterculiac. 27, t. 2 B; Aubrév. Fl. For. Soud.-Guin. 163, t. 29, 3. *APD acc*

Dombeya mastersii of F.T.A. 1: 228, partly (Irving spec.).

A weedy shrub, or small tree, to 15 ft. high, with pithy branches; leaves with very long channelled petioles; flowers white, usually with red centre, about 1 in. across, turning yellow in drying.

[I have been unable to trace authentic material of this species; the type, Ledermann 1557, was collected between Fossong in Mamfe Division of the British Cameroons and Dchang in the French Cameroons. *D. discolor* Engl. l.c., from Babudju (probably in the French Cameroons), is also known now only from the description; it appears to be close to our plant.]

Dombeya squarrosa Engl. Bot. Jahrb. 45: 318 (1910).No authentic material available; possibly a form of *D. buettneri* K. Schum.

Br. Cam.: Bamenda Prov.: Babungo (Dec.) Ledermann 1967. Ngom (Jan.) Ledermann 2089.

Imperfectly known species.

8. MELHANIA

Forsk. — F.T.A. 1: 230.

- 1 A low shrublet; branches and leaves softly stellate-tomentose; leaves ovate-elliptic, subcordate at base, rounded or truncate at apex, about 3 cm. long and 1.5 cm. broad, crenate-serrate; stipules subulate-filiform, 3 mm. long, becoming glabrous; flowers axillary, solitary; bracteoles 3, much enlarged, membranous, and wing-like in fruit, about 3 cm. diam.; stamens 5, with alternating staminodes; fruit a small loculicidal capsule, 1–2-seeded *1. denhamii*

A low shrublet as above, but bracteoles linear-subulate and cells of fruit 3-seeded *2. ovata*

1. *Melhanian denhamii* R. Br. — F.T.A. 1: 230; K. Schum. in Engl. Monogr. Afr. Sterculiac. 15, t. 1 A; Chev. Bot., 84. APD acc

A small shrublet, woody at the base, the flowers enclosed in large bracteoles.

Sen.: Walo and Cayor (Dec.–Mar.) Perrottet 90! Fr. Sud.: Timbuktu (fl. & fr. June–July) Hagerup 119! 213!

Extends from Mauritania to India.

2. *Melhanian ovata* (Cav.) Spreng. Syst. Veg. 3: 32 (1826); K. Schum. l.c. 6, t. 1 D. APD acc*Brotera ovata* Cav. (1799).*B. lepriurii* Guill. & Perr. Fl. Seneg. 85 (1831).*Melhanian abyssinica* A. Rich. (1847) — F.T.A. 1: 231.*Melhanian lepriuri* Webb in Hook. Nig. Fl. 110, t. 4–5 (1849).

Sen.: St. Louis, Gandole and Four-à-Chaux (Sept.–Oct.) Perrottet.

Sandy deserts in N. and S. tropical Africa generally; also in India.

Our plant is var. *oblongata* (Hochst.) K. Schum. l.c. 7.

9. HERMANNIA

Linn. — F.T.A. 1: 232.

- 1 Herb, woody only at the base; stems ascending; leaves lanceolate or lanceolate-elliptic, subacute at each end, 2–6 cm. long, 1–2.5 cm. broad, loosely stellate-pubescent on both surfaces; petiole up to 1 cm. long; stipules linear-lanceolate, acute, 4–6 mm. long, often leafy; flowers axillary; pedicels very slender, 3–4 cm. long; calyx-lobes triangular-lanceolate, 1.5 mm. long, strongly nervose; fruits broadly turbinate, truncate and with several horns at the apex, 5–6 mm. long, loosely stellate-pubescent [tigreensis](#)

Hermannia tigreensis *Hochst. ex A. Rich.* — F.T.A. 1: 233; K. Schum. in Engl. Monogr. Afr. Sterculiac. 85. *APD acc*

A herb of farms, 1 ft. high, not common; flowers small, deep red.

Sen.: Cayor Berhaut 1314. **N. Nig.:** Sokoto (Aug.) Dalz. 414! Bichikki, 13 miles W. of Bauchi (Sept.) Lely 626!

Also in **N. Cameroons**, extending to Abyssinia, Eritrea and **Angola**.

10. MELOCHIA

Linn. — F.T.A. 1: 235.

- 1 Flowers in terminal clusters; stems with lines of stellate hairs on the young parts; leaves ovate, rounded or very slightly cuneate at base, acute, 3–6 cm. long, up to 4 cm. broad, 5-nerved at the base, nearly glabrous; petiole 1/3–1/2 as long as the blade; bracts linear, ciliate [l. corchorifolia](#)
- Flowers axillary; petioles very short: **2**
- 2 Stems and young parts densely covered with long silky hairs; leaves ovate-lanceolate, acute, rounded to truncate at the base, 4–8 cm. long, 2–3.5 cm. broad, pilose; petiole about 1/4 as long as the blades; bracts very long-linear, densely plumose-pilose [2a. melissifolia var. mollis](#)
- Stems at most pubescent with rather short hairs: **3**
- 3 Bracts about 1 cm. long; leaves ovate-lanceolate, pointed, 4–7 cm. long, 2–3 cm. broad [2b. melissifolia var. bracteosa](#)
- Bracts about 0.5 cm. long; leaves rather broadly ovate, scarcely pointed, 2–4 cm. long, about 1.5 cm. broad. [2c. melissifolia var. microphylla](#)

1. **Melochia corchorifolia** *Linn.* — F.T.A. 1: 236; K. Schum. in Engl. Monogr. Afr. Sterculiac. 41, t. 39; Chev. Bot. 84. *APD acc*

Herb or undershrub, 1 1/2–2 ft. or more, with hollow stems, erect or sometimes prostrate; flowers small, white or sometimes yellowish or pinkish; more common in wet places.

Sen.: Heudelot 494! Roger 119! M'bidjem (Oct.) Thierry 84! **Gam.:** Wallikunda (Sept.) Macluskie 14! **Fr. Sud.:** Tacadji (Aug.) Chev. 2747! Sansanding (Sept.) Chev. 24965! **Fr. Widespread in the tropics of the Old World.

2. **Melochia melissifolia** *Benth.* in Hook. Journ. Bot. 4: 124 (1841); K. Schum. l.c. 42. *APD acc*

Several varieties are widespread in tropical Africa; var. *melissifolia* is in tropical America. For this edition I have followed K. Schumann, but I am not altogether satisfied that these varieties are really distinct. There seems no justification for raising them to specific rank as in the first edition. A thorough study of this variable species throughout its range is needed.

2a. **Melochia melissifolia var. mollis** *K. Schum. l.c. 43 (1900). APD acc*

Melochia mollis (*K. Schum.*) *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 250 (1928); Kew Bull. 1928: 296.

Herb with axillary clusters of small white or yellowish flowers.

Lib.: Monrovia Whyte! Vonjama (Oct.) Baldwin 9865! **S. Nig.:** Eket Talbot! **Br. Cam.:** Rio del Rey Johnston!

Extends to Shari, Upper Nile.

2b. Melochia melissifolia var. bracteosa (*F. Hoffm.*) *K. Schum.* l.c. 43 (1900).

APD: *Synonym of Melochia bracteosa F. Hoffm.*

Melochia bracteosa *F. Hoffm.* (1889) — F.W.T.A., ed. 1, 1: 250.

? **M. melissifolia var. brachyphylla** *K. Schum.* l.c., partly (*Sc. Elliot* 5095).

Habit of the preceding, up to 5 ft. high.

Sen.: Berhaut 1335; 2324; 4354. **S. L.:** Kambia (Dec.) *Sc. Elliot* 4351! Deighton 863! Pujehun (Dec.) Deighton 268! Yonibana (Nov.) Thomas 4915! 5061! Musaia (Dec.) Widespread in the tropics.

12. OCTOLOBUS

Welw. ex Benth. & Hook. f. Gen. Pl. 1: 982 (1867); Hutch, in Kew Bull. 1937: 394.

- Shrub or small tree; branchlets shortly tomentose when very young, soon glabrous; stipules subulate, caducous; leaves unifoliate, with petiole up to 5 cm. long, swollen at apex; lamina oblanceolate to elliptic-obovate, narrowed to the cuneate or rounded base, gradually long-acuminate, 6–24 cm. long, 2.5–7.5 cm. broad, glabrous, lateral nerves arcuate and prominent beneath, 7–9 pairs, venation closely reticulate; flowers unisexual, solitary and surrounded at base by an involucre of bracts, in axils of lower leaves, or on stem just below the leaves; calyx up to 2.8 cm. long, more or less densely tomentose outside, with 8 lanceolate lobes, 1.2–1.5 cm. long, each with a crisped marginal fringe, tube about 1–1.3 cm. long, narrow in male flower but broader in female; anthers about 4 mm. long, in 1 whorl with stipe about 5 mm. long; carpels numerous; fruiting carpels oblique ellipsoid, 2–2.5 cm. long, about 1.5 cm. broad, with stipe 1–1.5 cm. long, densely crowded, each with 5–6 seeds[angustatus](#)

Octolobus angustatus *Hutch. in Kew Bull. 1937: 395.*

APD: Synonym of Octolobus spectabilis Welw.

Octolobus spectabilis of Aubrév. Fl. For. C. Iv. 2: 252, t. 225 A (1936), not of Welw.

Cola rolandi-principis A. Chev. Bot. 83, name only.

Cola angustifolia of F.W.T.A., ed. 1, 1: 255, partly (as to syn.).

C. flavo-velutina of F.W.T.A., ed. 1, 1: 255, partly (Unwin & Smythe 53).

Small tree, to 25 ft. (rarely to 50 ft.) high, or shrub, in **forest**; flowers yellow or cream; fruiting carpels red, with shining black seeds.

S. L.: Gola Forest (fr. Jan.) Unwin & Smythe 53! **Iv. C.:** Adzopé to Boudépé (fr. Dec.) Chev. 22672! **G. C.:** Kwahu Prasu (Feb.) Vigne FH 1602! S. Fomang Su F.R. (Jan.) Vigne FH 2674! [O. spectabilis Welw. from Gabon and Angola is closely related.]

Octolobus sp.

Forest tree, to 35 ft. high; flowers not known.

Br. Cam.: Mombo, S. Bakosi Forest, Kumba Dist. (fr. May) Olorunfemi FHI 30565!

Imperfectly known species.

13. PTERYGOTA

Schott & Endl. Meletem. Bot. 32 (1832).

- Undersurface of young leaves and shoots and inflorescence axes with very short appressed stellate hairs, often whitish or olivaceous in colour; leaves usually 7-nerved at base, more or less pentagonal-ovate, sometimes slightly lobed, widely to deeply cordate at base, 10–38 cm. long and broad; flowers 17–20 mm. long, distinctly pedicellate, sepals tomentose outside but subglabrous within; fruiting carpels 12–18 cm. long, 10–13 cm.

broad, ellipsoid or subglobose, rounded on the side opposite the suture, with a stout stipe 1.5–4.5 cm. long and 1.5–2 cm. diam.; seeds (including wing) 8–12 cm. long, 3.5–5.5 cm. broad [1. macrocarpa](#)

Undersurface of young leaves and shoots and inflorescence axes densely brown stellate-tomentose; leaves usually 5-nerved at base, oblong-ovate to suborbicular, truncate to widely cordate at base, 5–17 cm. long and broad; flowers 10–12 mm. long, sessile or subsessile, sepals tomentose outside and inside; fruiting carpels tapered on the side opposite the centre of the suture, 7.5–10 cm. broad from the centre of the suture to the tip of the tapered back, 5–7 cm. long, attenuate at base into the 3–5 cm. long stipe which is about 4–5 mm. diam. in the middle; seeds (including wing) 7–7.5 cm. long, 2.5–3 cm. broad [2. bequaertii](#)

1. *Pterygota macrocarpa* K. Schum. in Engl. Monogr. Afr. Sterculiac. 135, fig. 1, A–B (1900); Aubrév. Fl. For. C. Iv. 2: 254, t. 226; Milne-Redhead in Kew Bull. 1950: 348, partly (excl. ref. frts., Maitland 445 and carpel walls associated with Maitland 90). *APD acc*

Pterygota cordifolia A. Chev. Vég. Util. 5: 252 (1909).

Forest tree, to 120 ft. high, with buttresses.

S. L.: Smythe 258! (sterile spec., ident. provis.). Iv. C.: Aubrév. 957! Morénou (Nov.) Chev. 22462! Man Aubrév. 405! Zaranou (fr. Mar.) Chev. 16271. G. C.: Nkawe Chipp 143! Dedeswa (fr. Mar.) Also in French Cameroons, Gabon and Belgian Congo.

Besides the above indigenous species, *P. alata* (Roxb.) R. Br. from tropical Asia has been collected (Maitland 445) at Victoria, British Cameroons; the references to the fruit in Milne-Redhead's paper (Kew Bull. 1950: 348) are based on this specimen and not on *P. macrocarpa* K. Schum.

14. STERCULIA

Linn. — F.T.A. 1: 215.

- 1 Leaves digitately nerved and lobed, cordate at base, lobes triangular-acuminate, up to 20 cm. long and broad, softly stellate-tomentellous beneath, becoming less so with age; flowers in short crowded cymes on the previous year's shoots; calyx widely campanulate, lobed to about the middle, about 1 cm. long, tomentose outside; fruiting carpels boat-shaped, 6 or more cm. long, very hairy inside; seeds ellipsoid, slate-coloured, 10–14 mm. long, with a yellow fleshy aril at base [1. setigera](#)

Leaves pinnately nerved and entire: [2](#)

- 2 Calyx divided to the base, lobes about 5 mm. long, woolly inside; fruiting carpels with very woody walls about 1 cm. thick, ellipsoid, with a short stout stipe, acuminate at apex, 10–16 cm. long, with about 16 seeds each completely enclosed in yellow aril; panicles with 1–5-flowered lateral branches up to about 2 cm. long; leaves elliptic or oblong, rounded to obtuse at base, shortly acuminate at apex, 7–14 cm. long, 4–8 cm. broad, with 10–14 pairs of parallel lateral nerves, thinly stellate-pubescent to subglabrous beneath, petioles 2–7 cm. long [2. oblonga](#)

Calyx campanulate, lobed in the upper half; fruiting carpels with walls up to 5 mm. thick, boat-shaped, distinctly stipitate, 5–7 cm. long; seeds not covered with yellow aril; lateral branches of inflorescence several-flowered,

up to 5 cm. long:.....3

- 3 Calyx-lobes not adhering at apex, with apical incurved hairy appendages; inflorescence axes sparingly stellate puberulous; leaves glabrous or nearly so beneath, more or less oblong, rounded at base, scarcely acuminate, 10–30 cm. long, 4–16 cm. broad, petioles 3–11 cm. long; fruiting carpels glabrous or puberulous inside, with about 8 seeds each completely enclosed in bright red aril [3. *rhinopetala*](#)

Calyx-lobes adhering at apex, without appendages; inflorescence axes densely stellate-tomentose; leaves stellate-tomentellous beneath, ovate-elliptic or slightly obovate, rounded to slightly cordate at base, obtusely and shortly acuminate, 10–18 cm. long, 5–11 cm. broad, petioles 2–7.5 cm. long; fruiting carpels bristly-tomentose inside, with slate-coloured seeds, not arillate [4. *tragacantha*](#)

1. *Sterculia setigera* Del. Cent. Pl. Afr. 61 (1826); Aubrév. Fl. For. Soud.-Guin. 159, t. 28. *APD acc*

Sterculia tomentosa Guill. & Perr. Fl. Seneg. 1: 81, t. 16 (1831); F.T.A. 1: 217; K. Schum. in Engl. Monogr. Afr. Sterculiac. 106; F.W.T.A., ed. 1, 1: 251; Kennedy For. Fl. S. Nig. 63; not of Thunb. (1794).

Sterculia cinerea A. Rich. — F.T.A. 1: 218.

A deciduous, [savannah](#) tree, to 40 ft. high; bark rough, yielding a white gum; young branches softly tomentose; flowers dull red or yellowish-green with red streaks, appearing before the new foliage; fruiting carpels usually 4–5, grey to brownish outside, beaked, velvety inside with pungent bristles along the placenta line.

Widespread in tropical Africa.

***Sterculia foetida* Linn.**

A native of tropical Asia, it has been introduced into cultivation in our area.

***Sterculia apetala* (Jacq.) Karst**

Sterculia carthaginensis Cav.

A native of tropical America, it has been introduced into cultivation in our area.

Schott & Endl. — F.T.A. 1: 220.

***Chlamydocola* (K. Schum.) Bodard** in J. Agr. Trop. Bot. Appliq. 1: 313 (1954).

- 1 Leaves compound, digitate; anthers in 1 whorl (N.B. — rudimentary anthers can always be observed below the carpels in the female flowers):2
- Leaves simple, lobed or entire: 11
- 2 Leaflets with undersurface completely hidden (or almost so) by scales clearly visible under x 10 lens, and giving the surface a silvery appearance; leaflets 3, up to 50 cm. long and 20 cm. broad, shortly petiolulate; flowers in densely clustered cymes on the older wood; pedicels jointed, distinct, scaly; calyx-tube campanulate, 7–10 mm. long, densely scaly outside, lobes with crisped marginal frill [1. lepidota](#)
- Leaflets not scaly, or only minutely, sparsely and inconspicuously so; leaflets 5–7 (–9):3
- 3 Calyx 6–9 cm. long, elongate-urceolate, ribbed, brown-woolly in bud, later only minutely stellate-puberulous; plant cauliflorous; leaflets usually deeply lobed, subsessile, central leaflets up to 45 cm. long, basal leaflets much smaller [2. gigas](#)
- Calyx up to 4 cm. long:4
- 4 Flowers in axillary clusters among the leaves, sometimes also a few clusters just below the leaves:5
- Flowers borne on the older wood below the leaves:7
- 5 Leaflets, at least the central ones, usually deeply lobed, never abruptly caudate-acuminate; stipules caducous; perianth without a crisped marginal fringe, lobes more or less erect; stamens grouped in bundles within the whorl; fruiting carpels long-stipitate, smooth:6
- Leaflets oblanceolate to obovate, not lobed, very abruptly long-caudate-acuminate at apex, up to 40 cm. long and 11 cm. broad; branchlets, pedicels and outside of flowers brown-tomentellous, petiole and midrib beneath puberulous; stipules ovate-lanceolate, erect and rigid, 1.5–4.5 cm. long; calyx-tube about 8–12 mm. long, lobes reflexed, about 14–16 mm. long, with a crisped almost lacinate marginal fringe towards the apex; stamens in a continuous whorl, not grouped or twisted; fruiting carpels apparently sessile, with irregular conical warts, ellipsoid to subglobose, 4–5 cm. diam., 3–8 cm. long [5. rostrata](#)
- 6 Leaves papery to subcoriaceous, gradually acuminate at apices of leaflets and often also of upper lobes, up to 55 cm. long, almost glabrous beneath; petioles 2.5–7 mm. diam.; male calyx about 15 mm. long, lobed to below the middle or to base; fruiting carpels opening out almost flat with the seeds borne on the margins .. [3. digitata](#)
- Leaves thickly coriaceous and rigid, obtuse or hardly acuminate at apices of leaflets and lobes, up to 85 cm. long, densely stellate-puberulous beneath; petioles 8–15 mm. diam.; male calyx 16–22 mm. long, lobed to the middle; fruiting carpels apparently not opening out flat, boat-shaped [4. megalophylla](#)
- 7 Pedicels 1.8–5 cm. long; calyx subglabrous or minutely puberulous outside, campanulate to shortly funnel-shaped, 1.3–3.5 cm. long; leaflets broadly oblanceolate to obovate, always petiolulate, not lobed, but sometimes sinuate especially towards the acuminate apex, up to 35 cm. long and 14.5 cm. broad, subglabrous

- beneath; fruiting carpels shortly stipitate, ellipsoid or oblong, stout, glabrous, up to 20 cm. long and 10 cm. thick [6. pachycarpa](#)
- Pedicels up to 1 cm. long; calyx densely pubescent or puberulous outside: **8**
- 8** Leaflets all sessile, basal ones very asymmetrical towards base (proximal side more or less rounded, distal side cuneate) more or less glaucous-grey beneath; petiole, midrib and lateral nerves at first with coarse plumose or stellate hairs which are easily rubbed off; central leaflets to 35 cm. long and 15 cm. broad; pedicels up to 3 mm. long with small ovate bracts at base; calyx campanulate 9–15 mm. long [7. argentea](#)
- Leaflets petiolulate, rarely some sessile, entire or rarely sporadically sinuately lobed, not glaucous beneath, basal ones cuneate and not or only very slightly asymmetrical at base: **9**
- 9** Carpels 3–5; calyx-tube up to 9 mm. long, lobes up to 13 mm. long; pedicels up to 1 cm. long in flower; leaflets papery to thinly coriaceous, always long-petiolulate: **10**
- Carpels 9–12; calyx-tube 1.1–1.9 cm. long, lobes 1.3–2.5 cm. long; stamens 17–18; flowers sessile or subsessile; fruiting carpels thick-walled, obliquely oblong, 9–12 (–16) cm. long, densely tomentellous, subsessile, with a short, curved beak; leaflets up to 60 cm. long and 20 cm. broad, petiolulate or subsessile, acuminate [10. chlamydantha](#)
- 10** Calyx-tube 2–3 mm. long, lobes 6–7 mm. long; anthers 8–10; carpels 3–4; flowers fasciculate; fruiting carpels when dry thin-walled, shortly boat-shaped to cylindrical, 4–9 cm. long, longitudinally ridged, otherwise smooth and subglabrous, with stipe up to 8 mm. long and beak up to 15 mm. long; leaflets up to 30 cm. long, gradually acuminate, ultimate venation obscure [8. umbratilis](#)
- Calyx-tube 7–9 mm. long, lobes 8–13 mm. long; anthers about 15; carpels 4–5; flowers in short panicles, with common axis up to 3 cm. long; leaflets up to 42 cm. long, gradually acuminate, ultimate venation a prominent reticulum [9. buntingii](#)
- 11** Leaves mostly deeply digitately lobed and nerved; anthers in 1 whorl (N.B. — rudimentary anthers can always be observed below the carpels in the female flowers): **12**
- Leaves entire, sometimes obscurely lobed but then anthers in 2 whorls: **19**
- 12** Stipules persistent, linear, 1.4–2.8 cm. long, rigid; leaves closely crowded at the top of the unbranched main stem, very variable in size, petioles of lower leaves up to 53 cm. long; lamina deeply 3-lobed, sometimes with 1–2 additional basal lobes, acuminate abrupt, very narrow, up to 4 cm. long, central lobe with 8–14 main lateral nerves on each side of midrib; petioles and main nerves beneath scurfy-puberulous, surface of lamina otherwise glabrous except for closely set minute reddish sessile glands; flowers sessile, bracteate, in clusters in leaf-axils and down to base of trunk; calyx about 6 mm. long, densely rusty-pubescent outside, deep plum-purple inside with numerous minute papillae; carpels 3; fruiting carpels ellipsoid, acuminate at apex, 4–7 cm. long, 1–3-seeded [11. ficifolia](#)
- Stipules soon caducous, up to 1 (–1.5) cm. long; main stem usually branched, leaves not closely crowded at top; leaves (2–) 3–5 (–7)-lobed or rarely entire, gradually acuminate, central lobe with up to 7 main lateral nerves on each side of midrib; flowers mostly in cymes; calyx 9–20 mm. long: **13**
- 13** Calyx with numerous minute papillae inside; carpels 4–6; fruiting carpels ellipsoid to subcylindrical, with a long apical beak; leaves 2–3-lobed, or rarely entire; young branchlets and petioles with short stellate pubescence; flowers in slender few-flowered cymes, pedicels well-developed [12. heterophylla](#)
- Calyx with elongate more or less flexuous simple hairs inside; carpels (5–) 8–11: **14**
- 14** Carpels 5–7, in fruit elongate, subcylindrical, up to 8 cm. long, including the 2–3 cm. long beak; leaves not more than 3-lobed, sometimes simple, often with long hairs on petiole-apex and main nerves; flowers yellowish; calyx with usually rather sparse stellate hairs outside; small tree to 3.6 m. high; see below [13. brevipes](#)
- Carpels (6–) 8–11, in fruit (where known) without a long apical beak; leaves 3–7-lobed, never simple: **15**
- 15** Petioles and main basal nerves of leaves beneath pubescent, puberulous or almost glabrous; hairs short, stellate or simple, not hispid; lobes of leaves usually entire: **16**
- Petioles and main basal nerves of leaves beneath hispid with long spreading simple or fascicled hairs: **18**
- 16** Calyx-lobes 1–2 mm. thick, 4 or 5, sometimes 3; flowers yellowish inside, with dense usually brownish stellate indumentum outside; inflorescence-axes and pedicels very short; inflorescences few-flowered; fruits not known: **17**
- Calyx-lobes 1 mm. or less thick, usually 5, rarely 4; flowers normally red or purplish-red inside (very rarely uniformly pale yellow), with short stellate indumentum outside, usually rather sparse on the lobes; inflorescence-axes and pedicels usually distinct; inflorescences several- to many-flowered; leaves usually 5-lobed, sometimes 3- or 7-lobed; petioles and main basal nerves of leaves beneath more or less stellate-pubescent; fruiting carpels sessile, obovoid to ellipsoid, rounded at apex, up to 8.5 cm. long and 3–5 cm. broad, glabrous; tree 4–12 (–18) m. high [16. millenii](#)
- 17** Leaves 3-lobed, sometimes with 2 additional basal lobes, the lobes separated by open sinuses, their margins not overlapping; leaves green; tree to 5 m. high [14. flaviflora](#)
- Leaves 5-, very rarely 3-lobed, the lobes close to one another and usually with their margins overlapping; leaves reddish or purplish beneath when fresh [15. ricinifolia](#)

- 18** Calyx outside with sparse to moderately dense indumentum of small stellate hairs, lobes 4–7.5 mm. long; leaves usually 5-lobed, sometimes with secondary lobes; fruiting carpels with stipe about 1.5 cm. long, subcylindrical, narrowed to apex, with prominent suture, up to 10 cm. long and 3 cm. broad, glabrous [17. caricaefolia](#)
- Calyx outside densely and shortly brown-tomentose, lobes 3.5–5 mm. long; leaves 3- or 5-lobed, usually without secondary lobes; fruiting carpels subsessile, obovoid to ellipsoid, rounded at apex, up to 5 cm. long and 3 cm. broad, densely pubescent to shortly tomentose [18. hispida](#)
- 19** Anthers in 1 whorl (N.B. — rudimentary anthers can always be observed below the carpels in the female flowers): **20**
- Anthers in 2 superposed whorls (N.B. — rudimentary anthers can always be observed below the carpels in the female flowers): **36**
- 20** Leaves cordate at base, often with a pair of small pouches near base of lamina, obovate-elliptic, abruptly acutely acuminate, up to 35 cm. long and 15 cm. broad; stems, stipules, petioles and midrib of leaves beneath densely clothed with long spreading hairs; flowers crowded in the upper axils, shortly pedicellate; calyx 5–12.5 mm. long, more or less spreading-pilose outside, with minute simple elongate flexuose hairs inside; carpels 5–6; fruiting carpels subcylindrical, beaked, up to about 7 cm. long and 1.5 cm. diam. (when dry) .. [19. marsupium](#)
- Leaves not cordate, lamina without small pouches at base: **21**
- 21** Calyx 3–5 cm. long, campanulate, stellate-puberulous outside, tube glabrous within except for microscopic papillae near base, lobes densely stellate-puberulous within; flowers solitary or fasciculate in leaf-axils, pedicels about 2–3.5 cm. long; carpels 4–5, densely and minutely tomentellous, with an androgynophore up to 3 mm. long; leaves obovate, more or less rounded at base, shortly acuminate, up to 40 cm. long and 16 cm. broad, coriaceous, glabrous or nearly so when mature [20. altissima](#)
- Calyx up to 2.5 cm. long: **22**
- 22** Calyx with minute simple elongate more or less flexuose hairs inside; petioles usually with long spreading simple or fascicled hairs; flowers shortly pedicellate in the upper axils; calyx 7–13 mm. long, sparsely stellate-pubescent outside; carpels 5–7, shortly tomentose; fruiting carpels subcylindrical, up to 8 cm. long including the 2–3 cm. long beak; leaves obovate or obovate-elliptic, acute or rounded at base, more or less acuminate at apex, up to 35 cm. long and 13 cm. broad, sometimes lobed; see above [13. brevipes](#)
- Calyx with minute papillae inside; young branchlets and petioles without long spreading hairs: **23**
- 23** Flowers in cymes or panicles, with main axis well-developed: **24**
- Flowers fasciculate, main axis of inflorescence absent or nearly so; mature leaves glabrous or nearly so: **25**
- 24** Inflorescence and flowers densely and shortly rusty-tomentose, paniculate, many-flowered; calyx 4–6 mm. long with very short tube; leaves and shoots when young with dense easily detached ginger-brown stellate indumentum; leaves elliptic to lanceolate-elliptic, usually obtuse at each end, to 25 cm. long and 13 cm. broad, coriaceous; fruiting carpels 4–6, subglobose, rounded at apex, up to 5 cm. long [21. laurifolia](#)
- Inflorescence and flowers rather sparsely and very shortly grey-puberulous, cymose, rather few-flowered; calyx 7–20 mm. long; leaves and shoots when young with indumentum as on inflorescence; leaves more or less acuminate at apex, membranous; fruiting carpels ellipsoid to ellipsoid-oblong, beaked [12. heterophylla](#)
- 25** Stipules large and persistent, 2.5–3.5 cm. long; flowers sessile; calyx campanulate, about 5–7 mm. long, tomentellous outside; leaves elongate-obovate or elliptic-lanceolate, abruptly acuminate at apex, up to 58 cm. long and 20 cm. broad, woolly-tomentose when young, glabrescent, petiole up to 36.5 cm. long [22. semecarpophylla](#)
- Stipules usually up to 1.5 cm. long, caducous (but in No. 23 up to 3 cm. long and more or less persistent); flowers distinctly pedicellate: **26**
- 26** Calyx 6–25 mm. long: **27**
- Calyx 2.5–5 (–6) mm. long; carpels 3–5: **31**
- 27** Calyx glabrous outside, 16–25 mm. long, with very short tube; anthers 9–10; carpels 8, glabrous except for microscopic papillae; ovules 6–7 per carpel; styles bifid at apex; flowers borne on cushions along whole of trunk; pedicels up to 14 mm. long, jointed 2.5–5 mm. above base, glabrous; leaves crowded at ends of shoots, with stipules up to 3 cm. long and more or less persistent; lamina oblanceolate-elliptic, up to 35 cm. long and 14 cm. broad, often smaller; fruiting carpels subglobose, stipitate [23. glabra](#)
- Calyx more or less puberulous to tomentose outside, 6–17 mm. long; carpels (3–) 4–5, tomentellous to tomentose; pedicels hairy: **28**
- Petioles up to 1 cm. long, rarely a few up to 2.8 cm.: **30**
- 29** Stipules lanceolate, caducous; upper pulvinus of petiole glabrous, or with a few minute simple hairs on upper side; calyx 9–10 mm. long, stellate-puberulous outside; leaves elliptic or elongate-elliptic, up to 27 cm. long and 12.5 cm. broad [24. nigerica](#)
- Stipules subulate, up to 7 (–14) mm. long, persistent; upper pulvinus of petiole densely and shortly puberulous all round; calyx 6–17 mm. long, coarsely brown-pubescent outside; leaves elliptic or oblanceolate-elliptic, up to 30 cm. long and 10 cm. broad [25. flavo-velutina](#)
- 30** Outside of calyx with sparse stellate hairs; calyx about 10 mm. long, with tube about 5 mm. long; androphore and

base of calyx inside glabrous except for minute papillae on latter; carpels whitish-pubescent; leaves oblong-elliptic to oblong-oblancheolate or lanceolate, up to 14 (–20) cm. long and 5 (–8) cm. broad; fruiting carpels boat-shaped, 3.5–4 cm. long, subsessile, with short deflexed beak about 5 mm. long [26. reticulata](#)

28...... Petioles 2.5–8 cm. long, but sometimes shorter near the apices of shoots: **29**

Outside of calyx densely tomentellous; calyx about 6–8 mm. long, with tube about 1–2 mm. long; androphore and base of calyx inside pubescent; carpels rusty-pubescent; leaves oblanceolate to elliptic-oblancheolate or obovate, up to 20 cm. long and 5 cm. broad, coriaceous [27. angustifolia](#)

31 Acumen of leaves long, enlarged towards the blunt apex; lamina ovate-elliptic or elliptic, up to 11.5 cm. long and 4.5 cm. broad; petiole up to 8 mm. long, puberulous; flowers solitary or paired in leaf-axils on slender puberulous pedicels about 8–10 mm. long; calyx densely puberulous outside [28. philipi-jonesii](#)

Acumen of leaves not enlarged towards the apex:..... **32**

32 Petioles up to 1.2 cm. long, rarely longer; lamina oblanceolate or obovate, long-attenuate to a usually narrow obtuse base; leaves aggregated near ends of shoots, mostly 10–22 (–30) cm. long and 3–9 (–10) cm. broad; flowers fascicled on leafy twigs and all down stems, on slender sparsely puberulous pedicels up to 16 mm. long; calyx sparsely puberulous or subglabrous outside; fruiting carpels 5, up to 6 cm. long and 4.5 cm. broad, narrowed to base, shortly beaked [29. cauliflora](#)

Petioles (1.2–) 2–9 cm. long; lamina not long-attenuate at base; leaves not conspicuously aggregated near ends of shoots: **33**

33 Calyx glabrous or almost so except on lobe-margins and for microscopic papillae inside; carpels glabrous; fruiting carpels obliquely subglobose to obovoid, 1.5–3 cm. long, 1.4–2.2 cm. broad, usually with 2 seeds in each; flowers numerous in dense fascicles among and just below leaves; pedicels 4–13 mm. long, glabrous; leaves oblanceolate to elliptic, up to about 15 cm. long and 6.5 cm. broad [30. boxiana](#)

Calyx densely puberulous to pubescent outside; carpels pubescent: **34**

34 Leaves narrowed to a rounded or obtuse base, lanceolate to slightly oblanceolate, gradually very long-acuminate, 15–40 cm. long, 4–12 cm. broad; flower-fascicles among leaves and below; pedicels slender, up to about 13 mm. long; ovules 4–6 per carpel [31. praeacuta](#)

Leaves narrowed to an acute base, more shortly and abruptly acuminate, acumen to 1.5 cm. long; flowers on old wood:..... **35**

35 Acumen of leaves tapering to a very narrow (0.75–1 mm.) apex; pedicels short, about 3–6 mm. long; ovules 2 per carpel; leaves oblanceolate to obovate, 8–22 cm. long, 3.2–10 cm. broad [32. bodardii](#)

Acumen of leaves 2–3 mm. broad near apex; pedicels about 2 cm. long; ovules 1 per carpel; leaves broadly oblanceolate, 12–26 cm. long, 5–10 cm. broad; fruiting carpels subglobose, apiculate, stipitate, about 1.5 cm. long, glabrous. [33. attiensis](#)

36 Leaves elliptic to oblong-lanceolate or obovate, rarely ovate-elliptic, cuneate or rounded at base, never lobed, more or less clearly 3-nerved at base: **37**

Leaves ovate to suborbicular, mostly truncate to cordate at base: **41**

37 Leaves not verticillate at nodes, though sometimes appearing in a false verticil terminating the shoot but with alternate leaves below; flowers and bracts (except in No. 36) non-verticillate; cotyledons 2 or more: **38**

Leaves verticillate but sometimes a few not clearly whorled; flowers and bracts tending to be verticillate; inflorescence very densely tomentellous, up to 7 cm. long, with short pedicels, densely flowered; calyx-lobes densely tomentellous within as well as without; cotyledons 3–6 (rarely 2):..... **40**

38 Flowers and bracts non-verticillate; inflorescence puberulous, sometimes densely so, not conspicuously elongated, up to 9 cm. long; flowers up to 2 (–3) cm. long: **39**

Flowers and bracts irregularly verticillate; inflorescence very densely shortly tomentose all over (brown when dry), often conspicuously elongated (sometimes growing into leafy shoots) up to 17 cm. long, with long bare axes bearing 2–3 pairs of long-pedunculate lateral cymules, the latter small and dense with short pedicels; calyx not more than 1 cm. long, apparently not opening widely; leaves oblong-elliptic, up to 26 cm. long and about 9 cm. broad, with acumen which is often abrupt and usually rather long; fruiting carpels with surface as in No. 35 and without tubercles; seeds (in only carpel opened) 4, each with 2 cotyledons [36. simiarum](#)

39 Fruiting carpels green and shiny, surface smooth to touch, but knobbly with large tubercles, up to about 13 cm. long and 7 cm. broad, upper suture forming a conspicuous ridge produced into a short deflexed beak; seeds 4–8 (–10) per carpel, each seed with 2 cotyledons; leaves broadly oblong to broadly elliptic, sometimes elliptic-oblancheolate, abruptly and shortly acuminate at apex, up to 33 cm. long and 13 cm. broad, usually smaller, often discoloured on lower surface when dry; indumentum on inflorescence often dense [34. nitida](#)

Fruiting carpels russet-brown or olivaceous, surface rough to touch owing to a minute indumentum, but not knobbly, up to 20 cm. long by 6 cm. broad, narrowed to apex, upper suture not conspicuously ridged, apex not deflexed; seeds up to 14 per carpel, each seed with 3–4 (rarely 2 or 5–6) cotyledons; leaves oblanceolate to narrowly oblong or elliptic, sometimes narrowly obovate, gradually long-acuminate at apex, the acumen often twisted downwards, up to 22 cm. long and 8 cm. broad; indumentum on inflorescence often comparatively sparse and fine [35. acuminata](#)

- 40** Leaves usually in whorls of 4; fruiting carpels similar to No. 35, up to 20 cm. long and 9 cm. broad; seeds about 6–8 per carpel, each with thick testa and (2–) 3–4 cotyledons; leaves elliptic-lanceolate or obovate, shortly and rather abruptly narrowly acuminate, 11–25 cm. long, 3·5–9 cm. broad [37. *verticillata*](#)
- Leaves usually in whorls of 3; fruiting carpels green, surface with close rounded knobs and ridges and with a more or less straight beak at apex, keeled on upper suture, up to 12 cm. long; seeds (in only carpel opened) 2 per carpel, each with (3–) 4–5 (–6) cotyledons; leaves elliptic to obovate-elliptic, rarely ovate-elliptic, up to 17 cm. long and 7·5 cm. broad, with a usually short acumen, lamina usually less elongate than in No. 37, with close lateral nerves and prominent venation [38. *anomala*](#)
- 41** Leaves golden beneath with dense scales, rigidly coriaceous, obtuse to subcordate at base, obtuse to rounded at apex, sometimes apiculate, 7·5–40 cm. long, 5–30 cm. broad, lateral nerves (including basal) 4–5; panicles axillary, golden-scaly, sparingly branched near the base with spiciform branches much shorter than the leaves, or appearing unbranched; flowers sessile or subsessile, up to 5 mm. long; fruiting carpels 4–5, sessile, 3–7 cm. long, 2–4 cm. broad, very shortly and abruptly beaked and when dry with interrupted longitudinal ridges .. [39. *hypochrysea*](#)
- Leaves glabrous or puberulous to shortly tomentose with stellate hairs beneath, not scaly, lamina truncate to cordate at base; panicles not scaly, well branched throughout: **42**
- 42** Inflorescence-axes and outside of calyx puberulous, the surface usually visible between the small stellate hairs; calyx thin; leaves sparingly puberulous beneath when young, nearly glabrous when mature; fruiting carpels glabrous, ellipsoid to suborbicular, knobby or smooth outside, 5–10 cm. long: **43**
- Inflorescence-axes and outside of calyx densely puberulous to shortly tomentose all over; calyx thick; leaves sparingly puberulous to shortly tomentose beneath; fruiting carpels glabrous or tomentose: **44**
- 43** Pedicels well-developed, about 4·5–15 mm. long, each breaking at the joint, leaving the 1·5–11 mm. long slender basal portion, the latter dilated at apex; leaves acute to shortly acuminate at apex, 8–35 cm. long, 5·5–30 cm. broad [40. *lateritia* var. *lateritia*](#)
- Pedicels mostly 0·5–2 mm. long, rarely some (especially towards base of inflorescence) up to 6·5 mm., each breaking at the joint leaving the basal portion up to about 1·5 mm. long (rarely up to 5 mm.); leaves shortly acuminate at apex, 9–45 cm. long, 8–40 cm. broad [40a. *lateritia* var. *maclaudi*](#)
- 44** Leaves sparingly and minutely puberulous beneath when young, nearly glabrous when mature, the surface not grey; leaves 7–45 (–68) cm. long, 7–44 cm. broad; inflorescence shortly brown-tomentose; fruiting carpels tomentose outside, up to 15 cm. long [41a. *gigantea* var. *glabrescens*](#)
- Leaves densely tomentellous or shortly tomentose beneath when young, the surface completely covered, grey to brownish-grey: **45**
- 45** Young branchlets, petioles, inflorescence-axes and outside of calyx densely and shortly brown-tomentose; leaves densely and shortly tomentose beneath, even when mature, lamina 13–37 cm. long, 10·5–30 cm. broad; fruiting carpels densely brown-tomentose outside, scarcely beaked, up to 9 cm. long [41. *gigantea* var. *gigantea*](#)
- Young branchlets, petioles, inflorescence-axes and outside of calyx densely and very shortly grey-tomentellous; leaves densely and very shortly tomentellous beneath when young, surface becoming clearly visible between the hairs when mature, lamina often shallowly 3-lobed, rounded to subacute at apex, 8–35 cm. long, 8–30 cm. broad; fruiting carpels glabrous, crescent-shaped, 11·5–15 cm. long, tapered into a long, recurved beak at apex [42. *cordifolia*](#)

1. *Cola lepidota* K. Schum. in Engl. Monogr. Afr. Sterculiac. 121, t. 13 (1900); Pellegr. in Mém. Soc. Bot. Fr. 1950–51: 41. *APD acc*

Forest tree, to 60 ft. high, cauliflorous; flowers brownish-red and scaly outside, red-purple within; fruiting carpels about 20 cm. long and 5 cm. broad, subcylindric, shortly acuminate, roughly scaly; seeds smooth, brownish.

29. **Cola cauliflora** *Mast.* in F.T.A. 1: 221 (1868), partly; K. Schum. Monogr. 117. *APD acc*

Sterculia cauliflora (*Mast.*) *Roberty* (1953).

Cola micrantha *K. Schum.* (1899) — l.c. 116, t. 14 D.

Straggling shrub or small tree, 4–15 ft. high; flowers pinkish, with orange tinge; **in forest**.

S. Nig.: Oban Talbot 188! **Br. Cam.:** Ambas Bay (Feb.) Mann 772! S. Bakundu F.R. (Mar.) Onochie in Hb. Brenan 9304! Johann-Albrechtshöhe (Feb.) Staudt 602!

Also in **French Cameroons** and **Gabon**.

30. **Cola boxiana** *Brenan & Keay* l.c. t. 3529 (1955). *APD acc*

Understorey forest tree, up to 50 ft. high and 5 ft. girth; flowers creamy yellow, profuse; fruiting carpels bright red.

G. C.: Atewa Range, E. Prov. (Feb.) Vigne FH 4331! 4825! Akrom Ravine, near Begoro, E. Prov. (fl. & fr. Oct.) Box 3495!

31. **Cola praeacuta** *Brenan & Keay* l.c. t. 3535 (1955). *APD acc*

Shrub in **forest**.

Br. Cam.: Musongiseli, Kumba Dist. (Feb.) Smith 78/36!

32. *Cola bodardii* Pellegr. in Bull. Soc. Bot. Fr. 97: 189 (1950).

APD: *Synonym of Cola attiensis* var. *bodardii* (Pellegr.) N. Hallé

Small tree, about 15 ft. high and 8 in. girth; “flowers pale translucent cream”; in forest.

S. Nig.: near Ibeku-Ayetoro crossing of Owena R., Shasha F.R. (Feb.) Jones & Onochie FHI 16718!

Also in **Gabon**.

[The Nigerian specimen has thinner, less glossy leaves than the type.]

33. *Cola attiensis* Aubrév. & Pellegr. in Bull. Soc. Bot. Fr. 92: 255 (1946); Aubrév. Fl. For. C. Iv. 2: 244, t. 221, 4–6 (1936), French descr. only. *APD acc*

Shrub or small tree.

[Pellegrin in a letter dated 16 July 1945 describes in detail the indumentum of the leaves of Adanson 214 which evidently agrees closely with more recent material from the same area.]

1. **C. winkleri** Engl. & K. Krause in Engl. Bot. Jahrb. 45: 333 (1911).

Flowers not described; type presumably destroyed; possibly near *C. flaviflora* Engl. & K. Krause.

Br. Cam.: Johann-Albrechtshöhe (fr. Dec.) Winkler 1045.

Imperfectly known species.

2. **Cola triloba** (R.Br.) K. Schum. in Engl. Monogr. Afr. Sterculiac. 119 (1900).

Courtenia triloba R.Br. in Benn. Pl. Jav. Rar. 236 (1844).

Cola heterophylla of F.T.A. 1: 223, partly (Heudelot spec.); ?Aubrév. Fl. For. C. Iv. 2: 250, t. 221, 1–3.

Tree, to 30 ft. high; previously regarded as conspecific with *C. heterophylla* (P. Beauv.) Schott & Endl., but differs in the dense rusty pubescence on young shoots and apparently in the calyx being densely rusty-pubescent outside; the leaves are mostly shallowly to deeply 3-lobed. Trilobed forms of *heterophylla* are not known from French Guinea and Sierra Leone.

Fr. G.: Heudelot 720! **S. L.:** Gberia Fotombu (old fr. Oct.) Small 405! **Iv. C.:** Abidjan Aubrév. 163!

Imperfectly known species.

3. Cola sp. A.

Near *C. anomala* K. Schum., but leaves not verticillate.

S. Nig.: Rosevear 14/30! **Br. Cam.:** Ossidinge (Oct.) Rudatis 78!

Imperfectly known species.

4. Cola sp. B.

Shrub; leaves obovate, about 21–24 cm. long and 10·5–11·5 cm. broad, shortly lobed near apex or entire, glabrous, coriaceous; petioles 8·5–10 cm. long; fruiting carpels 12, red, shortly stipitate, 4·3 cm. long, 2·5 cm. broad, shortly more or less stellate-pubescent, 6-seeded.

Lib.: Ganta (fr. Feb.) Harley 852!

Imperfectly known species.

5. Cola sp. C.

Shrub or tree, to 15 ft., with red fruit; **on flooded ground; leaves narrowly obovate up to 15 cm.** long and 5·5 cm. broad; fruiting carpels probably about 6, with stipe 1·25–1·5 cm. long, shortly and broadly ellipsoid, shortly beaked, about 3·5 cm. long and 2·5 cm. broad, more or less rusty stellate-tomentellous.

Lib.: Piatah (fr. Dec.) Baldwin 10597a!

Imperfectly known species.

6. Cola sp. D.

Forest tree; “flowers growing from cushions on the old wood, purple”; leaves digitate, leaflets oblanceolate, sessile, long-acuminate, entire, up to 30 cm. long and 7 cm. broad.

Br. Cam.: Mopanya, Cam. Mt., 2,400 ft. (Apr.) Maitland 1069!

Imperfectly known species.

7. Cola sp. E.

Forest tree, to 60 ft. high and 3 ft. girth; fruits borne on stem; leaves digitate, leaflets oblanceolate, more or less petiolulate, acuminate, up to 27 cm. long and 8 cm. broad, coriaceous, with scurfy stellate-puberulence beneath, especially on midrib, stipules subulate, up to 7 cm. long; fruiting carpels, tomentellous.

Br. Cam.: Korup F.R., Kumba Dist. (fr. July) Olorunfemi FHI 30672!

Imperfectly known species.

8. Cola sp. F.

Small **forest** tree, 12–15 ft. high; fruits borne on stem near base; leaves digitate; leaflets oblanceolate, acuminate, shortly petiolulate, up to 30 cm. long and 9·5 cm. broad; fruiting carpels 7–9, with stipe about 1·5 cm. long, up to about 15 cm. long and 4·5 cm. broad, bright orange-red.

S. L.: Smythe 53! Gola Forest (fr. May) Small 602! **Lib.:** Jaurazon, Sinoe (young fr. Mar.) Baldwin 11476!

Imperfectly known species.

9. Cola sp. G.

Cola heterophylla of F.W.T.A., ed. 1, 1: 255, partly.

Stems, petioles and midrib of leaves above hirsute with rather long spreading hairs; stipules filiform, up to 1 cm. long; petioles slender, to 6 cm. long; leaves thin, ovate-elliptic, very acutely acuminate, sometimes with 1 or 2 acute small marginal lobes; flowers in short cymes among the leaves, about 10–12 mm. long, 4-lobed, more or less densely stellate-pubescent outside, papillose inside.

S. Nig.: Degema Talbot 3741!

Imperfectly known species.

16. HILDEGARDIA

Schott & Endl. Meletem. Bot. 33 (1832); Kostermans in Bull. Jard. Bot. Brux. 24: 335 (1954).

- 1 Branchlets rather thick, glabrous; leaves very broadly ovate-cordate, shortly acuminate, 15–25 cm. long and broad, very thin, about 7-nerved at base, thinly pilose when quite young; petiole up to 25 cm. long; flowers in numerous slender panicles towards the ends of the branchlets; calyx long-tubular, narrower in the middle, 2 cm. long, minutely puberulous; lobes 5, lanceolate, acute, pubescent inside; stamens and carpels exserted; fruit broadly and obliquely inflated, submembranous, red, 7 cm. long, 3 cm. broad[barteri](#)

Hildegardia barteri (*Mast.*) *Kosterm.* l.c. 337 (1954). *APD acc*

Wassidimo, E. of Benu Chipp 210! Prestea (Oct.) Vigne 231!

The species also occurs in Gabon, as var. *densiflora* Pellegr. l.c.

BOMBACACEAE

Trees sometimes very large. Leaves simple or digitate, alternate, often lepidote; stipules deciduous. Flowers hermaphrodite, large and showy. Calyx closed and valvate in bud, often with an epicalyx. Petals often elongated, sometimes absent. Stamens numerous free or united into a tube; anthers reniform to linear, 1-celled; pollen smooth. Ovary superior, 2–5-celled; style simple, capitate or lobed; ovules 2 or more on the inner angle of each cell. Capsule loculicidally dehiscent or not dehiscent, the valves rarely falling away. Seeds often embedded in hairs from the wall of the fruit, with little or no endosperm and flat or contorted or plicate cotyledons.

Confined to the tropics.

Arboreal relatives of the Malvaceae, with which they have much in common.

- 1 Calyx deeply 5-lobed, 5.5–8.5 cm. long; fruit indehiscent, not woolly inside; flowers large, solitary, pendulous on pedicels up to 25 cm. long; stamens very numerous [1. *Adansonia*](#)
- Calyx truncate to slightly 5-lobed, up to about 3 cm. long; fruit filled with softly woolly floss inside; pedicels up to about 3 cm. long: [2](#)
- 2 Stamens numerous; flowers 4–9 cm. long, solitary [2. *Bombax*](#)
- Stamens 5–15, in 5 bundles of 1–3; flowers generally 3 cm. long or less, in fascicles [3. *Ceiba*](#)

Ochroma lagopus Sw.

O. pyramidale (Cav.) Urb.

The Balsa wood tree, a native of central America has been introduced into our area; for note on nomenclature see Little in Caribbean Forester 5: 108–114 (1944).

1. ADANSONIA

Linn. — F.T.A. 1: 212. *APD acc*

- 1 A large tree (see frontispiece in Vol. I, Part 1); leaves digitately 5-foliolate, long-petiolate; leaflets obovate, acutely acuminate, subsessile, up to about 12 cm. long and 5 cm. broad, entire or denticulate, stellate-pubescent or nearly glabrous beneath; flowers large, pendulous on long stalks; calyx deeply 5-lobed, very hirsute-tomentose on both sides; petals setose outside, adnate to the base of the staminal column; stamens very numerous; fruits oblong-ellipsoid to globose [digitata](#)

Adansonia digitata Linn. — F.T.A. 1: 212; Chev. Bot. 73; Bakhuizen in Bull. Jard. Bot. Buitenz., sér. 3, 167; Aubrév. Fl. For. Soud.-Guin. 165, t. 30, 1–4. *APD acc*

Adansonia sphaerocarpa A. Chev. (1901).

Stem comparatively short and stout, 40–60 ft. high, 30–40 or more feet in girth, with short thick branches; bark unarmed, often purplish; fruit 6–9 in. long, pendulous on long stalks, yellowish-felted outside; seeds embedded in a dry acid pulp; often planted near villages, mainly in the drier regions.

Widespread in the drier regions of Africa.

2. BOMBAX

Linn. — F.T.A. 1: 213.

Salmalia Schott & Endl. (1832).

Rhodognaphalon (Ulbr.) Roberty (1953).

- 1 Petals red, orange or pink (rarely yellow), oblong; calyx silky-pilose within, separating from the receptacle and

falling with the petals and stamens, broadly cup-shaped; stamens grouped in 5 bundles; floss white or greyish: **2**

Petals white, lanceolate, 4·8–5·2 cm. long, about 1 cm. broad; calyx glabrous within, remaining attached to the receptacle after the fall of the petals and stamens, campanulate; stamens not grouped in bundles; fruits obovoid, 5–8 cm. long, 3–4 cm. broad, with brownish floss; leaflets broadly obovate, rounded or shortly acuminate at apex, with up to 10 pairs of main lateral nerves; tree of forest regions. **3. brevicuspe**

- 2** Young leaves and shoots glabrous; leaflets with about 15–25 main lateral nerves on each side of the midrib; flowers 6·5–9 cm. long; fruits cylindrical, 10–18 (–25) cm. long, 4·3–6 (–8) cm. broad, with valves more or less flat when mature, fruit thus angular in section; tree of forest regions **1. buonopozense**

Young leaves and shoots densely stellate-pubescent, but soon glabrescent; leaflets with about 8–10 main lateral nerves on each side of the midrib; flowers 4–7 cm. long; fruits cylindrical to subglobose, 6–16 cm. long, 4–6 cm. broad, with convex valves; tree of savannah regions **2. costatum**

- 1. Bombax buonopozense P. Beauv.** Fl. Oware 2: 42, t. 83, 1 (1816); Aubrév. Fl. For. Soud.-Guin. 170; F.W.T.A., ed. 1, 1: 258, in part only. **APD acc**

Probably of ancient introduction in Africa; distributed throughout the tropics; the genus is native in tropical America.

MALVACEAE

Herbs often with fibrous stems or rarely shrubs; hairs usually stellate or lepidote. Leaves alternate, often palmately nerved or divided; stipules present. Flowers actinomorphic, hermaphrodite or rarely unisexual. Sepals valvate, with or without an epicalyx of bracteoles. Petals 5, free from each other but often adnate at the base to the staminal column, contorted or imbricate. Stamens numerous, monadelphous; anthers 1-celled. Ovary syncarpous, rarely of 1 carpel, rarely the carpels in vertical rows; style one. Ovules on axile placentas. Fruit a capsule or breaking into separate compartments. Seeds usually with some endosperm and straight or curved embryo, the cotyledons often folded.

A large cosmopolitan family.

Generally recognised by the usually stellate indumentum, showy flowers with valvate calyx, monadelphous stamens and 1-celled anthers.

- 1 Epicalyx absent: **2**
 Epicalyx present: **5**
 2 Carpels transversely divided, contracted in the middle, the upper half spreading stellately in fruit, 2-seeded, the lower seed tomentose; leaves entire, cordate; flowers small in panicles [1. Wissadula](#)

- Carpels not transversely divided:3
- 3 Staminal column provided with anthers up to the top or nearly so:4
- Staminal column destitute of anthers at the top; some of the leaves trifoliate [10. Hibiscus](#)
- 4 Carpels 10 or more, with more than 1 ovule in each cell; leaves always cordate [2. Abutilon](#)
- Carpels up to 10, with 1 ovule in each cell; leaves usually not cordate [3. Sida](#)
- 5 Styles twice as many as the carpels; staminal column destitute of anthers at the apex:6
- Styles the same number as the carpels or style more or less undivided:8
- 6 Flowers not in heads or at any rate not surrounded by an involucre:7
- Flowers in heads surrounded by an involucre of bracts [6. Malachra](#)
- 7 Bracteoles of epicalyx connate at the base and adnate to the calyx; carpels with hooked spines [4. Urena](#)
- Bracteoles of epicalyx free to the base or nearly so; carpels without hooked spines, but sometimes with barbate bristles [5. Pavonia](#)
- 8 Style undivided or nearly so:9
- Style divided into separate stigmas:11
- 9 Calyx truncate:10
- Calyx 5-lobed; seeds cottony-hairy; dwarf shrublet with glandular leaves [9. Cienfuegosia](#)
- 10 Leaves with minute scales, otherwise glabrous; epicalyx of 3–5 bracteoles; fruit indehiscent; seeds pubescent [7. Thespesia](#)
- Leaves with abundant stellate hairs; epicalyx of (5–) 9–15 bracteoles; fruit dehiscent; seeds glabrescent [8. Azanza](#)
- 11 Epicalyx of 5 or more free or partially connate usually narrow bracteoles; ovules 3 or more in each cell; carpels 5, dehiscent, not separating from the axis; seeds various [10. Hibiscus](#)
- Epicalyx of 3 broad foliaceous more or less cordate usually deeply toothed or lacinate bracteoles; calyx truncate or nearly so; carpels usually 5, with numerous ovules, dehiscent; seeds covered with long cottony hairs [11. Gossypium](#)
- Epicalyx of 7–10 small or obsolete linear bracteoles; ovary 5-celled with 1 ovule in each cell; fruits depressed, prominently 5-angled; carpels dehiscent [12. Kosteletzkya](#)
- Epicalyx of 1–3 narrow free bracteoles; carpels 8–12, 1-ovulate, subindehiscent, separating from the central axis [13. Malvastrum](#)

1. WISSADULA

Medic. — F.T.A. 1: 182.

- 1 An undershrub with slender branches, the latter puberulous with very short hairs and often also pubescent with stellate hairs; leaves ovate, cordate, acutely acuminate, 5–10 cm. long, 4–8 cm. broad, entire, minutely puberulous above, densely stellate-tomentellous beneath; flowers small in terminal panicles; epicalyx none; calyx 5-lobed to about the middle; fruiting carpels 5, about 1 cm. long, abruptly spreading in the upper half, with rather long sharp beaks, minutely puberulous, constricted in the middle, the upper seed puberulous, the lower tomentose [amplissima var. rostrata](#)

Wissadula amplissima (Linn.) R. E. Fries in Kungl. Sv. Vet. Akad. Handl. 43, 4: 48 (1908). *APD acc*

Sida amplissima Linn. (1753).

Wissadula amplissima var. rostrata (Schum. & Thonn.) R. E. Fries l.c. 51, t. 6, 13–14 (1908); Exell Cat. S. Tomé 116 (q.v. for synonymy).

APD: Synonym of Wissadula rostrata (Schumach.) Hook. f.

Sida rostrata Schum. & Thonn. (1827).

Wissadula rostrata (Schum.) Hook. f. — F.T.A. 1: 182.

Wissadula hernandioides of Chev. Bot. 59.

Wissadula periplocifolia of Chev. Bot. 59.

Erect, 3–7 ft.; leaves hoary beneath; flowers yellow or orange to reddish; **in savannah and cleared ground.**

Throughout tropical Africa including Cape Verde Islands and S. Tomé; var. *amplissima* is found in tropical America.

2. ABUTILON

Mill. — *F.T.A.* 1: 183. *APD acc*

- 1 Carpels numerous, 20 or more:2
Carpels about 10:6
- 2 Pedicels and branchlets eglandular, usually densely tomentellous or tomentose, with or without long weak hairs:3
Pedicels and branchlets with gland-tipped hairs as well as longer spreading eglandular hairs; carpels acute or shortly acuminate at apex; flowers solitary; calyx-lobes acuminate; leaves ovate-rounded, cordate at base, acute to acuminate at apex, 5–15 cm. long, 4–11 cm. broad, doubly dentate, shortly stellate-tomentellous beneath, puberulous above [5. *hirtum*](#)
- 3 Carpels rounded at apex:4
Carpels acute or acuminate; flowers solitary; pedicels long; especially in fruit, jointed near the top; calyx-lobes acuminate; leaves broadly ovate, stellate-tomentellous beneath, less so above:5
- 4 Branches terete or subterete, softly tomentellous; leaves ovate-rounded, cordate at base, triangular-acute at apex, 3–7 cm. diam., doubly dentate, softly tomentellous on both sides; flowers usually paired, shortly pedicellate; calyx-lobes acuminate, tomentose [1. *pannosum*](#)
Branches angular, tomentellous, leaves broadly ovate, acuminate, widely cordate, 5–12 cm. long, up to 10 cm. broad, slightly crenulate, minutely tomentellous; flowers in leafy panicles; calyx-lobes acute, tomentellous [2. *angulatum*](#)
- 5 Leaves not acuminate, crenate, 3–7 cm. long; carpels abruptly acute, remaining more or less erect and villous [3. *guineense*](#)
Leaves conspicuously acuminate, slightly dentate, 4–12 cm. long; carpels gradually acuminate, spreading stellately in fruit, at first densely pilose, at length nearly glabrous and blackish [4. *mauritanum*](#)
- 6 Stems densely pilose with long rather weak, more or less reflexed hairs; calyx-lobes broadly ovate, as long as the carpels; carpels 10, acute, villous, 3–5-seeded; petioles becoming reflexed; leaves broadly ovate, cordate, gradually acute, up to 10 cm. long and 8 cm. broad, crenate, slightly stellate-pubescent above, more densely so beneath; flowers solitary or paired on each peduncle [6. *grandifolium*](#)
Stems at most shortly stellate-tomentose, rarely with a few longer, very weak ascending hairs:7
- 7 Leaves acuminate; indumentum lax and soft:8
Leaves not acuminate, cordate at base; indumentum very short and tomentellous; stipules linear, caducous; pedicels jointed near the apex:9
- 8 Stipules ovate to broadly lanceolate, subcordate at base, 1–2 cm. long, up to 1.3 cm. broad; leaves ovate-rounded, denticulate, rather widely cordate, 5–12 cm. long, with long spreading hairs on the nerves beneath; flowers in terminal panicles; pedicels jointed about the middle; carpels acute [7. *auritum*](#)
Stipules filiform, 1 cm. long, ciliate; leaves rounded-ovate, slightly trilobate, up to 12 cm. broad, coarsely crenate, pilose on the nerves; flowers in axillary and terminal cymes; pedicels jointed near the apex; carpels with long subulate points [8. *ramosum*](#)
- 9 Leaves ovate, subentire or denticulate, 2.5–7 cm. long, 2–5 cm. broad; flowers solitary or paired; carpels densely tomentose, acute [9. *fruticosum*](#)
Leaves subreniform, shortly 3–5-lobulate, about 2.5 cm. broad; flowers axillary and terminal, 1–3 together; carpels with subulate points [10. *macropodium*](#)

1. *Abutilon pannosum* (Forst. f.) Schlechtend. in Bot. Zeit. 9: 828 (1851). *APD acc*

Sida pannosa Forst. f. (1787).

Sida grandifolia Willd. (1809).

Abutilon tortuosum Guill. & Perr. (1831); Chev. Bot. 60.

Abutilon graveolens of F.T.A. 1: 184.

A tall perennial, 3–6 ft. high, with more or less zigzag hairy branches; flowers yellow to orange.

Sen.: Roger! St. Louis Chev. Walo, Richard Tol, etc. (Sept., Oct.) Perrottet 75! **Fr. Sud.:** Macina (Sept.) Chev. 24828.

A native of S. America, introduced into parts of Africa and India, and Madeira.

7. *Abutilon auritum* (Wall. ex Link) Sweet l.c. (1826); Bot. Mag. t. 2495; F.T.A. 1: 187. *APD acc*

Sida aurita Wall. ex Link (1822).

A tall perennial covered with down and spreading hairs; leaves on long hispid petioles, with conspicuous ear-like stipules; seeds with scattered groups of short stellate hairs; flowers orange-red.

S. L.: Wellington (fl. & fr. Mar.) Kirk 4! Leicester (fl. & fr. Dec.) Sc. Elliot 3892! Deighton 3354! Murray Town (fl. & fr. Apr.) Deighton 5761!

Probably native in the East Indies, introduced into various parts of the world.

8. *Abutilon ramosum* (Cav.) Guill. & Perr. — F.T.A. 1: 186. *APD acc*

Sida ramosa Cav. (1785).

An erect branching perennial, somewhat glandular-tomentose and with spreading hairs; leaves long-stalked; flowers yellow or whitish; carpels 2–3-seeded.

Sen.: Heudelot 303! Walo (Nov.) Perrottet 77! 78! Richard Tol (Dec.) Roger 137! **N. Nig.:** Katagum (Sept.) Dalz. 71!

Widespread in the drier parts of tropical Africa.

9. *Abutilon fruticosum* Guill. & Perr. Fl. Seneg. 1: 70 (1831); F.T.A. 1: 187; Chev. Bot. 59. *APD acc*

A hoary, much-branched, woody perennial, 3–6 ft. high, with comparatively small leaves; flowers yellow; carpels 2–3-seeded.

Sen.: Roger! Saffal Isl., R. Senegal, near St. Louis (Sept., Oct.) Perrottet 80!

Widespread in the drier parts of Africa, extending to **Arabia** and N.W. India.

10. *Abutilon macropodium* Guill. & Perr. l.c. 69, t. 14 (1831); F.T.A. 1: 185. *APD acc*

Low, much-branched, suffrutescent, downy on the younger parts; flowers yellow; seeds large, 3 in each carpel.

Sen.: Walo, Richard Tol, etc. (Sept.–Oct.) Perrottet!

3. SIDA

Linn. — F.T.A. 1: 178.

- 1** Prostrate, with long slender branches, often rooting at the lower nodes; stems weakly pilose; stipules linear-filiform; leaves broadly ovate, widely cordate, acuminate, 2–5 cm. long, up to 4 cm. broad, doubly crenate, sparingly pubescent; petiole nearly as long as the lamina; flowers solitary or paired; pedicels filiform [1. *veronicifolia*](#)
More or less erect herbs or small shrubs, rarely procumbent, but then stems woody; not rooting at the nodes: ...**2**
- 2** Leaves linear or linear-lanceolate, entire; flowers in lax terminal cymes; leaf-lamina up to 12 cm. long and 1.5 cm. broad, loosely pilose; petiole short; stipules linear; pedicels jointed above the middle; carpels 5 or 6, scarcely beaked [2. *linifolia*](#)
Leaves lanceolate to broadly ovate or rounded, toothed or crenate; flowers mostly axillary:**3**
- 3** Leaves cordate at base, broadly ovate; flowers clustered or rarely subsolitary:**4**
Leaves rounded to acute at base; flowers mostly solitary or paired:**5**
- 4** Indumentum of long pilose loose hairs; leaves crenate-serrate, 3–7 cm. long, 2–4 cm. broad, pilose; petiole fairly long; stipules subulate; flowers clustered or rarely solitary, shortly pedicellate; carpels 5, scarcely beaked ...[3. *urens*](#)
Indumentum of short dense stellate hairs; leaves dentate, not acuminate, 3–7 cm. long, 3–5 cm. broad, softly tomentose; petiole stout, nearly as long as the lamina; stipules filiform, short; flowers solitary in the lower axils, more crowded above; carpels 10, with long sharp awns covered with reflexed hairs [4. *cordifolia*](#)
- 5** Carpels 5, each breaking at the base to release the seed, awned; flowers solitary to clustered; leaves oblong to rounded, 1.5–3 cm. long, 0.5–2 cm. broad, crenate, softly tomentellous beneath [5. *alba*](#)
Carpels 7–10, dehiscent along the dorsal side, or indehiscent:**6**
- 6** Carpels indehiscent, usually 7–8, rugose, more or less connivent; leaves ovate-elliptic, rounded at apex, 2.5–4.5 cm. long, 1.5–3 cm. broad, crenate, shortly tomentellous beneath [6. *ovata*](#)
Carpels dehiscent (often only gaping) along the dorsal side, usually 8–10, not connivent:.....**7**

- 7 Leaves finely stellate-tomentellous beneath, at least when young, the hairs covering the surface of the lamina: **8**
 Leaves pilose, pubescent, or more or less glabrescent beneath, with the surface of the lamina clearly visible
 beneath the hairs; carpels strongly rugose on sides as well as back: **10**
- 8 Sides of carpels rugose; leaves more or less obovate-elliptic or obovate; flowers often rather long-pedicellate and
 solitary [7a. *rhombifolia* var. *α*](#)
 Sides of carpels smooth; leaves more or less elliptic; flowers usually shortly pedicellate, often clustered: **9**
- 9 Leaves with minute stellate hairs only on upper surface [7b. *rhombifolia* var. *β*](#)
 Leaves with long simple hairs on upper surface [7c. *rhombifolia* var. *γ*](#)
- 10 Flowers about 2.5–2.8 cm. diam. when open; stems often procumbent; leaves elliptic, up to about 3 cm. long and
 1 cm. broad, rarely more; carpels awned, pubescent towards the apex [8. *scabrida*](#)
 Flowers up to about 1.5 cm. diam. when open; stems erect: **11**
- 11 Carpels awned (sometimes only shortly so); stem and leaves with minute stellate hairs and rather sparse simple
 or fascicled hairs; leaves up to 7.5 cm. long and 2.5 cm. broad: **12**
 Carpels more or less beaked, but not awned; stem and leaves clothed, often densely, with long simple hairs;
 leaves rhombic-elliptic to ovate-lanceolate up to 14 cm. long and 5.8 cm. broad, rather coarsely serrate in the
 upper half [11. *corymbosa*](#)
- 12 Carpels longer than broad, gradually narrowed into the rather short awns, usually ochre-coloured; leaves more or
 less lanceolate, up to 6.5 (–7.5) cm. long and 1.2 (–2) cm. broad [9. *acuta*](#)
 Carpels as broad as long, D-shaped, rather abruptly awned, awns often long; carpels usually brown; leaves
 elliptic-ovate to elliptic-lanceolate, up to 7.5 cm. long and 2.5 cm. broad [10. *stipulata*](#)

1. *Sida veronicifolia* Lam. Encycl. 1: 5 (1783).

APD: *Synonym of Sida pilosa* Retz.

APD: *Synonym of Sida javensis* Cav.

Sida humilis Cav. (1788) — F.T.A. 1: 179; Chev. Bot. 59.

A straggling **wayside plant**, sometimes matting the sandy soil, with pale yellow flowers.

S. L.: Talla Hills (Feb.) Sc. Elliot 4857! Njala (Nov.) Deighton 1509! Musaia (Dec.) Deighton 5694! **Lib.:** Peahtah (Oct.) Bequaert 1058! Vonjama (Oct.) Baldwin 9863! **iv. C.:** Bingerville (Dec.) Chev. 16054. Bouroukrou (Dec.–Jan.) Chev. 16674. **G. C.:** Fumso (Mar.) Darko 531! Afram Plains (Dec.) Morton GC 6090! **S. Nig.:** Lagos Barter 2139! Millen 73! Ibadan (Dec.) Umana FHI 26750! Idanre (Jan.) Brenan 8719! **Br. Cam.:** Buea (Dec.) Maitland 905!

Distributed in the tropics generally.

2. *Sida linifolia* Juss. ex Cav. — F.T.A. 1: 179; Chev. Bot. 58. APD acc

A stiff, erect, more or less hairy weed, 1½–2 ft.; flowers white, sometimes pink, 1/2–3/4 in. across; petals red-purple at the base.

Sen.: Heudelot 492! **Gam.:** Hayes 581! **Fr. Sud.:** Tabacco (Jan.) Chev. 126. **Fr. G.:** Maclaud! **S. L.:** Barter! Freetown (Oct.) Deighton 247! Port Loko (Nov.) Thomas 6532! Makump (Jan.) Glanville 145! **Lib.:** Tawata, Boporo (Nov.) Baldwin 10312! Soplina, Kolahun (Nov.) Baldwin 10048! **iv. C.:** Dabou (Feb.) Chev. 17248. **G. C.:** Cape Coast (July) T. Vogel 19! Widespread in tropical Africa and America.

3. *Sida urens* Linn. — F.T.A. 1: 179; Chev. Bot. 59. APD acc

A hirsute perennial; branches sometimes lax and trailing; flowers whitish or pale yellow.

Sen.: Roger 142! Heudelot 553! **S. L.:** Heddle's Farm (Dec.) Sc. Elliot 3907! Kumrabai (Dec.–Jan.) Thomas 6901! Magbile (Dec.) Thomas 6222! Kenema (Nov.) Deighton 411! **G. C.:** Aburi (May) Hughes 812! Kumasi (Oct.) Darko 350! **N. Nig.:** Ilorin Prov. Clarke 13! **S. Nig.:** Ibadan (Jan.) Meikle 939! Aguku Dist. Thomas 737!

Widespread in the tropics and subtropics.

4. *Sida cordifolia* Linn. — F.T.A. 1: 181; Chev. Bot. 57. APD acc

An erect, softly downy perennial, up to 5 ft. high, with bright yellow flowers; **common in waste and sandy places.**

Sen.: Heudelot 490! **Fr. Sud.:** Bara (Sept.) Hagerup 370a! Ténétou (Mar.) Chev. 657! **Port. G.:** Barro to Sedengal (Nov.) Esp. Santo 3126! **Fr. G.:** Timbo (Feb.) Pobéguin 135! Whyte! Linder 1560! Peahtah (Oct.) Linder 951! Suacoco, Gbanga (Nov.) Daniel 35! **G. C.:** Abra (Oct.) Howes 994! Paliba (Dec.) Adams & Akpabla GC 4123! Tamale (Nov.) Williams 396! **Togo:** Lome Warnecke 237! **Dah.:** Cotonou (Mar.) Debeaux! **N. Nig.:** Nupe Barter! Kontagora (Nov.) Dalz. 129! Sokoto (Aug.) Dalz. 428! Panyam (July) Lely 437! **S. Nig.:** Lagos Millen 123! Ibadan (Dec.) Meikle 900! Awka (Oct.) Jones FHI 6788!

Widespread in the tropics and subtropics.

5. *Sida alba* Linn. Sp. Pl., ed. 2, 2: 960 (1763). *APD acc*

Sida spinosa of Linn. (1753), partly; F.T.A. 1: 180; Chev. Bot. 58.

A woody herb, with branches sometimes lax and trailing; flowers small, white.

Sen.: Roger! Dakar (May) Baldwin 5709! **Gam.:** Genieri (Feb.) Fox 42! **Fr. Sud.:** Bara, Amongo (Sept.) Hagerup 370! Sompi, and Mopti to Djenné, fide Chev. l.c. **S. L.:** Bonthe Isl. (Mar.) Deighton 2478! **G. C.:** Accra (Mar.) Deighton 565! **Togo:** Lome Warnecke 150! **N. Nig.:** Sokoto Lely 150! Fodama (Dec.) Moiser 251! Lemme (May) Lely 140! Biu (Aug.) Noble 13!

Widespread in the tropics.

6. *Sida ovata* Forsk. Fl. Aegypt.-Arab. 124 (1775). *APD acc*

Sida grewioides Guill. & Perr. (1831) — F.T.A. 1: 182; Chev. Bot. 57; F.W.T.A., ed. 1, 1: 263.

A rather hoary woody herb, 2 ft. or more high; flowers yellow.

Sen.: Roger 8! Heudelot 413! Walo (Sept., Oct.) Perrottet. **Fr. Sud.:** L. Télélé, Goundam (Aug.) Chev. 2748! Timbuktu (July) Hagerup 219! **iv. C.:** fide Chev. l.c. **N. Nig.:** Bindawa valley, Katsina (July) Grove 4! Katagum (Oct.) Dalz. 69! Karaswa, Bornu (June) Onochie FHI 23341!

In the drier parts of Africa, and extending to **Arabia** and India.

7. *Sida rhombifolia* Linn. Sp. Pl. 2: 684 (1753); F.T.A. 1: 181; Chev. Bot. 58. *APD acc*

A widespread perennial weed; requiring further taxonomical study throughout its range.

There appear to be three varieties in our area: —

7a. *Sida rhombifolia* var. *α*.

Flowers pale yellow.

Fr. G.: Heudelot 697 (partly)! Kouria (Oct.) Caille in Hb. Chev. 15029! **S. L.:** Rokupr (Jan.) Deighton 2959! Jordan 704! Bureh town (Dec.) Deighton 3289! Bumbuna (Oct.) Thomas 3712! **G. C.:** Akwadum (July) Deighton 5281! **Fr. Nig.:** Niamey (Oct.) Hagerup 504! **N. Nig.:** Sokoto (Nov.) Moiser 35! Katagum (Oct.) Dalz. 70! Nupe Barter 1718! **S. Nig.:** Ibadan (Apr., July, Dec.) Meikle 909! 1448!

Widespread in the tropics.

7b. *Sida rhombifolia* var. *β*.

Flowers pale yellow.

Fr. G.: Heudelot 697 (partly)! **S. L.:** Njala (Dec.) Deighton 1795! Baoma, Koya (Dec.) Deighton 3799! Musaia (Dec.) Deighton 5695! **Lib.:** Kakatown Whyte! **G. C.:** Benso (June) Andoh FH 5527! Kaasi, Kumasi (Feb.) Darko 524! **Togo:** Lome Warnecke 429! **N. Nig.:** Kontagora (Nov.) Dalz. 126! Lokoja Ansell! **S. Nig.:** Ibadan (Jan.) Meikle 938! Okomu F.R. (Feb.) Brenan 9164! Nun R. T. Vogel 26! Ikoma (Dec.) Rosevear 44/30a! **Br. Cam.:** Buea (Nov., Jan.) Maitland 118! 254! Bamenda (Feb., Apr.) Maitland 1729! Migeod 462! **F. Po.:** (Dec.) Guinea 289.

Widespread in tropical Africa and (?) in the tropics generally.

7c. *Sida rhombifolia* var. *γ*.

Possibly a montane form; flowers yellow or pinkish-yellow.

Br. Cam.: Cam. Mt., 4,400–6,000 ft. (Dec., Jan., Apr.) Maitland, 809! 1119! Dunlap 30! Bamenda 6,600 ft. (Jan.) Keay FHI 28411!

Also in **N.E. tropical Africa**.

8. **Sida scabrida** *Wight & Arn.* Prodr. Fl. Pen. Ind. Or. 1: 57 (1834).

APD: Synonym of Sida rhombifolia L.

Woody herb, to 18 in. high, or procumbent; flowers pale orange, larger than the other related species.

S. L.: Makunde, Limba (Apr.) Sc. Elliot 5714! Rokupr (Mar.) Jordan 426! **Lib.:** Monrovia (Nov.) Linder 1526! **S. Nig.:** Ibadan (Apr.) Meikle 1410!

Also in **India**.

9. **Sida acuta** *Burm. f.* Fl. Ind. 147 (1768). *APD acc*

Sida carpinifolia of F.W.T.A., ed. 1, 1: 263, partly, not of Linn. f.

Sida vogelii *Hook. f.* in Fl. Nigrit. 231.

A shrubby perennial, much-branched, to 3 ft. high; flowers pale yellow.

S. L.: Mano (Nov., Dec.) Deighton 5661! 5662! Bumpe (Nov.) Deighton 5874! **Lib.:** Sinoe Basin Whyte! **G. C.:** Accra Moloney! Kaasi, Kumasi (Feb.) Darko 519! **Togo:** Lome Warnecke 188! **N. Nig.:** Fodama (Dec.) Moiser 161! Aguji, Ilorin Thornton! Bauchi Plateau (Aug.) Lely P. 610! **S. Nig.:** Ibadan (Aug., Dec.) Golding 4! Meikle 882! 887! 892! Olokemeji (May) Foster 287! **F. Po.:** (Nov.) T. Vogel 214!

Widespread in the tropics.

10. **Sida stipulata** *Cav.* Diss. 1: 22, t. 3, 10 (1785).

APD: Synonym of Sida acuta Burm. f. subsp. acuta

Sida carpinifolia of F.W.T.A., ed. 1, 1: 263, partly, not of Linn. f.

Shrubby perennial, to 4 ft. high; flowers yellow.

S. L.: (June) T. Vogel 26! 83! Leicester Peak (Dec.) Sc. Elliot 3897! Kenema (Nov.) Deighton 418! Musaia (Apr.) Deighton 5463! **Lib.:** Cinco, Monrovia (Nov.) Linder 1546! Sinkor (June) Barker 1360! **G. C.:** Cape Coast (July) T. Vogel 13! Woase (June) Chipp 487! Asuansi (Feb.) Williams 282! Kumasi (Feb.) Andoh FH 4134! **Togo:** Amedzofe (Feb.) Irvine 180! **S. Nig.:** Idu, Sapoba (Nov.) A. F. Ross 220! Calabar (Apr.) Holland 114! **Br. Cam.:** Victoria (June) Maitland 49! **F. Po.:** (Dec.) Guinea 283.

Also in tropical America.

11. **Sida corymbosa** *R. E. Fries* in Bull. Herb. Boiss., sér. 2, 7: 998 (1907).

APD: Synonym of Sida collina Schlttdl.

A shrubby perennial, to 7 ft. high; flowers yellow, often apricot-coloured.

S. L.: Sumbuya (Nov.) Deighton 2272! Mattru (Nov.) Deighton 2350! Gegbwema, Tunkia (Oct.) Deighton 5202! Njala (Oct., Dec.) Deighton 5189! 5293! **Lib.:** Gbanga (Sept.) Linder 595! **S. Nig.:** Ibadan (Nov., Dec.) Meikle 880! 888! 897! Keay FHI 28297! Idanre (Jan.) Brenan 8708!

Also in **central America**.

Hybrids probably occur between several of the above species. Meikle has collected specimens from Ibadan, Nigeria, which appear to be hybrids between *S. acuta* and *S. corymbosa*. A specimen from Lagos (Foster 326) may be a hybrid between *S. stipulata* and *S. corymbosa*.

4. URENA

Linn. — F.T.A. 1: 189.

- 1 A fibrous undershrub covered with stellate hairs; leaves very variable, usually more or less 3–5-lobed, sometimes deeply so, whitish beneath; middle nerve often with a large pitted gland near the base; flowers axillary, usually solitary; epicalyx of 5 linear-lanceolate bracteoles united at the base and persistent in fruit; fruit depressed-globose, covered with rigid hooked bristles [lobata](#)

Urena lobata Linn. — F.T.A. 1: 189; Chev. Bot. 61 (incl. vars.). *APD acc*

Varying from a low woody weed to a shrub 8–10 ft. high; flowers rose-pink or yellow, 1 in. or less long; *cultivated in some of its forms.*

Sen.: (Aug.) Roger 118! **Gam.:** Brooks 13! **Fr. Sud.:** Ianfola (Mar.) Chev. 450! **Fr. G.:** Conakry Lecerf! Farana (Mar.) Sc. Elliot 5321! **S. L.:** Freetown (Nov.) Deighton 233! Yetaya (Sept.) Thomas 2289! Gberia Timbako (Sept.) Small 312! **Lib.:** Kakatown Whyte! Vonjama (Oct.) Baldwin 9927! Suacoco, Gbanga (Nov.) Daniel 32! **G. C.:** Cape Coast (July) T. Vogel 32! Wanki (June) Chipp 479! Accra (Oct.) Morton GC 6021! Tamale (Oct.) Williams 381! **Togo:** Lome Warnecke 232! **Fr. Nig.:** Niamey (Oct.) Hagerup 556! **N. Nig.:** Kebbi, Sokoto Prov. (Oct.) Dalz. 422! Nupe Barter 849! Bauchi Plateau (Aug.) Lely P. 574! 581! Yola (Sept.) Shaw 68! **S. Nig.:** Ibadan (Dec.) Meikle 916! Idu, Sapoba (Nov.) A. F. Ross 224! Nun R. (Aug.) T. Vogel 5! Oban Talbot 1265! **Br. Cam.:** Buea (Nov.) Migeod 224! Bambili, Bamenda (Aug.) Ujor FHI 29984! **F. Po:** Barter!

Widely distributed in the tropics and subtropics.

5. PAVONIA

Cav. — F.T.A. 1: 189; Ulbrich in Engl. Bot. Jahrb. 57: 54–184 (1920).

- 1 Fruiting carpels with a narrow membranous wing on the margin, not awned, not enclosed by the calyx; epicalyx of 10 linear-filiform bracteoles, much longer than the calyx, forming a little open basket around the carpels in fruit; leaves up to 2.5 cm. long, with long and short stellate hairs beneath; flowers solitary on long pedicels jointed towards the top: **2**
- Fruiting carpels not winged, enclosed by the persistent calyx; epicalyx of 10–12 linear or linear-lanceolate bracteoles, shorter than or about as long as the calyx; leaves usually much exceeding 2.5 cm. long, usually cordate at base; flowers solitary or clustered: **3**
- 2 Leaves digitately divided almost to the base; lobes 3–5, oblanceolate, slightly toothed, up to 2.5 cm. long **1. zeylanica**
- Leaves elliptic-suborbicular, not lobed, rounded at base, 1–2 cm. long **2. kotschy**
- 3 Fruiting carpels not awned, with reflexed hairs on the margins; leaves slightly lobed, lobes triangular, doubly dentate; stem and leaves densely tomentose beneath; flowers solitary, or crowded above **3. hirsuta**
- Fruiting carpels with long awns armed with short reflexed bristles; leaves more or less distinctly digitately lobed, usually coarsely toothed; flowers clustered in leaf-axils on short pedicels, or solitary towards ends of shoots: **4**
- 4 Stem and leaves more or less densely long-hirsute **4. urens var. urens**
- Stem and leaves pubescent or glabrescent **4a. urens var. glabrescens**

1. **Pavonia zeylanica** Cav. — F.T.A. 1: 192; Ulbr. in Engl. Bot. Jahrb. 57: 153 (as var. *microphylla* Ulbr.). *APD acc*

APD: *Synonym of Pavonia arenaria var. microphylla (Ulbr.) Verdc.*

Pavonia arabica of Chev. Bot. 62.

Perennial with hispid branches 1–1½ ft. high from a thick woody stock; flowers yellow or reddish, exceeding the epicalyx.

Sen.: Perrottet 69! Richard Tol Lelièvre! Walo Heudelot! **Fr. Sud.:** Tacadji (Aug.) Chev.!

Extends to Abyssinia and Somaliland, S.E. **Arabia** and India.

2. **Pavonia kotschy** Hochst. ex Webb — F.T.A. 1: 192; Ulbr. l.c. 171; Chev. Bot. 62. *APD acc*

A low woody perennial of semi-desert regions, with short densely pubescent branchlets; flowers yellow, less than 1 in. across, shorter than the epicalyx.

Fr. Sud.: Timbuktu (fl. & fr. July) Chev. 1246! Hagerup 188! **N. Nig.:** Kukawa (fl. & fr. Jan.) E. Vogel 27!

Extends to Abyssinia and Somaliland; also in [Arabia](#).

3. **Pavonia hirsuta** *Guill. & Perr.* — F.T.A. 1: 191; Ulbr. l.c. 116 (incl. var. *microphylla* Ulbr.); Chev. Bot. 62 (excl. Chev. 18504 which is *Kosteletzkya grantii*).

APD: Synonym of Pavonia senegalensis (Cav.) Leistner

An erect or sometimes prostrate undershrub, softly yellowish tomentose all over; flowers large, yellow with a red-purple centre 2 in. or more across; epicalyx of 12 downy free bracts, calyx with 3–5 green veins.

Sen.: Heudelot 410! Walo (Jan.) Perrottet 71! **Fr. Sud.:** Timbuktu (July, Sept.) Chev. 1244! Hagerup 201! **N. Nig.:** Sokoto (June, Nov.) Dalz. 420! Moiser 59! Katagum (Nov.) Dalz. 72! L. Chad (Feb., Mar., Oct., Dec.) E. Vogel 42! Elliott 148!

Widespread in the drier parts of tropical Africa.

4. **Pavonia urens** *Cav. var. urens* — Diss. 3: 137, t. 49, 1 (1787); Ulbr. l.c. 104; Brenan in Mem. N.Y. Bot. Gard. 8, 3: 223. *APD acc*

Pavonia schimperiana var. **hirsuta** of F.W.T.A., ed. 1, 1: 263; Chev. Bot. 62.

Coarse woody herb, to 10 ft. high; flowers white, with pink or purplish markings.

Fr. G.: Dalaba to Diaguissa (Sept.) Chev. 18588! **S. L.:** Bintumane Peak, 5,400 ft. (Jan.) T. S. Jones 140! **N. Nig.:** Bauchi Plateau (Sept.) Lely P. 709! **S. Nig.:** Mt. Koloishe, Obudu, 4,800 ft. (Dec.) Keay & Savory FHI 25124! **Br. Cam.:** Cam. Mt., 4,000 ft. (Dec.) Maitland 840! Bambili, Bamenda (Aug.) Ujor FHI 29976! Nchan, Bamenda (June) Maitland 1681! **F. Po:** Mioka, near Moka (Feb.) Exell 849!

Widespread in tropical Africa, also in [Madagascar](#) and the [Mascarenes](#).

- 4a. **Pavonia urens** var. **glabrescens** (*Ulbr.*) *Brenan* in F. W. Andr. Fl. Pl. A.-E. Sudan 2: 36 (1952).

APD: Synonym of Pavonia schimperiana Hochst. ex A. Rich.

Pavonia schimperiana var. **glabrescens** *Ulbr.* l.c. 108 (1920).

Pavonia schimperiana of F.W.T.A., ed. 1, 1: 263.

Woody herb; flowers white with pink or reddish markings.

Fr. G.: Longuery (Dec.) Chev. 14828! **Togo:** Bismarckburg (fl. Oct., Nov., fr. Nov.) Büttner 261! **Br. Cam.:** Buea (Jan.) Dunlap 126! Maitland 318! **F. Po:** Finca Puente (Jan.) Guinea 1710!

Widespread in tropical Africa.

6. MALACHRA

Linn. — F.T.A. 1: 188.

- 1 Leaves deeply 3–7-lobed, lobes oblanceolate, toothed, coarsely strigose beneath like the stems, about 6 cm. long; flowers in dense subglobose heads subtended by leafy suborbicular bracts; epicalyx of several linear-filiform plumose bracteoles; calyx long-pilose; fruiting carpels reticulate, about 1/2 as long as the calyx [1. radiata](#)

Leaves slightly 3–7-lobed, lobes broad at the base, slightly pubescent beneath and on the stems, 5–9 cm. long; flowers few in heads; bracts ovate, cordate, pale with distinct veins; calyx markedly veined, pilose; carpels shorter than the calyx, finely reticulate, glabrous [2. capitata](#)

1. **Malachra radiata** (*Linn.*) *Linn.* Syst., ed. 12, 2: 459 (1767); F.T.A. 1: 188; Chev. Bot. 61. *APD acc*

Sida radiata *Linn.* (1763).

An erect, coarsely hairy perennial, about 4 ft. high; [in wet places; flowers light red.](#)

Sen.: Néma Berhaut 823. **Iv. C.:** between Toumodi and Nzaakro (Aug.) Chev. 22422! **G. C.:** Hatogodo, near Quittah (Sept.) Akpabla 330! **N. Nig.:** Nupe Barter 1547!

Extends to A.-E. [Sudan](#), also in tropical America.

2. *Malachra capitata* (Linn.) Linn. l.c. 458 (1767); F.T.A. 1: 188. *APD acc**Sida capitata* Linn. (1753).

Like the last, with roundish leaves and yellow or white flowers.

Sen.: Richard Tol Perrottet 64!

A plant of the West Indies and central America.

7. THESPESIA*Soland. ex Corr.* — F.T.A. 1: 209.

- 1** Leaves ovate, cordate at base, acuminate at apex, entire, with minute scales on both surfaces, otherwise glabrous, 6–15 cm. long, 5–10 cm. broad; flowers axillary, solitary; epicalyx of 3–5 oblong-lanceolate segments, early caducous; calyx about 1 cm. long, scaly outside; fruit depressed-globose, woody, finely scaly, about 2.5 cm. diam. [populnea](#)

Thespesia populnea (Linn.) *Soland. ex Corr.* — F.T.A. 1: 209; Chev. Bot. 70; J. B. Hutch. in New Phytol. 46: 135. *APD acc*

*APD: Synonym of Thespesia populneoides (Roxb.) Kostel.**Hibiscus populneus* Linn. (1753).

A coastal tree or shrub; petals yellow, large and showy; generally planted in the streets of the coastal towns.

Sen.: St. Louis Brunner! Farman 110! **G. C.:** Cape Coast T. Vogel! Dixcove (Apr.) Chipp 179! Achimota (Jan.) Irvine 1946! **Togo:** Lome Warnecke 357! **Dah.:** Zagnanado Chev. 23087. **S. Nig.:** Calabar (fr. Jan.) Goldie!

Widely distributed in the tropics.

8. AZANZA

Alef. in Bot. Zeit. 29: 298 (1861); Exell & Hillcoat in Contrib. Conhec. Fl. Mocamb. 2: 59 (1954). *APD acc*

- 1** Leaves palmately 3–5-lobed, cordate at base, lobes usually obtuse, more or less stellate-pubescent above, densely stellate-pubescent to tomentose and reticulate beneath, 4–13 cm. long, 5–14 cm. broad; flowers axillary, solitary, sometimes crowded towards ends of shoots; epicalyx of (5–) 9–15 linear segments, more or less caducous; calyx about 1 cm. long, densely stellate-tomentose or tomentellous outside; fruits tomentose [garckeana](#)

Azanza garckeana (F. Hoffm.) Exell & Hillcoat l.c. (1954).

*APD: Synonym of Thespesia garckeana F. Hoffm.**Thespesia garckeana* F. Hoffm. Beitr. Fl. Centr. Ost-Afr. 12 (1889).Tree to 30 ft. high, or more, **in savannah regions**; possibly introduced in our area; flowers large, yellow.**N. Nig.:** Tula Dist., Bauchi Prov. Kennedy FHI 7276!

Widespread in east and south tropical Africa.

Azanza lampas (Cav.) *Alef.*

A native of tropical Asia, it has been introduced into gardens.

9. CIENFUEGOSIA

Cav. Diss. 3: 174 (1787); J. B. Hutchinson in New Phytol. 46: 125 (1947).

Fugosia Juss. (1789) — F.T.A. 1: 208.

- 1 Leaves undivided or slightly lobulate, obovate, very shortly acuminate, 8–13 cm. long, 4–6.5 cm. broad, 5-nerved at the base, glabrous but gland-dotted beneath, finely reticulate on both surfaces; petiole very short; stipules linear-subulate, about 5 mm. long; flowers from near the base of the previous season's stem; pedicels up to 3 cm. long; epicalyx of about 3 short unequal bracteoles; calyx turbinate, 1.5 cm. long, 5-lobed, lobes acuminate, nerved and gland-dotted [1. heteroclada](#)

Leaves digitately divided to the base, lobes 5–7, linear or oblanceolate, up to 4 cm. long, glabrous; petiole about 1/3 as long as the leaf; stipules linear, slightly pubescent; flowers on the young shoots, axillary, solitary; pedicels longer than the leaves; epicalyx of 10–12 short linear bracteoles; calyx 1.5 cm. long, lobes lanceolate, acuminate, 3-nerved and gland-dotted [2. digitata](#)

1. *Cienfuegosia heteroclada* Sprague in Kew Bull. 1907: 48; J. B. Hutch. in New Phytol. 46: 127. *APD acc*

A suffrutex, in [savannah](#), sending up branches from a woody stock after burning; stems angular, glabrous, dark gland-dotted; flowers pink or purplish, 1 in. or more long; capsule obovoid, 3/4 in. long, gland-punctate; seeds densely clothed with long rusty hairs.

G. C.: Zuarungu Dist. (Jan.) Vigne FH 4665! **N. Nig.:** Kontagora (fl. & fr. Dec.–Jan.) Dalz. 122! Meikle 1034! Naraguta (Mar.) Hill 25!

2. *Cienfuegosia digitata* Cav. Diss. 3: 174, t. 72, 2 (1787); Chev. Bot. 69; J. B. Hutch. l.c. 128. *APD acc*

Fugosia digitata (Cav.) Pers. — F.T.A. 1: 209.

A low shrubby plant a foot or more high, with angular branches; flowers yellow with red-purple centre, 1–2 in. in diam.

Sen.: Sieber 58! Richard Tol (Sept.) Perrottet 66! Roger! Walo Heudelot! **Fr. Sud.:** Amango (Sept.) Hagerup 385a! **G. C.:** Bawku (Nov.) Vigne FH 4664! **Fr. Nig.:** Fada to Koupéla, Gourma (July) Chev. 24535! **N. Nig.:** Kano (Mar., May) Buxton! Ejiofor FHI 26150a! Bauchi Plateau (July) Lely P. 563!

Widespread in the drier parts of tropical Africa.

10. HIBISCUS

Linn. — F.T.A. 1: 194.

- 1 Calyx persistent, not splitting down one side, usually more or less deeply lobed: **2**
Calyx spathaceous, splitting down one side and falling off at anthesis or in fruit: **33**
- 2 Calyx more or less deeply lobed: **3**
Calyx cupuliform, about 7 mm. long, with very short lobes; epicalyx cupuliform, 5-dentate; corolla about 4.5 cm. long; branchlets, petioles and midrib and nerves on underside of leaves hispid-pilose; stipules filiform; leaves obovate-oblong, rounded or obtuse at base, acuminate at apex, margin remotely dentate in upper part [29. grewoides](#)
- 3 Bracteoles of epicalyx united for more than half their length; trees with broadly ovate or pentagonal, rather large, more or less cordate leaves: **4**
Bracteoles of epicalyx free, or united only at base, or absent; shrubs, straggling climbers or herbs: **5**
- 4 Leaves broadly ovate-rounded, deeply cordate, acuminate, up to 15 cm. long and broad, entire or crenulate, at length glabrous, canous-tomentellous beneath, digitately nerved from the base; flowers solitary, large and showy [1. tiliaceus](#)
Leaves pentagonal, with triangular denticulate lobes, rather widely cordate, up to 15 cm. broad, minutely stellate-puberulous beneath, 5–7-nerved at the base; flowers comparatively small in cymes [2. sterculiifolius](#)
- 5 Epicalyx absent; annual herbs; leaves very variable, simple to trifoliate sometimes on the same plant, long-petiolate; flowers solitary, axillary; seeds strongly tuberculate: **6**
Epicalyx present: **7**
- 6 Calyx longer than the fruit; leaf-margin entire or slightly dentate; stems more or less pubescent [3. sidiformis](#)
Calyx shorter than the fruit; leaf-margin distinctly dentate; stems with long weak hairs [4. lobatus](#)
- 7 Bracteoles of epicalyx forked or provided with a foliaceous appendage: **8**
Bracteoles of epicalyx neither forked nor provided with a foliaceous appendage: **11**

- 8 Stipules foliaceous, reniform-orbicular, 1–1.5 cm. long; stems prickly; leaves digitately 3–5-lobed, lobes coarsely toothed, up to 7 cm. long, prickly on the nerves beneath and on the petioles; flowers solitary; bracteoles of the epicalyx nearly as long as the calyx, linear with a foliaceous appendage on the back [5. *surattensis*](#)
Stipules not foliaceous: 9
- 9 Stems prickly; flowers axillary; bracteoles of epicalyx 8–12, shorter than the calyx: 10
Stems not prickly; flowers umbellate; pedicels up to 2.5 cm. long; bracteoles of epicalyx 5–6, entire, spatulate-ob lanceolate, much longer than the calyx; leaves 3–7-lobed, suborbicular, up to 18 cm. broad, crenate, softly pubescent beneath [8. *comoensis*](#)
- 10 Pedicels up to 2 cm. long; sepals ovate-lanceolate, long-acuminate; leaves mostly deeply digitately 3–5-lobed, lobes coarsely toothed, up to 6.5 cm. long; bracteoles of epicalyx with a foliaceous appendage but often without lateral lobes; stems prickly and more or less shortly hirsute [6. *noldeae*](#)
Pedicels 2–13 cm. long; sepals ovate, acute; leaves usually palmately 3–5-lobed, or triangular or ovate, up to about 17 cm. long and broad; bracteoles of epicalyx forked; stems prickly and more or less long-hirsute [7. *rostellatus*](#)
- 11 Calyx inflated; bracteoles of epicalyx 7–12, free, linear, ciliate; upper leaves mostly deeply 3–5-lobed with the lobes variable in shape; much-branched hispid annual [9. *trionum*](#)
Calyx not inflated: 12
- 12 Epicalyx of more than 5 bracteoles: 13
Epicalyx of 5 bracteoles: 29
- 13 Bracteoles of epicalyx spatulate, somewhat widened above the middle, nearly as long as the calyx; leaves ovate to orbicular, often somewhat pentagonal, 5–8 cm. long and broad, doubly crenate, densely and softly tomentose beneath; flowers usually solitary, shortly stalked; fruit a little longer than the calyx, very villous [10. *panduriformis*](#)
Bracteoles of epicalyx narrowed to the apex: 14
- 14 Epicalyx of subulate or filiform, more or less terete bracteoles: 15
Epicalyx of linear to lanceolate, more or less flat bracteoles: 20
- 15 Leaves broad, 5-lobed or pentagonal, with long petioles; flowers on slender pedicels: 16
Leaves lanceolate to ovate, distinctly but rather shortly petiolate, serrate-dentate, 3–5 cm. long, 1–3.5 cm. broad, scabrid; flowers solitary on slender pedicels; bracteoles of the epicalyx small and inconspicuous [15. *micranthus*](#)
- 16 Capsule depressed, distinctly winged, setose on the wings; leaves without incrustations at the base of the nerves beneath: 17
Capsule pointed, not winged, densely villous; leaves long-petiolate, usually rather sharply 5-lobed, dentate, softly pubescent, with chalk-like incrustations at the base of the nerves beneath; bracteoles of epicalyx very slender: 18
- 17 Stems densely pubescent, with prickles; leaves ovate to palmately 3– or slightly 5-lobed [11. *vitifolius* var. *vitifolius*](#)
Stems with small prickles; leaves deeply lobed [11a. *vitifolius* var. *ricinifolius*](#)
- 18 Epicalyx about 1/2 as long as the calyx: 19
Epicalyx about 1/4 as long as the calyx [14. *longisepalus*](#)
- 19 Leaves more or less 5-lobed; indumentum of rather long and short hairs [12. *physaloides*](#)
Leaves obscurely 3-lobed or not lobed; indumentum short and harsh [13. *pseudohirtus*](#)
- 20 Leaves not lobed, linear or lanceolate, subsessile or shortly petiolate, obtusely serrate: 21
Leaves lobed or broadly ovate, usually with a fairly long petiole: 24
- 21 Leaves linear, 5–13 cm. long, softly pubescent beneath; seeds covered with small scales; bracteoles of epicalyx about 10, linear, shorter than the calyx; calyx-lobes lanceolate, setose; capsule about 1.5 cm. long, setose-pilose [16. *squamosus*](#)
Leaves lanceolate or linear-lanceolate, thinly pubescent beneath or glabrous; seeds not scaly: 22
- 22 Petals up to 1 cm. long; calyx-lobes triangular, about 6 mm. long; bracteoles of epicalyx about 7, lanceolate, about 1/3 as long as calyx; capsule scarcely 1 cm. long; leaves narrowly lanceolate, 5–6 cm. long, thinly stellate-pubescent beneath; suffrutex with erect shoots up to 15 cm. long [17. *gourmania*](#)
Petals at least 2 cm. long; calyx-lobes lanceolate, 1 cm. long or more: 23
- 23 Stems trailing or suberect, up to 60 cm. long, hispid with yellowish spreading hairs; leaves linear-lanceolate towards the ends of shoots, but usually more or less lobed below [18. *articulatus* var. *articulatus*](#)
Stems erect, up to 2 m. high, not hispid, or hispid only below; leaves lanceolate, apparently never lobed [18a. *articulatus* var. *glabrescens*](#)

- 24 Stems very hispid with yellowish spreading hairs; leaves deeply 3-lobed, or scarcely lobed, 5–7 cm. long, lobes oblong-lanceolate, crenate, slightly setulose on the nerves beneath; pedicels longer than the calyces; bracteoles of epicalyx 8–10, pilose; capsule about 1.5 cm. long, sparingly setose; seeds nearly smooth [18. *articulatus* var. *articulatus*](#)
- Stems not hispid, sometimes prickly; flowers shortly pedicellate: 25
- 25 Calyx fleshy at maturity; stems not prickly; leaves ovate or 3-lobed, glabrous or nearly so [19. *sabdariffa*](#)
- Calyx not fleshy at maturity: 26
- 26 Bracteoles of the epicalyx much shorter than the calyx in fruit; petiole usually long, often as long as the lamina: 27
- Bracteoles of the epicalyx nearly as long as the calyx in fruit; petioles short; leaves ovate-triangular, irregularly dentate, slightly setulose [23. *whytei*](#)
- 27 Calyx woolly as well as setose; leaves deeply lobed or broadly ovate, rather sharply serrate, glabrescent; stems smooth or sometimes slightly prickly [20. *cannabinus*](#)
- Calyx not woolly, sometimes setose, or puberulous with small stellate hairs; leaves often deeply lobed, puberulous to tomentellous beneath; stems often prickly or sometimes scabrid: 28
- 28 Calyx densely setose, but only sparingly puberulous and later glabrescent between the broad-based simple setae; stems more or less prickly; leaves puberulous beneath [21. *asper*](#)
- Calyx stellate-puberulous, with fascicles of longer hairs, but scarcely setose; stems slightly scabrid and densely pubescent; leaves tomentellous beneath [22. *scotellii*](#)
- 29 Leaves linear-lanceolate, often hastate at the base, up to 18 cm. long and 4 cm. broad, serrulate, slightly pubescent beneath; flowers crowded at the apex of the shoots, very shortly stalked; bracteoles of epicalyx linear, about as long as the calyx, ciliate [24. *congestiflorus*](#)
- Leaves broadly ovate to more or less pentagonal, rounded or cordate at base; flowers axillary, shortly pedicellate: 30
- 30 Bracteoles of epicalyx linear-subulate about 1 cm. long and scarcely 1.5 mm. broad, bristly pilose, shorter than the calyx; calyx-lobes lanceolate, contracted towards the base; corolla about 6 cm. long; leaves ovate, 4–6.5 cm. long, 3.5–5 cm. broad, rather coarsely doubly dentate, stellate-hirsute beneath [25. *lonchosepalus*](#)
- Bracteoles of epicalyx linear to lanceolate, 1–8–2.8 cm. long, as long as or longer than the calyx: 31
- 31 Leaves permanently and softly stellate-tomentose beneath, ovate or obscurely 3-lobed; fruits stellate-tomentose but not setose; seeds long-pilose [26. *owariensis*](#)
- Leaves beneath stellate-hirsute, or glabrescent and pubescent mainly on the nerves; fruits setose at first; seeds shortly pubescent or papillose: 32
- 32 Bracteoles of epicalyx linear, about 1.5 mm. broad, not touching each other towards the base; flowers crowded towards the apex of the stem; leaves more or less glabrescent and pubescent mainly on the nerves beneath [27. *lunarifolius*](#)
- Bracteoles of epicalyx rather broadly lanceolate, 5–7 mm. broad and touching each other towards the base; flowers not crowded; leaves rather coarsely stellate-hirsute beneath [28. *macranthus*](#)
- 33 Bracteoles of the epicalyx linear, 6 or more, not early caducous; flowers large: 34
- Bracteoles of the epicalyx ovate to lanceolate, 4–8, persistent, or caducous before anthesis: 35
- 34 Pedicel as long as the fruit or longer; fruits narrowly ovoid, narrowed to the base, acuminate at apex, more or less membranous, up to 8 cm. long; stems covered with reflexed bristly hairs [30. *abelmoschus*](#)
- Pedicel much shorter than the fruit; fruits elongate-conical, truncate at base, ribbed, becoming fibrous, up to 30 cm. long; stems glabrous or shortly pubescent [31. *esculentus*](#)
- 35 Lobes of leaves obtuse, narrowed to their base; bracteoles 5–6, lanceolate, early caducous; upper flowers in terminal leafless racemes; flowers small, about 3 cm. long; fruits ovoid, up to about 4 cm. long; stems pubescent or glabrescent, with minute thorns [32. *ficulneus*](#)
- Lobes of leaves acute (or leaves sometimes not lobed); bracteoles 4–8, ovate to ovate-lanceolate, persistent; flowers large; fruits ovoid, up to about 6 cm. long: 36
- 36 Stems, pedicels and fruits covered with long bristly hairs; pedicels about 3 cm. long; bracteoles usually 4 [33. *manihot* var. *manihot*](#)
- Stems and pedicels glabrous or glabrescent; pedicels 1–1.5 cm. long; bracteoles 6–8, long-ciliate on the margins, otherwise glabrous [33a. *manihot* var. *caillei*](#)

1. **Hibiscus tiliaceus** Linn. — F.T.A. 1: 207; Chev. Bot. 69 (incl. var. *elatus* Hochr.). *APD acc*

Epicalyx not enclosing the calyx in bud, with very short lobes much shorter than the tube. A small tree with purplish branches; stipules leafy, leaving annular scars; flowers 2–3 in. long, yellow with a purple centre. [Common near the sea.](#)

Sen.: Perrottet 48! Heudelot! Sieber 34! Carabane (fr. Feb.) Chev. 2741! **Gam.:** (fl. & fr. July) Ruxton 3! **Port. G.:** Bissau (Feb.) Esp. Santo 1784! **S. L.:** T. Vogel 58! Rotomba Isl. (Mar.) 9. **Hibiscus trionum** *Linn.* — F.T.A. 1: 196; Hochr. l.c. 144; Chev. Bot. 69. *APD acc*

Much-branched hispid annual; flowers yellow with a purple centre.

Sen.: Richard Tol Berhaut 1412. **Fr. Sud.:** Sompi (Aug.) Chev.!

Widespread in the tropics of the Old World.

10. **Hibiscus panduriformis** *Burm. f.* — F.T.A. 1: 203; Hochr. in Ann. Conserv. Jard. Bot. Genève. 4: 95; Chev. Bot. 66. *APD acc*

Erect branched undershrub, 4–8 ft., covered with fine down mixed with bristles; flowers large, yellow turning orange, or purple-streaked, with a red or purple centre; seeds striped.

Sen.: Roger 12! Walo (Sept.–Oct.) Perrottet 58! 60! **G. C.:** Shai Plains (Feb.) Irvine 1979! Burufo, Lawra (fl. & fr. Dec.) Adams GC 4426! **Dah.:** Abbo to Massé Chev. 22974! **N. Nig.:** Kontagora (fl. & fr. Nov.) Dalz. 131! Maigana, Zaria (Dec.) Lamb 68! Nabardo (fl. & fr. Sept.) Lely 615! Bauchi Plateau (fl. & fr. Aug.) Lely P. 658!

Widespread in tropical Africa, also in **Madagascar**, **tropical Asia** and **Australia**.

11. **Hibiscus vitifolius** *Linn. var. vitifolius* — F.T.A. 1: 197, partly; Hochr. l.c. 169 (as var. *genuinus*); Chev. Bot. 69. *APD acc*

Low shrub, or scrambling herb, to 6 ft. high; flowers bright yellow with a purple centre, about 2 in. long; recognisable by the 5-winged fruit.

G. C.: Cape Coast (fl. & fr. July) T. Vogel 66! Aburi (Nov.) Johnson 847! Accra Plains (fl. & fr. Aug.) Irvine 70! **Togo:** Lome Warnecke 204! **Dah.:** Adjaonéré to Abbo (fl. & fr. Feb.) Chev. 22956! **N. Nig.:** Jebba Barter! Katagum (fl. & fr. Sept.) Dalz. 62! **S. Nig.:** Abeokuta Millen 95! Olokemeji (fl. & fr. Sept.) Onochie FHI 20227! Ibadan (fl. & fr. Aug.) Golding 5!

Widespread in tropical Africa, **Madagascar**, **Asia** and **Australia**, also in **West Indies** (? introduced).

11a. **Hibiscus vitifolius var. ricinifolius** (*E. Mey. ex Harv.*) *Hochr.* in Ann. Conserv. Jard. Bot. Genève. 4: 170 (1900); Brenan in Mem. N.Y. Bot. Gard. 8, 3: 225.

APD: Synonym of Hibiscus vitifolius L. subsp. vitifolius

Hibiscus ricinifolius E. Mey. ex Harv. (1860).

Br. Cam.: Mopanya, Cam. Mt., 2,400 ft. (fr. Apr.) Maitland FHI 12332!

Also in **Uganda**, **Abyssinia**, **Eritrea**, **Nyasaland**, **Angola** and **Natal**.

12. *Hibiscus physaloides* Guill. & Perr. — F.T.A. 1: 199, partly; Hochr. l.c. 161 (as var. *genuinus*); Chev. Bot. 67. *APD acc*

A woody herb, to 6 ft. high, with spreading pungent hairs; flowers up to 4 in. diam., yellow, with a red base turning violet.

Sen.: Dagana, Walo (Sept.–Oct.) Perrottet 61! 62! **Gam.:** Albreda Perrottet. **Fr. Sud.:** Kati to Kita (Oct.) Chev. 2745! **Port. G.:** Picle, Bissau Esp. Santo 1737! **S. L.:** Gene (Nov.) Deighton 446! Makump (Dec.) Glanville 110! Njala (Dec.) Deighton 1577! **Lib.:** Kakatown Whyte! Karmadhun (Nov.) Baldwin 10187! **IV. C.:** Ano (Dec.) Chev. 22534! Beoumi (Dec.) Lowe! **N. Widespread in tropical Africa, and in **Canary Islands**, **Cape Verde Islands** and **Comoro Islands**, **Madagascar** and **Seychelles**.

13. *Hibiscus pseudohirtus* Hochr. in Bull. Soc. Bot. Fr. 61, Mém. 8: 247 (1916); Chev. Bot. 67; Cufodontis in Ann. Naturhist. Mus. Wein 56: 55. *APD acc*

An undershrub with shortly pilose and scabrid branchlets; flowers white, rather small, solitary, on long peduncles

Fr. Sud.: Macina (fl. & fr. Sept.) Chev. 24866!

14. *Hibiscus longisepalus* Hochr. l.c. 250 (1916); Chev. Bot. 66. *APD acc*

An undershrub, tomentose and with spreading hairs; flowers yellow, 1–1½ in. long; epicalyx very small, setaceous.

Fr. Sud.: Macina (Sept.) Chev. 24842!

15. *Hibiscus micranthus* Linn. f. Suppl. Pl. 308 (1781); F.T.A. 1: 205; Hochr. in Ann. Conserv. Jard. Bot. Genève. 5: 60; Cufodontis l.c. 46 (q.v. for vars.). *APD acc*

APD: Synonym of Hibiscus praeteritus R.A. Dyer

Undershrub, 5–6 ft. high, with stiff, straight, scabrid branches; stipules almost spiny; flowers small, about ½ in. long, white turning pink; seeds cottony.

Sen.: Heudelot 539! Walo (Sept.–Nov.) Perrottet. **Fr. Sud.:** Gao (Sept.) Hagerup 365! **G. C.:** Cape Coast Brass. Accra (Mar., May) Deighton 587! Irvine 721! **Togo:** Lome Warnecke 218! 339!

Widespread in the drier parts of tropical Africa, S. Africa, Madagascar, **Arabia** and India.

16. *Hibiscus squamosus* Hochr. in Ann. Conserv. Jard. Bot. Genève. 4: 165 (1900). *APD acc*

Hibiscus epidospermus Mast. in F.T.A. 1: 197 (1868), not of Miq. (1859).

Stem erect, little-branched, 3 ft. or more, scabrid-pubescent or downy; flowers conspicuous, pale yellow with dark purple centre; **common in marshy places**.

G. C.: Imp. Inst.! Tamale (Oct.) Williams 401! **N. Nig.:** Nupe Barter 1165! Kontagora (fl. & fr. Nov.) Dalz. 127! **S. Nig.:** Awba R., Ibadan (fl. & fr. Oct.) Jones FHI 6365!

17. *Hibiscus gourmania* Hutch. & Dalz. F.W.T.A., ed. 1, 1: 267 (1928); Kew Bull. 1928: 298. *APD acc*

Gourmania grewioides A. Chev. Bot. 86, name only.

Suffrutex, with stems up to 6 in. high, from short erect woody rhizomes; flowers white.

IV. C.: Ouagadougou to Ouahigouya (Aug.) Chev. 24717. **Fr. Nig.:** Fada to Koupéla, Gourma (July) Chev. 24514! **N. Nig.:** Ejidogari F.R., Ilorin (Feb.) Ejiofor FHI 19831!

18. **Hibiscus articulatus** *Hochst. ex A. Rich. var. articulatus* — F.T.A. 1: 200; Hochr. l.c. 159 (as var. *genuinus*); Chev. Bot. 63. *APD acc*

Stems trailing or suberect, to 2 ft. long, from woody rhizome; leaves very variable in shape; flowers white or yellow (? sometimes turning pink); **in marshy ground**.

IV. C.: Toura country (May) Chev. 21746! **G. C.:** Nangodi (June) Vigne FH 4514! **Fr. Nig.:** Gourma (July) Chev. 24428! **N. Nig.:** Aguji, Ilorin (Dec.) Thornton! Nabardo (May) Lely 206! Kwoya Dist., Bornu (Aug.) Daggash FHI 24859!

Widespread in tropical Africa.

- 18a. **Hibiscus articulatus var. glabrescens** *Hochr. l.c. 159 (1900). APD acc*

Erect herb, to 6 ft. high; leaves apparently not lobed; flowers white or yellow or pink.

Togo: Misahöhe Baumann 48! **N. Nig.:** Kentish Rankin! Lema, Laflagi Dist., Ilorin (Aug.) Onyeagocha FHI 27266!

Also in **A.-E. Sudan**.

19. **Hibiscus sabdariffa** *Linn. — F.T.A. 1: 204; Hochr. l.c. 116; Chev. Bot. 67; Berhaut Fl. Sen. 160. APD acc*

Erect, slightly branched with smooth or slightly hispid stem, often coloured; epicalyx and calyx sometimes with scattered hairs and tubercles, becoming succulent; flowers an inch or more long, yellow with a purple centre; **widely cultivated** and variable in form and size.

Sen.: fide Berhaut l.c. **Fr. Sud.:** Timbuktu Chev. 1250! **Fr. G.:** fide Chev. l.c. **S. L.:** Sc. Elliot 4173! Njala (Nov.) Deighton 1849! Yonguru (Jan.) Thomas 7149! **G. C.:** Tamale Dudgeon! **Dah.:** Burton! **N. Nig.:** Katagum (Sept.) Dalz. 68! Kukawa (Feb.) E. Vogel 42! 52! **S. Nig.:** Olokemeji (Nov.) Onochie FHI 8156! Sapoba Kennedy 1654!

Widely cultivated in the tropics.

20. **Hibiscus cannabinus** *Linn. — F.T.A. 1: 204, partly; Hochr. l.c. 114, partly; Chev. Bot. 64–65 (excl. var. *chevalieri*). APD acc*

An erect annual, to 15 ft. high; flowers large, yellow with a red-purple centre; **cultivated as a fibre plant, and naturalized**.

Sen.: Richard Tol (Feb.) Döllinger! **Gam.:** MacCarthy Isl. (fl. & fr. Jan.) Dalz. 8129! **Fr. Sud.:** Sansanding (Sept.) Chev. 24967! Koulikoro (Sept.) Chev. 25026! Labbézenga (Sept.) Hagerup 458! And many other localities fide Chev. l.c. **S. L.:** Deighton 2935! **G. C.:** Kpong (fl. & fr. Oct.) Johnson 827! **Togo:** Lome Warncke 282! **N. Nig.:** Sokoto Dalz. 424! 425! Katagum (fl. & fr. Sept.–Oct.) Dalz. 63! 64! Kalkala, L. Chad (fl. & fr. Mar.) Gwynn 93! **S. Nig.:** Lagos Dodd 442!

Cultivated in most tropical countries.

21. **Hibiscus asper** *Hook. f. in Fl. Nigrit. 228 (1849); Berhaut Fl. Sen. 160 (? Incl. var.).*

APD: Synonym of Hibiscus cannabinus L.

Hibiscus cannabinus var. chevalieri *Hochr. — Chev. Bot. 65.*

Hibiscus cannabinus of F.T.A. 1: 204, partly; Hochr. l.c., partly.

Erect fibrous herb to 8 ft. high, often red-tinged in parts and armed with small spine-tipped tubercles; flowers yellow with purple centre; **probably native in savannah areas**.

Sen.: fide Berhaut l.c. **Gam.:** (July) Brooks 14! **Fr. Sud.:** Sarédina (May) Davey 130! Bure, Amongo (fl. & fr. Sept.) Hagerup 409! **Fr. G.:** Kouria (Oct.) Caille in Hb. Chev. 14909! **S. L.:** Turner! Waterloo (fl. & fr. Dec.) Deighton 3346! Kora, Scarcies R. (fr. Feb.) Sc. Elliot 4592! Mahela, Samu (fl. & fr. Dec.) Sc. Elliot 4041! Musaia (fl. & fr. Dec.) Deighton 4499! **G. C.:** Dukwesein (fl. & fr. Dec.) Chipp 599! Lumbunga (fl. & fr. Dec.) Morton GC 6225! **Dah.:** Burton! **N. Nig.:** Sokoto (fl. & fr. Oct.) Dalz. 426! Nupe Barter 1026! Zungeru (Oct.) Dalz. 128! Katagum (Sept.) Dalz. 65 (partly)! **S. Nig.:** Foster 362! Higginson 11!

Probably widespread in tropical Africa.

Perhaps no more than varietally distinct from *H. cannabinus* Linn.

22. *Hibiscus scotellii* *Bak. f.* in J. Linn. Soc. 30: 74 (1894); Hochr. l.c. 117. *APD acc*

APD: Synonym of Hibiscus sineaculeatus F.D. Wilson

Erect fibrous herb, to 6 ft. high; flowers yellow with a dark red or purplish centre; **often on rocky hills**; probably native.

S. L.: Sasseni, Scarcies R. Sc. Elliot 4535! Lungi (fl. & fr. Nov.) Glanville 111! Waterloo (fl. & fr. Dec.) Deighton 3347! Tisana, Bonthe Isl. (fl. & fr. Nov.) Deighton 2318! **Lib.:** Vonjama (Oct.) Baldwin 9887! Kolahun (fl. & fr. Nov.) Baldwin 10148! **G. C.:** Kwahu-Pepeease (fl. & fr. Nov.) Irvine 1713! **N. Nig.:** Anara F.R. (fl. & fr. Sept., Oct.) Keay FHI 20117! 24354! Bauchi Plateau (Sept.) Lely P. 686! Panshanu (fl. & fr. Sept.) Lely 609! **S. Nig.:** Idanre Hills (fl. & fr. Oct.) Keay FHI 22587!

[The specimens from Liberia, Gold Coast, and Nigeria differ somewhat from the Sierra Leone material and are rather intermediate between typical *H. scotellii* and typical *H. asper*.]

23. *Hibiscus whytei* *Stapf* in J. Linn. Soc. 37: 79 (1905); Chev. Bot. 69. *APD acc*

A tall woody herb, sparingly stellate-pubescent; leaves 11/2–31/2 in. long; bracteoles of epicalyx 10, narrow linear-lanceolate; corolla yellow with purple centre, about 11/2 in. long.

Fr. G.: Kindia Chev. 13031; 13224. Kouria to Ymbo Chev. 14750. **Lib.:** Kakatown Whyte! **Iv. C.:** Bouroukrou Chev. 16614; 16787. Bingerville Chev. 17355.

24. *Hibiscus congestiflorus* *Hochr.* in Ann. Conserv. Jard. Bot. Genève. 10: 21 (1906); Chev. Bot. 65. *APD acc*

Hibiscus baumannii *Ulbr.* (1922).

Erect herb, to 10 ft. high, often unbranched; stems pilose; flowers yellow with purple centre, 11/2–21/2 in. long; **in savannah**.

G. C.: Irvine! Kintampo (Nov.) Andoh FH 5440! **Togo:** Kpedsu (fl. & fr. Dec.) Howes 1052! **Dah.:** Massé to Kétou (Feb.) Chev. 23006! **N. Nig.:** Lokoja (Oct.) Dalz. 80! Bauchi Plateau (Oct.) Lely P. 831! Yola (Oct.) Shaw 70! **S. Nig.:** Eruwa Road, Olokemeji (Nov.) Onochie FHI 8163! Oyo (fl. & fr. Jan.) Keay FHI 25646! Owo G. Burton 3!

Also in **Ubangi-Shari**.

25. *Hibiscus lonchosepalus* *Hochr.* in Bull. Soc. Bot. Fr. 61, Mém. 8: 251 (1917); Chev. Bot. 66. *APD acc*

A tall undershrub; flowers probably yellow with purple centre.

Dah.: Agouagon (May) Chev. 23540!

26. *Hibiscus owariensis* *P. Beauv.* Fl. Oware 2: 88, t. 117 (1820). *APD acc*

Hibiscus calycinus of F.T.A. 1: 202, partly.

Hibiscus calyphyllus of Chev. Bot. 64.

An undershrub, to 6 ft. high; flowers large, yellow with red-purple centre.

Iv. C.: Kouroukoro to Touna (May) Chev. 21790! **G. C.:** Afaben (fl. & fr. Aug.) Johnson 110! Akwapim Hills (fl. & fr. Aug.) Johnson 772! Aburi (July) Deighton 3384! **Togo:** Lome Warnecke 222! **S. Nig.:** Foster 365! Lagos Colony (fl. & fr. Aug.) Rowland! Ijaiye F.R. (fr. Apr.) Onochie FHI 21956! Warri Beauvois.

Also in **A.-E. Sudan**.

27. *Hibiscus lunarifolius* *Willd.* — F.T.A. 1: 202, partly. *APD acc*

A tall undershrub, stellate-hirsute becoming glabrous; flowers large, yellow with purple centre.

S. L.: Deighton 5712! Koflu Mt. (fr. Jan.) Sc. Elliot 4612! **Lib.:** St. Paul R. Reynolds! **S. Nig.:** Lagos Colony Foster 358! Calabar Maitland 13!

An Indian plant found also in parts of tropical Africa.

28. **Hibiscus macranthus** *Hochst. ex A. Rich.* Fl. Abyss. 1: 55 (1847).

APD: Synonym of Hibiscus ludwigii Eckl. & Zeyh.

Hibiscus lunarifolius of F.T.A. 1: 202, partly.

Shrub, or woody herb, to 6 ft. high or more; flowers large, yellow with deep purple centre.

Br. Cam.: Bamenda, 5,000 ft. (fl. & fr. Jan.) Migeod 402!

Also in **Abyssinia** and **Eritrea**.

29. **Hibiscus grewoides** *Bak. f.* in Cat. Talb. 9 (1913). *APD acc*

A small tree, up to 16 ft. high; flowers yellow.

S. Nig.: near Owum, Oban Talbot 1343!

30. **Hibiscus abelmoschus** *Linn.* — F.T.A. 1: 207; Hochr. in Ann. Conserv. Jard. Bot. Genève. 4: 150; Chev. Bot. 63; Rev. Bot. Appliq. 20: 325.

APD: Synonym of Abelmoschus moschatus Medik.

To 6 ft. high; leaves 3–5-lobed; flowers about 4 in. diam., yellow, with crimson centre; seeds musk-scented; **an introduced plant, found near habitation.**

Sen.: Roger! R. Senegal (Sept.) Perrottet 51! **Fr. G.:** Farana circle Chev. 20400. **S. L.:** Luseniya, Samu (fr. Dec.) Sc. Elliot 4087! Futa, Masakoi (fl. & fr. Sept.) Deighton 2240! Ronietta (Nov.) Thomas 5380! **Lib.:** Grand Basaa (July) T. Vogel 26! Sinoe Basin Whyte! Jabroke, Webo (July) Baldwin 6685! **Iv. C.:** Baoulé-Nord circle Chev. 22307. **G. C.:** Aburi Brown 784! Ancobra Junction (Jan.) Irvine 1072! **Dah.:** Savalou Chev. 23690. **S. Nig.:** Lagos (Aug.) Dodd 423! Onitsha Prov. Thomas 607!

Widely distributed in the tropics.

31. **Hibiscus esculentus** *Linn.* — F.T.A. 1: 207; Hochr. l.c. 150; Chev. Bot. 65; Rev. Bot. Appliq. 20: 323 (incl. vars.).

APD: Synonym of Abelmoschus esculentus (L.) Moench

APD: Synonym of Abelmoschus caillei (A. Chev.) Stevels

? **H. hispidissimus** *A. Chev.* l.c. 326, t. 10 (1940).

A cultivated, or subspontaneous herb, with long-stalked, usually 5-lobed leaves; flowers large, yellow, with purple or red centre.

Sen.: **Fr. Sud.:** & **Dah.:** fide Chev. l.c. **S. L.:** Mayoso (Aug.) Thomas 1421! **N. Nig.:** Yates 42! **S. Nig.:** Lagos Millen 5!

Widespread in the tropics.

32. **Hibiscus ficulneus** *Linn.* Sp. Pl. 2: 695 (1753); Hochr. l.c. 153; Chev. in Rev. Bot. Appliq. 20: 320.

APD: Synonym of Abelmoschus ficulneus (L.) Wight & Arn.

A fibrous herb, becoming woody below; flowers about 1 in. diam., pink or white, with rosy centre.

Fr. Nig.: fide Chev. l.c. **N. Nig.:** Gosling! Mud flats near Dikoa, L. Chad Lamb 111!

Also in **A.–E. Sudan**, **Madagascar**, **Asia** and **Australia**; possibly introduced and naturalized in Africa, but stated by Lamb to be wild.

33. **Hibiscus manihot** *Linn.* **var. manihot** — Sp. Pl. 2: 696 (1753); Hochr. l.c. 153; Chev. in Rev. Bot. Appliq. 20: 322.

APD: Synonym of Abelmoschus manihot (L.) Medik. var. manihot

Hibiscus abelmoschus of F.W.T.A., ed. 1, 1: 268, partly, not of Linn.

To 6 ft. high; leaves 3–5-lobed; flowers 4–9 in. diam., pale yellow (or white), with purple centre; an introduced plant, found near habitation.

S. L.: Likuru, Tamisso (fr. Feb.) Sc. Elliot 4954! Mabonto (Oct.) Thomas 3578! **Br. Cam.:** Sofo, Buea (Dec.) Maitland 142!

Widespread and native in Asia.

33a. *Hibiscus manihot* var. *caillei* A. Chev. in Rev. Bot. Appliq. 20: 322, t. 8 (1940).

*APD: Synonym of *Abelmoschus caillei* (A. Chev.) Stevels*

Similar in appearance to *H. esculentus*, but with large bracteoles.

Fr. G.: Kouria (Oct.) Caille in Hb.Chev. 14910. **S. L.:** Bumhuna (Oct.) Thomas 3341! **Lib.:** Kakatown Whyte!

***Hibiscus clandestinus* Cav.** Icon. 1: 1, t. 2 (1791); Cufodontis l.c. 35 (1948).

Based on a plant from Senegal **cultivated** by Cavanilles; flowers scarcely 2 mm. long.

Usually regarded as a synonym of *H. micranthus* Linn. f., but maintained by Cufodontis.

Imperfectly known species.

***Hibiscus* (sect. *Abelmoschus*) sp. A.**

To 8 ft. high, in **cultivated ground**; flowers in a long leafless raceme.

G. C.: Kumasi Cummins 200!

Imperfectly known species.

***Hibiscus mutabilis* Linn.**

Is cultivated.

***Hibiscus rosa-sinensis* Linn.**

Is cultivated.

***Hibiscus schizopetalus* (Mast.) Hook. f.**

Is cultivated.

11. GOSSYPIUM

Linn.— F.T.A. 1: 210; J. B. Hutchinson, Silow & Stephens, The Evolution of Gossypium (1947); see also Watt, Wild & Cultivated Cotton Pl. (1907); Watt in Kew Bull. 1926: 193–210, and op. cit. 1927: 321–356; Wouters in Publ. I.N.É.A.C., Sér. Sci. 34 (1948); Roberty in Candollea 9: 19–103 (1942), and op. cit. 13: 9–165 (1950).

- 1** Bracteoles linear-oblong or narrowly triangular, not more than 4 mm. broad, with up to 4 teeth, or entire; capsules with hairs on the sutures; seeds with a single coat of fine brown hairs, but without long lint-hairs (“cotton-wool”) [1. *anomalum*](#)
Bracteoles suborbicular or broadly triangular, more than 1 cm. broad; capsules without hairs on the sutures; seeds with long lint-hairs (“cotton-wool”), with or without a layer of fuzz-hairs below: **2**
- 2** Bracteoles entire or dentate, the teeth usually less than 3 times longer than broad: **3**
Bracteoles deeply lacinate, the laciniae usually more than 3 times as long as broad: **4**
- 3** Bracteoles closely investing the flower, longer than broad, entire or with 3–4 teeth near the apex; capsules tapering [2. *arboreum*](#)
Bracteoles flaring widely from the flower, usually broader than long, the upper margin usually with 6–8 teeth; capsules rounded, or with prominent shoulders; plants covered with a dense even coat of long hairs [3. *herbaceum* var. *acerifolium*](#)
- 4** Staminal column short; anthers loosely arranged, the filaments longer in the upper part of the column than below; capsule surface smooth, sometimes with oil-glands conspicuous beneath the surface [4. *hirsutum*](#)
Staminal column long; anthers compactly arranged, on short subequal filaments; capsule surface usually coarsely

pitted with black oil-glands in the pits:5

- 5 Capsules usually less than 6 cm. long, broadest near the base; seeds free5. *barbadense* var. *barbadense*

Capsules usually more than 6 cm. long, broadest near the middle and tapering to the base; seeds connate5a. *barbadense* var. *brasiliense*

1. **Gossypium anomalum** Wawra in Sitzungsber. Math.-Nat. Akad. Wiss. Wien 38: 561 (1860); F.T.A. 1: 211; Chev. in Bev. Bot. Appliq. 13: 190–194; J. B. Hutch, in J. B. Hutch, et al. Evol. Gossyp. 28, t. 4 (q.v. for syn.). *APD acc*

Fr. Sud.: & Fr. Nig.: fide Chev. l.c.

Extends to A.–E. Sudan, Eritrea, Somaliland, S.W. Africa and Angola.

2. **Gossypium arboreum** Linn. — F.T.A. 1: 211; J. B. Hutch. l.c. 32, t. 4 (q.v. for syn.; specimens from our area are referred to the race soudanense). *APD acc*

Gossypium simpsonii of F.W.T.A., ed. 1, 1: 269.

Gossypium africanum of F.W.T.A., ed. 1, 1: 269.

Perennial shrubs, or annual subshrubs; flowers red or purple, or yellow.

G. C.: Gambaga Imp. Inst. 48487! Togo: Kpedsu (Jan.) Howes 1099! Dah.: Zagnanado (Feb.) Chev. 23069! N. Nig.: Nupe Barter 1182! Kazaure (fl. & fr. Feb.) Imp. Inst. H 1258/1913. Ilorin (Nov.) Lamb 3! Thornton! Bassa (June) Elliott 249! Kano (Jan.) Andrew! Lamb 8! Geidam (Dec.) Elliott 135! S. Nig.: Lagos Rowland! Abeokuta Irving! Millen! Oba Foster 188!

Widespread in tropical and subtropical Africa, Madagascar and Asia.

3. **Gossypium herbaceum** var. **acerifolium** (Guill. & Perr.) A. Chev. in Compt. Rend. Acad. Sci. 208: 25 (1939); Rev. Bot. Appliq. 19: 540; J. B. Hutch. l.c. 36, t. 5 (q.v. for syn.). *APD acc*

Gossypium punctatum var. **acerifolium** Guill. & Perr. (1831).

Gossypium obtusifolium var. **wightianum** (Tod.) Watt — F.W.T.A., ed. 1, 1: 269.

A hairy shrub, to 6 ft. high; flowers yellow usually purple-blotched in centre.

Sen.: fide Guill. & Perr. l.c. Dah.: Dassa-Zoumè (fl. & fr. May) Chev. 23614! N. Nig.: Nupe Barter! Kano Prov. Imp. Inst. 46323! Ilorin Thornton! S. Nig.: Abeokuta (Feb.) Irving!

Extends to India and Nyasaland.

4. **Gossypium hirsutum** Linn. Sp. Pl., ed. 2, 2: 975 (1763); J. B. Hutch. l.c. 40, 6–7 (q.v. for syn.), including var. *punctatum* (Schum. & Thonn.) J. B. Hutch, *G. mexicanum* Tod. and *G. purpurascens* Poir. — F.W.T.A., ed. 1, 1: 269. *APD acc*

Cultivated and subspontaneous.

Fr. Sud.: Goundam (Aug.) Chev. 2732! Gam.: Dudgeon! Georgetown (Jan.) Dalz. 8130! S. L.: Barter! Moyamba (fl. & fr. Feb.) Dudgeon 7! G. C.: Winnebuh (Feb.) Dalz. 8283! Anum (Feb.) Johnson! Native and cultivated in tropical S. America, now distributed throughout central America and the Antilles, sporadic in Africa and India.

12. KOSTELETZKYA

C. Presl — F.T.A. 1: 193.

- 1 Flowers densely clustered at the ends of the shoots, forming a panicle of spike-like racemes; fruits enclosed by the calyx, 5-angled, tomentose all over and bristly pilose mainly on the angles; epicalyx of 8–10 filiform pilose bracteoles as long as the calyx; leaves suborbicular to ovate, widely cordate at base, slightly 3-lobed, up to about 12 cm. long and broad, stellate pilose, doubly dentate [1. grantii](#)
Flowers solitary on well-developed pedicels, or in lax axillary fascicles or cymes; fruits not enclosed by the calyx: [2](#)
- 2 Leaves linear to linear-lanceolate, up to 12 cm. long and 1.3 cm. broad, the lower ones sometimes hastate at the base, serrulated, scabrid on both surfaces; stems scabrid; flowers solitary; pedicels up to 4 cm. long; epicalyx of 7–10 linear bracteoles a little shorter than the calyx; fruits depressed, pentagonal, bristly pilose all over [2. buettneri](#)
Leaves ovate, pentagonal or 3 (–5)-lobed: [3](#)
- 3 Fruits with recurved bristles on the very prominent, almost winged angles, the body tomentose and about 7 mm. diam.; flowers in lax fascicles or cymes; epicalyx of about 7 linear pubescent bracteoles, shorter than the calyx; leaves pentagonal, crenate about 7 cm. diam., shortly stellate-pubescent above, stellate-pubescent and with longer stellate hairs beneath, somewhat glabrescent; stems stellate-pubescent [3. stellata](#)
Fruits with spreading, not recurved bristles, mainly on the angles, the body stellate-pubescent and about 5 mm. diam.; flowers in lax axillary fascicles; epicalyx of about 7 linear-filiform long-pilose bracteoles, about as long as the calyx, or longer; leaves ovate to 3 (–5)-lobed, dentate, up to about 10 cm. long and 8 cm. broad, more or less densely hirsute on both surfaces; stems more or less densely hirsute or somewhat glabrescent [4. adoensis](#)

1. *Kosteletzkya grantii* (Mast.) Garcke in Linnaea 43: 53 (1881). *APD acc*

Hibiscus grantii Mast. in F.T.A. 1: 203 (1868).

Kosteletzkya chevalieri Hochr. (1906) — Chev. Bot. 63; F.W.T.A., ed. 1, 1: 270.

Erect coarse herb, to 6 ft. high, densely strigose-hispid; flowers pale pink.

Port. G.: Piche to Canquelifa (Oct.) Esp. Santo 3107! **Fr. G.:** Timbo to Ditinn (Sept.) Chev. 18504! Soumbalako to Boulivel (Sept.) Chev. 18661! **S. L.:** Musaia (Oct.–Dec.) Thomas 2609! Deighton 4452! Warantamba (Oct.) Small 338! **N. Nig.:** Kontagora (Oct.) Dalz. 130!

Extends to A.–E. **Sudan**, **Uganda**, **Belgian Congo** and **Angola**.

2. *Kosteletzkya buettneri* Gürke in Verh. Bot. Verein. Brand. 31: 92 (1889). *APD acc*

13. MALVASTRUM

*APD: Synonym of Anisodonteia C. Presl**A. Gray* — F.T.A. 1: 177.

- 1 Woody herb; branches with loose long appressed branched hairs; leaves with slender petioles, ovate, coarsely serrate, more or less rounded at the base, 3–5 cm. long, 2–2.5 cm. broad, laxly pilose on the upper surface with simple hairs, hairs branched beneath; flowers single or crowded, shortly stalked; epicalyx of 3 narrow bracteoles; calyx-lobes broadly lanceolate, acute; carpels 8–12, with 3 sharp points at the apex and on the sides, laxly pilose. [coromandelianum](#)

Malvastrum coromandelianum (Linn.) Garcke in Bonplandia 5: 297 (1857); Chev. Bot. 56. *APD acc**Malva coromandeliana* Linn. (1753).*Malvastrum tricuspidatum* A. Gray (1852) — F.W.T.A., ed. 1, 1: 270.

Erect, 2–3 ft.; flowers pale yellow.

G. C.: W. of Axim (Apr.) Morton GC 6649! Obrachera (Nov.) Morton GC 7890! Kumasi (Sept.) Darko 594! Accra (Mar.) Deighton 564! **Dah.:** Adjara, Porto Novo (Jan.) Chev. 22751. **N. Nig.:** Aguji, Ilorin Thornton! **S. Nig.:** Lagos Rowland! Ibadan (Jan.–Apr., Aug.) Golding 3! 18! Meikle 935! 1145! 1455!

Native of America, widely distributed in the tropics.

MALPIGHIACEAE

Trees, shrubs or climbers, usually clothed with appressed medifixed hairs. Leaves opposite or rarely alternate, simple; a pair of glands often present at the base of the blade; stipules present or absent, sometimes connate. Flowers mostly hermaphrodite, actinomorphic. Sepals 5, imbricate or rarely valvate, often biglandular outside. Petals 5, clawed. Disk small. Stamens 10, hypogynous; filaments free or connate at the base; anthers 2-celled, opening lengthwise. Carpels usually 3, free or connate into a 3-celled ovary; cells 1-ovuled; styles usually separate and spreading. Fruiting carpels mostly winged or carpels connate into a fleshy or woody drupe. Seeds without endosperm and with straight, curved or uncinate, rarely circinate embryo.

A distinct and mainly tropical family, most highly represented in tropical America.

The medifixed hairs, glandular calyx-lobes and samaroid fruit are almost constant features of the few represented in our area.

- 1 Leaves alternate: **2**
 Leaves opposite: **3**
- 2 Samara more or less oblanceolate or obovate, the wing arising from the upper part of the fruit body **1.**
[Acridocarpus](#)
 Samara elliptic-suborbicular, the wing surrounding the outer side of the fruit body **2.** [Rhinopterys](#)
- 3 Sepals closed over the petals in bud **3.** [Flabellaria](#)
 Sepals open in bud, the petals conspicuous: **4**
- 4 Wing of samara very small, the latter nut-like **4.** [Stigmaphyllon](#)

- Wing of samara large:5
- 5 Samara broadly elliptic; calycine glands large and fleshy[5. *Heteropteris*](#)
- Samara shield-like, orbicular; calycine glands absent[6. *Triaspis*](#)

***Thryallis glauca* (Cav.) O. Ktze.**

***Galphimia glauca* Cav.**

A native of Central America, it is commonly cultivated as a hedge plant.

Species of *Malpighia* Linn. are also cultivated in our area.

1. ACRIDOCARPUS

Guill. & Perr. — F.T.A. 1: 277. APD acc

- 1 Bracts and bracteoles erect, usually small and subulate (rarely short and ovate), up to 3 mm. long; inflorescence not or only a little branched; mature leaves glabrous beneath, or the midrib sometimes shortly pubescent:.....2
- Bracts and bracteoles soon becoming reflexed, spatulate-oblongate to broadly lanceolate or ovate, 4–6 mm. long, persistent; inflorescence much-branched, with curved spreading branches; leaves more or less obovate to oblanceolate-obovate, cuneate, rounded or subcordate at base, rounded and often apiculate at apex:6
- 2 Bracts and bracteoles subulate, without glands:3
- Bracts and bracteoles glandular; leaves more or less cuneate at base; flowers in long racemes or subpaniculate; samara oblanceolate about 5 cm. long and 1.5 cm. broad:5
- 3 Leaves more or less oblong, rounded or very often obtuse at base, distinctly acuminate; samara at least 2.5 cm. long:4
- Leaves oblanceolate, or oblong-oblanceolate, cuneate at base, rounded and sometimes very shortly cuspidate at apex, 8–13 cm. long, 2–5 cm. broad; flowers in long racemes; calyx with 2–3 glands; samara up to 2.8 cm. long[3. *chevalieri*](#)
- 4 Flowers racemose, numerous, floriferous part of axis at least 5 cm. long; calyx with a single large gland below the lobes and opposite the outer petal; leaves more or less oblong, 12–27 cm. long, 7–12 cm. broad, lateral nerves looped and very prominent beneath, coarsely reticulate; samara 3–5 cm. long, 1.2–2 cm. broad[1. *longifolius*](#)
- Flowers subcorymbose, few, floriferous part of axis up to 5 cm. long; calyx with 2 glands; leaves narrowly oblong, 8–12 cm. long, 3.5–5 cm. broad, rather finely reticulate beneath; samara up to 3.5 cm. long and 1.5 cm. broad[2. *alternifolius*](#)
- 5 Leaves oblong or narrowly obovate-oblanceolate, 6–12 cm. long, 3–5 cm. broad, lateral nerves about 6 pairs, much branched; pedicels up to about 1.5 cm. long[4. *smeathmannii*](#)
- Leaves broadly obovate, about 18 cm. long and 8 cm. broad, with about 9 pairs of strong lateral nerves and few tertiary nerves; pedicels up to about 8 mm. long[5. *staudtii*](#)
- 6 Sepals 3–3.5 mm. long; anthers acute at apex, not 2-horned; samara obliquely oblanceolate, up to 7 cm. long and 2 cm. broad; leaves 8–30 cm. long, 4–14 cm. broad, glabrous or pubescent beneath[6. *plagiopterus*](#)
- Sepals 6–6.5 mm. long; anthers with two divergent sterile horns at the apex; samara up to 6 cm. long and 2.2 cm. broad; leaves 10–30 cm. long, 5–17 cm. broad, more or less pilose beneath[7. *macrocalyx*](#)

1. ***Acridocarpus longifolius* (G. Don) Hook. f.** in Fl. Nigrit. 244 (1849); Niedenzu in Engl. Pflanzenr. Malpighiac. 271 (incl. vars.) *APD acc*

***Anomalopteris longifolia* G. Don** (1831).

***Acridocarpus smeathmannii* var. ♂** Oliv. F.T.A. 1: 278.

A glabrous scandent shrub; flowers yellow; fruits reddish; **often growing near water.**

Lib.: Fishtown Dinklage 2040. Monrovia (June) Baldwin 5873! Dinklage 2218. Dime (fl. & fr. Apr.) Barker 1260! **S. Nig.:** Lagos (Feb., July) Barter 2196! Millen 145! Dalz. 1262! Nun R. (fl. & fr. Also in **French Cameroons**.

Acridocarpus sp.

Similar to *A. longifolius* but calyx with 3 glands instead of 1. More material required.

S. Nig.: Utanga, Obudu Div. (fl. & fr. Dec.) Keay & Savory FHI 25147!

Imperfectly known species.

2. RHINOPTERYS

Niendenzu in E. & P. Pflanzenfam. 3, 4: 352 (1897); Engl. Pflanzenr. Malpighiac. 279.

- 1 Sepals obovate to oblanceolate-obovate:.....2
 Sepals ovate; branchlets shortly pilose; leaves oblong, acute, 13 cm. long, 3–5.5 cm. broad, densely reticulate; racemes lax-flowered, densely pilose; petals 1.2 cm. long; samara semicordate, 6 cm. long and 3.5 cm. broad.[3. kerstingii](#)
- 2 Branchlets pubescent; leaves alternate, sessile, oblong-elliptic, or elliptic, rounded at base, rounded or very slightly acuminate at apex, 8–15 cm. long, 4–8 cm. broad, very coarsely reticulate and thinly pubescent beneath, with about 8–9 pairs of lateral nerves; racemes stout, about 30 cm. long, densely flowered; pedicels 2 cm. long, pubescent; petals nearly 1.5 cm. long; samara elliptic-orbicular, the wing all round the side of the fruit-body, slightly pubescent, 4 cm. long[1. spectabilis](#)
- Branchlets nearly glabrous; leaves alternate, subsessile, narrowly oblong or oblong-oblanceolate, subacute at base, triangular-acuminate, 10–17 cm. long, 2.5–4.5 cm. broad, coarsely reticulate and slightly pubescent beneath, with about 10 pairs of much-branched lateral nerves; racemes about 20 cm. long, thinly pubescent; pedicels 2 cm. long, pubescent; samara orbicular-elliptic, the wing all round one side of the fruit body, slightly pubescent, about 6 cm. long[2. angustifolia](#)

1. *Rhinopterys spectabilis* Niendenzu in E. & P. Pflanzenfam. 3, 4: 352 (1897); Engl. Pflanzenr. Malpighiac. 280.

*APD: Synonym of *Acridocarpus spectabilis* (Nied.) Doorn-Hoekm.*

Acridocarpus hemicyclopterus Sprague (1906).

Suffrutex, or shrub.

Gam.: Brown-Lester 47! 50! Ozanne 5! Genieri (Feb.) Fox 41!

2. *Rhinopterys angustifolia* Sprague in Kew Bull. 1922: 194.

*APD: Synonym of *Acridocarpus spectabilis* (Nied.) Doorn-Hoekm.*

Rhinopterys spectabilis subsp. *angustifolia* (Sprague) Niendenzu l.c. 281.

A small tree in **savannah**, with red-brown branchlets and white flowers.

G. C.: Lawra, N.T. (fr. Feb.) Macleod 815!

3. *Rhinopterys kerstingii* (Engl.) Niendenzu in Arb. Bot. Inst. Ak. Braunsberg 7: 20 (1921); Engl. Pflanzenr. Malpighiac. 280.

*APD: Synonym of *Acridocarpus spectabilis* (Nied.) Doorn-Hoekm.*

Acridocarpus kerstingii Engl. Bot. Jahrb. 43: 383 (1909).

Suffrutex, in **savannah**.

Fr. G.: Pobéguin 2143! **Togo:** Bangeli (fr. Mar.) Kersting 507.

***Rhinopterys* sp. A**

Straggling plant in **savannah**.

G. C.: Gambaga (fr. June) Akpabla 680.

More thorough field work is required to determine just how far the above species are really distinct.

Imperfectly known species.

3. FLABELLARIA

Cav. — F.T.A. 1: 282.

- 1 Climbing shrub; branchlets appressed-pubescent; leaves opposite, ovate or ovate-orbicular, obtuse or subacute, 10–14 cm. long, up to 10 cm. broad, glabrous above, appressed-silky-tomentose beneath; lateral nerves about 4–5 pairs; petiole 1.5–2 cm. long, tomentose; panicles terminal, lax, many-flowered; bracts oblanceolate; pedicels 8–10 mm. long; sepals closed in bud, 4 mm. long; petals entire, glabrous; wings of fruit together suborbicular, about 3–6 cm. diam. [paniculata](#)

Flabellaria paniculata Cav. — F.T.A. 1: 282; Niedenzu in Engl. Pflanzenr. Malpighiac. 38, t. 10. *APD acc*

A climbing shrub with grey-silky branchlets and leaves, and white to light pink flowers.

Sen.: Messira Berhaut 1792. **Port. G.:** Formosa (Apr.) Esp. Santo 1964! **Fr. G.:** Rio Nunez Heudelot 848! Kouroussa (fl. & fr. Mar.) Pobéguin 672! Diaguissa to Timbo (Apr.) Chev. 13441! **S. Also in **French Cameroons**, **Gabon**, **Belgian Congo**, **A.-E. Sudan**, **Uganda**, **Tanganyika** and **Angola**.

4. STIGMAPHYLLON

A. Juss. in St.-Hil. Fl. Bras. Mer. 3: 48 (1832).

Brachypterys *A. Juss.* (1837) — F.W.T.A., ed. 1, 1: 273.

- 1 Branchlets finely appressed-pubescent; leaves opposite, lanceolate, obtusely pointed, shortly cuneate at base, about 7 cm. long and 2.5 cm. broad, minutely appressed-pubescent beneath; lateral nerves about 6 pairs, slender and inconspicuous; flowers few, at the ends of short lateral branchlets; pedicels about 2 cm. long, glabrous; sepals with 2 large contiguous glands in the lower part; petals with a long claw, suborbicular, about 1.5 cm. long, crenulate; stamens 10; styles 3, distinct; samaras 2–3 together, nut-like, with a very small wing [ovatum](#)

Stigmaphyllon ovatum (Cav.) Niedenzu in Ind. lect. Lyc. Braunsberg. p. aest. 1900: 31 (1900); Engl. Pflanzenr. Malpighiac. 515.

APD: *Synonym of Stigmaphyllon bannisterioides* (L.) C.E. Anderson

Banisteria ovata Cav. (1790).

Brachypterys ovata (Cav.) Small (1910) — F.W.T.A., ed. 1, 1: 273.

A soft-wooded straggling climber in mangrove swamps and among rocks on sandy sea shores; flowers yellow.

Fr. G.: Rio Nunez Whitfield! **S. L.:** Mahela (Nov., Dec.) Sc. Elliot 4089! T. S. Jones 49! Rokupr (fl. & fr. July) Jordan 54! Tombo (May) Deighton 2768! Kent (fr. Nov.) Tindall 21! Bonthe Isl. (Nov.) Deighton 2273!

Also in **Central Tropical America** and **East Tropical America**.

5. HETEROPTERIS

APD: *Synonym of Heteropteris Kunth*

Kunth Nov. Gen. Sp. Pl. 5: 163 (1822).

- Branchlets lenticellate; leaves opposite, oblong-elliptic, shortly acuminate, rounded at base, 12–20 cm. long, 5–8 cm. broad, thinly pubescent beneath, at length glabrous but densely papillose; lateral nerves about 10 pairs, much branched; petiole 1 cm. long, thicker at the base; panicles terminal, about 10 cm. long, rusty-tomentose; bracts ovate, 4 mm. long; calycine glands very large and fleshy; stamens 10; samaras 1–3, broadly obliquely elliptic, about 2.5 cm. long, tomentellous [leona](#)

Heteropteris leona (Cav.) Exell Cat. S. Tomé 123 (1944). *APD acc**Banisteria leona* Cav. (1790), partly — F.W.T.A., ed. 1, 1: 274.*Heteropteris africana* A. Juss. (1843) — F.T.A. 1: 276; Chev. Bot. 95; Niedenzu in Engl. Pflanzenr. Malpighiac. 375, incl. vars.

A climbing shrub with coriaceous leaves, yellow flowers and red-winged fruits; **chiefly in coastal districts.**

Also in **French Cameroons, Gabon, Belgian Congo, Angola, Principe** and **S. Tomé.**

6. TRIASPIS

Burchell — F.T.A. 1: 280.

- 1 Stipules persistent, foliaceous, reniform, 1–1.5 cm. long, silky below; leaves opposite, ovate to ovate-lanceolate, acuminate, rounded at base, 8–15 cm. long, 5–9 cm. broad, thinly long-appressed-pilose beneath; petiole about 1 cm. long; panicles rather lax-flowered, with large leafy bracts; pedicels about 1.5 cm. long; sepals elliptic, pubescent, 3 mm. long; petals glabrous; wings of fruit together orbicular, about 5–6 cm. diam., glabrous [1. stipulata](#)

Stipules small and deciduous; leaves ovate-elliptic, very shortly acuminate, cordate at base, 7–8 cm. long, 4.5–5.5 cm. broad, densely appressed-villous beneath; petiole 1.5 cm. long, tomentose; panicles rather small and densely flowered; pedicels about 1 cm. long, tomentose; sepals oblong, tomentose; petals glabrous; wings of fruit together suborbicular, cordate at base, about 2.5 cm. diam., glabrous [2. odorata](#)

1. **Triaspis stipulata** Oliv. F.T.A. 1: 281 (1868); Niedenzu in Engl. Pflanzenr. Malpighiac. 49. *APD acc*

A woody climber with brownish-pilose branchlets and inflorescence; flowers in abundant panicles; calyx pinkish brown, petals white to yellow, and pink.

Togo: Misahöhe (Nov.) Mildbr. 7323! **S. Nig.:** Lagos Rowland! Millen 71! Abeokuta Irving 99! Usonigbe F.R. (Nov.) Keay FHI 25583! Awgu (Nov.) Keay FHI 21532! **Br. Cam.:** Victoria (fl. & fr. Dec.–Feb.) Maitland 911! Dalz. 8173!

Also in **French Cameroons.**

HUMIRIACEAE

Trees or shrubs. Leaves alternate, simple; stipules absent. Flowers hermaphrodite, actinomorphic. Sepals 5, imbricate, shortly or wholly connate. Petals 5, free, soon falling away, slightly imbricate-contorted. Stamens 10 or more, hypogynous, more or less connate in the lower part; anthers versatile, 2–4-celled, opening lengthwise. Disk annular and often toothed, or of separate glands, surrounding the base of the ovary. Ovary free, sessile, 5–7-celled; style simple; ovules 1–3, pendulous from the apex, anatropous. Fruit a drupe with rather thin fleshy pericarp and hard endocarp, sometimes with numerous resin-filled cavities. Seeds 1–2 in each cell; embryo straight in the middle of copious endosperm; cotyledons short.

A small family confined to tropical America and Africa.

Recognized by the exstipulate leaves, stamens 10 or more, partially connate, style undivided.

SACOGLOTTIS

Mart. Nov. Gen. & Sp. 2: 146 (1827). *Aubrya* Baill. — *F.T.A.* 1: 275.

Trees; leaves leathery, glabrous, toothed. Flowers in axillary cymes. Ovary 5-celled; style simple; ovules solitary. Fruit with a thick woody pericarp with resin-filled cavities.

- 1 A large tree, 25 m. or more; branchlets with the bark splitting lengthwise; leaves oblong-elliptic, shortly cuneate at base, obtusely acuminate, 10–15 cm. long, 3–6 cm. broad, coriaceous, crenulate, glabrous, reticulate on both surfaces, with rather numerous much-branched lateral nerves; petiole about 0.5 cm. long, swollen at the base; cymes axillary, many-flowered, about 1/2 as long as the leaves; pedicels very short, stout; calyx pubescent, 2 mm. long, with broad, almost truncate lobes; petals slightly imbricate, shortly pubescent except on the margin; fruit hard, ellipsoid, 3–4 cm. long, 2.5 cm. diam., with numerous unequal resin-filled cavities [gabonensis](#)

Sacoglottis gabonensis (Baill.) Urb. in *Mart. Fl. Bras.* 12, 2: 449 (1877); Aubrév. *Fl. For. C. Iv.* 1: 306, t. 123. *APD acc*

Aubrya gabonensis Baill.—*F.T.A.* 1: 275.

A. occidentalis Chev. *Bot.* 94, name only.

A forest tree, with red-brown shaggy bark; flowers yellow.

S. L.: Gola Forest (Jan.) Unwin & Smythe 55! **Lib.:** Dukwia R. (fr. Aug.) Linder 219! Cooper 274! Duport (Nov.) Linder 1469! **Iv. C.:** Dabou (Feb.) Chev. 16195! Abidjan Aubrév. 92! **G. Also in **French Cameroons**, **Gabon** and **Angola**. (See Appendix, p. 134.)

IXONANTHACEAE

Trees and shrubs. Leaves alternate, simple, entire or toothed, pinnately nerved; stipules very small, caducous. Flowers hermaphrodite, in axillary fascicles or cymes. Sepals 5, shortly connate, imbricate. Petals 5, free, contorted, persistent and indurated in fruit. Stamens 5–20, inserted on an annular disk or shortly united at base, hypogynous or subperigynous; filaments otherwise free; anthers 2-celled, short. Ovary 5–3-celled; ovules 2 in each cell, pendulous from the central axis; style simple or shortly 5–3-fid. Fruit a capsule, woody or coriaceous, septicidal, the carpels often spuriously septate. Seeds arillate, with fleshy endosperm.

OCHTHOCOSMUS

Benth. in *Hook. Lond. Journ. Bot.* 2: 366 (1843).

Phyllocosmus Klotzsch — *F.T.A.* 1: 272.

- 1 Leaves acuminate, with black glandular teeth on the margin of the acumen, oblong lanceolate or obovate, acute at base, 8–11 cm. long, 2–4 cm. broad, shining above; lateral nerves few, ascending, with numerous obscure fine parallel tertiary nerves; racemes of fascicles clustered, axillary, slender, up to 7 cm. long; rhachis puberulous; pedicels slender, fasciculate, 2–3 mm. long [1. africanus](#)
- Leaves rounded at the apex, shortly crenate-dentate nearly to the base, obovate-oblancoate, acute or obtuse at base, 8–15 cm. long, 2.5–6 cm. broad, rigidly coriaceous, dull or slightly shining, with about 10 pairs of lateral nerves rather obscure beneath and the tertiary nerves not evident; petiole swollen, transversely split; panicles clustered near the ends of the shoots, up to 15 cm. long; rhachis and pedicels glabrous, the latter 5 mm. long; flowers white, turning pink [2. chippii](#)

1. **Ochthocosmus africanus** Hook. f. in *Fl. Nigrit.* 240, t. 23 (1849); Aubrév. *Fl. For. C. Iv.* 1: 302.

*APD: Synonym of *Phyllocosmus africanus* (Hook. f.) Klotzsch*

Phyllocosmus africanus (Hook. f.) Klotzsch — F.T.A. 1: 273; Stapf 583; Chev. Bot. 94.

A small tree or shrub, with sarmentose branches, to 50 ft. high; flowers very abundant, small, white or yellowish, fragrant; capsules 1–2 seeded, 5–6 mm. long.

Port. G.: Mansoa (Oct.) Esp. Santo 2319! **Fr. G.:** Conrakry (Dec.) Chev. 25687. **S. L.:** Don! Hedde's Farm (Mar.) Lane-Poole 360! Kukuna (Jan.) Sc. Elliot 4665! Roruks (Sept.) Deighton 4844! ERYTHROXYLACEAE

Trees, shrubs, or undershrubs. Leaves alternate, rarely opposite, simple, entire; stipules intrapetiolar, rarely extrapetiolar, often caducous. Flowers fasciculate, hermaphrodite, rarely subdioecious, hypogynous, actinomorphic. Calyx persistent, campanulate, lobes 5, imbricate. Petals 5, free, deciduous, imbricate, mostly ligulate on the inside. Stamens 10, in 2 series, more or less connate at the base; anthers ellipsoid, 2-celled, opening lengthwise. Ovary of 3 carpels, 3-celled, mostly two of the cells sterile, fertile cells 1–2-ovuled; ovules pendulous; styles 3, free or more or less connate; stigmas oblique, depressed-capitate or clavate. Fruit drupaceous; seeds with or without endosperm; embryo straight.

A small family sparsely represented in Africa.

Stipules mostly intrapetiolar; petals with a scale on the inside.

ERYTHROXYLUM

Browne — F.T.A. 1: 273. *APD acc*

Shrubs or small trees. Leaves alternate, entire; stipules intrapetiolar. Flowers small, pedicellate, in axillary fascicles. Sepals usually 5. Petals as many, imbricate, with a scale on the inner side. Stamens 10. Ovary 3–4-celled; styles 3 or 4. Fruit a drupe.

- 1 Leaves oblanceolate to narrowly obovate, slightly narrowed to the very obtuse emarginate apex, 3–8 cm. long, 2–3 cm. broad, shining above and reticulate on both surfaces; stipules triangular-ovate, keeled, 4 mm. long; flowers small, 1–4 in clusters on stout pedicels about 5 mm. long; sepals triangular, obtuse [1. emarginatum](#)

Leaves obovate, rounded at the apex, 3–6 cm. long, 1.5–2.5 cm. broad, slightly shining above and laxly reticulate on both surfaces; stipules curved inside the petiole, becoming hardened; flowers several in clusters, on rather slender pedicels about 1 cm. long; sepals triangular, acute; young fruits arcuate, about 1 cm. long .[2. mannii](#)

1. *Erythroxylum emarginatum* *Thonn.* — F.T.A. 1: 274; O. E. Schulz in Engl. Pflanzenr. Erythroxylac. 135; Aubrév. Fl. For. C. Iv. 1: 304. *APD acc*

A glabrous shrub or small tree; flowers white, fragrant; fruit red.

Fr. G.: Kouroussa Pobéguin 671! **G. C.:** Thonning. Accra Plains Irvine 424. Krepi (Jan.) Johnson 560! Afram Plains (fr. May) Kitson 1097! Abokobi (Oct.) Vigne FH 4260! **Dah.:** Abomey (Feb.) Chev. 23128! **N. Nig.:** Nupe Barter 1650! Kachiya (Feb.) Meikle 1205! **S. Nig.:** Ijaye Barter 3421! Olokemeji Foster 277! Idanre Hills (Oct.–Jan.) Keay FHI 22681! Brenan 8663!

Widespread in tropical Africa.

2. *Erythroxylum mannii* Oliv. F.T.A. 1: 274 (1868); O. E. Schulz l.c. 124, t. 22; Aubrév. l.c. 1: 304, t. 122. *APD acc*

A forest tree, to 80 ft. high and 6 ft. girth, with straight bole and open spreading crown, deciduous; profuse white flowers.

S. L.: Bagroo R. (Apr.) Mann 850! Gorahun (fl. & young fr. June) Small 719! **Iv. C.:** Aubrév. 662! 1379! **G. C.:** Ofin Headwaters (Apr.) Vigne FH 1907. **Br. Cam.:** Johann-Albrechtshöhe (Apr.) Staudt 941!

Also in **French Camerouns.**

***Erythroxylum coca* Lam.**

Besides the above indigenous species, the Cocaine plant, a native of tropical S. America, is cultivated in our area.

LEPIDOBOTRYACEAE

Trees, shrubs or climbers. Leaves alternate, pinnate trifoliate or unifoliate with a jointed petiole, leaflets entire, pinnately nerved; stipules and stipels caducous. Flowers hermaphrodite or unisexual, actinomorphic; in axillary or terminal panicles or slender or short catkin-like racemes. Sepals 5, imbricate, united in the lower part. Petals 5, imbricate, free. Stamens 10, inserted on the margin of a fleshy disk; filaments more or less connate at the base into a short tube, sterile in female flowers; anthers 2-celled, dorsifixed, opening by slits lengthwise. Ovary superior, 5- or 3-celled; styles 5 or 3, free or shortly connate at the base; ovules 2 in each cell, on axile placentas, collateral or superposed. Fruit berry-like, indehiscent or septicidally dehiscent. Seeds covered by a fleshy, sometimes lacinate aril, with endosperm; embryo straight or oblique, with 2 fleshy foliaceous cotyledons.

A family of three genera in tropical Asia and Africa.

LEPIDOBOTRYS

Engl. Bot. Jahrb. 32: 108 (1902).

- 1 Small tree; leaves alternate, unifoliate, oblong-elliptic, acuminate, 6–10 cm. long, 3–4.5 cm. broad, pinnately nerved; petiolule jointed at the base; stipules and stipels caducous, the former small and suborbicular, the latter oblong; flowers unisexual, dioecious, the males arranged in short dense sessile catkin-like axillary inflorescences; bracts and bracteoles small, hairy, persistent; female flowers fewer in short fascicle-like racemes; pedicels jointed at the apex, subpersistent; male flowers: sepals 5, imbricate, shortly connate at the base; petals 5, free, imbricate; stamens 10, inserted on the margin of a fleshy disk; rudimentary ovary small, with 3 stigmas; female flowers like the male but with sterile stamens; ovary 3-celled; ovule 2, collateral on axile placentas, pendulous; styles 3, connate at the base; capsule 1-seeded, dehiscing septicidally; seeds nearly covered by a fleshy aril; embryo straight [*staudtii*](#)

***Lepidobotrys staudtii* Engl.** *Bot. Jahrb.* 32: 108 (1902). *APD acc*

Small tree of forest.

S. Nig.: Sapoba (Nov.) Ross 221! Kennedy 2827! Kwale, Warri (Jan.) Ainslie FHI 2827! **Br. Cam.:** Johann-Albrechtshöhe Staudt 911!

Also in **French Camerouns, Ubangi-Shari, Gabon** and **Belgian Congo.**

CTENOLOPHONACEAE

Trees. Leaves opposite, undivided, oblong-elliptic, acuminate, pinnately nerved, coriaceous; stipules interpetiolar, united in pairs, deciduous. Flowers hermaphrodite, actinomorphic; in short terminal

panicles; bracts very small and caducous. Sepals 5, rounded, broadly elliptic, imbricate. Petals 5, free, oblong, imbricate. Stamens 10, hypogynous; filaments free, alternately shorter; anthers 2-celled, introrse, opening lengthwise. Ovary superior, 2-celled; style 2-fid at the apex; ovules 2 in each cell, collateral, pendulous from a rather long funicle attached to the central axis. Fruit woody, 1-seeded, splitting unilaterally. Seed pendulous from the slender free central axis, nearly covered by a fibrous comb-like aril.

A family with a single genus of two species, one in West Africa, the other in South-East Asia.

CTENOLOPHON

Oliv. in Trans. Linn. Soc. 28: 516 (1873).

- 1 Tree; with shortly stellate-pubescent branchlets; leaves coriaceous, broadly ovate to elliptic-ovate, obtuse at base, broadly acuminate, 4–9 cm. long, 2.5–5 cm. broad, glabrous; flowers in short terminal panicles, pedicels short; sepals suborbicular to broadly transverse elliptic, about 4 mm. broad; petals about 1 cm. long and 2 mm. broad, densely stellate-lepidote outside; fruit a bivalved capsule, about 2.5 cm. long and 8 mm. broad, with a single seed 1.5 cm. long, bearing a dorsal fibrillate aril [englerianus](#)

Ctenolophon englerianus *Mildbr.* in Notizbl. Bot. Gart. Berl. 8: 706 (1924); Kennedy For. Fl. S. Nig. 27; Exell & Mendonça in Consp. Fl. Angol. 1: 248. *APD acc*

Riparian forest tree, to 80 ft. high; flowers pink.

S. Nig.: Sapoba (Mar., Sept.) Kennedy 1574! 1689! Jones FHI 7442! Calabar (Apr.) Amachi FHI 24306!

Also in [Angola](#); the other species of the genus occur in S.E. Asia.

LINACEAE

Trees, shrubs, rarely herbs; branches sometimes climbing by hooks. Leaves simple, alternate or opposite; stipules present or absent, sometimes gland-like. Flowers actinomorphic, hermaphrodite. Sepals 4–5, free or partly united, imbricate. Petals free, contorted, fugacious. Stamens as many as and alternate with the petals, sometimes alternating with small staminodes; filaments connate at base; anthers introrse, 2-celled, opening lengthwise. Ovary superior, 3–5-celled, cells often again partially subdivided; ovules 2 in each cell, pendulous; styles 3–5, free or partly united, with simple capitate stigmas. Fruit a septicidal capsule. Seeds compressed, shining, with or without endosperm; embryo straight, cotyledons flat.

- 1 Woody shrubs, mostly scandent; stems often with recurved hooks; stipules deeply divided; leaves alternate; flowers 5-merous; sepals not lobed; petals longer than the sepals [1. Hugonia](#)
Delicate annual herb; leaves opposite, 3 mm. long or less; flowers 4-merous, sepals lobed or toothed at the apex; petals about equalling the sepals [2. Radiola](#)

1. HUGONIA

Linn. — F.T.A. 1: 270.

- 1 Flowers in leafless racemes or panicles, terminal above the leaves, or terminating leafless lateral shoots; outer sepals ovate, about 5 mm. long, tomentose outside; petals about 1 cm. long, glabrous; fruit globose, about 15 mm. diam., glabrous; stipules early caducous; leaves elliptic or ovate-elliptic, broadly rounded at base, subacute at apex, 12–22 cm. long, 5–11 cm. broad, distinctly crenate, with 12–18 pairs of lateral nerves: **2**
Flowers axillary among the leaves, in cymes or solitary, along the shoots or clustered towards the ends of the branches among numerous young leaves: **3**
2 Mature leaves densely tomentose beneath, venation obscured [1. spicata var. spicata](#)
Mature leaves puberulous to glabrescent beneath, venation not obscured [1a. spicata var. glabrescens](#)
3 Young branchlets, petioles and midribs glabrous; flowers in few-flowered axillary cymes towards the ends of the branches; outer sepals suborbicular, about 3 mm. long, pubescent outside; petals about 12 mm. long; stipules

- early caducous; leaves obovate-ob lanceolate, cuneate at base, obtuse at apex, 6–14 cm. long, 4–6 cm. broad, glabrous [2. obtusifolia](#)
- Young branchlets, petioles and midribs, and often leaf-surface as well, hairy, sometimes very densely so; outer sepals 5 mm. or more long: **4**
- 4** Outer sepals suborbicular, 5–6 mm. long, striate, with a broad membranous recurved margin, spreading in bud; petals 15–20 mm. long; flowers 2–5 together in axillary cymes; leaves oblong to obovate or oblanceolate, somewhat narrowed to the base, obtuse or subacute at apex, 7–14 cm. long, 3–7 cm. broad [3. platysepala](#)
- Outer sepals without a membranous margin, acute: **5**
- 5** Outer sepals spreading in bud; flowers in long-pedunculate pseudo-corymbs, axillary towards the ends of the branches; whole plant pilose with golden hairs; leaves obovate to obovate-ob lanceolate, long-cuneate at base, acute at apex, 11–23 cm. long, 5–9 cm. broad, coarsely dentate; stipules with triangular centre and long filiform lobes [4. talbotii](#)
- Outer sepals not spreading in bud: **6**
- 6** Petals densely pilose outside; flowers crowded at the ends of the shoots, amongst long-pectinate stipules and the young leaves, not axillary along the shoots; stems densely and thickly tomentose; leaves elongate-obovate, narrowed to the very short hirsute petiole, densely rusty-hirsute on midrib above and beneath and on the nerves beneath: **7**
- Petals glabrous; flowers mostly axillary along the shoots, rarely crowded at the apex as well; leaves not elongate-obovate, densely tomentose or shortly pubescent, not long-hirsute: **8**
- 7** Petals triangular, about 26 mm. long, 12 mm. broad at apex, narrowed gradually at the base into a small claw; stipules palmate, with 5–9 subulate, long-plumose segments, joined only at the base; leaves 12–30 cm. long, 5–10 cm. broad, gradually acuminate, margin entire, with 15–22 pairs of lateral nerves [5. macrophylla](#)
- Petals elongate-oblong, about 16 mm. long, 5 mm. broad at apex, abruptly long-clawed at base; stipules pinnately divided with a flattened, subglabrous central portion and 5–9 subulate, pubescent segments, not long-plumose; leaves 10–20 cm. long, 3.5–7.5 cm. broad, rounded at apex, with an abrupt short acumen, or mucronate; margin obscurely denticulate to dentate, with tufts of hairs at intervals all round the margin; 12–17 pairs of lateral nerves [6. rufipilis](#)
- 8** Branchlets and undersurface of leaves on young shoots pubescent with short brown hairs; stipules more or less persistent, pinnately divided into subulate lobes; leaves elliptic to oblanceolate, cuneate at base, acutely acuminate, 7–15 cm. long, 3–6 cm. broad, mature leaves glabrescent except for the midrib; flowers in short axillary 2–4-flowered cymes; flower buds very long-acuminate, sepals ovate-lanceolate about 10 mm. long, densely brown pubescent outside, becoming reflexed; petals triangular, 2–2.5 cm. long [7. planchonii](#)
- Branchlets and undersurface of leaves on young shoots, densely white-woolly-tomentose; flower-buds acute or shortly and bluntly beaked, sepals narrowly ovate, about 10 mm. long, white woolly-tomentose outside; flowers 2–3, shortly pedicellate in leaf-axils along the shoots: **9**
- 9** Mature leaves glabrous beneath except for the puberulous midrib and nerves, venation obvious; leaves elliptic, or oblong-elliptic, rounded or broadly cuneate at base, abruptly acuminate, 15–17 cm. long, 5–9 cm. broad, irregularly serrate [8. foliosa](#)
- Mature leaves densely white-tomentose or -tomentellous beneath, elliptic to oblong-elliptic, rounded or narrowed at base, acute to acuminate, 8–18 cm. long, 3–8 cm. broad, crenate-dentate; 7–16 pairs of lateral nerves [9. afzelii](#)

1. *Hugonia spicata* Oliv. var. *spicata* — F.T.A. 1: 270 (1868).

A woody climber, stems to 30 ft. long.

F. Po: (Jan.) Mann 224!

1a. *Hugonia spicata* var. *glabrescens* Keay in Bull. Jard. Bot. Brux. 26: 183 (1956). *APD acc*

Woody climber as above; sepals olive-brown, petals white.

S. Nig.: Okomu F.R. (Feb.) Brenan 9084! Onicha Olona (Oct.) Thomas 1875!

Also in **Belgian Congo**.

2. *Hugonia obtusifolia* C. H. Wright in Kew Bull. 1901: 119. *APD acc*

A scrambling shrub; flowers bright yellow, “waxy-looking”.

S. Nig.: Imo R. Kennedy 2563! Eket Talbot 3023! Cross R. (Jan.–Mar.) Johnston!

Also in **French Cameroons** and **Belgian Congo**.

3. *Hugonia platysepala* *Welw. ex Oliv.* F.T.A. 1: 272 (1868); Chev. Bot. 93. *APD acc*

Hugonia baumannii *Engl.* (1902); F.W.T.A., ed. 1, 1: 132.

Scandent shrub, flowers bright yellow; **mainly in regrowth forest.**

Fr. G.: Macenta (May) Collenette 11! **S. L.:** Limba (Apr.) Sc. Elliot 5504! 5523! Sherbro Sc. Elliot 5757! Njala (May) Deighton 667! Daru (Apr.) Deighton 3146! **Lib.:** Gola (Apr.) Bunting! 8. *Hugonia foliosa* *Oliv.* F.T.A. 1: 271 (1868); Chev. Bot. 93.

APD: *Synonym of Hugonia afzelii* *R. Br. ex Planch.*

A woody climber.

S. L.: Bagroo R. (Apr.) Mann 816! **Iv. C.:** Byanouan to Soubiré (Mar.) Chev. 17739! **S. Nig.:** Akure F.R. Keay FHI 25584!

9. *Hugonia afzelii* *R.Br. ex Planch* — F.T.A. 1: 270; Chev. Bot. 93; Mildbr. in Fedde Rep. 41: 254 (1937). *APD acc*

Hugonia chevalieri *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 132 (1927); Kew Bull. 1928: 29.

A shrub, 15–18 ft. high, with long, loose branches; flowers yellow.

S. L.: Afzelius! Kasewe Hills F.R. (June) Deighton 5832! **Lib.:** Monrovia (Mar.) Dinklage 3069! **Iv. C.:** Guidéko (May) Chev. 16371! **G. C.:** Axim (Feb.) Akpabla 104!

Also in **Belgian Congo**.

1. **Hugonia dinklagei** *Engl. ex Mildbr.* in Fedde Rep. 41: 254 (1937), name only.

Lib.: Dinklage 2535.

Imperfectly known species.

2. **Hugonia sp. A.**

Leaves oblanceolate, 20–25 cm. long, 6–6.5 cm. broad, glabrous beneath; flowers and fruits not known.

S. L.: Thomas 4539!

Imperfectly known species.

3. **Hugonia sp. B.**

Small scandent shrub; leaves oblanceolate, 25–40 cm. long, 6–11 cm. broad, pubescent beneath, very densely so when young; flowers and fruits not known.

S. Nig.: Shasha F.R. Tamajong FHI 20287! Akure F.R. Keay FHI 25612!

Imperfectly known species.

2. RADIOLA

Hill — F.T.A. 1: 268.

- 1 A very small glabrous annual herb; leaves opposite, ovate or elliptic, about 4 mm. long and 2–3 mm. broad; flowers very small, numerous, in leafy dichotomous cymes; sepals ovate, acute; valves of the capsule tipped by the persistent styles [linoides](#)

Radiola linoides *Roth* Tent. Fl. Germ. 1: 71 (1788); Clapham, Tutin & Warburg Fl. Brit. Isl. 377. *APD acc*

Radiola millegrana *Sm.* (1800) — F.T.A. 1: 268.

A very small delicate annual, up to 3 in. high; petals white.

Br. Cam.: Cam. Mt., 7–12,000 ft. (Nov., Jan.) Mann 1334! 2021! Maitland 816! 1293!

Also in **Europe**, **Madeira**, **Teneriffe**, **N. Africa** and **temperate Africa**.

ZYGOPHYLLACEAE

Shrubs or herbs woody at the base, rarely trees; branches often jointed at the nodes. Leaves opposite or alternate, simple, 2-foliolate or pinnate, rarely 3-foliolate, not gland-dotted; stipules present, persistent, often spinescent. Flowers hermaphrodite, actinomorphic or zygomorphic. Sepals 5, rarely 4, free or rarely connate at the base, imbricate, rarely valvate. Petals 4–5, rarely absent, hypogynous, free, imbricate or contorted, rarely valvate. Disk mostly present. Stamens the same number to three times the number of the petals, often unequal in length; filaments free, often with a scale inside; anthers 2-celled, opening lengthwise. Ovary superior, sessile or rarely stipitate, usually 4–5-celled; cells rarely transversely locellate; style simple, short, or stigmas sessile; ovules 2 or more in each cell, axile. Fruits various. Seeds mostly with some endosperm; embryo as long as the seed, straight or slightly curved.

Mainly in the tropics and subtropics, often in the drier parts.

- 1 Fruits not drupaceous: **2**
Fruits drupaceous: **5**

- 2 Leaves pinnate, with 3–7 pairs of leaflets, anisophyllous; spreading herbs filaments without scales at the base, but the alternate ones each subtended by a gland: **3**
 Leaves 1–3-foliolate: **4**
- 3 Fruit dividing into usually 10 (twice as many as original carpels) 1-seeded nutlets [1. *Kallstroemia*](#)
 Fruit dividing into usually 5 carpels, each with 3–5 compartments, the compartments 1-seeded [2. *Tribulus*](#)
- 4 Unarmed shrublets with fleshy leaves; filaments each with a scale at the base; fruit sharply 5-angled, ellipsoid, opening lengthwise [3. *Zygophyllum*](#)
 Spiny diffuse subwoody annual; filaments without scales at the base; fruit pyramidal, opening from below into five 1-seeded cocci tipped by the persistent style [4. *Fagonia*](#)
- 5 Leaves simple; branchlets spiny; stamens (10–) 15; ovary and fruit 3-celled [5. *Nitraria*](#)
 Leaves 2-foliolate; branchlets often armed with supra-axillary spines; flowers in supra-axillary fascicles or racemes; stamens 10; ovary 5-celled; fruit a 1-seeded drupe [6. *Balanites*](#)

***Guaiacum officinale* Linn.**

A native of tropical America, known as “Lignum Vitae,” it is cultivated in our area.

1. KALLSTROEMIA

Scop. Introd. 212 (1777).

- 1 Stems diffuse or ascending, striate; stipules lanceolate, 3 mm. long; leaves 3–5 cm. long; petioles shorter than the leaflets; leaflets usually 3 pairs, obliquely elliptic or oval, rounded and mucronate at apex, 1–2 cm. long; pedicels in fruit about 2 cm. long, strongly ribbed and thickened upwards; sepals narrowly linear-lanceolate, hispid; petals yellow, obovate, 6–7 mm. long; fruit pyramidal, ribbed and muricate, beaked by the persistent style, strigose [pubescens](#)

Kallstroemia pubescens* (G. Don) Dandy in Kew Bull. 1955: 138. *APD acc

Tribulus pubescens G. Don Gen. Syst. 1: 769 (1831).

Kallstroemia caribaea Rydb. in N. Am. Fl. 25, 2: 111 (1910); Engl. in E. & P. Pflanzenfam. 19A: 177 (1931).

Tribulus maximus of F.T.A. 1: 284 and of F.W.T.A., ed. 1, 1: 136, not of Linn.

A spreading annual herb [of waste places; introduced](#).

G. C.: Cape Coast (July) Don! T. Vogel 58! Achimota Irvine 657! **S. Nig.:** Lagos (June) Dalz. 1039! A native of tropical America,

2. TRIBULUS

Linn. — F.T.A. 1: 283.

- 1 Stems diffuse and trailing, hirsute, slightly swollen at nodes; stipules subulate, caducous; petioles about as long as leaflets; leaves 2–5 cm. long; leaflets 5–7 pairs, oblong or elliptic, somewhat oblique, rather obtuse, 3–13 mm. long; pedicels in fruit about 1 cm. long, stout; sepals caducous; petals obovate, pale yellow, about 4 mm. long; fruit depressed, spiny, each carpel with two large rigid divergent spines and a few tubercles, thinly setose-pilose [terrestris](#)

Tribulus terrestris* Linn. — F.T.A. 1: 283; Chev. Bot. 96; Engl. in E. & P. Pflanzenfam. 19A: 176 (1931). *APD acc

APD: *Synonym of *Tribulus zeyheri* subsp. *macranthus* (Hassk.) Hadidi*

Tribulus saharae Chev. Bot. 96, name only.

A trailing herb, woody below, from pubescent to tomentose; [a pest of footpaths and fields](#).

Sen.: Sieber 14! Heudelot! **Fr. Sud.:** Timbuktu (July) Chev. 1287! **G. C.:** Accra (Mar.) Deighton 562! **Togo:** Lome Warnecke 12! **Dah.:** Debeaux 161! **Fr. Nig.:** Zinder (Oct.) Hagerup 589a! **N. Nig.:** Sokoto (Sept.) Moiser 98! Maiduguri (May) Ujor FHI 32966!

Also common throughout the tropical and warm temperate regions of the world.

3. ZYGOPHYLLUM*Linn.* — F.T.A. 1: 285.

- 1** Leaves 2-foliolate, opposite, fleshy, internodes short; flowers solitary or paired, axillary:.....**2**
 Leaves 1-foliolate, opposite, slightly fleshy; flowers solitary, axillary; fruits glabrous, globular, depressed at apex
 with the style persistent, deeply 5-angled, about 2 mm. long[3. simplex](#)
- 2** Fruits villous, linear, rounded at apex, 5-angled, about 10 mm. long [1. waterlotii](#)
 Fruits glabrous, oblong-ellipsoid, rounded at apex, 5-angled, about 5 mm. long [2. fontanesii](#)

- 1. *Zygophyllum waterlotii* Maire** in Bull. Soc. Hist. Nat. Afr. Nord 28: 348 (1937); Trochain Contrib. Étude Vég. Sénégal 386 (1940).

*APD: Synonym of *Tetraena gaetula* subsp. *waterlotii* (Maire) Beier & Thulin*

A fleshy shrublet.

Sen.: fide Trochain l.c.Also in **Mauritania** and **S.W. Sahara**.

- 2. *Zygophyllum fontanesii* Webb & Berth.** Phytog. Canar. 3, 1: 17, t. 1 (1836); Chev. Bot. 97; Berhaut Fl. Sen. 9.

*APD: Synonym of *Tetraena fontanesii* (Webb & Berthel.) Beier & Thulin*An undershrub about 1 ft. high with a woody rootstock; flowers white; **a maritime plant.****Sen.:** Oualo Berhaut 1355.Also in **Mauritania**, **N. Africa**, **Canary** and **Cape Verde Islands**.

- 3. *Zygophyllum simplex* Linn.** — F.T.A. 1: 285; Berhaut l.c. 76.

*APD: Synonym of *Tetraena simplex* (L.) Beier & Thulin*

A diffuse wiry undershrub a few inches high; flowers yellow.

Sen.: Gandiole Berhaut 1747.Also in **Cape Verde Islands**, through the arid regions of northern tropical Africa to **Arabia** and Baluchistan and in S.W. Africa.**4. FAGONIA***Linn.* — F.T.A. 1: 286.

- 1** A diffuse woody spiny annual, puberulous-glandular or nearly glabrous; leaves very variable, 1–3-foliolate, opposite, leaflets linear to lanceolate, acute, with a callous tip, bright green, up to 2 cm. long; stipules spinose, often longer than the leaves, very acute; flowers solitary, axillary; pedicels nearly 0.5 cm. long; sepals ovate, very acute, 3 mm. long; petals more than twice the length of the sepals, rose or lilac, narrowly clawed; fruit pyramidal, shortly pubescent, about 0.5 cm. long, tipped by the hard persistent style, opening from below into five 1-seeded cocci[cretica](#)

Fagonia cretica* Linn.** — F.T.A. 1: 287. *APD acc**APD: Synonym of *Fagonia tenuifolia* Hochst. & Steud. ex Boiss.*Fagonia bruguieri* DC.** — Berhaut Fl. Sen. 53, 75.

A variable desert plant sometimes forming meadows in hollow places.

Sen.: Gandiole Berhaut 1745.

Also throughout the warmer dry parts of the world.

5. NITRARIA

Linn. — F.T.A. 1: 288; Engl. in E. & P. Pflanzenfam. 19A: 178 (1931).

- 1 A shrub 2–3 m. high; branchlets becoming spiny; leaves mostly borne on short arrested branchlets, obovate, entire, 1.5–3 cm. long, up to 1 cm. broad, rather fleshy, glabrous; petiole slender, about 4 mm. long; flowers in short cymes, nearly sessile, the terminal ones pedicellate; sepals ovate-lanceolate, fleshy, slightly puberulous, about 1.5 mm. long; petals about twice as long; fruits narrowly conical, triangular, 1 cm. long, capped by the sessile stigma [retusa](#)

Nitraria retusa (Forsk.) Aschers. in Verh. Bot. Ver. Brandenb. 18: 94 (1876); Engl. l.c., fig. 85, H–P.
APD acc

Peganum retusum Forsk. (1775).

Nitraria senegalensis Lam. (1798) — F.W.T.A., ed. 1, 1: 484; Berhaut Fl. Sen. 135.

Nitraria tridentata Dest. (1798)—Chev. Bot. 97.

Nitraria schoberi of F.T.A. 1: 288.

A plant of dry and saline areas; commonly known as “Nitre Bush.”

Sen.: On banks of the lower R. Senegal (Jan.) Döllinger! Heudelot 432!

Extends from Mauritania and desert regions of northern Africa to Palestine and [Arabia](#).

6. BALANITES

Del. — F.T.A. 1: 314; Engl. in E. & P. Pflanzenfam. 19A: 179 (1931). *APD acc*

- 1 A forest tree; flowering branchlets mostly unarmed, sterile branchlets with simple or forked spines 1–4 cm. long; branchlets and petioles more or less densely, or sparingly, minutely puberulous; petioles 1–2.5 cm. long; petiolules 0.4–1.4 cm. long; leaflets broadly ovate, rounded or obtuse and often unequal at base, shortly acuminate, 5–8.5 (–12) cm. long, 4–6 (–7) cm. broad, glabrous or nearly so; flowers in supra-axillary puberulous or tomentellous pseudumbels; peduncles 0.5–1.8 cm. long, pedicels 1–1.7 cm. long; buds nearly globose, tomentellous; petals about 8 mm. long, more or less long-pilose inside; ovary tomentellous; fruits ellipsoid or ovoid-ellipsoid, about 4.5–10 cm. long, 3.5–5 cm. broad [L. wilsoniana](#)

A savannah tree; all branchlets with stout, rigid, simple spines up to 8 cm. long; branchlets and petioles pubescent and often glabrescent; petioles up to 1 cm. long; leaflets subsessile, obovate to orbicular-rhomboid, 0.7–5 cm. long and 0.4–4.5 cm. broad, pubescent beneath, then glabrescent; flowers in tomentose supra-axillary fascicles or rarely subracemose; pedicels up to 1 cm. long; buds ovoid tomentose; petals about 5 mm. long, glabrous inside; ovary tomentose; fruits broadly oblong-ellipsoid, rounded at each end, 3–4 cm. long, smooth or wrinkled, tomentose when young [2. aegyptiaca](#)

1. **Balanites wilsoniana Dawe & Sprague** in J. Linn. Soc. 37: 506 (1906); Aubrév. Fl. For. C. Iv. 2: 99, t. 166; Kennedy For. Fl. S. Nig. 152. *APD acc*

Balanites tieghemi A. Chev. (1912) — Chev. Bot. 105.

Balanites mayumbensis Exell (1927).

A [forest](#) tree to 120 ft. high, with high buttresses, sometimes spiny, continuing upwards as twisted fluting; young trees with forked spines up to 4 in. long; flowers greenish-yellow, ripe fruits yellow with strong smelling pulp and a single woody seed.

Widespread in the drier parts of tropical Africa, extending from Mauritania and the Central Sahara to Palestine, **Arabia** and India.

EUPHORBIACEAE

Trees, shrubs or herbs, occasionally with milky juice. Leaves alternate or rarely opposite, simple or digitately compound, sometimes reduced, mostly stipulate. Flowers unisexual, mostly monoecious. Sepals imbricate or valvate, or in very specialized inflorescences much reduced or absent. Petals absent or rarely present and sometimes united. Stamens 1–1,000, free or variously connate; anthers 2–4-celled, erect or inflexed in bud, opening lengthwise, rarely by pores. Rudimentary ovary often present in the male flowers. Ovary mostly 3-celled; styles free or united at the base; ovules solitary or paired, pendulous from the inner angle of the cells. Fruit a capsule or drupe. Seeds often with a conspicuous caruncle; endosperm copious, fleshy; embryo straight.

A large and heterogeneous family, mainly in the tropics and subtropics.

Flowers much reduced and mostly apetalous; allied to Sterculiaceae, Flacourtiaceae, Celastraceae, and perhaps Sapindaceae.

KEY TO THE TRIBES.

- 1 Male and female flowers not enclosed in a common involucre; stamens usually more than 1:.....2
Male and female flowers much reduced and enclosed in a common involucre; stamens 1; perianth usually absent or rim-like, rarely cupular; plants with milky juice4. *EUPHORBIEAE*
- 2 Ovary-cells 2-ovuled; plants without milky juice1. *PHYLLANTHEAE*
Ovary-cells 1-ovuled:.....3
- 3 Petals present; stamens 1-seriate, opposite the sepals; flowers very small in axillary fascicles; plants without milky juice2. *GALEARIEAE*
Petals present or absent; stamens 1–2-seriate, the outer alternate with the sepals or all more or less central, sometimes very numerous; plants with or without milky juice3. *CROTONEAE*

Tribe 1. — PHYLLANTHEAE.

- 1 Leaves digitately compound, opposite; leaflets stalked; flowers dioecious; petals absent; stamens 4–101. *Oldfieldia*
Leaves simple:.....2
- 2 Sepals of the male flowers valvate in bud; petals present (in our species), 5; stamens 5, connate in their lower part:3
Sepals of the male flowers imbricate in bud:.....4
- 3 Flowers in axillary fascicles or glomerules; ovary 2-celled; fruit drupaceous, 1–2-celled; tertiary nerves of the leaves usually parallel2. *Bridelia*
Flowers in short axillary racemes; ovary 3-celled; fruit capsular, 3-celled; tertiary nerves not parallel3. *Cleistanthus*
- 4 Petals present in the male flowers; stamens 5 (–6):.....5
Petals absent from the male flowers; stamens 2 to numerous:.....8
- 5 Inflorescence spicate, racemose or fasciculate:6

- Inflorescence paniculate, flowers dioecious; capsule ellipsoid, entire, loculicidal; stigmas reflexed, entire; leaves very unequal in size, borne on petioles of very unequal length [7. *Spondianthus*](#)
- 6 Styles absent; stigmas sessile, thick, entire; flowers monoecious, with conspicuous coriaceous bracts; filaments free; fruit capsular [4. *Amanoa*](#)
- Styles well-developed, usually divided; fruit a 3-lobed capsule; bracts not large and coriaceous: [7](#)
- 7 Flowers in axillary fascicles, monoecious; filaments shortly connate at the base [5. *Pentabrachion*](#)
- Flowers in spikes or racemes, dioecious; filaments free; fruit with 1 seed per cell; see also below [6. *Thecacoris*](#)
- 8 Male and female flowers not surrounded by an involucre of calycine bracts: [9](#)
- Male flowers in a globose head surrounded by calycine bracts; female solitary in an involucre of bracts; fruit indehiscent, containing 3–4 pyrenes [18. *Uapaca*](#)
- 9 Flowers in spikes or racemes (see also No. 16): [10](#)
- Flowers in fascicles or glomerules, or solitary in the leaf-axils, or (*Phyllanthus muellerianus* and *P. profusus*) in racemes of fascicles: [16](#)
- 10 Fruits not winged; disk present in both sexes, or rarely absent from the female; leaves not glandular beneath: [11](#)
- Fruits 2-celled, broadly winged, flat; leaves glandular beneath; male inflorescence a catkin-like spike, female shortly racemose; styles 2, free from the base [14. *Hymenocardia*](#)
- 11 Stems perennial; much-branched trees or shrubs: [12](#)
- Stems annual, mostly simple, arising from a woody rhizome; flowers dioecious; capsule 3-lobed [13. *Cyathogyne*](#)
- 12 Ovary 2-celled, each cell divided by a false septum; styles 2, connate at the base, undivided [8. *Martretia*](#)
- Ovary cells not divided; styles bifid or bilobed: [13](#)
- 13 Ovary 4-celled; male spikes fasciculate, axillary [9. *Apodiscus*](#)
- Ovary 2–3-celled: [14](#)
- Ovary 1-celled; fruit drupaceous; flowers small, in slender catkin-like inflorescences [12. *Antidesma*](#)
- 14 Bracts subtending the male flowers in 3 series, the middle bract cupular and enclosing the flower in bud; disk of the female flower adnate to the sepals; flowers dioecious; capsule large, septicidal [10. *Protomegabaria*](#)
- Bract subtending the male flowers solitary; disk in the female not adnate to the sepals: [15](#)
- 15 Fruits depressed-globose, 3-lobed, 3-celled, dehiscent into 2-valved cocci; see also above [6. *Thecacoris*](#)
- Fruits entire, 1-celled by abortion [11. *Maesobotrya*](#)
- 16 Disk in the male flowers central; fruit indehiscent; flowers dioecious; ovary and fruit 1–7-celled; stamens 4–30, filaments free, variously inserted around and in the folds of the disk; trees and shrubs [15. *Drypetes*](#)
- Disk in the male flowers not central; fruit usually dehiscent; ovary and fruit 3-celled; shrubs and herbs, rarely trees: [17](#)
- 17 Rudimentary ovary absent from the male flower; flowers usually monoecious; stamens 2–5, free or variously united [16. *Phyllanthus*](#)
- Rudimentary ovary present in the male flower, deeply 2–3-partite; flowers dioecious; stamens 5, free [17. *Securinega*](#)

Tribe 2. — GALEARIEAE.

- 1 Flowers small in axillary fascicles; fruit a small indehiscent drupe; rudimentary ovary present in the male flowers; shrub with pellucid-dotted leaves [19. *Microdesmis*](#)

Tribe 3. — CROTONEAE.

- 1 Leaves digitately compound, with separate leaflets; flowers paniculate: [2](#)
- Leaves simple, sometimes deeply lobed but not into separate leaflets: [3](#)
- 2 Petals absent; fruit capsular; the introduced Para rubber tree [20. *Hevea*](#)
- Petals present and connate; fruit indehiscent; indigenous tree, not rubber-producing; stipules broad, reniform, toothed [21. *Ricinodendron*](#)
- 3 Petals present in the male flowers: [4](#)
- Petals absent from the male flower: [14](#)
- 4 Anthers inflexed in bud; calyx-lobes valvate; male petals free; leaves often lepidote or stellate-pubescent beneath; flowers spicate or racemose [22. *Croton*](#)
- Anthers erect in bud: [5](#)
- 5 Male calyx-lobes imbricate: [6](#)
- Male calyx-lobes valvate: [8](#)
- 6 Flowers in axillary fascicles or the females solitary; shrub with narrow leaves; filaments partially connate; fruit a

- small capsule [23. *Clutia*](#)
- Flowers cymose or paniculate: **7**
- 7** Inflorescence bisexual; male petals free or united into a tube; stamens 8, filaments partially connate; shrubs or herbs with entire or digitately lobed leaves [24. *Jatropha*](#)
- Inflorescence unisexual; male petals free, imbricate; stamens 10–20, on a hairy receptacle; fruit a 3-lobed capsule; a shrub [25. *Mildbraedia*](#)
- 8** Herbs, monoecious; calyx splitting regularly into 5–7-lobes; filaments connate into a column: **9**
- Trees, shrubs and lianes, usually dioecious; calyx splitting irregularly into 2–3-lobes: **10**
- 9** Rudimentary ovary present in the male flowers; styles lacerate; flowers in lax axillary racemes; capsule covered with processes [26. *Caperonia*](#)
- Rudimentary ovary absent; style 2-fid; flowers in rather dense racemes from the axils of the upper leaves; capsule covered with stellate hairs or scales [27. *Chrozophora*](#)
- 10** Plants without stellate hairs or scales: **11**
- Plants with stellate hairs and/or scales at least on the inflorescence; leaves 2-glandular or multiglandular at the base; filaments free: **12**
- 11** Disk of male flowers with 5 glands outside the stamens and alternate with the petals; stamens 13–40, filaments (in our species) irregularly connate at the base; flowers in racemes or panicles [28. *Grossera*](#)
- Disk of male flowers without extrastaminal glands; stamens 20–30, filaments free; flowers in racemes [29. *Pseudagrostistachys*](#)
- 12** Lower surface of leaves concealed by a dense covering of silvery scales; stamens about 30, accompanied by an equal number of interstaminal glands; male petals free; inflorescence paniculate [30. *Cyrtogonone*](#)
- Lower surface of leaves not concealed by scales; stamens 7–25, not accompanied by interstaminal glands: **13**
- 13** Leaves pinnately nerved; plants with scales at least on the inflorescence; stamens 7–19; male petals mostly united (free in *C. preussii*); inflorescence racemose [31. *Crotonogyne*](#)
- Leaves palmately nerved; plants with stellate hairs, but without scales; stamens 10–25; male petals united; inflorescence paniculate [32. *Manniophyton*](#)
- 14** Male calyx closed in bud and enveloping the stamens; plants mostly without milky juice (but see Nos. 53 and 56): **15**
- Male calyx open in bud, not covering the stamens; plants mostly with milky juice: **40**
- 15** Calyx-lobes of male flowers valvate: **16**
- Calyx-lobes of male flowers imbricate: **36**
- 16** Styles free, or if connate into a column then continuous with the central axis: **17**
- Styles connate into a stout column and continuous with the body of the carpels: **33**
- 17** Filaments unbranched, usually free: **18**
- Filaments repeatedly branched, columnar below; anthers 2-celled; leaves peltate, palmately lobed; capsule smooth or echinate [49. *Ricinus*](#)
- 18** Anther-cells not long-cylindrical and worm-like: **19**
- Anther-cells long-cylindrical or worm-like; stamens 8 or fewer; flowers monoecious or rarely dioecious; female flowers within a variously toothed or lobed, sometimes foliaceous bract; styles often laciniate [48. *Acalypha*](#)
- 19** The anther-cells erect and separate, 2-celled: **20**
- The anther-cells pendulous, either separate or adnate to the connective: **22**
- 20** Buds perulate; flowers in racemes or glomerules; pedicels capillary, jointed near the base; stamens 2–60, free; capsule usually 2-lobed [33. *Erythrococca*](#)
- Buds not perulate: **21**
- 21** Flowers regularly distributed along the rhachis of the spikes or racemes; fruits 2-lobed; stamens 6–12, free; trees or shrubs [34. *Claoxylon*](#)
- Flowers in distant glomerules or spikelets on a filiform rhachis; stamens 3–20, free; fruits 3- or rarely 2-lobed; annual herbs [35. *Micrococca*](#)
- 22** Anthers 2-celled: **23**
- Anthers 4-celled: **32**
- 23** Leaves opposite; stamens without receptacular glands, numerous, free; flowers generally dioecious; plants with stellate hairs; leaves gland-dotted or not beneath [36. *Mallotus*](#)
- Leaves alternate: **24**
- 24** Stamens 7–8; flowers dioecious; styles simple: **25**

- Stamens 9–120: **27**
- 25** Interstaminal glands absent; male flowers paniculate or racemose; ovary 2- or 3-celled; styles 5–15 mm. long **37**.
Alchornea
- Interstaminal glands present; ovary 2- or 3-celled; styles not exceeding 1 mm. long, recurved: **26**
- 26** Flower spikes in large terminal panicles; interstaminal glands numerous, hairy; fruits dehiscent **38**.
Discoglypsemna
- Flower spikes fasciculate or solitary, from nodes on the old wood or sometimes axillary; glands among the outer stamens only; fruits indehiscent **39**. *Mareyopsis*
- 27** Leaves palmately nerved, orbicular-cordate; flowers in terminal panicles, usually dioecious; stamens 15–40; disk-glands extrastaminal; leaves glandular and stellate-pubescent beneath **40**. *Neoboutonia*
- Leaves pinnately nerved, not orbicular-cordate; flowers racemose or spicate, mostly monoecious: **28**
- 28** Stamens 9–25: **29**
- Stamens 30–120: **30**
- 29** Leaves with distinct petiole 1–5 cm. long, cuneate or obtuse at base; connective of stamens broad; styles plumose **41**. *Mareya*
- Leaves sessile, auriculate-cordate at base; connective of stamens narrow; styles lacerate at the tips **42**.
Crotonogynopsis
- 30** Leaves oblanceolate, with numerous lateral nerves; styles simple, often more or less connate: **31**
- Leaves obovate-elliptic, with 7–10 lateral nerves on each side of the midrib; styles bifid **45**. *Necepsia*
- 31** Ovary and fruit smooth **43**. *Argomuellera*
- Ovary and fruit with 6 wing- or horn-like appendages; see also below **44**. *Pycnocomma*
- 32** Stamens numerous; anther-cells superposed, connective produced; styles bifid; leaves not gland-dotted beneath **46**. *Cleidion*
- Stamens 1–6 (in our species); anther-cells collateral, connective not produced; styles simple; leaves gland-dotted beneath; fruits glandular-granular **47**. *Macaranga*
- 33** Flowers racemose or spicate, not in involucre heads: **34**
- Flowers in dense involucre heads; stamens 20–30, connate below; stems usually twining **52**. *Dalechampia*
- 34** Ovary 4-celled; stamens 8–40, free, mixed with interstaminal glands; racemes axillary or leaf-opposed **50**.
Tetracarpidium
- Ovary 3-celled: **35**
- 35** Stamens numerous; female flowers at the top of the inflorescence; stems not twining; see also above **44**.
Pycnocomma
- Stamens 3, free; female flowers at the base; stems often twining; plants often with stinging hairs **51**. *Tragia*
- 36** Leaves digitately lobed, rarely some simple; flowers monoecious, in terminal or subterminal racemes or panicles; calyx large, often coloured; stamens 10, in two series, free; cultivated plants **53**. *Manihot*
- Leaves not lobed, or rarely some slightly 3-lobed (see No. 56); calyx small; flowers dioecious: **37**
- 37** Calyx 4–6-lobed; stamens 8–30; anthers 2-celled: **38**
- Calyx 3-lobed; stamens 3; anthers 4-celled; male flowers in catkin-like spikes; female flowers in very short racemes or solitary; leaves opposite or alternate **57**. *Tetrorchidium*
- 38** Flowers in axillary and terminal panicles; leaves distinctly petiolate; stamens 8 or 10 in two series **54**.
Klaineanthus
- Flowers in fascicles or racemes up to 4 cm. long; stamens 18–30, filaments very short; **39**
- 39** Flowers in small leaf-opposed fascicles; leaves sessile or very shortly petiolate; plant without milky juice **55**.
Gelonium
- Flowers in axillary racemes; leaves distinctly petiolate, sometimes slightly 3-lobed; plant with milky juice ... **56**.
Hamilcoa
- 40** Flowers racemose, dioecious; stamens 15–32; calyx 5(-6)-lobed; ovary 1-celled; fruit indehiscent **58**.
Plagiostyles
- Flowers spicate, mostly monoecious, with a few female flowers below the male flowers at the base of the spike; stamens 2–3 (rarely 1 or 4); calyx 2–3(-5)-lobed; ovary 2–3-celled; fruits mostly dehiscent: **41**
- 41** Stamens free; spikes slender: **42**
- Stamens monadelphous; male flowers in densely ovoid or subglobose spikes **61**. *Maprounea*
- 42** Seeds strophiole; ovary 3-celled; fruits dehiscent **59**. *Sebastiania*
- Seeds not strophiole; ovary 2–3-celled; fruits dehiscent or indehiscent **60**. *Sapium*

Tribe 4. — EUPHORBIEAE.

- 1 Ovary (female flower) with a cup-like calyx at its base, half surrounded by 4 involucre formed of free bracts, containing the stamens; male flowers usually about 8 in each involucre, each consisting of a single stamen with a cup-like perianth at its base, jointed to the pedicel; fruit 3-lobed; trees [62. Anthostema](#)
- Ovary (female flower) enclosed in the same involucre as the stamens or in a separate involucre, the latter cupular or 4-angled, more or less lobed and often bearing variously shaped glands on the margin: **2**
- 2 Involucre 4-angled, divided into 4 compartments by 4 large partition-like glands, without glands on the margin; small tree with milky juice [63. Dichostemma](#)
- Involucre not 4-angled, with 1–8 distinct and often very conspicuous glands on the margin: **3**
- 3 Fruit a capsule; trees, shrubs, fleshy plants or small herbs [64. Euphorbia](#)
- Fruit indehiscent, drupaceous, thick and fleshy; trees with succulent angular branches [65. Elaeophorbia](#)

Hura crepitans Linn.

The Sandbox Tree, a native of tropical America is introduced.

Aleurites cordata (Thunb.) R.Br. ex Steud.

The Tung-oil tree, a native of S.E. Asia is introduced.

A. moluccana (Linn.) Willd.

The Candle Nut, probably native of the Malaya region but now widely cultivated in the tropics

Codiaeum variegatum (Linn.) Blume

Shrubs widely grown, in numerous varieties, for their coloured leaves, commonly called “Croton”

Hippomane mancinella Linn.

A native of central America is introduced.

Putranjiva roxburghii Wall.

A native of India is introduced.

Breynia nivos (W. G. Sm.) Small

Phyllanthus nivosus W. G. Sm.

Apparently a native of Polynesia, widely cultivated as a hedge-plant on account of its decorative foliage, the “Snow bush”

Pedilanthus tithymaloides (Linn.) Poit.

A native of tropical America is introduced.

1. OLDFIELDIA

Benth. & Hook. f. — F.T.A. 6, 1: 625; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 297 (1922).

- 1 Leaves opposite, digitately 5–8-foliolate; leaflets oblanceolate or oblong-elliptic, more or less acuminate, very acute at base, up to 17 cm. long and 6 cm. broad, glabrous; male flowers in axillary cymes; calyx pubescent; capsule depressed-globose, 2.5 cm. diam., woody [africana](#)

Oldfieldia africana Benth. & Hook. f. — F.T.A. 6, 1: 625; Chev. Bot. 561; Aubrév. Fl. For. C. Iv. 2: 22, t. 128. *APD acc*

A tall forest tree, up to 100 ft. or more in height, with straight bole of 50 ft. and girth 16 ft.; bark scaly, flaking; young branchlets rusty-puberulous; fruit hard, brown, nut-like, with 3 seeds.

S. L.: Oldfield! Welw. 478! Rotumba Isl. Kirk! Gola Forest (fl. & fr. Apr.–May) Small 621! 707! **Lib.:** Brewers Landing (fr. Nov.) Linder 1395! Dukwia R. (fr. May, Oct.) Cooper 88! 344! 439! **Iv. C.:** Malamalasso (Mar.) Chev. 16250!

2. BRIDELIA

Willd. — F.T.A. 6, 1: 611; Jablonszky in Engl. Pflanzenr. Euph. 8: 54–88 (1915).

- 1 Fruits 2-celled, subglobose, black, about 8 mm. diam.; branchlets pubescent; leaves oblong or oblanceolate,

rounded at apex, 3–11 cm. long, 1–5 cm. broad, stiffly coriaceous, more or less pubescent on the nerves beneath, very closely and strongly reticulate beneath, the lateral nerves continued to the margin [1. *scleroneura*](#)

Fruits 1-celled:2

- 2 Lateral nerves not continued to the margin to form a marginal nerve; branchlets flexuose, slightly pubescent; leaves oblong-elliptic, acuminate, 8–16 cm. long, 4–7 cm. broad, glabrescent on both surfaces, not prominently reticulate, drying black; fruits oblong-ellipsoid, about 6 mm. long, black[2. *atroviridis*](#)

Lateral nerves continued to the margin and forming a marginal nerve:3

- 3 Acumen of leaves conspicuously mucronate; leaves glabrous or glabrescent on both surfaces, veins inconspicuous beneath, lamina oblong-elliptic, long-acuminate, 7–14 cm. long, 4–6.5 cm. broad; branchlets glabrous or puberulous; tree in montane forest[3. *speciosa*](#)

Acumen of leaves not mucronate; branchlets and undersurface of leaves puberulous to pubescent or tomentose:4

- 4 Undersurface of leaves minutely puberulous with appressed hairs on the surface of the lamina as well as on the midrib, nerves and veins, sometimes also with longer hairs on the midrib and nerves, at length glabrescent; veins not prominent beneath; branchlets pubescent to glabrescent; leaves elliptic to obovate, acuminate, 4–17 (–30) cm. long, 1.5–8 (–12) cm. broad[4. *micrantha*](#)

Undersurface of leaves pubescent to pilose, the hairs not appressed; branchlets pubescent to tomentose:5

- 5 Hairs spread over the undersurface of the leaf and not confined to the nerves and veins; leaves elongate-elliptic to oblong-oblancheolate or oblong-lanceolate, gradually long-acuminate, 7–14 cm. long, 2–5.5 cm. broad, lateral nerves (8–) 10–13 on each side of the midrib; forest tree with black bark on stem and branches[5. *grandis*](#)

Hairs confined to the midrib, nerves and veins beneath, often very dense when young; venation very prominent beneath; leaves oblong, to oblong-obovate or suborbicular, shortly acuminate; bark more or less greyish-brown:6

- 6 Leaves (3–) 3.5–10.5 cm. long, (1.8–) 2.5–5.5 (–7) cm. broad; lateral nerves 5–9 on each side of the midrib; densely to rather sparsely pubescent beneath; savannah tree or shrub[6. *ferruginea*](#)

Leaves 6–20 cm. long, 3.8–10 cm. broad; lateral nerves 9–13 on each side of the midrib; indumentum on midrib and nerves redder (in dried specimens) and denser than on the veins; tree of fringing forest[7. *ndellensis*](#)

1. ***Bridelia scleroneura* Müll. Arg.** in Flora 47: 515 (1864); F.T.A. 6, 1: 614; Chev. Bot. 554. *APD acc*

Bridelia scleroneuroides Pax (1893).

Bridelia tenuifolia of Aubrév. Fl. For. Soud.-Guin. 179–182, t. 4.

A *savannah* shrub or tree, to 15 ft. high, or more; flowers in small axillary clusters, red in bud, yellow when open.

Fr. G.: Irébéléya to Timbo (Sept.) Chev. 18295. **iv. C.:** Boromo Aubrév. 2198. **G. C.:** Sambisi Kitson 544! Prang (June) Vigne FH 3903! **Togo:** Sansanné Mango Aubrév. 131d. **Fr. Bridelia aubrevillei of F. W. Andr. in Fl. Pl. A.-E. Sud. 2: 56, not of Pellegr.

Tree of fringing forest in savannah regions, to 45 ft. high, with small stilt-roots and spiny stem and branches; flowers greenish-yellow.

Dah.: Birni (Feb.) Aubrév. 99d! **S. Nig.:** Old Oyo F. R., Oyo Prov. (Feb.) Keay FHI 16289!

Also in **Ubangi-Shari**, **A.-E. Sudan**, **Belgian Congo** and **Uganda**.

3. CLEISTANTHUS

Hook. f. — F.T.A. 6, 1: 621; Jablonszky in Engl. Pflanzenr. Euph. 8: 8 (1915).

- 1 Branchlets rusty-pubescent, then glabrescent, grey; leaves coriaceous oblong-lanceolate or oblong-elliptic, caudate-acuminate, 5–9 cm. long, 1.3–4 cm. broad, acumens 0.5–2 cm. long; flowers in short axillary rusty-tomentose racemes; bracts 2–5 mm. long; ovary densely rusty-tomentose; fruits subglobose, muricate [polystachyus](#)

Cleistanthus polystachyus *Hook. f. ex Planch.* — F.T.A. 6, 1: 624; Jablonszky l.c. 8: 47; Aubrév. Fl. For. C. Iv. 2: 54, t. 133, 7–9. *APD acc*

APD: Synonym of Cleistanthus ripicola J. Léonard

APD: Synonym of Cleistanthus libericus N.E. Br.

Cleistanthus libericus N.E. Br. — F.T.A. 6, 1: 624; Jablonszky l.c. 8: 46; Chev. Bot. 555; F.W.T.A., ed. 1, 1: 282.

A shrub or small tree, to 30 ft. high, in forest.

S. L.: Whitfield! Madina, Limba (Apr.) Sc. Elliot 5597! Laoma (Apr.) Aylmer 589! Falaba (Apr.) Aylmer 54! Njala (Apr.) Deighton 1138! **Lib.:** Sinoe Basin Whyte! Harbel Plantation, Kingsville (Mar.) Aug.) Moor 269! **S. Nig.:** Lower Enyong F.R., Calabar (fr. May) Onochie FHI 33213!

Also on **S. Tomé** and widespread in tropical Africa.

4. AMANOA

Aubl. — F.T.A. 6, 1: 630; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 195 (1922). *APD acc*

- 1 Flower clusters spicate; leaves oblong-lanceolate, obtusely acuminate, deltoid at the base, 9–18 cm. long, 3–6 cm. broad, rigidly coriaceous; lateral nerves 8–10 pairs, slightly raised beneath; capsule subglobose, about 2.5 cm. long; seeds shining [I. bracteosa](#)

Flower clusters solitary; leaves oblanceolate or oblong-elliptic, 8–23 cm. long, 2.5–9.5 cm. broad, coriaceous; lateral nerves 8–12 pairs, conspicuous below; capsule up to 3.8 cm. long [2. strobilacea](#)

1. **Amanoa bracteosa** *Planch.* — F.T.A. 6, 1: 631; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 200; Aubrév. Fl. For. C. Iv. 2: 54, t. 139. *APD acc*

A glabrous tree, up to 60 ft. high and 5 ft. diam., with stiff, bracteate, bright yellow, flower-spikes and hard-shelled fruit.

S. L.: Afzelius! Unwin & Smythe 12! Near Freetown Don! York Pass (fr. Apr.) Lane-Poole 78! Kambui F.R. (Apr., May) Lane-Poole 248! King 241! Magibisi to Baiima (fr. Sept.) 2. **Amanoa strobilacea** *Müll. Arg.* — F.T.A. 6, 1: 631; Pax & K. Hoffm. l.c. 198, fig. 16. *APD acc*

A glabrous tree, 30 ft. high, with flowers in small bracteate sessile subglobose heads.

Lib.: Sinoe Basin Whyte! **G. C.:** Mumuni Camp, Prestea road, Enchi Dist. (Mar.) Andoh FH 5621! **Br. Cam.:** Cameroons R. (Jan.) Mann 745! 2220! Muyaku (fr. May) Maitland 1144!

Also in **French Cameroons** and **Cabinda**.

5. PENTABRACHION

Müll. Arg. in Flora 47: 532 (1864); Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 188 (1922).

- 1 Small tree or shrub; branchlets and leaves glabrous or very nearly so; leaves oblong, rarely obovate, acute or

obtuse at base, long-caudate-acuminate, 9–24 cm. long, 3.5–11 cm. broad, strongly reticulate on both surfaces; petiole 2–7 mm. long; flowers monoecious in axillary fascicles, the females very few; sepals imbricate, about 2 mm. long; petals present, 1/3 length of sepals; male flowers with 5–6 stamens, filaments shortly connate at base, inserted within the disk, rudimentary ovary 3-partite; ovary 3-celled; capsule 3-lobed, about 1–2 cm. long and broad, on pedicel about 2.5 cm. long, glabrous outside; seeds 2 in each cell[reticulatum](#)

Pentabrachion reticulatum Müll. Arg. l.c. 47: 533 (1864); Pax & K. Hoffm. l.c. fig. 15. *APD acc*

Actephila reticulata (Müll. Arg.) Pax (1899) — F.T.A. 6, 1: 632.

A forest tree, to 25 ft. high, or shrub.

Br. Cam.: Mombo-Bakosi, Kumba (fr. May) Olorunfemi FHI 30556!

Also in **French Cameroons** and **Gabon**.

6. THECACORIS

A. Juss. — F.T.A. 6, 1: 658; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 8 (1922).

1 Ovary glabrous or nearly so:2

Ovary densely setose-pilose; leaves oblong-elliptic, unequally rounded or obtuse at base, acuminate, 18–34 cm. long, 8–15 cm. broad, with very sparse setose-hairs on midrib beneath; inflorescences up to 25 cm. long, densely pubescent on the rachis; petals absent from male flowers; capsules 3-lobed, about 9 mm. diam. [3. cf. annobonae](#)

2 Leaves minutely puberulous on the midrib beneath or glabrescent; petals absent from male flowers; leaves elliptic-lanceolate or elliptic-oblong, rarely oblong, unequally cuneate or sometimes rounded at base, long-acuminate, 9.5–27 cm. long, 3.2–12 (–15) cm. broad; male inflorescences very slender, 4–16 cm. long, sparingly pubescent; female inflorescences up to 18 cm. long in fruit; capsules 3-lobed, 6–7 mm. diam.[1. leptobotrya](#)

Leaves with setose hairs on the midrib beneath, sometimes very sparse; petals present in male flowers, linear-oblong, ciliate at apex; leaves elliptic or obovate-elliptic, cuneate to rounded at base, acuminate or obtuse at apex, 5–18 cm. long, 2–9 cm. broad; male inflorescences 2–8 cm. long, pubescent; female inflorescences up to 10 cm. long in fruit; capsules 3-lobed, about 9 mm. diam.[2. stenopetala](#)

1. **Thecacoris leptobotrya** (Müll. Arg.) Brenan in Kew Bull. 1952: 446 (1953). *APD acc*

Antidesma leptobotryum Müll. Arg. (1864) — F.T.A. 6, 1: 645; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 149.

Thecacoris gymnogyne Pax (1899) — F.T.A. 6, 1: 662; Pax & K. Hoffm. l.c. 15: 12.

Thecacoris obanensis Hutch. in F.W.T.A., ed. 1, 1: 283 (1928).

Thecacoris talbotae Hutch. l.c. (1928), excl. Chev. 19502.

A small forest tree, to 35 ft. high, or shrub; inflorescences drooping, with green axes and yellowish flowers.

S. Nig.: Oban Talbot 1503! 2330! s.n.! Kwa Falls, Calabar (Mar.) Brenan 9232! New Ndebiji (fr. May) Ujor FHI 30153! 30159! **Br. Cam.:** Korup F.R., Kumba (fr. June) Olorunfemi FHI 30638!

Also in **French Cameroons**, **Spanish Guinea** and **Gabon**.

2. **Thecacoris stenopetala** (Müll. Arg.) Müll. Arg. — F.T.A. 6, 1: 659; Pax & K. Hoffm. l.c. 15: 11. *APD acc*

Antidesma stenopetalum Müll. Arg. (1864).

Thecacoris chevalieri Beille (1910) — F.T.A. 6, 1: 660; Chev. Bot. 567; Pax & K. Hoffm. l.c.; F.W.T.A., ed. 1, 1: 283.

A forest shrub, 5–12 ft. high; flowers greenish-yellow.

S. L.: Bagroo R. (Apr.) Mann 833! Rowala (fr. July) Thomas 1034! Dumbuna (fl. & fr. Oct., fr. Jan.) Thomas 3132! 3322! 3324! Deighton 3593! Roruks (July, Nov.) Thomas 5783! Also in **Principe** and **S. Tomé**.

[*T. batesii* Hutch, from the **French Cameroons** is doubtfully distinct from this rather variable species.]

3. **Thecacoris cf. annobonae** Pax & K. Hoffm. l.c. 15: 9 (1922). *APD acc*

An understorey forest tree, to 30 ft. high; flowers greenish-yellow.

Br. Cam.: S. Bakundu F.R. (Jan.) Keay & Russell FHI 28679! Mungo R., Kumba (Apr.) Olorunfemi FHI 30531! Kiliwindi — Mamfe road (fr. July) Akuo FHI 15153!

(The type specimen from Annobon Island is not available but the description suggests that it may be conspecific with our material.)

7. SPONDIANTHUS

Engl. Bot. Jahrb. 36: 215 (1905); *F.T.A.* 6, 1: 1044; Pax & K. Hoffm. in *Engl. Pflanzenr. Euph.* 15: 13–15 (1922).

Megabaria Pierre ex Hutch. (1910) — *F.T.A.* 6, 1: 627.

- 1 Leaves obovate or elliptic, obtuse at apex, glabrous, up to 36 cm. long and 18 cm. broad, very unequal in size, borne on petioles of very unequal length; inflorescence terminal, paniculate; capsule ellipsoid, horny, 1.5–2 cm. long and 1–1.5 cm. broad; seeds ellipsoid, about 1 cm. long, red, shining:

Inflorescence pubescent, paniculate, terminal; leaves obovate or elliptic, obtuse, 9–18 cm. long, 4–11 cm. broad, glabrous, on petioles of very unequal length; lateral nerves 6–8 pairs; petiole up to 8 cm. long, wrinkled at the apex; capsule subsessile or shortly pedicellate, ellipsoid, horny, 2 cm. long, 1.5 cm. broad; seeds ellipsoid, 1 cm. long, red, shining *L. preussii* var. *preussii*

Inflorescence glabrous; leaves more or less as above, but with 6–14 lateral nerves; fruits ellipsoid, angular, 2.5 cm. long, red-brown, slightly pointed at the ends *L. preussii* var. *glaber*

1. **Spondianthus preussii** Engl. var. *preussii* — *Bot. Jahrb.* 36: 216 (1905); *Engl. in Notizbl. Bot. Gart. Berl.* 5: 241 (1911); *F.T.A.* 6, 1: 1044; Pax & K. Hoffm. l.c. 15: 13, fig. 2 (as var. *genuinus*); Aubrév. *Fl. For. C. Iv.* 2: 52, t. 138. *APD acc*

Megabaria trillesii Pierre ex Hutch. (1910), partly — *F.T.A.* 6, 1: 627, partly.

M. ugandensis of Chev. *Bot.* 586 and of *F.W.T.A.*, ed. 1, 1: 282, partly.

Tree, to 90 ft. high, in swampy areas within the rain forest; flowers cream.

Lib.: Fisherman's Lake, Grand Cape Mount (fr. Dec.) Baldwin 10894! Brewersville (fr. Dec.) Baldwin 10973! **IV. C.:** Agboville (fr. Nov.) Chev. 22381! Banco Martineau 309! Abidjan Aubrév. 123! 8. MARTRETIA

Beille — F.T.A. 6, 1: 655; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 79 (1922).

- 1 Leaves lanceolate to ovate-elliptic, gradually acuminate, shortly cuneate at base, 10–22 cm. long, 3–9 cm. broad, glabrous, with 10–15 pairs of nerves slightly prominent on both surfaces; flowers dioecious; male racemes axillary, 5 cm. long; sepals 4; stamens 5–7; female sepals 5 or 6; ovary 2-lobed, each lobe slightly bifid; styles linear, undivided [quadricornis](#)

Martretia quadricornis *Beille* — F.T.A. 6, 1: 655; Chev. Bot. 585; Pax & K. Hoffm. l.c.; Aubrév. Fl. For. C. Iv. 2: 60, t. 142. *APD acc*

A small **forest** tree of swampy places, with glabrous branchlets.

S. L.: Mano Thomas 9913! Senihun, Kamagai (Sept.) Deighton 3051! Dimbaia, Samu (Sept.) Adames 251! **Iv. C.:** Bingerville (fr. Feb.) Chev. 17360! Dabou Chev. 16215. **S. Nig.:** Onitsha Dist. Cons. of For. OC 31!

Also in **Upper Ubangi region** and **Belgian Congo**.

9. APODISCUS

Hutch. — F.T.A. 6, 1: 1045; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 45 (1922). *APD acc*

- 1 A tree; branchlets glabrous; leaves oblong-elliptic, acuminate, subcuneate at base, 8–17 cm. long, 3–8 cm. broad, entire, leathery, glabrous; lateral nerves 8–14 pairs with intermediate ones less conspicuous; spikes bisexual, with 1–2 shortly pedicellate females towards the base; axis tomentose; male sepals tomentellous; stamens 5; ovary 4-celled, pubescent [chevalieri](#)

Apodiscus chevalieri *Hutch.* — F.T.A. 6, 1: 1046; Hook. Ic. Pl. 3032; Chev. Bot. 586; Pax & K. Hoffm. l.c. *APD acc*

A tree 25–30 ft. high.

Fr. G.: between Santa R. and Timbo (Mar.) Chev. 12588. By tributary of Bowali R. (Nov.) Chev. 14997! 15057!

10. PROTOMEGABARIA

Hutch. — F.T.A. 6, 1: 656; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 43 (1922).

- 1 Leaves pubescent on the midrib and lateral nerves beneath; rudimentary ovary bipartite; leaf-blade elongate-oblong or obovate, rounded or shortly acuminate, 15–37 cm. long, 8–15 cm. broad, thinly papery; lateral nerves 10–17 pairs; male racemes about 7 cm. long, slender; capsule subglobose or oblong-ellipsoid, 3–4 cm. diam. [1. stapfiana](#)

Leaves glabrous on the midrib and lateral nerves; rudimentary ovary undivided; otherwise more or less as above, but male racemes 10–13 cm. long [2. macrophylla](#)

1. **Protomegabaria stapfiana** (*Beille*) *Hutch.* in Hook. Ic. Pl. t. 2929 (1911); F.T.A. 6, 1: 656; Chev. Bot. 586; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 44; Aubrév. Fl. For. C. Iv. 2: 58, t. 141. *APD acc*

Maesobotrya stapfiana *Beille* (1910).

Spondianthus obovatus *Engl.* (1911).

A **forest** tree, to 80 ft. high, with stout glabrous branchlets, low branching and buttressed stem; **locally abundant** in swampy parts of the rain forest.

S. L.: Falaba-Pujehun (Mar.) Aylmer 18! Gorahun (Apr.) Deighton 3650! 4106! **Lib.:** Dukwia R. (fr. Mar.) Cooper 109! 294! Webo Dist. (fr. June–July) Baldwin 6215! 6672! **IV. C.:** Malamalasso (Mar.) Chev. 16249! Soubiré to Yaou, Sanvi (Mar.) Chev. 17782. **G. C.:** Kankan, E. Akim (Mar.) Johnson 596! Kwahu Dist. Thompson 92! Bawdia (fl. & fr. Apr.) Vigne 156! **S. Nig.:** Oban Talbot 2326! Calabar (Apr.) Ejiofor FHI 21889! **Br. Cam.:** Mamfe (Apr.) Ndep Enoh 42/38!

Also in **Gabon**.

2. *Protomegalaria macrophylla* Hutch. — F.T.A. 6, 1: 657; Pax & K. Hoffm. l.c. *APD acc*

Baccaurea macrophylla Pax (1899), not of Müll. Arg. (1866).

A forest tree, to 50 ft. high; like the preceding and perhaps only varietally distinct from it.

G. C.: Benso, Tarkwa (Apr.) Andoh FH 5474! **S. Nig.:** Oban Talbot! **Br. Cam.:** N. Korup F.R. (fr. June) Olorunfemi FHI 30654!

Also in **French Cameroons**, **Gabon**, **Principe** and **S. Tomé**.

11. MAESOBOTRYA

Benth. — F.T.A. 6, 1: 663; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 17–26 (1922).

- 1 Stipules foliaceous, falcate, up to 2.5 cm. long, persistent or subpersistent; leaves elliptic or oblong-elliptic, rounded at base, caudate-acuminate, 9–25 cm. long, 4–10 cm. broad, obscurely denticulate, setulose on the midrib and nerves beneath; male and female racemes, up to 17 cm. long in dense clusters on the older wood, the former sometimes extending on to the leafy shoots; ovary glabrous; fruits obovoid, 8–9 mm. long, about 7 mm. broad, glabrous [1. *dusenii*](#)
- Stipules not foliaceous, very small, symmetrical, soon caducous: **2**
- 2 Leaves distinctly pilose or setose on the upper surface; ovary glabrous; male inflorescences crowded on young woody shoots below the leaves; female inflorescences in clusters, arising from the stem and larger branches, up to 9 cm. long; fruits obovoid-ellipsoid, up to about 6 mm. long and 5 mm. broad; leaves elliptic to obovate-elliptic, mostly rounded at base, 11–25 cm. long, 7–10 cm. broad; branchlets, petioles and both surfaces of leaves hispid [2. *staudtii*](#)
- Leaves glabrous above except on the midrib; ovary glabrous or pilose: **3**
- 3 Ovary and fruit glabrous; axes of male racemes puberulous, usually sparingly so; male inflorescences mostly on young shoots among or just below the leaves or on bole; female inflorescences mostly on the bole and large branches; young branchlets, petioles and underside of midribs sparsely to distinctly pilose with weak, yellowish (in dried specimens) hairs; petioles up to 8 cm. long; lamina membranous elliptic to elliptic-obovate, gradually acutely acuminate, 7–22.5 cm. long, 2.7–10 cm. broad; fruits fleshy, about 12–14 mm. long and broad [3a. *barteri* var. *sparsiflora*](#)
- Ovary densely setose, fruit sparingly setulose; axes of male racemes densely pubescent: **4**
- 4 Midrib and main nerves beneath pale yellowish brown when dry, like the petioles and young shoots, sparsely to distinctly pilose; male and female inflorescences extending on to the bole, the female not normally found among the leaves; flesh surrounding the seed red; otherwise as above [3. *barteri* var. *barteri*](#)
- Midrib and main nerves beneath reddish when dry, densely pilose with long, patent hairs; petiole and young shoots patent-pilose; male and female inflorescences on the young shoots amongst the leaves; flesh surrounding the seed bright blue; leaves oblong-obovate or oblong-elliptic, abruptly acuminate, 7.5–17 cm. long, 4–7.5 cm. broad [4. *floribunda* var. *vermeulenii*](#)

1. *Maesobotrya dusenii* (Pax) Hutch. in F.T.A. 6, 1: 664 (1912); Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 19, fig. 4, A.

APD: *Synonym of Maesobotrya vermeulenii* (De Wild.) J. Léonard

APD: *Synonym of Maesobotrya klaineana* (Pierre) J. Léonard

Staphysora dusenii Pax (1897).

A forest tree or shrub, to 45 ft. high; branchlets pilose; flowers and ripe fruits red.

S. Nig.: Eket Talbot! Calabar (Mar.) Brenan 9230! Oban Talbot 11! 16! 609! 1581! R. Njujua, Shakwa, Obudu (May) Latilo FHI 30931! **Br. Cam.:** S. Bakundu F.R. (fl. Apr., fr. 4. *Maesobotrya floribunda* Benth. var. *vermeulenii* (De Wild.) J. Léonard in Bull. Jard. Bot. Brux. 17: 258 (1945).

Baccaurea vermeulenii De Wild. (1910).

Tree, about 12 ft. high; flowers greenish-yellow; fruit dehiscent, exposing the bright blue flesh surrounding the seed.

S. Nig.: Oban (Mar.) Onochie FHI 34824! **Br. Cam.:** Bambui, Bamenda (fl. & fr. Jan.) Keay FHI 28420!

Also in **French Cameroons**, **Gabon**, **Cabinda** and **Belgian Congo**.

12. ANTIDESMA

Linn. — F.T.A. 6, 1: 642; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 107 (1922). *APD acc*

- 1 Stipules laciniate, deeply 3–8-partite; leaves oblong to oblanceolate-elliptic, rounded at base, acuminate at apex, 10–25 cm. long, 4–11 cm. broad; racemes up to 25 cm. long; ovary glabrous; fruits ellipsoid, 5–7 mm. long: **2**
Stipules entire: **3**
- 2 Midribs and nerves beneath, petioles and branchlets shortly pubescent; lobes of stipules 3–6, lanceolate **1.**
laciniatum var. *laciniatum*
Midribs and nerves beneath, petioles and branchlets densely clothed with long spreading hairs; lobes of stipules 6–9, filiform, sometimes branched *la. laciniatum* var. *membranaceum*
- 3 Leaves mostly rounded, obtuse or very shortly and obtusely acuminate at apex, obovate, or obovate-elliptic, or obovate-oblong, 3–10.5 cm. long, 1.5–5 cm. broad, rarely larger, tomentose to nearly glabrous beneath; male inflorescences up to 8.5 cm. long, female up to 7.5 cm. long; fruits ellipsoid, 6–8 mm. long, 5–7 mm. broad; mostly in savannah **2. venosum**

Leaves mostly distinctly and often long and acutely acuminate, up to 25 cm. long and 12 cm. broad; male inflorescences up to 24 cm. long, female up to 42 cm. long; in rain forest and fringing forest outliers:4

- 4 Fruits 3–5 mm. long, 2–4 mm. broad; leaves usually rather densely pubescent beneath, more or less oblong-elliptic, 4–15 cm. long, 2–6 cm. broad; inflorescences up to 24 cm. long; mostly in fringing forest outliers ..3. [membranaceum](#)

Fruits 7–8 mm. long, 4–5 mm. broad; leaves sparingly pilose mainly on midrib and main nerves beneath; in rain forest:5

- 5 Leaves obovate to elliptic-oblongate, usually caudate-acuminate, 7–25 cm. long, 3–12 cm. broad; female inflorescences up to 42 cm. long, male up to 13 cm. long; female calyx cup-shaped, very shortly lobed4. [vogelianum](#)

Leaves elongate-oblong, usually rather broadly triangular-acuminate, 7·5–25 cm. long, 2·7–5·6 (–7) cm. broad; female inflorescences up to 11·5 cm. long, male up to 22 cm. long; female calyx deeply lobed5. [oblonga](#)

1. **Antidesma laciniatum** Müll. Arg. var. **laciniatum** in Flora 47: 520 (1864); F.T.A. 6, 1: 643; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 145, fig. 13 (as var. *genuinum*); Chev. Bot. 564. *APD acc*

Small forest tree, to 30 ft. high; flowers in pale red spikes; fruits red when ripe.

Antidesma sp.

A small tree, up to 25 ft. high; female inflorescences shorter than the leaves. Fruits and male flowers not known.

Br. Cam.: Buea, 3,000 ft. (Jan., Mar.) Maitland 191! 451! Bali-Ngemba F.R., Bamenda (June) Ujor FHI 30410!

Imperfectly known species.

13. CYATHOGYNE

Müll. Arg. — F.T.A. 6, 1: 653; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 40 (1922).

- 1 A herb; leaves obovate-elliptic, shortly acuminate, acute or subacute at base, 7–11 cm. long, 4–5 cm. broad, coarsely repand-dentate except in the lower third, glabrous or nearly so; lateral nerves 5–6 pairs; female racemes 4 cm. long[viridis](#)

Cyathogyne viridis Müll. Arg. — F.T.A. 6, 1: 654; Pax & K. Hoffm. l.c. 15: 41 (incl. var. *preussii*).

APD: Synonym of *Thecacoris viridis* (Müll. Arg.) G.L. Webster

APD: Synonym of *Thecacoris viridis* (Müll. Arg.) G.L. Webster

Cyathogyne preussii Pax (1897) — F.T.A. 6, 1: 655 (1912); F.W.T.A., ed. 1, 1: 284.

Forest herb, about 1 ft. high, from a horizontal rhizome.

S. Nig.: Umon Ndealichi F.R., Calabar (Apr.) Akpata FHI 3936! **Br. Cam.:** Victoria Preuss 1210!

Also in **French Cameroons**, **Spanish Guinea**, **Gabon** and **Belgian Congo**.

14. HYMENOCARDIA

Wall. ex Lindl. — F.T.A. 6, 1: 648; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 72–78 (1922).

- 1 Axis of the fruit projecting from the middle of an obscure sinus, the wings spreading horizontally; leaves elliptic to broadly ovate or rounded, cordate at base, obtuse at apex, 3.5–9 cm. long, 2.2–7 cm. broad, papery, midrib and lateral nerves pubescent beneath; male spikes 2.5–5 cm. long; fruits 2.5–3 cm. broad, 1.4–1.6 cm. long, reticulate, glabrous or pubescent [1. heudelotii](#)

Axis of the fruit not projecting from the middle of the sinus, the wings well-developed and ascending: **2**

- 2 Leaves ovate-elliptic, rounded at base, acuminate apex, papery, 3.5–8.5 cm. long, 1–4 cm. broad, laxly glandular beneath, hairy only in axils of nerves; wings of the cocci almost touching at the top, forming a very narrow sinus, fruits lyrate, 2–2.5 cm. long; forest species [2. lyrata](#)

Leaves elliptic oblong, obtuse or rounded at both ends, coriaceous, 4–9 cm. long, 1.5–3 (–4) cm. broad, densely glandular beneath, pubescent when young but usually becoming glabrous; wings of the cocci divergent, forming a broad sinus at the top; fruits obcordate, about 2.5 cm. long; savannah species [3. acida](#)

1. **Hymenocardia heudelotii** Müll. Arg. — F.T.A. 6, 1: 650; Chev. Bot. 567; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 74, fig. 8, C; Aubrév. Fl. For. C. Iv. 2: 48, t. 137, A, B, E; Fl. For. Soud.-Guin. 184, t. 34, 8–9. **APD acc**

Hymenocardia chevalieri Beille (1908) — F.W.T.A., ed. 1, 1: 286; Pax & K. Hoffm. l.c. 75, fig. 8, D; Aubrév. ll.c.; Berhaut Fl. Sen. 131.

Shrub or small tree, to 30 ft. high, **locally abundant in riverain forest**.

Sen.: Niokolo-Koba Berhaut 1471; 4502. **Fr. Sud.:** Kita Dubois 197! **Port. G.:** Salinho (fr. May) Esp. Santo 2488! Pirada, Gabu (fr. June) Esp. Santo 3038! **Fr. G.:** Heudelot 838! Widespread in tropical Africa.

***Hymenocardia intermedia* Dinkl. ex Mildbr.** in Fedde Rep. 41: 255 (1937), name only. *APD acc*

Hymenocardia chevalieri of Pax & K. Hoffm. l.c. 15: 75, partly (Dinklage 2483).

Possibly *H. lyrata*, or a hybrid.

Lib.: Dinklage 2483; 2686.

Imperfectly known species.

15. DRYPETES

Vahl — F.T.A. 6, 1: 674; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 229–279.

Cyclostemon Blume (1825).

KEY TO SPECIMENS WITH MALE FLOWERS.

- 1 Stamens inserted around the margin of the disk, free, or enclosed by marginal folds but not in the central part of the disk; flowers in several- to many-flowered fascicles: **2**
 Stamens deeply enclosed by folds near the centre as well as at the margin of the much-folded disk; flowers axillary on leafy shoots; leaves distichous, with very short petioles, usually oblique and markedly unequal at the base (but see No. 24), margins usually serrate: **19**
- 2 Stamens inserted outside the thin cup-shaped disk, not enclosed by folds; flowers in axillary fascicles on leafy shoots; stamens 4–8; sepals 4, rarely 5, up to 3 mm. long; leaves cuneate or obtuse at base: **3**
 Stamens inserted between the marginal lobes of the disk; sepals usually 5: **8**
- 3 Sepals puberulous or tomentellous outside; stamens 4–6: **4**
 Sepals, disk, branchlets and leaves glabrous; sepals 4; stamens 7–8; leaves elliptic to elliptic-lanceolate, unequal at base, shortly acuminate, 5–19 cm. long, 2.5–9 cm. broad, entire *6. aframensis*
- 4 Disk glabrous within: **5**
 Disk and sepals pubescent within; leaves oblong to oblong-elliptic, caudate-acuminate, 7.5–12.5 cm. long, 3.5–4.5 cm. broad, entire, lateral nerves 10–11 on each side of midrib, with parallel secondary nerves; branchlets and petioles puberulous *5. paxii*
- 5 Sepals normally 5, tomentellous outside, puberulous within; stamens 4–6; leaves elliptic to lanceolate, obtusely acuminate, 10–25 cm. long, 5–10.5 cm. broad, crenate-serrulate to subentire, lateral nerves 5–7 on each side of midrib, long-ascending; branchlets and leaves glabrous or nearly so *1. pellegrii*
 Sepals normally 4; stamens 4; leaves up to 12 cm. long and 6 cm. broad, branchlets and petioles pubescent, rarely glabrous; leaves entire or subentire: **6**
- 6 Disk with a small conical projection in the middle; leaves rhomboid-lanceolate, shortly obtusely acuminate, 2.5–6 cm. long, 0.8–2.5 cm. broad, main lateral nerves 3–4 on each side of midrib *2. klainei*
 Disk without a conical projection in the middle; leaves up to 12 cm. long and 6 cm. broad: **7**
- 7 Leaves with numerous close, parallel, lateral nerves; lamina ovate-elliptic to elliptic-lanceolate, caudate-acuminate, 6–11 cm. long, 1.5–4.5 cm. broad *3. aubrevillei*
 Leaves with 4–7 main lateral nerves on each side of midrib, the secondary nerves and venation not parallel; lamina elliptic to elliptic-lanceolate, 3.5–12 cm. long, 1.5–6 cm. broad *4. leonensis*
- 8 Disk more or less plano-convex and rugose; sepals not exceeding 9 mm. long and 6 mm. broad; trees and shrubs

- to 25 m. high, not, so far as is known, smelling strongly of horse-radish:9
- Disk cup-shaped, the folded margins higher than the centre which has rudimentary linear styles; stamens about 30; sepals ovate, 12–16 mm. long, 8–10 mm. broad, densely brownish tomentellous; pedicels up to about 2 cm. long; flowers in axils of lower leaves and just below the leafy shoots; leaves more or less oblong, unequally obtuse or cuneate at base, abruptly acuminate, 11–24 cm. long, 3.6–7.5 cm. broad, crenate-dentate, glabrous; tree to 42 m. high, cut parts emitting a strong smell of horse-radish [18. gossweileri](#)
- 9 Stamens 4–22: 10
- Stamens about 30; sepals ovate, 7–8 mm. long, about 5 mm. broad, glabrous outside; flowers in fascicles on woody branches; branchlets angular, glabrous; petiole and leaves glabrous; leaves oblong-elliptic, unequal at base, one side cuneate or obtuse, the other rounded to cordate, gradually acuminate at apex, 26–40 cm. long, 8.5–13 cm. broad [17. staudtii](#)
- 10 Leaves more or less spiny-dentate, coriaceous, ovate-elliptic to oblong or oblong-lanceolate, rounded or obtuse, and often unequally sided at base, shortly acuminate, 3.5–11.5 cm. long, 1–5.5 cm. broad; branchlets and petioles shortly pubescent; flowers on main stem and branches, rarely among the leaves; sepals glabrous outside except for ciliate margins; stamens 10–15; disk glabrous [7. floribunda](#)
- Leaves not spiny-dentate: 11
- 11 Stamens 4–10: 12
- Stamens 12–22; flowers in fascicles on the main stem or on leafless branches: 16
- 12 Sepals oblong-lanceolate or oblong, about 3 mm. long and 1.5 mm. broad, glabrous or sparsely puberulous outside; stamens 4–6; flowers in fascicles on the branches among and below the leaves; stipules woody, subsistent, 6–10 mm. long; leaves oblong-elliptic, cuneate to obtuse at base, obtuse at apex, 30–43 cm. long, 9–15 cm. broad, glabrous, coriaceous, margin undulate, main lateral nerves 8–11 on each side of midrib [8. similis](#)
- Sepals orbiculate to orbicular-ovate, at least 2.5 mm. broad; stipules not woody; leaves up to 28 cm. long and 11 cm. broad: 13
- 13 Sepals puberulous outside; stipules early caducous; flower fascicles axillary on leafy twigs or just below the leaves; trees to 10 m. high: 14
- Sepals glabrous outside, except for the ciliate margins; stamens 8; flowers on the main stem; branchlets, petioles and midribs beneath densely pubescent, the latter glabrescent; stipules subulate, subsistent, about 5 mm. long; leaves lanceolate-elliptic to elliptic or oblong-obovate, unequal at base, one side cuneate, the other rounded or obtuse, rather long-acuminate, 10–28 cm. long, 4–8 cm. broad, denticulate to subentire; small tree, to 4 m. high [12. ivorensis](#)
- 14 Disk glabrous; leaves glabrous and coriaceous: 15
- Disk pilose in centre; stamens 8–10; branchlets, petioles and midribs beneath more or less densely pubescent at first, then glabrescent; leaves obovate-oblong to oblong-lanceolate, cuneate to obtuse at base, shortly acuminate, 9–23 cm. long, 2–10 cm. broad, crenate-dentate to subentire [11. principum](#)
- 15 Sepals 2.5–3 mm. long, 2.5 mm. broad; stamens 5–8; leaves oblong to oblong-elliptic, cuneate to obtuse at base, acuminate, 12–23 cm. long, 3.5–8.5 cm. broad, margin obscurely denticulate, main lateral nerves 5–6 on each side of midrib; flowers mostly below the leaves [9. aylmeri](#)
- Sepals about 3.5 mm. long and 3 mm. broad; stamens 9; leaves oblong-elliptic, obtuse to cuneate and unequal at base, shortly acuminate, 15–25 cm. long, 6.5–11 cm. broad, margin undulate, main lateral nerves 7–9 on each side of midrib; flowers among the leaves [10. femandopoana](#)
- 16 Stipules persistent, 5–10 mm. long; sepals ovate, about 6–9 mm. long and 4–6 mm. broad, sparingly pubescent outside; stamens 12–18; flowers on the main stem; leaves elongate-oblong to obovate-oblong, cuneate to obtuse at base, abruptly long-acuminate, 11–27 cm. long, 4–9 cm. broad, lateral nerves rather strong beneath and looping, impressed above, margin crenate [13. molundana](#)
- Stipules early caducous; sepals glabrous outside except for the ciliate margins; leaves with 4–7 main lateral nerves on each side of midrib: 17
- 17 Branchlets, petioles and leaves glabrous; sepals 5–7 mm. long, 5–5.5 mm. broad; disk and anthers pubescent; flowers on main stem and lateral branches; pedicels about 1.5 cm. long; leaves oblong to oblong-elliptic, cuneate at base, acutely acuminate, 10–20 cm. long, 4–8 cm. broad, margin subentire [14. afzelii](#)
- Branchlets and petioles pubescent; sepals up to 4 mm. long and broad; anthers glabrous; leaves subobtusate to rounded at base, margins denticulate: 18
- 18 Pedicels scarcely 3 mm. long; sepals 3.5 mm. long and 3 mm. broad; disk pubescent; leaves ovate-oblong to lanceolate-ovate, cuspidate-acuminate, 5–11 cm. long, 1.5–5.5 cm. broad, midrib pubescent above, glabrous beneath; flowers on the older branches [15. obanensis](#)
- Pedicels (5–) 10–12 mm. long; sepals 4 mm. diam.; disk glabrous; leaves oblong to obovate-lanceolate, acuminate, 9–20 cm. long, 2.5–7 cm. broad, midrib glabrous above, pubescent beneath; flowers on the main stem [16. preussii](#)
- 19 Pedicels 3.5–10 cm. long, slender; sepals 5, glabrous outside, stamens about 25; branchlets and leaves glabrous;

- leaves oblong-elliptic or elliptic-lanceolate, rounded at base with proximal side of the lamina inserted on the petiole slightly below the distal, acutely caudate-acuminate, 7–18 cm. long, 3.5–6.8 cm. broad . [19. capillipes](#)
- Pedicels up to 8 mm. long; stamens 8–15 (–20): **20**
- 20** Flowers distinctly pedicellate, solitary or 2–3 together: **21**
- Flowers sessile or subsessile, in dense glomerules; sepals 4, pubescent outside; stamens 8–10; branchlets and leaves glabrous; leaves obliquely oblong-lanceolate, proximal side of lamina inserted on the petiole below the level of the distal side, 6–11 cm. long, 3–5 cm. broad [24. tessmanniana](#)
- 21** Sepals tomentellous or villous outside; young branchlets densely pubescent to pilose: **22**
- Sepals glabrous outside except for the margins, 4; young branchlets sparingly pubescent to glabrescent: **23**
- 22** Proximal side of leaf-lamina narrowed to an obtuse or subcordate base inserted on the petiole below the much broader distal side which is rounded at base; lamina obliquely oblong or ovate, acutely caudate-acuminate, 5–11 cm. long, 2.5–4.5 cm. broad; branchlets spreading-pilose; sepals 5, villous [20. inaequalis](#)
- Proximal side of leaf-lamina broadly auriculate at base, but inserted on the petiole at the same level as the distal side which is rounded or subcordate at base; lamina ovate to oblong-lanceolate, gradually long-acuminate, 5–18 cm. long, 2–7.5 cm. broad; young lateral shoots with suborbicular amplexicaul basal leaves; branchlets spreading-pubescent; sepals 4, tomentellous [21. chevalieri](#)
- 23** Proximal side of leaf-lamina inserted on the petiole below the distal, both sides obtuse to subcordate; lamina ovate- to oblong-elliptic, caudate-acuminate, 4–12 cm. long, 1.5–6 cm. broad; pedicels up to 8 mm. long .. [22. gilgiana](#)
- Proximal and distal sides of the leaf-lamina inserted on the petiole at the same level, rounded to subcordate; lamina ovate to ovate-lanceolate, subacutely acuminate, 4–12 cm. long, 1.3–4.5 cm. broad; pedicels up to 2 mm. long [23. parvifolia](#)

KEY TO SPECIMENS WITH FEMALE FLOWERS AND FRUITS.

See also the following species whose female flowers and fruits are not yet known: No. 10 D. fernandopoana, No. 15 D. obanensis and No. 24 D. tessmanniana.

- 1** Ovary and fruit 5–7-celled; fruits 3.3–10 cm. diam., depressed-subglobose: **2**
- Ovary and fruit 1–3 (–4)-celled; fruits (where known) up to 2.7 cm. diam.; trees and shrubs up to 25 m. high, not, so far as is known, smelling strongly of horse-radish: **3**
- 2** Leaves 11–24 cm. long, 3.6–7.5 cm. broad, unequally obtuse or cuneate at base, abruptly acuminate; fruits 8–10 cm. diam. 5–6 cm. long, tomentellous; flowers in axils of lower leaves and just below the leafy shoots; tree to 42 m. high, cut parts emitting a strong smell of horse-radish [18. gossweileri](#)
- Leaves 26–40 cm. long, 8.5–13 cm. broad, unequal at base, one side cuneate or obtuse, the other rounded to cordate, gradually acuminate; fruits about 3.3 cm. diam., scurfy-puberulous; flowers on main stem; tree to 11 m. high, not, so far as is known, smelling strongly of horseradish [17. staudtii](#)
- 3** Ovary and fruit 3 (–4)-celled; flowers on main stem and older branches: **4**
- Ovary and fruit 1–2-celled: **6**
- 4** Fruits 3-lobed, ellipsoid, about 1.8 cm. long and 1.1 cm. diam., glabrous [16. preussii](#)
- Fruits subglobose, not lobed: **5**
- 5** Fruits glabrous, about 1.5 cm. diam.; leaves more or less spiny-dentate [7. floribunda](#)
- Fruits puberulous, 2–2.7 cm. diam.; leaves not spiny-dentate [12. ivorensis](#)
- 6** Ovary and fruit 2-celled: **7**
- Ovary and fruit 1-celled; fruits ellipsoid, glabrous; leaves glabrous, coriaceous: **21**
- 7** Pedicels 3.5–10 cm. long; flowers 1–2 in leaf-axils; fruits ellipsoid up to 2.2 cm. long and 1.7 cm. broad, minutely tomentellous, later glabrescent [19. capillipes](#)
- Pedicels up to 2.5 cm. long: **8**
- 8** Sepals normally 5: **9**
- Sepals normally 4; flowers mostly axillary on leafy shoots (but see No. 6): **14**
- 9** Flowers solitary in leaf-axils; branchlets, petioles and midribs beneath densely hairy; leaves serrate: **10**
- Flowers in fascicles in leaf-axils or on leafless branches or on main stem: **11**
- 10** Leaves subsessile, obliquely oblong or ovate, proximal side narrowed to an obtuse or subcordate base, inserted on the petiole below the much broader distal side which is rounded at base, acutely caudate-acuminate, 5–11 cm. long, 2.5–4.5 cm. broad; branchlets spreading-pilose; fruits subglobose, up to 3 cm. diam. densely villous, stigmas close together [20. inaequalis](#)
- Leaves with petiole up to 1 cm. long, oblong-ovate, unequal and rounded or obtuse at base, acuminate, 10–16 cm. long, 4–8 cm. broad; branchlets tomentose; ovary villous; styles linear, spreading; fruits not known [25. occidentalis](#)

- 11 Stipules persistent, 5–10 mm. long; sepals ovate, about 6–9 mm. long and 4–6 mm. broad, sparingly pubescent outside; flowers on the main stem; fruits ovoid, or ellipsoid, 2·8–3 cm. long, up to 2·4 cm. diam. [13. *molundana*](#)
Stipules caducous: **12**
- 12 Sepals glabrous outside except for the ciliate margins, 5–7 mm. long, 5–5·5 mm. broad; flowers on main stem and leafless branches; fruits ellipsoid, about 2 cm. long and 1·7 cm. diam., densely puberulous [14. *afzelii*](#)
Sepals puberulous or tomentellous outside; sepals up to 4 mm. long and broad: **13**
- 13 Sepals 2·5–3 mm. long; flower fascicles in axils of leaves; leaves elliptic to lanceolate, obtusely acuminate; branchlets and leaves glabrous or nearly so [1. *pellegrini*](#)
Sepals 4 mm. long; flower fascicles in axils of leaves and on leafless branches; leaves obovate-oblong to oblong-lanceolate, shortly acuminate; branchlets, petioles and midribs beneath more or less densely pubescent at first, then glabrescent [11. *principum*](#)
- 14 Outside of sepals and mature fruits glabrous; young branchlets sparingly pubescent to glabrescent or glabrous; fruits globose: **15**
Outside of sepals and mature fruits hairy; branchlets pubescent: **17**
- 15 Flowers in fascicles on woody branchlets; leaves with distinct petioles 4–6 mm. long, unequally cuneate at base; fruits with fleshy pericarp, about 1·2 cm. diam. [6. *aframensis*](#)
Flowers solitary, or 2–3 together, axillary on leafy shoots; leaves very shortly petiolate: **16**
- 16 Proximal side of leaf-lamina inserted on the petiole below the distal, both sides obtuse to subcordate; fruits hard, crustaceous, up to 1·8 cm. diam. [22. *gilgiana*](#)
Proximal and distal sides of leaf-lamina inserted on the petiole at the same level, rounded to subcordate; fruits with fleshy pericarp, up to 1·2 cm. diam. [23. *parvifolia*](#)
- 17 Leaves very unequal at base, proximal side broadly auriculate inserted on the petiole at same level as the distal side which is rounded or subcordate at base, subsessile, serrate, distichous; lamina ovate to oblong-lanceolate, gradually long-acuminate; branchlets spreading-pubescent; flowers solitary; fruits ovoid, 2-lobed stigmas separated, up to 2·5 cm. long, tomentellous [21. *chevalieri*](#)
Leaves cuneate to obtuse at base, distinctly petiolate, subentire or crenate; flowers a few together: **18**
- 18 Leaves with numerous close, parallel, lateral nerves, caudate-acuminate at apex: **19**
Leaves with 3–7 main lateral nerves on each side of midrib; secondary nerves not parallel: **20**
- 19 Lamina ovate-elliptic to elliptic-lanceolate; fruits globose, about 1·3 diam., tomentellous [3. *aubrevillei*](#)
Lamina oblong to oblong-elliptic [5. *paxii*](#)
- 20 Fruits 2-lobed, rugose and tomentose on the surface; leaves rhomboid-lanceolate, 2·5–6 cm. long, 0·8–2·5 cm. broad; main lateral nerves 3–4 on each side of midrib [2. *klainei*](#)
Fruits globose, tomentellous, about 1 cm. diam.; leaves elliptic to elliptic-lanceolate, 3·5–12 cm. long, 1·5–6 cm. broad; main lateral nerves 4–7 on each side of midrib [4. *leonensis*](#)
- 21 Leaves 30–43 cm. long, 9–15 cm. broad, main lateral nerves 8–11 on each side of midrib; sepals oblong-lanceolate or oblong, glabrous; fruits 1·2–1·5 cm. long [8. *similis*](#)
Leaves 12–23 cm. long, 3·5–8·5 cm. broad, main lateral nerves 5–6 on each side of midrib; sepals orbicular, pubescent; fruits about 1·5 cm. long [9. *aylmeri*](#)

1. *Drypetes pellegrini* Léandri in Bull. Soc. Bot. Fr. 81: 459 (1934). *APD acc*

Drypetes *vigne* Hoyle in Kew Bull. 1935: 257.

A forest tree, 25–40 ft. high, with spreading branches; locally abundant; flowers white.

IV. C.: Soubré (Jan.) Aubrév. 864! **G. C.:** Mampong Scarp (Mar.) Vigne FH 1062! S. Scarp F.R. (fr. May) Moor FH 2344! Atewa Range (Feb.) Vigne FH 4344! Konkong, E. Akim (young fr. Mar.) Johnson 595!

2. *Drypetes klainei* Pierre ex Pax in Engl. Bot. Jahrb. 43: 218–219 (1909); F.T.A. 6, 1: 681; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 252; Aubrév. Fl. For. C. Iv. 2: 42, t. 134, 4–5. *APD acc*

A forest tree, to 80 ft. high.

IV. C.: Tai, In flood-plain of R. Cavally (young fr. Apr.) Aubrev. 1209!

Also in **Gabon**.

3. *Drypetes aubrevillei* Léandri l.c. 81: 458 (1934); Aubrév. l.c. 2: 42, t. 134, 1–3. *APD acc*

A forest tree, to 45 ft., rarely to 80 ft. high.

S. L.: Kambui F.R. Sawyerr FHI 13559! **Lib.:** Dukwia R. (fr. May) Cooper 227! 458! R. Cess, Grand Bassa (Mar.) 12530! **Iv. C.:** Agnéby Avbrév. 2117! Tabou (fr. Dec.) Aubrév. 1667! Nimba Mts. (Mar.) Aubrév. 1146! Banco (Feb.) Aubrév. 885! Mt. Momy Aubrév. 1182!

4. **Drypetes leonensis** *Pax* in Engl. Bot. Jahrb. 43: 219 (1909), not of (Pax) Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 262 (1922); F.T.A. 6, 1: 682. *APD acc*

Drypetes hutchinsonii *Pax & K. Hoffm.* l.c. 15: 254 (1912).

Drypetes rowlandii *Pax* l.c. 43: 219 (1909).

Drypetes kamerunica *Pax & K. Hoffm.* l.c. 15: 254 (1922).

Drypetes urophylla *Pax & K. Hoffm.* l.c. (1922).

A forest tree, to 70 ft. high; flowers heavily scented.

Fr. G.: massif de Fon, Beyla (Aug.) Schnell 3313! **S. L.:** Duniya, Talla Hills (Feb.) Sc. Elliot 4981! **Lib.:** Truo, Sinoe (young fr. Mar.) Baldwin 11385! (?). **G. C.:** Mansiso (Mar.) Keay FHI 22469! 22533! Owo F.R. (Apr.) Jones FHI 3519!

Also in **Belgian Congo**.

8. **Drypetes similis** *Hutch.* in F.T.A. 6, 1: 679 (1912); Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 267.

APD: *Synonym of Sibangea similis (Hutch.) Radcl.-Sm.*

A forest shrub or tree, to 20 ft. high.

S. Nig.: Oban Talbot 619! 1495! 1710! **Br. Cam.:** Kumba (Feb.) Smith 74/36!

Also in **French Camerouns**.

9. **Drypetes aylmeri** *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 288 (1928); Kew Bull. 1928; 300. *APD acc*

Drypetes mottikoro Léandri in Bull. Soc. Bot. Fr. 81: 459 (1934); Aubrév. Fl. For. C. Iv. 2: 44, t. 136, 1–4.

A forest tree, to 40 ft. high, with white easily split timber; flowers yellow, profuse on the branches; fruits white, 1-seeded.

S. L.: Gerihun (Sept.) Aylmer 246! **Lib.:** Dukwia R. Cooper 315! (? — sterile). **Iv. C.:** Aubrév. 1659! 2081! Djibi (fl. Sept., fr. Dec.) Aubrév. 533! 1642! Azaguié (Sept.) Chev. 22274! **G. C.:** Ankasa F.R. (fr. Dec.) Vigne FH 3181! Subiri F.R., Benso (Sept.) Andoh FH 5567!

10. *Drypetes fernandopoana Brenan* in Kew Bull. 1953: 92. *APD acc*

Cyclostemon glomeratus Müll. Arg. (1864).

Drypetes glomerata (Müll. Arg.) Hutch. in F.T.A. 6, 1: 679 (1912); Pax & K. Hoffm. l.c. 15: 242; not of Griseb. (1857).

A forest shrub, about 20 ft. high, with glabrous terete branchlets.

F. Po: Mann 278!

11. *Drypetes principum* (Müll. Arg.) Hutch. in F.T.A. 6, 1: 684 (1912); Pax & K. Hoffm. l.c. 15: 241; Aubrév. l.c. 2: 43, t. 135, 9–10. *APD acc*

Cyclostemon principum Müll. Arg. (1864).

A forest tree, to 30 ft. high; flowers cream, borne on leafy shoots and the woody branches; fruits dark brown, velvety.

Fr. G.: Longuéry, Kouria (Dec.) Caille in Hb. Chev. 14826! **Lib.:** Ganta (May) Harley 1191! **Iv. C.:** Mt. Tonkoui Aubrév. 1007. Mt. Dou Aubrév. 1076. **G. C.:** Ofin Headwaters F.R. (Feb.) Vigne FH 3423! Akumadan (Oct.) Vigne FH 2554! 2555! **S. Nig.:** Omo F.R. (fl. Oct., fr. Feb.) Tamajong FHI 20982! Jones & Onochie FHI 17586! Akure F.R. (Oct., Nov.) Keay FHI 16246! Latilo FHI 15285! Oban Talbot 679! **Br. Cam.:** Victoria Winkler 551; 552. Johann-Albrechtshöhe Staudt 849! **F. Po:** San Carlos Mildbr. 6791.

Also in **French Cameroons** and **Principe**.

12. *Drypetes ivorensis* Hutch. & Dalz. F.W.T.A., ed. 1, 1: 287 (1928); Kew Bull. 1928: 299; Aubrév. l.c. 2: 46, t. 135, 6–8. *APD acc*

Drypetes pierreana of Chev. Bot. 561, not of Hutch.

A small forest tree, to 15 ft. high; flowers greenish-yellow or white, on the main stem; fruits red, or yellow or orange.

Lib.: Dukwia R. (fr. May) Cooper 418! Truo, Sinoe (fr. Mar.) Baldwin 11387! 11396! Diebla, Webo (fr. July) Baldwin 6280! **Iv. C.:** between Mid. Sassandra and Mid. Cavally (July) Chev. 19227! Tèbo Yabas country (fr. July) Chev. 19416! **G. C.:** Subiri F.R., Benso (Sept.) Andoh FH 5562!

13. *Drypetes molunduana* Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 258 (1922). *APD acc*

A small forest tree, to 12 ft. high with deeply grooved pubescent branchlets; flowers greenish-yellow-white. in dense fascicles all down the main stem, not on the twigs.

S. Nig.: Onda, Omo F.R. (Feb.) Jones & Onochie FHI 16985! Okomu F.R. (Dec.) Brenan 3574! Oban Talbot 1645! **Br. Cam.:** S. Bakundu F.R. (Mar.) Brenan. 9296! 9297! 9310! 9311! Mayuku (Feb.) Dalz. 8239! Johann-Albrechtshöhe Staudt 739! 741.

Also in **French Cameroons**.

14. *Drypetes afzelii* (Pax) Hutch. in F.T.A. 6, 1: 685 (1912); Pax & K. Hoffm. l.c. 15: 249; Aubrév. l.c. 2: 46, t. 136, 5–9. *APD acc*

Cyclostemon afzelii Pax (1897).

A forest tree, to 80 ft. high; flowers on bole and branches, fragrant, male white or yellow, female green; fruits bright orange, abundant.

S. L.: Afzelius! Gerihun (Sept.) Aylmer 245! Jepihun (fr. Jan.) Smythe 236! Njala (fl. Oct., fr. Jan., Mar.) Deighton 1414! 2904! 4718! Dalz. 8102! Yonibana (Oct.) Thomas 4111! Kambui Hills (fl. Oct., fr. Dec.) Small 825! 854! **Lib.:** Yeh R., 2

miles above St. Paul R. (Oct.) Linder 990! **Iv. C.:** Mé Aubrév. 167. Guiglo Aubrév. 2075. **G. C.:** Enchie (Oct.) Tolmie FH 2381!

15. **Drypetes obanensis** *S. Moore* in Cat. Talb. 97 (1913); Pax & K. Hoffm. l.c. 15: 240. *APD acc*

A small forest tree with pubescent branchlets and crenate leaves; flowers small, colourless.

S. Nig.: Oban Talbot 677! 2310!

16. **Drypetes preussii** (*Pax*) *Hutch.* in F.T.A. 6, 1: 686 (1912); Pax & K. Hoffm. l.c. 15: 247. *APD acc*

Cyclostemon preussii Pax (1899).

A forest tree, to 65 ft. high; flowers yellow, borne on the stem.

S. Nig.: Oban Coombe 182! **Br. Cam.:** Barombi Preuss 23. S. Bakundu F.R. (fr. Aug.) Olorunfemi FHI 30739!

17. **Drypetes staudtii** (*Pax*) *Hutch.* in F.T.A. 6, 1: 688 (1912); Pax & K. Hoffm. l.c. 15: 263. *APD acc*

Cyclostemon staudtii Pax (1899).

A forest tree, to 40 ft. high; flowers heavily scented.

S. Nig.: Etemi, Omo F.R. (Mar.) Jones & Onochie FHI 16609! 16624! 16625! 17007! Ikom (fr. June) Latilo FHI 31851! Umon Ndealichi F.R., Calabar (young fr. May) Onochie FHI 33230! **Br. Cam.:** Meghom, Wum, Bamenda Prov. (fr. July) Ujor FHI 30488!

Also in **French Cameroons**.

18. **Drypetes gossweileri** *S. Moore* in J. Bot. 58: 271 (1920); Brenan in Kew Bull. 1952: 445. *APD acc*

Drypetes armoracia Pax & K. Hoffm. l.c. 15: 275 (1922).

Drypetes "arinozacia" of Kennedy For. Fl. S. Nig. 75.

Forest tree, to 125 ft. high, with straight clear bole; cut parts emitting a strong smell of horse-radish; flowers brownish-green.

S. Nig.: Okomu F.R., Benin (fl. & fr. Dec.) Brenan 8474! 8475! Sapoba (fl. May, Dec., fr. June) Kennedy 1986! 2075!

Also in **French Cameroons**, **Cabinda** and **Belgian Congo**.

19. **Drypetes capillipes** (*Pax*) Pax & K. Hoffm. l.c. 15: 260 (1922); Brenan in Kew Bull. 1952: 444. *APD acc*

Lingelsheimia capillipes Pax (1909) — F.T.A. 6, 1: 691.

A forest shrub or small tree, to 12 ft. high, with grey branches; pedicels drooping; flowers greenish-white; ripe fruits rather hard and orange.

S. Nig.: Fowa, Omo F.R. (young fr. Mar.) Jones & Onochie FHI 17205! Okomu F.R. (fl. & fr. Dec.–Jan.) Brenan 8403! 8411! 8466! 8751!

Also in **French Cameroons** and **Belgian Congo**.

20. **Drypetes inaequalis** *Hutch.* in F.T.A. 6, 1: 684 (1912). *APD acc*

Cyclostemon leonensis Pax (1903).

Drypetes leonensis (*Pax*) Pax & K. Hoffm. l.c. 15: 262 (1922), not of Pax (1909).

A forest shrub, to 16 ft. high; branchlets angular, with spreading yellowish pubescence; fruit orange.

S. L.: Afzelius! Ninia, Talla Hills (fr. Feb.) Sc. Elliot 4895! **Lib.:** Ganta (fr. Feb., May) Harley 1184! Baldwin 11003!

21. **Drypetes chevalieri** *Beille* in Bull. Soc. Bot. Fr. 61, Mém. 8: 293 (1917); Aubrév. Fl. For. C. Iv. 2: 44, t. 135, 1–3. *APD acc*

A forest shrub or small tree, to 15 ft. high; flowers greenish-cream; ripe fruits bright orange, firmly fleshy.

Lib.: Ganta (fr. Apr., Sept.) Harley 1140! Baldwin 9249! **Iv. C.:** Danané (Apr.) Chev. 21290! Dyolas country (Apr.) Chev. 21128! And several other localities fide Beille l.c. **G. C.:** Awiabo (fr. Also in **French Cameroons**.

23. *Drypetes parvifolia* (Müll. Arg.) Pax & K. Hoffm. l.c. 15: 262 (1922). *APD acc*

Cyclostemon parvifolius Müll. Arg. (1864).

Lingelsheimia parvifolia (Müll. Arg.) Hutch. (1912) — F.W.T.A., ed. 1, 1: 288; Aubrév. l.c. 2: 44 (in note).

A shrub or small tree, with pale grey branches; ripe fruits red.

S. L.: Afzelius. **Iv. C.:** Guiglo Aubrév. 2025! Mt. Nienokoué Chev. 19453! **G. C.:** Agboho to Dedesu, Afram Plains (fr. May) Kitson 1124! Alabadi (fr. Apr.) Scholes 295! Akatin (Oct.) Vigne FH 4040! Kwabia (Oct.) Vigne FH 4022! **N. Nig.:** Nupe Barter 1032! 1700!

[Aubrév. 2025 has branchlets, petioles and pedicels more pubescent than the type, but it does not seem to me specifically distinct.]

24. *Drypetes tessmanniana* (Pax) Pax & K. Hoffm. l.c. 15: 262 (1922). *APD acc*

Cyclostemon tessmannianus Pax (1910).

Lingelsheimia tessmanniana (Pax) Hutch. in F.T.A. 6, 1: 692 (1912).

A forest shrub or small tree.

Br. Cam.: Likomba (Nov.) Mildbr. 10600!

Also in **Spanish Guinea**.

26. *Drypetes occidentalis* (Müll. Arg.) Hutch. in F.T.A. 6, 1: 683 (1912); Pax & K. Hoffm. l.c. 15: 276. *APD acc*

Cyclostemon occidentalis Müll. Arg. (1864).

A forest tree, 20 ft. high.

F. Po: Mann 1158!

***Drypetes* sp.**

Probably a new species near to *D. chevalieri* Beille; male flowers are required.

G. C.: Adeiso, E.P. (Mar.) Irvine 2413!

Imperfectly known species. I have seen a number of sterile specimens which have been provisionally referred to this genus, but cannot be named with any certainty. Field workers are reminded that both sexes of flowers and mature fruits should be collected whenever possible. — R.W.J.K.

***Drypetes sassandraensis* Aubrév.** Fl. For. C. Iv. 2: 48 (1936), French descr. only. (Iv. C.: Aubrév. 863! 1110!).

This is *Casearia bridelioides* Mildbr. ex Hutch & Dalz. (Samydaceae), a species not recorded from the Ivory Coast when Vol. I, part 1 of the revised Flora was published.

Excluded species.

Drypetes talbotii *S. Moore* in Cat. Talb. 97 (1913); Pax & K. Hoffm. l.c. 241.

The type specimen (Talbot 8 from Oban, Nigeria) consists of a leafy shoot of *Uvariopsis bakeriana* (Hutch. & Dalz.) Robyns & Ghesq. (Annonaceae) and detached cauliflorous inflorescences of a *Drypetes* which cannot be determined with any certainty. The name *D. talbotii* S. Moore must therefore, be rejected under Art. 76 of the International Code of Botanical Nomenclature (1952). A second specimen (Talbot 2337) cited in F.W.T.A., ed. 1 as *D. talbotii* consists of a leafy shoot of a *Napoleona* and very poor female flowers of a *Drypetes*. Excluded species.

Cyclostemon gabonensis of Chev. Bot. 561, not of Pierre.

The specimen cited (Iv. C.:Chev. 1993!) is *Diospyros canaliculata* De Wild. (Ebenaceae), and not a species of *Enantia* as suggested in F.W.T.A., ed. 1, 1: 286. Excluded species.

16. PHYLLANTHUS

Linn. — F.T.A. 6, 1: 692; Pax & K. Hoffm. in E. & P. Pflanzenfam. 19C: 60 (1931).

- 1 Flowering branchlets fasciculate; filaments all free; shrubs, often straggling or scandent, or sometimes arborescent; leaves glabrous: 2
- Flowering branchlets not in fascicles: 3
- 2 Sepals and stamens 5; sepals about 1.25 mm. long, not drying white; fruits depressed-globose, fleshy, about 3 mm. diam.; branchlets reddish-brown; barren leafy shoots crowded at the tops of the shoots and resembling pinnate leaves; flowers produced on clustered slender leafless racemes of fascicles arising in the axils of the leafy flowerless shoots and/or on the older leafless branchlets; leaves ovate or ovate-elliptic, usually rounded at base, subacute at apex, 2–7 cm. long, 1.5–4 cm. broad, glaucous beneath [1. muellerianus](#)
- Sepals and stamens 4 (–5); sepals about 1.5 mm. long, drying white; young fruits conical, beaked, fibrous; branchlets grey; barren leafy shoots and inflorescences similar to above, upper inflorescences all male and sometimes with a few leaves, lower ones often bisexual; leaves ovate, rounded, obtuse or slightly cuneate at base, acutely acuminate, 2.5–7 cm. long, 2–4 cm. broad, paler beneath [2. profusus](#)
- 3 Filaments free to the base or rarely (No. 5) some free and the others connate: 4
- Filaments connate the whole length or nearly so; stamens 2–3 (–4): 9
- 4 Disk of male flowers annular; large shrub to tree to 30 m. high, dioecious; male flowers numerous in fascicles in the leaf-axils, the females paired; sepals and stamens 4; filaments all free; fruits 3–4-lobed, about 8 mm. diam.; leaves ovate-elliptic to obovate-oblongate, rounded to cuneate at base, mostly rounded at apex, 2.5–10 cm. long, 2–4 cm. broad, glabrous or pubescent [3. discoideus](#)
- Disk of male flowers composed of separate glands; herbs, or shrubs up to 3 m. high: 5
- 5 Stamens and sepals 5, rarely 4: 6
- Stamens 3, free; sepals 6; plants dioecious, shrubby, to 2 m. high; leaves variable in shape, often oblong, ovate or orbicular, 8–30 mm. long, 4–21 mm. broad [7. alpestris](#)
- 6 Two or three of the filaments connate to the apex, the others free; fruits depressed-globose, about 7 mm. diam., 8–16-seeded, fleshy; 1 female flower and 2–3 or more males in each fascicle; leaves oblong or elliptic, rounded at both ends, 1.5–4 cm. long, 0.7–1.5 cm. broad; shrubs to 3 m. high: 7
- All the filaments quite free; leaves glabrous, glaucous beneath; fruits depressed-globose, about 2 mm. diam., capsular: 8
- 7 Stem and leaves crisped-pubescent [4. reticulatus var. reticulatus](#)
- Stem and leaves glabrous or nearly so [4a. reticulatus var. glaber](#)
- 8 Pedicels very slender, up to 2 cm. long; leaves obovate or elliptic-obovate, obtuse or slightly cuneate at base, rounded or subacute and slightly mucronate at apex, 8–15 mm. long, 6–12 mm. broad; small shrub, to 1.5 m. high [5. capillaris](#)
- Pedicels shorter and stouter, usually less than 3 mm. long; leaves oblong-lanceolate or linear-lanceolate, subacute at apex, up to 2 cm. long and 8 mm. broad; herb, to 0.5 m. high [6. pentandrus](#)
- 9 Stamens (2–) 3 (–4): 10
- Stamens 2; sepals 4 in male flower, (5–) 6 in female; flowers dioecious, the males several in each fascicle with numerous membranous laciniate bracts at the base, the females few or solitary; branches with membranous peeling bark; leaves elliptic to oblanceolate, obtuse or subcuneate at base, obtusely pointed at apex, 2.5–10 cm. long, 1–4 cm. broad; shrub to 2 m. high [20. petraeus](#)

- 10 Sepals of both sexes 5, those of the females in a single series; herbs, sometimes subwoody: 11
 Sepals of both sexes 6, those of the female often in two series: 14
- 11 Ovary prominently warted; curved back of seed marked with 12–14 fine longitudinal ridges; leaves oblong, 4–10 mm. long, 1.5–3 mm. broad; male flowers 2–3 together in lower leaf-axils of branches, female solitary in upper axils; disk of female flower stellate with 5 deep lobes; styles very short, deeply bifid [8. niruroides](#)
 Ovary smooth; curved back of seed marked with 5–10 longitudinal ridges: 12
- 12 Sepals in fruit about 2.5 mm. long, more or less embracing and subequalling the ripe fruit; back of seed with 9–10 faint longitudinal ridges; plant with few (up to 10) lateral branches; leaves oblong-elliptic to oblong-obovate, 5–9 mm. long, 3–5 mm. broad; flowers arranged as in No. 8; anther-thecae horizontally dehiscent; disk of female flowers shallowly 9-crenate; styles very short, deeply bifid at apex [9. nigericus](#)
 Sepals in fruit 0.75–1.5 mm. long, scarcely embracing and much shorter than the ripe fruit; back of seed with 5–7 more prominent longitudinal ridges; plants normally profusely branched: 13
- 13 Disk of female flowers annular, not lobed; stigmas quite sessile, closely packed into a minute circle at top of ovary, each stigma when viewed from above appearing reniform with an emarginate apex; anther-thecae dehiscent vertically; male flowers 1–2 together in lower axils of flowering branches, female solitary in upper axils; leaves elliptic-oblong, about 5 mm. long, 1.5–2 mm. broad [10. sublanatus](#)
 Disk of female flowers stellate with normally 5 deep radiating lobes; styles short but distinct, deeply bifid at apex, not forming a closely packed circle at top of ovary; anther-thecae with markedly oblique dehiscence; 1 female flower together with 1 male flower in each axil; leaves elliptic-oblong, 5–10 mm. long, 2–4.5 mm. broad [11. amarus](#)
- 14 Ovary warted; seeds transversely ridged; branchlets narrowly winged, asperulate; leaves oblong, rounded at base, shortly pointed and minutely mucronate at apex, 6–15 mm. long, margins asperulate; monoecious; flowers solitary and subsessile [12. urinaria](#)
 Ovary smooth; seeds longitudinally ridged: 15
- 15 Disk of female flowers consisting of separate glands; seeds marked with 9–10 fine longitudinal lines of dots on back; branchlets sharply angular; leaves linear to oblanceolate, up to 4 cm. long and 1.3 cm. broad; stipules broad and auriculate at base; male and female flowers sometimes together in the leaf-axils or the female solitary and larger [13. maderaspatensis](#)
 Disk of female flowers annular, saucer-shaped or cupular: 16
- 16 Seeds 1–1.25 mm. long, marked with 6–7 longitudinal lines on the back; herbs and shrublets up to 1.5 m. high: **17**
 Seeds 2.5–3 mm., dotted all over with minute papillae which can easily be scraped off; flowers monoecious, the males quite small, the females much larger with thick reticulate sepals; branches with membranous peeling bark; leaves elongate-oblong or oblong-elliptic, rounded at base, rounded or truncate at apex, 1–4.5 cm. long, 0.5–2.5 cm. broad; shrub to 3 m. high [19. beillei](#)
- 17 Disk of female flowers deeply toothed; styles very short; stem and branchlets glabrous; leaves oblong-elliptic, rounded at both ends, 6–14 mm. long, 2.5–5.5 mm. broad; flowers monoecious, solitary, the males in the lower, the females in the upper axils; annual herb [14. niruri](#)
 Disk of female flowers only slightly crenate or undulate: 18
- 18 Leaves suborbicular or rounded-obovate, mostly about 5 mm. diam.; stem, branchlets and often the leaves asperulate with numerous pointed papillae; 2–3 male flowers and 1 female together in each leaf-axil; styles distinct, spreading [15. rotundifolius](#)
 Leaves not as above; stem and branchlets glabrous or pubescent: 19
- 19 Stem densely puberulous, woody; branchlets winged, puberulous; leaves oblong-linear-lanceolate, 12–21 mm. long, 4–5.5 mm. broad; flowers monoecious, the males occupying most of the branchlet, usually a solitary female in the axil of the uppermost leaf [16. dusenii](#)
 Stem and branchlets glabrous, or nearly so; leaves more or less oblong to obovate, 8–25 mm. long, 4–11 mm. broad: 20
- 20 Stipules 2.5–4 mm. long, brownish, conspicuous; branchlets not or scarcely winged; leaves obovate or obovate-elliptic, subacute at base, rounded and mucronate at apex; flowers dioecious (? always); male flowers 1–3 in each leaf-axil, females solitary, sepals broad, enclosing the fruit; ovary sessile; shrublet, to 1.5 m. high, in montane areas [17. mannianus](#)
 Stipules up to 2 mm. long, not conspicuous; branchlets flattened and winged; leaves oblong, rounded at base, obtuse at apex; flowers monoecious; male flowers few together in axils of lower leaves, females solitary in upper axils and larger, sepals oblong-linear, not completely enclosing the fruit; ovary very shortly stipitate; ruderal herb [18. odontadenius](#)

1. *Phyllanthus muellerianus* (O. Ktze.) Exell in Cat. S. Tomé 290 (1944). *APD acc*

Diasperus muellerianus O. Ktze. (1891).

Kirganelia floribunda Baill. (1860), not of Spreng. (1826).

Phyllanthus floribundus Müll. Arg. (1863), not of Kunth (1817); F.T.A. 6, 1: 701; F.W.T.A., ed. 1, 1: 290; Chev. Bot. 556; Aubrév.

Fl. For. Soud.-Guin. 189.

A glabrous shrub or woody climber, sometimes arborescent, often armed with recurved stipular spines, with copious inflorescences of minute greenish flowers, and small berry-like red fruit.

Fr. Sud.: Bamako Waterlot 1368. Birgo Dubois 210. **Port. G.:** Granja, Catió (June) Esp. Santo 2088! **Fr. G.:** Rio Nunez Heudelot 659! Kouroussa (June) Pobéguin 264! 812! **S. A common tropical weed but apparently rare in Africa.

13. **Phyllanthus maderaspatensis** *Linn.* — F.T.A. 6, 1: 722; Chev. Bot. 557. *APD acc*

A woody undershrub or herb, of variable habit; glabrous or slightly asperulate; **a weed in cultivated ground**.

Sen.: Dakar (fl. & fr. May) Baldwin 5707! **IV. C.**: Koupéla, Mossi Chev. 24544. **G. C.**: Accra (fl. & fr. Mar., June, July) Dalz. 139! Deighton 561! Irvine 726! **Togo**: Yendi (fl. & fr. Dec.) Adams & Akpabla GC 4065! **N. Nig.**: Sokoto (Aug.) Dalz. 391!

Throughout the tropical and subtropical regions of the Old World.

14. **Phyllanthus niruri** *Linn.* — F.T.A. 6, 1: 731.

APD: *Synonym of Phyllanthus fraternus G.L. Webster*

APD: *Synonym of Phyllanthus amarus Schumach. & Thonn.*

A glabrous annual weed, up to about 18 in. high, with smooth sulcate stem and slightly winged branchlets.

Sen.: Perrottet! **N. Nig.**: Nupe Barter 825!

Common in India, but apparently rare elsewhere.

15. *Phyllanthus rotundifolius* Klein ex. Willd. — F.T.A. 6, 1: 731. *APD acc*

Phyllanthus niruri var. *genuinus* Beille — Chev. Bot. 557.

An annual herb, to 18 in. high; seeds dark brown.

Sen.: Trochain. **Fr. Sud.:** Sumpi (fl. & fr. Aug.) Chev. 3462! Timbuktu (fl. & fr. July) Hagerup 147! 158a!

Extends from Cape Verde Islands to India.

16. *Phyllanthus dusenii* Hutch. — F.T.A. 6, 1: 723. *APD acc*

Stems flexuous, about 1 ft. high, arising from a stout woody root, the flowering branchlets crowded towards the top.

S. Nig.: Oban Talbot 2323! **Br. Cam.:** Dusen 296! On rocks in Ndian R., Kumba (Mar.) Smith 85/36!

17. *Phyllanthus mannianus* Müll. Arg. — F.T.A. 6, 1: 730; Chev. Bot. 557.

APD: *Synonym of Phyllanthus bancilhonae Brunel & J.P. Roux*

APD: *Synonym of Phyllanthus gagnioevae Brunel & J.P. Roux*

Erect shrublet, to 4 ft. high, in montane forest, woodland and grassland; sepals white with broad green central line.

Fr. G.: Fouta Djallon fide Chev. l.c. **Iv. C.:** Mt. Gbon, Haut Cavally, 3,500 ft. (fl. & fr. May) Fleury in Hb. Chev. 21415! **Br. Cam.:** Cam. Mt., 5,000–9,000 ft. (fl. & fr. Nov.–Jan.) Phyllanthus sp.

Dioecious shrub, to 15 ft. high; flowers solitary in leaf-axils, pedicels slender, up to about 1 cm. long in fruit; sepals 6; stamens 3, filaments united for about half their length.

S. L.: Lane-Poole 443! Edge of grassfield, Russell (May) Deighton 2647! **Lib.:** Sanokwele (Sept.) Baldwin 9413! Monrovia (Dec.) Baldwin 10510!

Imperfectly known species.

Phyllanthus acidus (Linn.) Skeel

A native of India and Madagascar has been introduced and is cultivated for its fruit: "Indian Gooseberry".

17. SECURINEGA

Commers. in Juss. Gen. 388 (1789); Pax & K. Hoffm. in E. & P. Pflanzenfam. 19C: 60 (1931).

Fluggea Willd. — F.T.A. 6, 1: 736.

- 1 Shrub or small tree; leaves elliptic or obovate, cuneate at base, up to 6 cm. long and 3 cm. broad, rigidly membranous, glabrous, often glaucous below; flowers dioecious, the males in axillary fascicles on slender pedicels up to 5 mm. long; stamens 5, free; rudimentary ovary tripartite; female disk annular; fruits depressed-globose, about 5 mm. diam.; seeds shining with several lines of pits on the back [virosa](#)

Securinega virosa (Roxb. ex Willd.) Baill. in Adansonia 6: 334 (1866).

APD: Synonym of Flueggea virosa (Roxb. ex Willd.) Voigt subsp. virosa

Phyllanthus virosus Roxb. ex Willd. (1805).

Fluggea virosa (Roxb. ex Willd.) Baill. (1858) — F.W.T.A., ed. 1, 1: 291.

F. microcarpa Blume (1825) — F.T.A. 6, 1: 736; Chev. Bot. 559.

Securinega microcarpa (Blume) Pax & K. Hoffm. ex Aubrév. Fl. For. Soud.-Guin. 190 (1950).

Up to 12 ft. high, with somewhat angular glabrous branchlets; fruit a small white berry; **locally common in open regrowth vegetation**. Liable to be mistaken for a species of *Phyllanthus*, but distinguished by the large tripartite rudimentary ovary in the male flower.

Sen.: Leprieur! Sieber 49! **Gam.:** Genieri (July) Fox 132! **Fr. Sud.:** various localities fide Aubrév. l.c. **Fr. G.:** Kouroussa (Apr.) Pobéguin 233! **S. L.:** Sc. Elliot! **Iv. Bauchi Plateau (Aug.) Lely P. 656! **S. Nig.:** Lagos Rowland! Abeokuta Irving!

Widespread in tropical Africa, S. Africa, the Mascarene Islands, tropical and subtropical Asia, and in **Australia**.

18. UAPACA

Baill. — F.T.A. 6, 1: 634; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 298–311 (1922).

- 1 Stipules foliaceous, lanceolate to ovate, persistent or subpersistent, up to 3 cm. long and 2 cm. broad; young shoots pubescent; trees of swamps in rain forest: **2**
- Stipules linear or linear-subulate, mostly early caducous (but see No. 3): **3**
- 2 Leaves glabrous or with the midrib minutely puberulous beneath, oblanceolate or obovate-oblanceolate, cuneate to rounded at base, (8–) 19–48 cm. long, (3·2–) 7–17 cm. broad, main lateral nerves 8–14 pairs; petiole 1–7 cm. long; bracts glabrous; heads of male flowers about 12 mm. diam.; male calyx glabrous; ovary puberulous; fruits ovoid or subglobose, 2–2·5 cm. diam., warted, puberulous, 3-seeded [1. staudtii](#)
- Leaves shortly pilose beneath on midrib, nerves and veins, obovate to oblong-obovate, rounded to cordate at base, 16–50 cm. long, 10–25 cm. broad, main lateral nerves 10–20 pairs; petiole 3–10 cm. long, stout; bracts pubescent outside; heads of male flowers 8–10 mm. diam.; male calyx pubescent; ovary velutinous; fruits ovoid, 2·5–3 cm. long, (3–) 4-seeded [2. paludosa](#)
- 3 Leaves pilose beneath, especially on midrib and nerves; fruits globose: **4**
- Leaves glabrous or rather sparsely puberulous beneath: **5**

- 4 Stipules persistent, linear-subulate, up to 1 cm. long; branchlets pilose; leaves obovate-oblongate, rounded to cuneate at base, 6–16 (–27) cm. long, 2.7–7.5 (–12) cm. broad, main lateral nerves 7–9 (–12) pairs; petiole 1.5–3.8 (–7.5) cm. long; fruits about 2 cm. diam., glabrous [3. vanhouttei](#)
- Stipules early caducous; branchlets sparsely pubescent; leaves obovate to obovate-suborbicular, rounded at base, 7.5–17 cm. long, 4–11.5 cm. broad, main lateral nerves 6–10 pairs; petiole 2–4 cm. long; bracts obovate-oblongate, pilose outside; heads of male flowers about 5 mm. diam.; male calyx pilose; ovary pubescent; fruits 2–2.5 cm. diam., warted, pubescent, 3-seeded [4. chevalieri](#)
- 5 Calyx of male flowers pilose; heads of male flowers 5–6.5 mm. diam.; fruits subglobose up to about 2 cm. diam.: [6](#)
- Calyx of male flowers glabrous or ciliate on the margin; heads of male flowers 7–13 mm. diam.; fruits ovoid or ellipsoid, 2.5–5 cm. long, glabrous; leaves cuneate at base, glabrous: [7](#)
- 6 Ovary densely pubescent; fruits pubescent, always with a ring of long hairs at the base; stipules and young branchlets pubescent, usually rather densely so; leaves usually oblong-obovate, entire or irregularly undulate, cuneate, obtuse or rounded at base, 11–25 cm. long, 5–15.5 cm. broad, sparingly puberulous or glabrescent beneath, coriaceous, rough to the touch; petiole 1–8 cm. long; tree of savannah normally without stilt-roots, sometimes in fringing forest with stilt-roots [5. togoensis](#)
- Ovary glandular, glabrous or nearly so; fruits glabrous, warted; stipules and young branchlets glabrous, or pubescent and soon glabrescent; leaves obovate, markedly undulate, cuneate at base, 7–26 cm. long, 2.8–13 cm. broad, glabrous beneath, thinly coriaceous; petiole 1.5–7 cm. long; tree with stilt-roots, in rain forest [6. guineensis](#)
- 7 Heads of male flowers 7–8 mm. diam., bracts glabrous; fruits ellipsoid, 2.5–3.5 cm. long, 1.2–2.5 cm. diam., 3-seeded; leaves oblanceolate to obovate-oblong, 8–20 cm. long, 3–6.5 cm. broad, papery; petiole 1–3.8 cm. long: [8](#)
- Heads of male flowers about 13 mm. diam., bracts puberulous; calyx of male flowers ciliate on the margin; fruits ovoid about 5 cm. long and 4 cm. broad, 5-seeded; leaves oblanceolate to oblong-obovate, 9–30 cm. long, 3–15 cm. broad, thickly coriaceous; lateral nerves 5–8 pairs; petiole 2–4.5 cm. long; young shoots glabrous, not waxy [9. esculenta](#)
- 8 Leaves rounded or obtuse at apex, lateral nerves 10–15 pairs; tufts of reddish curly hairs in leaf-axils [7. heudelotii](#)
- Leaves acuminate at apex, lateral nerves 7–8 pairs; tufts of curly hairs absent [8. acuminata](#)

1. **Uapaca staudtii** Pax — F.T.A. 6, 1: 638; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 15: 300. *APD acc*

Tree to 90 ft. high, with stilt-roots, in [swamp forest](#); flowers white or pale yellowish.

S. Nig.: Oni Sankey 14! Shasha F.R. (Apr.) Richards 3416! Boje, Ikom (May) Jones & Onochie FHI 17335! Okwango F.R., Obudu (May) Latilo FHI 30964! **Br. Cam.:** Victoria (fl. Apr., fr. Feb.) 20. HEVEA

Aubl. — F.T.A. 6, 1: 743; Pax & K. Hoffm. in E. & P. Pflanzenfam. 19C: 102 (1931).

Leaves digitately trifoliolate; leaflets stalked, elliptic or elliptic-oblongate, acuminate, narrowed to the base, 8–20 cm. long, 2.5–8 cm. broad, entire, glabrous, often glaucous beneath; lateral nerves about 20 pairs, looped near the margin, prominent beneath; stalks of leaflets each with a large flat orbicular gland at the base, the glands almost merged into one; petiole up to 25 cm. long; panicles below the leaves on each young shoot; male flowers numerous, females fewer; capsule 3-lobed, about 4.5 cm. diam.; seeds broadly oblong or oblong-ellipsoid, about 2.5 cm. long, 2 cm. broad; testa mottled and speckled, slightly shining *brasiliensis*

Hevea brasiliensis (*Kunth*) *Müll. Arg.* — F.T.A. 6, 1: 743; Holl. 4: 585. *APD acc*

Siphonia brasiliensis *Kunth* (1825).

The Para rubber tree; cultivated in plantations in many parts of the forest regions; native of tropical S. America.

21. RICINODENDRON

Müll. Arg. — F.T.A. 6, 1: 744; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 3: 45 (1911).

- 1 Leaves digitately 3–5-foliolate; leaflets sessile, obovate to obovate-elliptic, acuminate, narrowed to the base, the lateral ones often smaller, 6–20 cm. long, 2.5–12 cm. broad, glandular-denticulate, stellate-puberulous when young; lateral nerves 10–16 pairs; petiole up to 20 cm. long; stipules large, foliaceous, persistent, suborbicular, up to 2.5 cm. long, deeply toothed; male panicles slender, about 30 cm. long; stamens 10; disk-glands erect; fruit 2-lobed, 2-celled, 2 cm. long, 3 cm. broad [*heudelotii*](#)

Ricinodendron heudelotii (*Baill.*) *Pierre ex Pax* in Engl. Pflanzenr. Euph. 3: 46, figs. 13, C–D, & 16 (1911). *APD acc*

APD: *Synonym of Ricinodendron heudelotii* (*Baill.*) *Pierre ex Heckel subsp. heudelotii*

APD: *Synonym of Ricinodendron heudelotii* var. *africanum*

Jatropha heudelotii *Baill.* (1860).

Ricinodendron africanum *Müll. Arg.* (1864) — F.T.A. 6, 1: 745; F.W.T.A., ed. 1, 1: 294; Aubrév. Fl. For. C. Iv. 2: 63, t. 146.

A large deciduous tree, to 150 ft. high; in drier types of forest, especially in secondary regrowth; inflorescence yellow-tomentose, petals white; fruits indehiscent, yellow.

Port. G.: Fulacunda (May) Esp. Santo 2032! **Fr. G.:** Fouta Djallon Heudelot 857! **S. L.:** Bagroo R. (Apr.) Mann 825! Njala (Apr.) Deighton 1121! Ky Yema (Apr.) Lane-Poole 24! **Lib.:** Dukwia R. Also in **French Cameroons**, **Gabon**, **Spanish Guinea**, **Cabinda**, **Belgian Congo**, **A.-E. Sudan**, **Uganda**, **Tanganyika** and **Angola**.

22. CROTON

Linn. — F.T.A. 6, 1: 746; Pax & K. Hoffm. in E. & P. Pflanzenfam. 19C: 83 (1931).

- 1 Leaves digitately 3–5-lobed to near the base, up to 10 cm. long and broad; segments oblanceolate or obovate, acuminate, narrowed to the base, crenate or crenate-serrate; flowers monoecious, the lower half of the inflorescence consisting of subsessile female flowers, the upper part of much smaller males; fruit setose, 8 mm. long; herb, sometimes woody at base [1. lobatus](#)
- Leaves not lobed or rarely slightly so; mostly trees and shrubs (but see Nos. 2 & 3): **2**
- 2 Stems hirsute, densely covered with stellate hairs of which one or more rays are longer and more or less erect or deflexed, the others much shorter and appressed; flowers monoecious; racemes up to 5 cm. long, lower part with the female flowers, upper part with the much smaller males; herbs; leaves ovate, stellate-pubescent beneath, upper surface pilose with stellate hairs with only one long ray: **3**
- Stems not hirsute; trees and shrubs: **4**
- 3 Leaves serrate, the larger ones sometimes doubly crenate-serrate, 2.5–7 cm. long, 1–4.5 cm. broad, with a pair of long-stipitate glands at base; racemes up to 3 cm. long [2. hirtus](#)
- Leaves entire, up to 7.5 cm. long and 5 cm. broad, without glands at base [3. membranaceus](#)
- 4 Leaves densely covered beneath, at least when young, with silvery-grey, often fimbriate, scales or scale-like many-rayed stellate hairs: **5**
- Leaves glabrous or sparingly puberulous beneath, not scaly; petals absent from the female flowers, or very rudimentary; inflorescences, outside of flowers and fruits stellate-pubescent or glabrescent, not scaly: **9**
- 5 Leaves entire, permanently densely scaly beneath: **6**
- Leaves with obscurely serrate margins, undersurface densely covered with silvery fimbriate scale-like many-rayed stellate hairs, upper surface also with scale-like hairs; leaves ovate, cordate or rounded and with 2–4 stipitate glands at base, shortly and obtusely acuminate at apex, 6.5–18.5 cm. long, 4.5–13 cm. broad; petiole 3.5–12 cm. long; racemes normally unisexual, up to 25 cm. long, many-flowered [8. macrostachyus](#)
- 6 Upper surface of leaves entirely glabrous; petals well-developed in the female flowers; stamens 13–20; branchlets, undersurface of leaves and inflorescences densely covered with silvery and rust-coloured scales: **7**
- Upper surface of leaves with scales or stellate hairs: **8**
- 7 Racemes much abbreviated, giving the flowers a clustered appearance, up to 1 cm. long; leaves subverticillate, lanceolate, elliptic-lanceolate or ovate, obtuse at apex, 1.5–9 cm. long, 0.8–2.5 cm. broad, basal glands absent or very obscure; petiole up to 2.5 cm. long [4. pseudopulchellus](#)
- Racemes elongated, 3–15 cm. long; leaves not or scarcely verticillate, lanceolate, oblong-lanceolate or oblong-elliptic, acuminate or obtuse at apex, 4–15 cm. long, 1.5–6.5 cm. broad, with a pair of long-stipitate glands at base; petiole up to 4 cm. long [5. zambesicus](#)
- 8 Upper surface of leaves with orbicular unfringed scales; petals absent from the female flowers; stamens about 7; leaves oblong-lanceolate or elliptic-oblong, very acute at apex, 6–12 cm. long, 2–4 cm. broad; petiole up to 2.5 cm. long, with a pair of flat sessile glands at apex; branchlets, leaves and inflorescence densely covered with scales, those on undersurface of leaves fimbriate; racemes unisexual, terminal, up to 13 cm. long; capsule densely scaly [6. leonensis](#)
- Upper surface of leaves minutely stellate-puberulous, dark when dry, under-surface densely covered with silvery and rusty fimbriate scales; petals present in the female flowers; stamens about 30; leaves ovate-elliptic, cordate and with 2 large glands at base, acuminate at apex, 4–16 cm. long, 2–8 cm. broad; petiole 2.5–7.5 cm. long; branchlets and inflorescence densely scaly; flowers monoecious; racemes 7–20 cm. long; styles 3, each one 3 times bifid; fruits subglobose, about 9 mm. diam., scaly [7. sp. nr. mubango](#)
- 9 Leaves clustered on much-shortened branchlets, glabrous, entire, oblanceolate to obovate, rounded at apex, 1.3–4 cm. long, up to 1.8 cm. broad, membranous; male racemes very short, about 5-flowered, 6 mm. long; female flowers solitary on a branchlet separate from the males; stamens 5–6 [9. scarciensis](#)
- Leaves laxly arranged on more or less elongated branchlets, obscurely or distinctly toothed, glabrous or pubescent; stamens 10–12; racemes elongated: **10**
- 10 Petiole up to 1 (–3.2) cm. long; leaves lanceolate to elliptic, obtuse at both ends, crenate or serrate, 3–10.5 cm. long, 1.3–5.3 cm. broad, glabrous or pubescent, with a pair of shortly stipitate glands at the base; racemes up to 15 cm. long, slender, with female flowers at the base and males towards the top; calyx of female flowers up to 1.5 mm. long; fruits subglobose, 3-lobed, about 5 mm. diam. [10. nigritanus](#)
- Petioles 1.2–8.5 cm. long; racemes 15–42 cm. long; calyx of female flowers 2–5 mm. long: **11**
- 11 Basal glands on leaves long-stipitate, 2–3 mm. long; leaves elliptic to ovate-elliptic, rounded or cuneate at base, shortly and abruptly acuminate, crenate, 6–14 cm. long, 3.5–8 cm. broad; petiole 2–5.5 cm. long; racemes solitary, terminal, 28–42 cm. long, bisexual; calyx of female flowers 2–3 mm. long [11. penduliflorus](#)
- Basal glands on leaves sessile: **12**
- 12 Leaf-margin distinctly crenate or crenate-serrate; petiole 2–8.5 cm. long; lamina ovate to lanceolate-elliptic, obtuse or cuneate at base, rather long-acuminate, 8–19 cm. long, 4–9 cm. broad, lateral nerves 5–9 on each side of midrib; male racemes up to 40 cm. long; bisexual racemes up to 16 cm. long; calyx of female flowers about 5 mm. long; bracts 4–7 mm. long, subpersistent; fruits 3-lobed, about 2.7 cm. long and broad [12. longiracemosus](#)

Leaf-margin subentire, with sessile glands at intervals, often nearly hyaline; petiole 1·2–3 (–4) cm. long; lamina ovate, round to cuneate at base, abruptly acuminate, 5–9·5 cm. long, 3–6·5 cm. broad, lateral nerves 4–5 on each side of midrib; racemes bisexual, 15–27 cm. long; bracts up to 3 mm. long, mostly caducous; calyx of female flowers about 2 mm. long; fruits ovoid-ellipsoid, about 1 cm. long[3. dispar](#)

1. **Croton lobatus** Linn. — F.T.A. 6, 1: 750; Chev. Bot. 570.

APD: *Synonym of Jatropha glauca Vahl var. glauca*

APD: *Synonym of Astraea lobata (L.) Klotzsch*

An erect branched pubescent annual, 2–3 ft. high, sometimes woody at base.

12. *Croton longiracemosus* Hutch. in F.T.A. 6, 1: 1052 (1913). *APD acc*

Croton lehmbachii Hutch. l.c. (1913).

Tree, to 40 ft. high; flowers greenish-white; racemes apparently bisexual or entirely male.

Br. Cam.: Buea (fl. Mar., Apr., fr. June) Deistel! Lehmbach 19! Reder 24! Maitland 59! 465! 1107! Mimbria (Apr.) Maitland 1106! Moliko (Apr.) Hutch. & Metcalfe 86!

[Sankey 10 from Ondo Prov., Nigeria was cited as this species in the first edition, but it appears to be distinct. It is described as a tree 60–80 ft. high. The fruits which may or may not belong to the specimen are only about 7 mm. long. Further specimens are needed.]

13. *Croton dispar* N. E. Br. — F.T.A. 6, 1: 763. *APD acc*

Croton collenettei Hutch. & Dalz. F.W.T.A., ed. 1, 1: 297 (1928); Kew Bull. 1928: 300.

A straggling bush, to 10 ft. high (tree 25 ft. high fide Collenette); flowers cream.

Fr. G.: Macenta (May) Collenette 15! **S. L.:** Njala (fl. May–July, fr. Sept.) Deighton 670! 753! 1734! 2638–2641! Cole 61! Mayoso (fr. Aug.) Thomas 1416! Mattru to Sumbuya (June) Deighton 4775! **Lib.:** Monrovia Whyte! Tappita (fr. Aug.) Baldwin 9090! Vonjama (fr. Oct.) Baldwin 9895!

***Croton eluteria* (Linn.) Sw.**

A native of the Bahamas, has been introduced into Nigeria.

***Croton* sp. A.**

Forest tree, about 20 ft. high; fruits bright orange.

S. Nig.: Ubiaja (fr. Aug.) Onochie FHI 33254!

Imperfectly known species.

***Croton* sp. B.**

Fr. G.: Mt. Ziama, Nialé (young fr. May) Adam 47!

A poor specimen recorded as *C. oxypetalus* Müll. Arg. by Aubrév. Fl. For. Soud.-Guin. 196. Imperfectly known species.

23. CLUTIA

Linn. — F.T.A. 6, 1: 805; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 3: 50 (1911).

- 1** Young branchlets densely woolly-tomentose; leaves narrowly lanceolate, subacute, narrowed to the base, 6–12 cm. long, 1–2.5 cm. broad, membranous, densely pubescent on the nerves beneath; lateral nerves 11–15 pairs; flowers monoecious, several males and 1–2 females in each leaf-axil; male pedicels short, female up to 1.3 cm. in fruit, the latter subglobose, 6 mm. diam., thinly pubescent [8. kamerunica](#)

Clutia kamerunica* Pax — F.T.A. 6, 1: 805; Pax & K. Hoffm. l.c. 3: 58. *APD acc

An erect shrub, to 15 ft. high, with densely tomentose branchlets and small yellowish axillary flowers; **in streamside forest.**

Br. Cam.: Bamenda Prov.: Mt. Mba Kokeka, 6,000 ft. (fl. & fr. Jan.) Keay FHI 28385! Bafut-Ngemba F.R. (Aug.) Tamajong FHI 26895!

Also in **French Cameroons.**

24. JATROPHA

Linn. — F.T.A. 6, 1: 775; Pax in Engl. Pflanzenr. Euph. 1: 21 (1910).

- 1** Leaves not peltate: **2**
 Leaves peltate; orbicular-ovate, palmately 3–5-lobed, 10–20 cm. long and broad, lobes more or less ovate, entire, glabrous, pale and glaucous beneath; petiole about 10 cm. long, glabrous; cymes congested, long-pedunculate; stems much swollen at the base [8. podagrica](#)
- 2** Leaves penninerved and undivided or 3-lobed: **3**
 Leaves variously divided or digitately nerved, long-petiolate: **5**

- 3 The leaves sessile, linear or linear-lanceolate, 9–15 cm. long, up to 3 cm. broad, serrulate, or sometimes broader (6 cm.) and more coarsely toothed:4
 The leaves with petioles 0.5–2 cm. long; leaves ovate-oblong or ovate-elliptic, or 3-lobed in the upper half, 12–15 cm. long, 6–10 cm. broad, serrulate; flowers in terminal few-flowered panicles[3. *kamerunica* var. *trochainii*](#)
- 4 Leaves shortly pilose beneath; cymes short, few-flowered, with gland-tipped lacinate bracts[1. *neriifolia*](#)
 Leaves glabrous beneath; bracts linear, toothed[2. *atacorensis*](#)
- 5 Petioles furnished with numerous stipitate glands resembling the stipules; leaves digitately 3–5-lobed beyond the middle, up to 13 cm. in diam., lobes obovate or obovate-oblongate, gland-toothed and shortly pubescent; cymes pedunculate, lax; bracts linear-lanceolate, with stipitate glands on the margin[4. *gossypiifolia*](#)
 Petioles not glandular:6
- 6 Leaf-segments 11–12, pinnatisect or pinnately lobed, lobes acute, apex tailed, 10–15 cm. long, 2.5–5 cm. broad, more or less glaucous beneath; cymes 2.5–5 cm. long; peduncle up to 16 cm. long; sepals entire ...[5. *multifida*](#)
 Leaf-segments or lobes toothed or rarely entire; leaves glabrous or nearly so:7
- 7 Leaf-segments toothed, ovate, sharply 5–8-dentate; stipules divided into filiform glabrous gland-tipped segments; sepals entire or with a few glandular teeth[6. *chevalieri*](#)
 Leaves undulately 5-lobed or entire; stipules very small; sepals entire[7. *curcas*](#)
1. ***Jatropha neriifolia* Müll. Arg.** — F.T.A. 6, 1: 781; Pax in Engl. Pflanzenr. Euph. 1: 65. *APD acc*
 Stems pubescent, about 1 ft. high from a woody base, with viscid greenish sap; flowers small, brick-red.
N. Nig.: Nupe Barter 1679! Abinsi, on laterite (May) Dalz. 752!
2. ***Jatropha atcorensis* A. Chev.** in Bull. Soc. Bot. Fr. 58, Mém. 8: 206 (1912). Habit of the last. *APD acc*
Dah.: Somba country Chev. 24015. Farfa to Toukountouna (fr. June) Chev. 24070! Toukountouna to Kototengou Chev. 24129.
3. ***Jatropha kamerunica* var. *trochainii* Léandri** in Bull. Soc. Bot. Fr. 83: 525 (1936). *APD acc*
Jatropha kamerunica of Berhaut Fl. Sen. 164.
 An erect herb, to 21/2 ft. high, with a large carrot-like rhizome.
Sen.: Tambacounda (fl. June, Sept., fr. June) Berhaut 1655! Trochain 3636.
4. ***Jatropha gossypiifolia* Linn.** — F.T.A. 6, 1: 783; Pax l.c. 1: 26 (as var. *elegans* (Klotzsch) Müll. Arg.); Chev. Bot. 569; Berhaut Fl. Sen. 144. *APD acc*
 A shrub, up to 6 ft. high with stout glabrous branches and glandular, often purple-tinged foliage; flowers deep red-purple; planted in villages.
Sen.: fide Berhaut l.c. **Fr. Sud.:** Ouassai Chev. 515. **Fr. G.:** Conakry! **S. L.:** Kayima Kono (fl. & fr. July–Aug.) Dawe 532! Mano (May) Deighton 1761! Bonthe (fl. & fr. Feb.) Dalz. 942! **G. An American plant, common in the tropics.

8. *Jatropha podagrica* Hook. in Bot. Mag. t. 4376 (1848); Pax l.c. 1: 44. *APD acc*

Stem up to 2 ft. high, much swollen at the base; flowers red; **cultivated in our area**.

S. L.: Njala (May) Deighton 1986! **G. C.:** fide Deighton. **S. Nig.:** Ibadan fide Keay.

A native of Central America.

25. MILDBRAEDIA

Pax — F.T.A. 6, 1: 798; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 3: 11 (1911).

- 1** A tree; young branches stellate-tomentellous, at length glabrous; leaves lanceolate-obovate or oblanceolate-elliptic, very obtuse at base, shortly and acutely acuminate, up to 15 cm. long, 1.5–6 cm. broad, acutely repand-dentate; lateral nerves 7–10 pairs; stipules subulate, setulose; male cymes few-flowered, the female cymules laxly racemose, only the terminal flower of each developed; stamens 20; ovary pubescent *paniculata*

Mildbraedia paniculata Pax — F.T.A. 6, 1: 800; Pax & K. Hoffm. l.c. 3: 12, fig. 2 (1911); Chev. Bot. 587.

APD: *Synonym of Plesiatropha paniculata (Pax) Breteler*

A **forest** shrub, to 10 ft. high; flowers greenish-white.

Lib.: Peahtah (Oct.) Linder 1124! Yangi (Sept.) Linder 847! Gletown, Tchien (fr. July) Baldwin 6917! **Iv. C.:** Kéeta, Oubi country Chev. 19332. Soubiré to Yaou Chev. 17802. Oubi to Fort Binger Chev. 19283.

Also in **Belgian Congo**.

26. CAPERONIA

St.-Hil. — F.T.A. 6, 1: 829; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 6: 27 (1912).

A thorough revision of this, mainly American, genus is much needed. The treatment given by Prain (in F.T.A.) and by Pax & K. Hoffmann is by no means satisfactory; I suspect that far too many species have been described. — R.W.J.K.

- 1** Leaves palmately 5-nerved at the base, ovate, crenate, slightly cordate, acute, 8–11 cm. long, 4.5–6 cm. broad, sparingly hispid on the nerves; stipules caducous; racemes 4–6 cm. long; male petals subequal; female sepals 6; ovary bristly; fruit muricate *1. latifolia*
- Leaves pinnately nerved, narrowly lanceolate, serrate: **2**
- 2** Leaves linear, remotely serrate or sometimes subentire, up to 15 cm. long; young stems not or very sparsely clothed with gland-tipped hairs; racemes up to 15 cm. long; male petals unequal; female sepals 5–6 *2. senegalensis*

Leaves lanceolate, closely serrate, up to 15 cm. long and 3.5 cm. broad; young stems very densely setose with stiff gland-tipped hairs; racemes up to 7.5 cm. long; male petals unequal; female sepals 6 [3. palustris](#)

1. **Caperonia latifolia** Pax — F.T.A. 6, 1: 830; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 6: 35. *APD acc*

A weak herb softly hispid in the upper parts, up to 3 ft. high; [in and by ponds](#).

S. Nig.: Okomu F.R., Benin (Dec.) Brenan 8587! **Br. Cam.:** Victoria Dusen 281.

Also in **S. Tomé** and (fide Prain) in S. America and the West Indies.

2. **Caperonia senegalensis** Müll. Arg. — F.T.A. 6, 1: 832; Pax & K. Hoffm. l.c. 40; Chev. Bot. 572.

APD: Synonym of Caperonia serrata (Turcz.) C. Presl

APD: Synonym of Caperonia serrata (Turcz.) C. Presl

Caperonia chevalieri Beille (1908) — Pax & K. Hoffm. l.c. 38.

A slender herb, erect or half procumbent, up to 3 ft. high, with small white flowers and roughly setose capsules; [usually in moist ground, sometimes a weed in rice fields](#).

Sen.: Bakel Leprieur. Casamance R. Perrottet 737. **Gam.:** Wallikunda (fl. Aug., Sept., fr. Sept.) Macluskie 11! 17! Kuntuar Ruxton 96! **Fr. Sud.:** Nafadié (fl. & fr. Jan.) Chev. 157! Deighton 2949! Kichom (July) Deighton 3756! **G. C.:** Walewale (fl. & fr. Dec.) Adams & Akpabla GC 4204! Burufo (fl. & fr. Dec.) Adams & Akpabla GC 4387! **Togo:** Lome Warnecke 430. Kpedsu (fl. & fr. Dec.) Howes 1044! **Dah.:** Savalou (May) Chev. 23709! **N. Nig.:** Nupe Barter! Zungeru (Aug.) Dalz. 65! Bida Dist. (fl. & fr. Dec.) Savory UCI 101! Kumu (fl. & fr. Oct.) Lely 669! Abinsi (fl. & fr. Nov.) Dalz. 783! **S. Nig.:** Lagos Rowland!

Also in **French Camerouns** and **Ubangi-Shari**.

3. **Caperonia palustris** (Linn.) St.-Hil. — F.T.A. 6, 1: 832; Pax & K. Hoffm. l.c. 33, figs. 1, A–B & 6, D–E; Chev. Bot. 572, partly.

APD: Synonym of Caperonia fistulosa Beille var. fistulosa

Croton palustris Linn. (1753).

Caperonia macrocarpa Pax & K. Hoffm. l.c. 39 (1912).

Caperonia fistulosa Beille (1908) — Pax & K. Hoffm. l.c. 37.

Caperonia hirtella Beille (1908) — Pax & K. Hoffm. l.c. 38.

A fairly stout herb, erect or half procumbent, up to 3 ft. high, with small white flowers and roughly setose capsules; [in moist ground](#).

Fr. Sud.: Gao (Sept.) Hagerup 367a! Cotaga (July) Chev. 1158. Sébi to Mopti (fl. & fr. Aug., Sept.) Chev. 15763. **G. C.:** R. Pawmpawm, E. of Anyaboni (fl. & fr. Dec.) Morton GC 6092! **N. Nig.:** Minna (fl. & fr. Dec.) Meikle 700! **S. Nig.:** Olokemeji (fl. & fr. Nov.) Keay FHI 14160! Awba Hills F.R., Ibadan (fl. & fr. Oct.) Jones FHI 5992! Lagos Rowland.

Widespread in tropical Africa, and in **S. Africa**, **Madagascar** and **S. America**.

27. CHROZOPHORA

Neck. — F.T.A. 6, 1: 834; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 6: 17 (1912).

- 1 Prostrate undershrub, covered with soft white stellate hairs; leaves ovate, rounded or very obtuse at apex, long-petiolate, biglandular at base, 1.3–3 cm. long, 1–2 cm. broad; stipules subulate; racemes short, leafy at base; stamens 12–15; ovary tomentose; fruits stellate-tomentose, deeply 3-lobed; seeds rough [1. plicata](#)

Usually ascending or suberect undershrubs; fruits lepidote; stamens up to 10: **2**

- 2 Indumentum of the shoots and lower surface of the leaves very woolly; petioles fairly long; leaves ovate-rhomboid, 2.5–4 cm. long, up to 3 cm. broad, biglandular at base, sometimes slightly 3-lobed; sepals in fruit sometimes elongating to 6 mm. long [2. brocchiana](#)

Indumentum of the shoots and lower surface of the leaves short and close; petioles comparatively short; leaves

similar to preceding; sepals not elongating in fruit [3. senegalensis](#)

1. **Chrozophora plicata** (Vahl) A. Juss. ex Spreng. — F.T.A. 6, 1: 834 (incl. var. *obliquifolia* (Vis.) Prain); Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 6: 19. *APD acc*

Croton plicatus Vahl (1790).

Sen.: Dagana Leprieur. Podar Mathieu. **N. Nig.:** Kukawa (fl. & fr. Jan.–Feb.) E. Vogel 3! 32!

Extends to A.-E, **Sudan** and Abyssinia, Mozambique and Rhodesia; also in **Egypt** and **Palestine**.

2. **Chrozophora brocchiana** Vis. — F.T.A. 6, 1: 838 (incl. *C. senegalensis* var. *lanigera* Prain); Pax & K. Hoffm. l.c. 6: 20; Chev. Bot. 573. *APD acc*

A low undershrub with stout, more or less erect stems; scales covering the capsules whitish or violet-tinged; **in sandy soil**.

Sen.: Perrottet 42! Roger! Dagana Leprieur! Cape Verde Brunner 108! **Fr. Sud.:** Timbuktu Chev. 1302. **N. Nig.:** by the Niger Barter! Borgu Barter 812! Bornu Oudney!

Also in **Mauritania**, and extends to the Red Sea.

3. **Chrozophora senegalensis** (Lam.) A. Juss. ex Spreng. — F.T.A. 6, 1: 837; Pax & K. Hoffm. l.c. 6: 21; Chev. Bot. 573. *APD acc*

Croton senegalensis Lam. (1786).

A low undershrub, sometimes prostrate; flowers scarlet; capsules as in the preceding.

Sen.: Dagana (Apr.) Leprieur 1194! Walo and Cayor Heudelot 419! Dakar (fl. & fr. May) Baldwin 5751! **Gam.:** Kudang (fl. & fr. Jan.) Dalz. 8054! Yundum (fl. & fr. Dec.) Austin 26! **Fr. 2. **Grossera baldwinii** Keay & Cavaco in Port. Acta Biol. (B), 6: 1, t. 1 (1955).

APD: Synonym of Cavacoa baldwinii (Keay & Cavaco) J. Léonard

A dioecious shrub, to 8 ft. high; female flowers green; male flowers yellow.

S. L.: between Gola F.R. boundary and Lalahun (Jan.) King 122b! **Lib.:** Grand Cape Mount Co.: Genna Tanyehun (Dec.) Baldwin 10747! Jabrocca (Dec.) Baldwin 12567!

29. PSEUDAGROSTISTACHYS

Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 6: 96 (1912); Lebrun in Bull. Soc. Roy. Bot. Belg. 67: 97 (1934).

- 1 A small tree, 8 m. high, glabrous; stipules connate into a sheath, soon falling off and leaving a scar; leaves oblong-elliptic, acute, shortly cuneate at base, 17–40 cm. long, up to 15 cm. broad, glabrous, with 2 basal glands on the upper surface at base; lateral nerves 18–20 pairs, raised on both surfaces; racemes axillary, up to 7.5 cm. long; flowers white; bracts striate; stamens about 20, free; ovary densely pilose [africana](#)

Pseudagrostistachys africana (Müll. Arg.) Pax & K. Hoffm. l.c. 97, fig. 18 (1912); Exell Cat. S. Tomé 296. *APD acc*

Agrostistachys africana Müll. Arg. (1864) — F.T.A. 6, 1: 829.

S. Nig.: Ikwette Plateau, Obudu Div., 4,200 ft. (fr. Dec.) Keay & Savory FHI 25207! **F. Po:** 4,000 ft. (Nov.) Mann 582!

Also on **S. Tomé**.

30. CYRTOGONONE

Prain — F.T.A. 6, 1: 815; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 6: 111 (1912).

- 1 A tree; branchlets and undersurface of the leaves densely silvery-lepidote; leaves long-petioled, elliptic to obovate, widely cuneate at base, abruptly acuminate, entire or lobulate-toothed, 15–25 cm. long, 8–13 cm. broad, with a pair of glands at base; flowers dioecious, in large terminal narrow panicles up to 30 cm. long; calyx globose in bud, at length splitting into 3 sepals, lepidote; stamens numerous, erect in bud; fruits 3-lobed, about 3.5 cm. long and 4 cm. broad, scurfy brown-tomentellous; seeds 3, about 2.5 cm. long and broad [argentea](#)

Cyrtogonone argentea (Pax) Prain — F.T.A. 6, 1: 815; Pax l.c. 6: 111, fig. 23; Prain in Hook. Ic. Pl. t. 3008. *APD acc*

Crotonogyne? argentea Pax (1903).

A forest tree, 30–100 ft. high; flowers white.

S. Nig.: Oban Talbot 1590! Afi River F.R., Ikom (May) Latilo FHI 30988! **Br. Cam.:** Likomba Mildbr. 10523! Bambuko F.R., Kumba (fr. Sept.) Olorunfemi FHI 30770! R. Metschum, Wum (young fr. July) Ujor FHI 29284!

Also in **French Cameroons** and **Spanish Guinea**.

[In the first edition this species was recorded from the Ivory Coast (fide Chev. Bot. 588) by error. The specimen upon which the record was based is *Crotonogyne caterviflora* N. E. Br., q.v.]

31. CROTONOGYNE

Müll. Arg. — F.T.A. 6, 1: 819; Pax & K. Hoffm. in E. & P. Pflanzenfam. 19C: 97 (1931); Pflanzenr. Euph. 6: 111 (1912).

Neomanniophyton Pax & K. Hoffm. l.c. 6: 115 (1912), see F.T.A. 6, 1: 1054.

- 1 Leaves elongate-oblancheolate, narrowed to a cordate-auriculate base, acuminate at apex, up to 55 cm. long, 5–13 cm. broad; leaves crowded; petioles up to 1.8 cm. long; racemes up to 60 cm. long, the flowers in both sexes occupying the greater part of the rachis; male pedicel longer than the calyx; male petals free; indumentum of plant lepidote [l. preussii](#)

- Leaves not cordate-auriculate at base, not crowded; female flowers few and solitary towards the apex of the raceme; male pedicel not longer than the calyx; male petals united:2
- 2 Indumentum lepidote only or none; ovary lepidote:3
- Indumentum of setae or stellate hairs or both, associated with or replacing the flattened scales; ovary setose:4
- 3 Bracts usually eglandular; leaves oblong, rounded at base, gradually acuminate, 10–17 cm. long, 4–7 cm. broad, very loosely scaly beneath; racemes 5–15 cm. long, the males sometimes in clusters on the old wood; female calyx-lobes eglandular2. *caterviflora*
- Bracts always 2-glandular; leaves obovate, long-narrowed to an acute base, abruptly and shortly acuminate, 16–28 cm. long, 5–10 cm. broad, with very few scales beneath; racemes up to 30 cm. long; female calyx-lobes with glands between3. *manniana*
- 4 Branchlets and stipules stellate-pubescent and sparingly lepidote; leaves oblong-obovate, abruptly narrowed into a distinct “pseudopetiole” longer than the petiole proper, shortly acuminate, 26–30 cm. long, 6–9 cm. broad; stipules ovate, acuminate, 5 mm. long; racemes very long; bracts 2-glandular; male calyx glabrous, female lepidote and densely stellate-pubescent4. *impedita*
- Branchlets, stipules, petioles, undersurface of leaves, racemes and calyces at least when young with stiff spreading hairs; stipules lanceolate, 0.6–1.5 cm. long; leaves acutely long-acuminate:5
- 5 Indumentum composed of scales and long stiff hairs; petioles 1.8–6 cm. long; lamina elliptic to oblanceolate, 15–23 cm. long, 3.5–9 cm. broad5. *chevalieri*
- Indumentum strigose, scales absent except on the inflorescence; petioles up to 1.2 cm. long; lamina elongate-obovate, 17–30 cm. long, 6–10 cm. broad6. *strigosa*
1. **Crotonogyne preussii** Pax — F.T.A. 6, 1: 821; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 6: 113, fig. 24. *APD acc*
- Pycnocomma macrophylla* of F.W.T.A., ed. 1, 1: 307, partly (Talbot 691).
- A shrub or small tree, 10–25 ft. high, in *rain forest*; flowers greenish-yellow or white; inflorescence erect.
- S. Nig.:** Owena, Ondo Prov. (Mar.) Darko 190! Idanre F.R. (fl. & young fr. July) Onochie FHI 33380! Oban Talbot 691! 694. **Br. Cam.:** Victoria (Apr.) Preuss 1220. Likomba (Oct.) Mildbr. 10544! S. Bakundu F.R. (Jan., Mar.) Brenan 9455! Keay FHI 28564!
- Also in *French Cameroons*.
2. **Crotonogyne caterviflora** N. E. Br. — F.T.A. 6, 1: 821; Chev. Bot. 573. *APD acc*
- Neomanniophyton caterviflorum* (N. E. Br.) Pax in Engl. Pflanzenr. Euph. 6: 118 (1912).
- Cyrtogonone argentea* of Chev. Bot. 588, not of Prain.
- A *forest* shrub, to 18 ft. high, scaly.

Hoffm. in Engl. Pflanzenr. Euph. 7: 86 (1914).*Chloropatane* Engl. (1899).*Athroandra* (Hook. f.) Pax & K. Hoffm. l.c. 7: 76 (1914).

- 1** Branchlets armed with a pair of sharp stipular spines at the base of each leaf; leaves ovate or oblong, acuminate, 4–5 cm. long, 2–3 cm. broad, faintly crenate, glabrous; lateral nerves about 2 pairs; male racemes very short and slender; calyx globose in bud, glabrous; stamens 6–11; stigmas lacinate; fruits 1–3-lobed, sparingly setose *l. anomala*
- Branchlets not spiny; stigmas entire, smooth or papillose; stamens 24–30: **2**
- 2** Filaments longer than the anthers; branchlets long-pilose with spreading hairs; leaves very shortly petiolate, oblong-obovate, coarsely jagged-toothed, 5–15 cm. long, 1.5–5 cm. broad, membranous, pilose with stiff

- slender hairs on both surfaces; stipules small and hyaline; male pedicels up to 1 cm. long; sepals glabrous; stamens about 27; stigmas recurved and closely appressed on the ovary [2. membranacea](#)
- Filaments shorter than the anthers; branchlets pubescent, puberulous, often glabrescent, or glabrous: **3**
- 3** Undersurface of leaves remaining densely pilose or softly pubescent: **4**
- Undersurface of leaves puberulous and glabrescent, or glabrous: **5**
- 4** Leaves ovate-oblong, obtuse or cuneate at base, long-acuminate, 7–20 cm. long, 2.2–7 cm. broad, distantly crenate-serrate, densely pilose beneath; petiole 5–16 mm. long; stigmas lanceolate, spreading, style distinct; fruits 12–15 mm. broad [3. hispida](#)
- Leaves ovate, or ovate-lanceolate, obtuse at base, cuspidate-acuminate, 3–5 cm. long and nearly 2 cm. broad, denticulate, softly pubescent beneath; petiole about 6 mm. long; stigmas suborbicular, connate at base, smooth [4. chevalieri](#)
- 5** Male buds rounded; stigmas usually suberect or spreading; branchlets, petioles and leaves puberulous, at least when young: **6**
- Male buds ovoid, pointed; stigmas sessile, closely oppressed on the ovary; branchlets, petioles and leaves glabrous; leaves oblong-lanceolate, acuminate, 7–20 cm. long, 2.5–6 cm. broad, distantly serrulate; male pedicels subumbellate, up to 1.5 cm. long [8. mannii](#)
- 6** Stigmas subsessile, suborbicular, spreading, papillose; leaves ovate, 4–6.5 cm. long, 2.5–4 cm. broad, crenate; male pedicels up to 1 cm. long [6. africana](#)
- Stigmas on a distinct style, smooth; male pedicels slender, 1–2 cm. long: **7**
- 7** Stigmas suborbicular, small, much shorter than the style; leaves oblong to elliptic-obovate, 10–15 cm. long, 5–6 cm. broad, remotely toothed [6. welwitschiana](#)
- Stigmas ovate-lanceolate, longer than the style; leaves oblong-lanceolate, 8–15 cm. long, 3–5 cm. broad, glandular-dentate [7. pallidifolia](#)

1. *Erythrococca anomala* (Juss. ex Poir.) Prain in Ann. Bot. 25: 614 (1911); Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 90. *APD acc*

Adelia anomala Juss. ex Poir. (1810).

Erythrococca aculeata Benth. (1849) — F.T.A. 6, 1: 858; Chev. Bot. 575.

A spiny shrub, 3–10 ft. high; fruit (as in the other species) usually 2-lobed and splitting to expose the pitted spherical seeds enclosed in a thin scarlet aril.

Fr. G.: Boquet Heudelot 856! **S. L.:** Smeathmann! Bagroo R. (Apr.) Mann 879! Mt. Aureole (Mar.) Dalz. 936! Ndilajula, Njala (Apr.) Deighton 3733! **Lib.:** Monrovia Whyte! Peahtah (Oct.) Claoxylon welwitschianum Müll. Arg. (1864).

Athroandra welwitschiana (Müll. Arg.) Pax & K. Hoffm. l.c. 7: 81, fig. 12 (1914).

A forest shrub, 4–15 ft. high.

S. Nig.: Oban Talbot 663!

Also in **French Cameroons**, extending to **Belgian Congo** and **Angola**.

7. *Erythrococca pallidifolia* (Pax & K. Hoffm.) Keay in Kew Bull. 1955: 139. *APD acc*

Athroandra pallidifolia Pax & K. Hoffm. l.c. 7: 84 (1914).

A shrub, to 6 ft. high, on forest-margin.

F. Po: Musola Mildbr. 7060.

8. *Erythrococca mannii* (Hook. f.) Prain — F.T.A. 6, 1: 865. *APD acc*

Claoxylon mannii Hook. f. (1862).

Athroandra mannii (Hook. f.) Pax & K. Hoffm. l.c. 7: 78 (1914).

A shrub, 15 ft. high.

F. Po: Clarence Peak, 5,000 ft. (Dec.) Mann 260; 633!

34. CLAOXYLON

A. Juss. — F.T.A. 6, 1: 874.

Discoclaoxylon (Müll. Arg.) Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 137 (1914).

- 1 Leaves long-cuneate at base, elongate obovate-oblongate, 15–25 cm. long, 5–6.5 cm. broad, purplish when young, remotely denticulate, nearly glabrous beneath; male flowers in lax racemes; stamens 11–12 [1. pedicellare](#)

Leaves rounded or very widely cuneate at base, elliptic-obovate, 17–35 cm. long, 8–15 cm. broad, closely serrate, the petioles purplish when young; male flowers in rather close racemes resembling catkins when young; stamens (3–) 6–8 [2. hexandrum](#)

1. *Claoxylon pedicellare* Müll. Arg. — F.T.A. 6, 1: 874.

APD: *Synonym of Discoclaoxylon pedicellare* (Müll. Arg.) Pax & K. Hoffm.

Discoclaoxylon pedicellare (Müll. Arg.) Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 137 (1914).

A small tree with rather long-petiolate leaves and green glabrescent branchlets.

F. Po: Mann!

2. *Claoxylon hexandrum* Müll. Arg — F.T.A. 6, 1: 875; Aubrév. Fl. For. C. Iv. 2: 77, t. 151, 1–5.

APD: *Synonym of Discoclaoxylon hexandrum* (Müll. Arg.) Pax & K. Hoffm.

Discoclaoxylon hexandrum (Müll. Arg.) Pax & K. Hoffm. l.c. 7: 139, fig. 19 (1914).

A soft-wooded forest tree, to 60 ft. high, mostly in secondary regrowth; flowers greenish-yellow, ripe seeds red.

Lib.: Gbanga (Sept.) Linder 734! Peahtah (Oct.) Linder 1104! Ganta (Sept.) Baldwin 9240! **IV. C.:** Yapo (Oct.) Chev. B. 22363! Agboville Aubrév. 1927! **G. C.:** Manso, Akim (Dec.) Irvine 2688! Ejiofor FHI 29375!

Throughout tropical Africa, also in Madagascar and Asia.

36. MALLOTUS

Lour. — F.T.A. 6, 1: 927; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 145 (1914).

- 1 Leaves not golden-glandular beneath; stipules persistent, rigid-subulate; fruit bristly; leaf-blades ovate or ovate-elliptic, rounded or subcordate at base, acuminate, 10–18 cm. long, 8–10 cm. broad, often entire ..*1. subulatus*
Leaves golden-glandular beneath; stipules small, caducous; fruits smooth; leaf-blades broadly ovate, rounded to quite cordate at base, up to 18 cm. long and 10 cm. broad, often toothed, glabrescent or pubescent beneath ..*2. oppositifolius*

1. *Mallotus subulatus* Müll. Arg — F.T.A. 6, 1: 927; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 153; Chev. Bot. 580. APD acc

A dioecious forest shrub or small tree, 3–15 ft. high, with stellate-pubescent branchlets and racemes; flowers cream.

S. L.: Nganyama, Bo (fl. Dec., fr. Mar.) Deighton 3514! 3580! Zimi to Gorahun, Gola Forest (Mar.) Deighton 4107! **Lib.:** Jabrocra (fr. Dec.) Baldwin 10859! **IV. C.:** Abiosso Chev. 17825. **G. Widespread in tropical Africa and in **Madagascar**.

Several forms or varieties exist, but the treatments given in the Pflanzenreich and in the F.T.A. are not satisfactory and more thorough research is required.

37. ALCHORNEA

Sw. — F.T.A. 6, 1: 914; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 220 (1914). *APD acc*

Lepidoturus Boj. ex Baill. — F.T.A. 6, 1: 913; F.W.T.A., ed. 1, 1: 303.

- 1 Leaves without stipel-like appendages, but with sessile glands at the base; bracts up to 1 mm. long, inconspicuous; male flowers in panicles of spikes:2
 Leaves with a pair of stipel-like appendages and sessile glands at the base; bracts 4–6 mm. long, conspicuous; male flowers in simple spikes, 4–10 cm. long, from perulate buds on the 1-year-old shoots, appearing before the leaves; female spikes axillary on the young shoots, flowers very few; ovary 3-celled; styles 3; fruit 3-celled, about 8 mm. broad, smooth, glabrescent; leaves ovate-elliptic, rounded at base, acutely acuminate, crenate or subentire, 8–13 (–16) cm. long, 3–5 (–10) cm. broad, sparsely pilose beneath; petioles 1–4 (–7.5) cm. long; branchlets and young leaves purplish4. *laxiflora*
- 2 Petioles 5–14 cm. long; ovary 2-celled; styles 2; leaves broadly ovate, cordate at base, shortly acuminate, repand-dentate or subentire, 10–28 cm. long, 6.5–16.5 cm. broad, finely stellate-puberulous or glabrescent beneath; male panicles axillary, 8–36 cm. long; female inflorescences axillary, branched or simple; fruits 2-celled, about 1 cm. broad, stellate-pubescent1. *cordifolia*
 Petioles 0.5–3 cm. long; ovary 3-celled; styles 3; leaves not cordate at base; indumentum not stellate:3
- 3 Leaves elongate-obovate-oblancoelate, long-attenuated to the base, shortly acuminate, repand-denticulate, 14–31 cm. long, 6–12 cm. broad, lateral nerves 12–19 pairs; branchlets, petioles and undersurface of leaves minutely puberulous; male panicles 10–25 cm. long, terminal, axillary and on the old wood; female inflorescences terminal, simple or branched, up to 11–40 cm. long; fruits 3-celled, about 8–11 mm. broad, smooth, pubescent2. *floribunda*
 Leaves oblong-elliptic, rounded at base, obtusely acuminate, crenate or entire, 7–13 cm. long, 2.5–6 cm. broad, lateral nerves 7–10 pairs; branchlets, petioles and undersurface of leaves with spreading pilose hairs; male panicles up to 17 cm. long, terminal and axillary, female inflorescences terminal, simple or branched, up to 8 cm. long; fruits 3-celled, 8–9 mm. broad, tuberculate3. *hirtella*

1. **Alchornea cordifolia** (*Schum. & Thonn.*) Müll. Arg. in Linnaea 34: 170 (1865); Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 230, fig. 34, A–C; Chev. Bot. 577. *APD acc*

Schousboea cordifolia Schum. & Thonn. (1827).

Alchornea cordata Benth. (1849) — F.T.A. 6, 1: 915.

A shrub or small tree, erect or half climbing; flowers greenish-white; styles long and persistent on the ripening fruits in lax pendulous spikes or racemes.

Sen.: Roger! **Gam.:** Heudelot 345! Genieri (Feb.) Fox 28! **Fr. Sud.:** Banamiane (Jan.) Chev. 151! Moussaia (Feb.) Chev. 456! **Port. G.:** Esp. Santo 428! **Fr. G.:** Timbo (Jan.) Pobéguin 124! Also in **French Cameroons**, **Spanish Guinea**, **Gabon**, **Cabinda**, **Belgian Congo** and **S. Tomé**.

39. MAREYOPSIS

Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 14: 13 (1919).

- 1 Shrub or tree, dioecious; branchlets and petioles shortly pubescent; leaves obovate, obovate-lanceolate or oblanceolate, cuneate or obtuse at base, long-acuminate, serrate-dentate, 14–32 cm. long, 6–13 cm. broad, puberulous beneath; spikes from nodes on the old wood, or females sometimes axillary, males several, females solitary, up to 20 cm. long; fruits indehiscent, depressed-globose, 3-lobed, up to 2.5 cm. broad and 1.5 cm. long [longifolia](#)

Mareyopsis longifolia (*Pax*) *Pax & K. Hoffm.* l.c. (1919). *APD acc*

Mareya longifolia *Pax* (1903) — F.T.A. 6, 1: 912.

A forest shrub or tree, to 30 ft. high.

S. Nig.: Uquo, Eket (young fr. May) Onochie FHI 33187! **Br. Cam.:** N. Korup F.R., Kumba (young fr. July) Olorunfemi FHI 30672!

Also in **French Cameroons** and **Belgian Congo**.

40. NEOBOUTONIA

Müll. Arg. — F.T.A. 6, 1: 918; *Pax & K. Hoffm.* in Engl. Pflanzenr. Euph. 7: 71–75 (1914).

- 1 Pubescence or scurf not continuous over the lower surface of the leaves:2
 Pubescence or scurf continuous and felted over the whole undersurface of the leaves; male calyx hairy; leaves orbicular-cordate, 10–20 cm. long and broad, entire, softly hairy on the nerves above; styles narrow, with 2 linear lobes; ovary and capsule densely velvety [4. velutina](#)
- 2 Leaves with long soft spreading hairs as well as scurf on the nerves beneath; male calyx pubescent:3
 Leaves without long hairs beneath; male calyx glabrous; leaf-blade suborbicular, shallowly cordate, 10–20 cm. long and broad; styles narrow, with 2 linear lobes [3. glabrescens](#)
- 3 Twigs and male panicles softly hairy with long simple hairs; leaves orbicular-cordate, crenate, 13–15 cm. long and broad [1. diaguissensis](#)
 Twigs and male panicles only scurfy-stellate-puberulous; leaves orbicular-cordate, entire, 10–20 cm. long and broad; styles narrow, with 2 linear lobes [2. mannii](#)

1. **Neoboutonia diaguissensis** *Beille* — F.T.A. 6, 1: 920; Chev. Bot. 579.

APD: *Synonym of Neoboutonia mannii Benth.*

Neoboutonia africana var. **diaguissensis** (*Beille*) *Pax & K. Hoffm.* in Engl. Pflanzenr. Euph. 7: 75 (1914).

A small tree.

Fr. G.: high plateau of Diaguissa (Apr.) Chev. 12691. Koumi (June) Pobéguin 1603! Labé, Ditinn, Dalaba and Toukan to Bouria fide Chev. l.c.

2. **Neoboutonia mannii** *Benth.* — F.T.A. 6, 1: 920; Exell Cat. S. Tomé 300 (q.v. for synonymy). *APD acc*

Neoboutonia africana var. **mannii** (*Benth.*) *Pax & K. Hoffm.* l.c. (1914).

A tree, to 70 ft. high, in [secondary forest regrowth](#); flowers yellowish-green.

S. Nig.: Ukpon F.R., Obubra (fr. July) Latilo FHI 31871! **Br. Cam.:** Buea (May) Deistel 643! Maitland 689! Big Kotto, Kumba Rosevear 90/37! **F. Po:** Mildbr. 6407.

Also in [French Cameroons](#), [Principe](#) and [S. Tomé](#).

3. *Neoboutonia glabrescens* Prain — F.T.A. 6, 1: 921.

APD: Synonym of Neoboutonia mannii Benth.

Neoboutonia africana Pax var. *glabrescens* (Prain) Pax & K. Hoffm. l.c. (1914).

A soft-wooded tree, to 55 ft. high, [growing in open spaces in forest](#).

Lib.: Dukwia R. (May) Cooper 438! **S. Nig.:** Shasha F.R. (Mar.) Richards 3203! Ikom Catterall 7! **Br. Cam.:** Bimbia Preuss 1288! Big Kotto, Kumba (June) Rosevear 89/37! Etawo, Mamfe (May) Ndep Enoh 48/38!

Also in [French Cameroons](#) and [Spanish Guinea](#).

4. *Neoboutonia velutina* Prain — F.T.A. 6, 1: 921.

APD: Synonym of Neoboutonia melleri (Müll. Arg.) Prain

Neoboutonia melleri Prain var. *velutina* (Prain) Pax & K. Hoffm. l.c. (1914).

A shrub or small tree, 15–20 ft. high with stellate-scurfy branchlets and panicles; flowers yellow; [in streamside forest](#).

Br. Cam.: Bamenda, 5,500 ft. Ledermann 1924! Bum Su, Bamenda (young fr. May) Maitland 1737! Nkom-Wum forest, Wum (fl. & fr. July) Ujor FHI 29279! 30474! Balibagam, Bamenda (fr. Jan.) Johnstone 277/32!

Also in [French Cameroons](#).

A thorough revision of this genus, which has a wide distribution in tropical Africa, is needed to determine how far the taxa recognized by Prain in the F.T.A. can still be maintained as distinct species.

41. MAREYA

Baill. — F.T.A. 6, 1: 910; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 14: 11 (1919).

- 1 Shrub or tree; branchlets and petioles puberulous or pubescent; leaves oblong-elliptic, obovate or oblanceolate, cuneate or obtuse at base, acuminate, slightly to coarsely toothed, 8–24 cm. long, 3–9 cm. broad, glabrous or pubescent beneath; flowers monoecious, in rather numerous interrupted spikes up to 39 cm. long; fruits 3-lobed, 3–4 mm. diam[micrantha](#)

Mareya micrantha (Benth.) Müll. Arg. in DC. Prod. 15, 2: 792 (1866), incl. vars.; Benth. in Hook. Ic. Pl. t. 1281; F.T.A. 6, 1: 911; Chev. Bot. 577. *APD acc*

APD: Synonym of Mareya congolensis (J. Léonard) J. Léonard

Acalypha micrantha Benth. (1849).

A. leonensis Benth. (1849).

Mareya leonensis (Benth.) Baill. (1874).

Mareya spicata Baill. (1860) — F.T.A. 6, 1: 911; Pax & K. Hoffm. l.c. 14: 11 (1919), incl. vars.; Chev. Bot. 577; F.W.T.A., ed. 1, 1: 303; Aubrév. Fl. For. C. Iv. 2: 76, t. 154.

A [forest](#) shrub or tree, up to 40 ft. high, rarely more; flowers white, or greenish; ripe fruits red.

Fr. G.: Landouma (Jan.) Heudelot 752! Kouria (Nov.) Caille in Hb. Chev. 14936! **S. L.:** Don! (May, June) T. Vogel 137! Barter! Wossin Highlands (fr. Mar.) Sc. Elliot 5055! Njala (Aug.) Dawe 567! Also in **French Cameroons**, **Spanish Guinea**, **Gabon**, **Belgian Congo**, **A.-E. Sudan**, **Uganda**, **Kenya**, **Tanganyika**, **Angola**, **Nyasaland**, **N. and S. Rhodesia** and **Mozambique**.

44. PYCNOCOMA

Benth. — F.T.A. 6, 1: 955; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 52 (1914).

- 1 Styles connate nearly to the top; leaves oblanceolate, narrowed into a distinct petiole, acute, 20–40 cm. long, 3–8 cm. broad, remotely denticulate in the upper part, glabrous, strongly reticulate; bracts lanceolate, acuminate, spreading or recurved, about 6 mm. long, shortly pubescent; male pedicels up to 2 cm. long, 1–3 to each bract [1. angustifolia](#)

Styles connate only in the lower third; bracts concave, not recurved: **2**

- 2 Rhachis of inflorescence slightly pubescent or glabrescent; leaves elongate-oblongate, narrowed into a winged petiole at the base, acutely acuminate, up to 50 cm. long and 11 cm. broad, glabrous, laxly reticulate; bracts broadly ovate-rounded, shortly appressed-pubescent; male pedicels up to 2 cm. long; fruits shortly horned .. [2. macrophylla](#)

Rhachis of inflorescence rather densely pubescent; leaves obovate-oblongate, gradually narrowed to the base, rather long-acuminate, up to 45 cm. long and 10 cm. broad, rather closely reticulate; bracts broadly ovate, villous; male pedicels up to 2 cm. long, 1–3 to each bract; fruits with large horn-like wings. [3. cornuta](#)

1. **Pycnocoma angustifolia** *Prain* — F.T.A. 6, 1: 960; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 58. *APD acc*

Pycnocoma beillei *A. Chev.* Bot. 582, name only.

A shrub, glabrous except on the inflorescence, the leaves clustered towards the ends of the branchlets; racemes peduncled in the upper axils; capsule (young) velvety, at length glabrous, 4 cm. diam., each lobe with a pair of wing-like horns; **often in forest** undergrowth.

Br. Cam.: Victoria (Sept.) Winkler 367.

Imperfectly known species.

45. NECEPSIA

Prain — F.T.A. 6, 1: 923; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 16 (1914).

- 1 Leaves obovate-elliptic, acutely acuminate, widely cuneate at base, 10–25 cm. long, 6–9 cm. broad, glabrous, remotely denticulate; lateral nerves about 10 pairs, with distinct parallel tertiary nerves; flowers monoecious, apetalous; spikes solitary, slender, about as long as the leaves; bracts clustered, persistent; stamens numerous, with pubescent glands between; styles fimbriate-papillose; fruits setose, 3-lobed, about 1 cm. diam. [afzelii](#)

Necepsia afzelii *Prain* — F.T.A. 6, 1: 923; Pax & K. Hoffm. l.c. 7: 17. *APD acc*

APD: *Synonym of Necepsia afzelii Prain var. afzelii*

A **forest** shrub or tree, to 40 ft. high; branchlets yellowish-pubescent, becoming glabrous.

Also in **French Cameroons** and **Gabon**.

47. MACARANGA

Thouars — F.T.A. 6, 1: 932; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 298 (1914).

- 1 Leaves palmately 5–9-nerved from the more or less cordate and auricled base, lamina usually more or less distinctly digitately or palmately lobed; petioles 7–46 cm. long; stipules 2.5–5.5 cm. long (but see No. 3), 1–3 cm. broad; ovary 2-celled; fruits 2-lobed: **2**
- Leaves 3-nerved at base, or pinnately nerved, not lobed; stipules up to 2.5 cm. long; ovary, where known, 1-celled: **5**
- 2 Bracts subtending the flower-clusters 3–4 mm. long, glandular-denticulate to subentire, densely glandular-puberulous; leaves rather shallowly palmately 3-lobed, lobes acute or shortly acuminate, 13–60 cm. long and nearly as broad; male panicles 5–23 cm. long; female panicles about 8 cm. long, little branched [1. schweinfurthii](#)
- Bracts subtending the flower-clusters 5–10 mm. long, sinuate-dentate or deeply lacinate: **3**
- 3 Bracts loosely pubescent or pilose, deeply lacinate; leaves cordate to subtruncate at base, caudate-acuminate at apices of leaf and lobes: **4**
- Bracts densely tomentellous, sinuate-dentate; leaves very shallowly 3-lobed, rarely not lobed, lobes cuspidate, the lateral ones sometimes no bigger than large teeth, margin repand-dentate, deeply overlapping-cordate at base, 14–30 cm. long and broad; male panicles 7–14 cm. long; female panicles 8–13 cm. long [4. occidentalis](#)
- 4 Leaves usually rather deeply digitately 3–7-lobed, rarely not lobed, coriaceous, midrib and main nerves beneath sparingly pubescent, 13–32 cm. long and broad; stipules more than 2.5 cm. long; male panicles 15–30 cm. long; female flowers in spike-like racemes or narrow sparsely branched panicles, up to 14 cm. long; fruits 12–20 mm. broad [2. heterophylla](#)
- Leaves not lobed or only shallowly 3-lobed, membranous, midrib and main nerves beneath with long spreading hairs, 10–17 cm. long, 11–17 cm. broad; stipules lanceolate, about 1.5 cm. long; male panicles about 10–15 cm. long; female flowers in spike-like racemes, up to 6 cm. long; fruits 6–10 mm. broad [3. beillei](#)
- 5 Bracts well-developed, 2–10 mm. long, more or less persistent in the male panicles: **6**
- Bracts less than 2 mm. long, caducous: **10**
- 6 Bracts orbicular, entire, sometimes apiculate, 3–4 mm. long; leaves thickly coriaceous, orbicular-obovate to broadly elliptic, obtuse at the glandular-auricled base, obtuse to shortly acuminate at apex, margin shallowly repand-dentate especially towards the apex, 12–16 cm. long, 6–11 cm. broad; petiole stout 4–11 cm. long; male panicles 4–7 cm. long, rusty-tomentellous; female not known [5. staudtii](#)
- Bracts ovate, mostly dentate; leaves not as above, mostly rather thin: **7**
- 7 Leaves distinctly toothed, mostly ovate: **8**
- Leaves entire or at most undulate, elliptic-obovate to oblong-oblongeolate, broadly cuneate or rounded and usually auriculate-glandular at base, shortly acuminate, 7–16 cm. long, 4–9 cm. broad, minutely and closely glandular beneath; petiole 2–10 cm. long; branchlets, petioles and midrib beneath densely rusty-tomentellous at least when young; bracts 3–8 mm. long, entire or somewhat dentate; male panicles 5–8 cm. long, axillary, among the leaves; female panicles 2–6 cm. long; fruits obliquely ovoid or subglobose, about 5 mm. diam., with pedicels up to 2.5 cm. long [9. barteri](#)
- 8 Branchlets, petioles and midrib beneath pubescent or pilose with whitish hairs or nearly glabrous; bracts 2–5 mm. long, dentate: **9**

Branchlets, petioles and midrib beneath densely rusty-tomentellous at least when young; bracts 4–10 mm. long, dentate; stipules 5–6 mm. long, early caducous; leaves ovate to oblong, rounded to cuneate at base, acute to acuminate, margin coarsely repand-dentate, 8–20 cm. long, 3.5–12 cm. broad, densely covered with rather small glands beneath; petiole 1.5–10.5 cm. long; panicles up to 10 cm. long, axillary, among the leaves; fruits obliquely ovoid, 6–8 mm. long and broad; stamens 2, rarely 1 [8. monandra](#)

- 9 Stipules about 2.5 cm. long; branchlets, petioles and midrib beneath very sparsely pubescent or glabrescent; bracts 2–2.5 mm. long; leaves ovate to orbicular-ovate, rounded at base, long-acuminate, margin sinuate-dentate, 9–25 cm. long, 5.5–13 cm. broad; petiole 6–10 cm. long; male panicles 6–7 cm. long; female racemes 2–3 cm. long [6. paxii](#)

Stipules up to 1 cm. long, early caducous; branchlets, petioles and midrib beneath more or less densely pubescent or pilose with whitish hairs; bracts 3–5 mm. long; leaves very broadly ovate, rounded or truncate at base, shortly acuminate, margin coarsely repand-dentate, 9–18 cm. long, 6–15 cm. broad; very densely glandular beneath; petiole 3–18 cm. long; panicles up to 10 cm. long, usually borne on leafless parts of the stem; fruits globose, about 3 mm. diam. [7. hurifolia](#)

- 10 Branchlets, petioles and midrib beneath densely rusty-tomentellous at least when young, without spreading whitish hairs: **11**

Branchlets, petioles and midrib beneath with long spreading whitish hairs; leaves elliptic-oblong, rounded at base, rather long-acuminate, margin undulate, 6–14 cm. long, 3.5–6 cm. broad; petiole 0.7–6 cm. long; panicles 3–6 cm. long; fruits subglobose, about 3 mm. diam., with pedicels up to 6 mm. long [12. spinosa](#)

- 11 Leaves ovate or ovate-elliptic, rather long-acuminate at apex, margin distinctly repand-dentate, rounded at base, 7–15 cm. long, 3.5–8.3 cm. broad; petiole 1.5–8 cm. long; male panicles up to 6 cm. long; female flowers and fruits not known [10. sp. A](#)

Leaves oblong-oblongate, abruptly and shortly acuminate at apex, margin entire or undulate, or denticulate in the upper half, obtuse at base, 4.5–12 cm. long, 2–5.5 cm. broad; petiole 0.5–2 (–3) cm. long; panicles up to 5 cm. long; fruits subglobose, about 3 mm. diam., with pedicels up to 1 cm. long [11. heudelotii](#)

1. **Macaranga schweinfurthii** Pax in Engl. Bot. Jahrb. 19: 92 (1894); F.T.A. 6, 1: 935; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 313. *APD acc*

Macaranga rosea Pax (1899) — F.T.A. 6, 1: 935; F.W.T.A., ed. 1, 1: 306.

A straggling tree or shrub, in **forest**; fruits with a yellow granular covering.

S. Nig.: Oban Talbot 112! 1377! Kanyang, Ikom (fr. May) Latilo FHI 30991! **Br. Cam.:** Johann-Albrechtshöhe Büsgen 39.

48. ACALYPHA

Linn. — F.T.A. 6, 1: 880; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 16: 12 (1924). *APD acc*

- 1 Male and female flowers on separate inflorescences; male racemes axillary, slender, female inflorescences terminal:2
- Male and female flowers on the same inflorescences or in the same leaf-axil; the males above the females:.....8
- 2 Female inflorescence paniculate, 10–36 cm. long, flowers pedicellate; stems pubescent; leaves ovate, subcordate at base, acuminate, 4–15 cm. long, 2·5–10 cm. broad, coarsely crenate-serrate, 5-nerved at base; petioles 5–16 cm. long; male racemes 6–14 cm. long [1. *racemosa*](#)
- Female inflorescence spicate, up to 15 cm. long, flowers sessile:3
- 3 Female spikes very short, ovoid; leaves more or less lanceolate, villous on both sides; stems very villous with reflexed hairs; styles laciniate:4
- Female spikes cylindrical, 5–15 cm. long; ovary without gland-tipped hairs; leaves more or less ovate:5
- 4 Styles 2–3 mm. long; leaves lanceolate to triangular-lanceolate, 4–8 cm. long, 1·5–2·5 cm. broad; petiole 1–1·5 cm. long [2. *senegalensis*](#)
- Styles 10–20 mm. long; ovary with gland-tipped hairs; leaves lanceolate, linear-lanceolate or oblong-lanceolate, 3·5–11 cm. long, 1–2 (–3·5) cm. broad; petiole 1·5–5·5 cm. long [3. *senensis*](#)
- 5 Bracts of the female flowers with numerous gland-tipped hairs on the teeth or within; bracts with short triangular teeth on either side of the acumen:6
- Bracts of the female flowers without gland-tipped hairs; bracts deeply divided into lanceolate lobes or laciniae:7
- 6 Styles bilobed and not laciniate; female bracts about 5-toothed on each side of the acumen; stems shortly pubescent; leaves ovate, rounded at base, caudate-acuminate, crenate-serrate, 3–6 cm. long, 2·5–4 cm. broad, softly pubescent beneath; petiole up to 4 cm. long [4. *nigritiana*](#)
- Styles laciniate; female bracts about 10-toothed on each side of the acumen, 8–12 mm. broad in fruit; stems

- shortly pubescent and sometimes villous; leaves ovate, rounded or subcordate at base, rather coarsely serrate, 5–15 cm. long, 3–10 cm. broad, spreadingly pilose beneath; petiole 1–13 cm. long [5. *ornata*](#)
- 7 Bracts of the female flowers about 7 mm. broad in fruit, with about 17 unequal lanceolate lobes up to about 1 mm. long, pubescent outside; female inflorescences terminal on short lateral branches; stems and petioles softly pubescent; leaves ovate rounded at base, acute at apex, crenate-serrate, up to 10 cm. long and 5 cm. broad, pubescent on both surfaces; petiole up to 3 cm. long [6. *sp. A*](#)
- Bracts of the female flowers 12–16 mm. broad in fruit, with 12–20 filiform laciniae 2–3 mm. long, densely hirsute; leaves ovate to ovate-lanceolate, rounded to cordate at base, gradually acuminate, crenate-serrate, 3–10 cm. long, 2.5–6 cm. broad, pubescent on both surfaces; petiole 3–6 cm. long [7. *manniana*](#)
- 8 Leaves with numerous raised resinous glands beneath, ovate-rhomboid, cuneate at base, acuminate, obtusely serrate, 6–9 cm. long, 1.5–5 cm. broad; petiole 2–4 cm. long; inflorescence bisexual axillary, the upper part male, with a few 2-flowered denticulate female bracts at the base enlarging in fruit to about 1.5 cm. broad .. [8. *ceraceopunctata*](#)
- Leaves without resinous glands beneath: [9](#)
- 9 Female bracts digitately 3-partite, with gland-tipped hairs on the margins; leaves ovate, subcordate at base, acuminate, crenate, 2–5 cm. long, 1.5–4 cm. broad, sparingly pubescent; petiole 1.5–7 cm. long; inflorescence very short, with 6–9 female flowers below; annual herb [9. *brachystachya*](#)
- Female bracts dentate, fimbriate or laciniate with numerous teeth: [10](#)
- 10 Annual herbs; leaves membranous; inflorescences axillary: [11](#)
- Shrub or small tree, 1.5–7 m. high; inflorescence bisexual, axillary, 2.5–12 cm. long, with 1–3 female flowers at the base; female bracts 4–6 mm. diam., repanddentate; leaves oblanceolate-elliptic, obovate or subrhomboid, more or less narrowed to the subcordate base, shortly caudate-acuminate, serrate, 8–20 cm. long, 3.5–10 cm. broad; petiole 2–8 cm. long [14. *neptunica*](#)
- 11 Female bracts fimbriate, with about 20 shortly ciliate teeth, ribbed; leaves ovate to rhomboid-ovate, obtuse to cordate at base, cuspidate-acuminate, crenate-serrate, 4–11 cm. long, 2–6 cm. broad, slightly scabrous; petiole 2–9 cm. long; inflorescences with about 10 female flowers in the lower part [10. *ciliata*](#)
- Female bracts crenate or dentate: [12](#)
- 12 Bracts of the female flowers pilose inside and outside, more or less triangular, narrowed to the base, in fruit about 6–7 mm. long and broad, with 8–9 teeth about 1.5 mm. long; stems and leaves pubescent and long-spreading pilose; leaves ovate, rounded at base, acute at apex, rather coarsely crenate-serrate, 2–7.5 cm. long, 1–4 cm. broad; petiole 0.8–5.5 cm. long; inflorescences with few to many female flowers in the lower part; bracts crowded in fruit [11. *sp. B*](#)
- Bracts of the female flowers glabrous or nearly so, except for the ciliate crenate or triangular dentate margins, broad at the base; stems and leaves shortly crisped-pubescent and sometimes with long hairs as well: [13](#)
- 13 Female bracts in fruit 4–4.5 mm. long, 7–8 mm. broad, dentate with 10–18 triangular teeth crowded and usually overlapping; leaves ovate, rounded at base, obtuse or subacute, lightly crenate, 2–5 cm. long, 1.3–3 cm. broad; petiole 2–6 cm. long [12. *crenata*](#)
- Female bracts in fruit up to 13 mm. long and broad, ovate when spread out, crenate, very laxly arranged; inflorescence about 2 cm. long, with 2–4 female flowers remote from the male; leaves ovate, obtuse at base, acute or subacute at apex, crenate, 1.5–6 cm. long, 1–3 cm. broad; petiole 1–7 cm. long [13. *segetalis*](#)

1. *Acalypha racemosa* Wall. ex Baill. Etud. Gén. Euphorb. 443 (1858). *APD acc*

Acalypha paniculata Miq. (1859) — F.T.A. 6, 1: 886; Chev. Bot. 577; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 16: 14, fig. 3; F.W.T.A., ed. 1, 1: 302.

A perennial herb or shrub, to 10 ft. high, with a copious female inflorescence of small flowers, often deep red in colour.

iv. C.: Bingerville Chev. 15348. **G. C.:** Kumasi (Jan.) Dalz. 141! Abofuo (July) Chipp 535! Begoro, Akim (fr. Apr.) Irvine 1192! **Togo:** Kratchi (May) Krause! **S. Nig.:** Lagos Dawodu 212! Odiani, Asaba (Aug.) Onochie FHI 33438! Agulu Thomas 1018! Oban Talbot 693! **Br. Cam.:** Ambas Bay (Feb.) Mann 767! Cam. Mt., 1,000 ft. (Dec.) Mann 1254! R. Malu, Wum (fl. & fr. July) Ujor FHI 30455! **F. Po:** Barter!

Widespread in tropical Africa and Asia.

2. *Acalypha senegalensis* Pax & K. Hoffm. l.c. 16: 79 (1924).

APD: *Synonym of Acalypha brachiata C. Krauss*

Perennial herb; stems to 16 in. high.

Sen.: Lecard 301. R. Bucoy Lecard 45.

[Hutchinson suggests this may be the same as *A. senensis*.]

3. *Acalypha senensis* *Klotzsch* — F.T.A. 6, 1: 888 (incl. var. *chariensis* (Beille) Hutch.); Chev. Bot. 577; Pax & K. Hoffm. l.c. 16: 79; Berhaut Fl. Sen. 167.

APD: *Synonym of Acalypha villicaulis Hochst. ex A. Rich.*

APD: *Synonym of Acalypha brachiata C. Krauss*

A hairy herb, 2–3 ft. or more high, woody at the base, with red-purple female flowers.

Sen.: Niokolo-Koba Berhaut 1544; 4595. **Fr. Sud.:** Dioubéba to Oualia (Dec.) Chev. 23. **Port. G.:** Buruntuma, Gabu (July) Esp. Santo 2700! **N. Nig.:** Farm Dutse (Oct.) Onwudinjoh FHI 24035! Bauchi Plateau (Aug.) Lely P. 660! Panyam (July) Lely 412! Matyoro Thornewill 135! Yola (May) Dalz. 159!

Widespread in tropical and southern Africa.

4. *Acalypha nigritiana* *Müll. Arg.* — F.T.A. 6, 1: 890; Pax & K. Hoffm. l.c. 16: 57.

APD: *Synonym of Acalypha ornata Hochst. ex A. Rich.*

A small shrub.

S. Nig.: Yoruba forests, Lagos Barter 3425!

[Hutchinson suggests this may be only a variety of *A. ornata*.]

5. *Acalypha ornata* *Hochst. ex A. Rich.* — F.T.A. 6, 1: 890; Pax & K. Hoffm. l.c. 16: 58. *APD acc*

A shrub, to 10 ft. high; **by streams and in open places.**

N. Nig.: Tilde Filani (fr. May) Lely 230! Bauchi Plateau (May) Lely P. 279! **S. Nig.:** Lagos Millen 20! 113! 135! Ajilite Millen 76! Olokemeji Foster 288! Idanre (fr. Apr.) Symington FHI 3357! **Br. Cam.:** Preuss 570!

Widespread in tropical Africa.

6. *Acalypha* sp. **A. APD acc**

Possibly new, but better material required.

Acalypha manniana of Chev. Bot. 576, not of Müll. Arg.

Fr. G.: Soumbalako to Boulivél, Fouta Djallon (fr. Sept.) Chev. 18652! **S. L.:** Yetaya (fl. & fr. Sept.) Thomas 2432!

7. *Acalypha manniana* *Müll. Arg.* — F.T.A. 6, 1: 893; Pax & K. Hoffm. l.c. 16: 70. *APD acc*

A slender, climbing shrub, to 6 ft. high, **at edge of forest**; flowers pinkish.

Br. Cam.: Cam. Mt., 3,000–5,700 ft. (fl. Nov.–Apr., fr. Feb.) Mann 1270! Maitland 210! 1305! Bamenda, 6,000 ft. (fl. & fr. Jan.) Migeod 425! Lakom (fl. & fr. Apr.) Maitland 1732! **F. Po:** Musola (Jan.) Guinea 1104! 1614! Moka, 3,500–4,000 ft. (Dec.) Boughey 65!

Also in **French Cameroons**.

8. *Acalypha ceraceopunctata* *Pax* — F.T.A. 6, 1: 896; Pax & K. Hoffm. l.c. 16: 136. *APD acc*

A shrub to 5 ft. high, **in savannah or fringing forest**; fruits hidden by the enlarged pale bracts, 3-lobed and dotted with yellow scale-like glands.

G. C.: Sirigu, N.T. (fr. Oct.) Vigne FH 4587! **N. Nig.:** Rimingata, Kano (fl. & fr. Aug.) Onwudinjoh FHI 24019! Katagum (fr. Sept.) Dalz. 209! Yola (June) Dalz. 151!

Also in the **French Cameroons**.

9. *Acalypha brachystachya* *Hornem.* — F.T.A. 6, 1: 899; Pax & K. Hoffm. l.c. 16: 101.

APD: *Synonym of Acalypha supera Forssk.*

A small slender-branched annual 6–12 in. high.

Br. Cam.: Buea Lehmbach 190; Preuss 1002!

Also from French Cameroons to Red Sea, Abyssinia, **Uganda**, **Belgian Congo**, **Angola** and E. Africa; also in tropical Asia.

10. **Acalypha ciliata Forsk.** — F.T.A. 6, 1: 901; Pax & K. Hoffm. l.c. 16: 98. *APD acc*

Acalypha fimbriata Schum. & Thonn. (1827) — Chev. Bot. 576.

Acalypha vahliana Müll. Arg. (1865) — Chev. Bot. 577.

An erect, slightly pubescent branched annual, to 21/2 ft. high.

Sen.: Roger 54! **Fr. Sud.:** Ouahigouya to Koro, Yatenga Chev. 24818. Diafarabé to Sansanding Chev. 2619. **Port. G.:** Ingora to Barro, S. Domingos (fl. & fr. Aug.) Esp. Santo 3087! **Fr. G.:** Mamou Chev. 15046. **S. L.:** Yetaya (fl. & fr. Sept.) Thomas 2398! Kukuna, Bramaia (fr. Oct.) Jordan 939! **Lib.:** Gbanga (fl. & fr. Sept.) Linder 555! **Iv. C.:** Sokomanta to Sampleu, Dyola Chev. 21087. **G. C.:** Aburi Brown 414! Amentia Irvine 525! **Togo:** Lome Warnecke 368! Kpandu (fr. June) Andoh FH 5282! **N. Nig.:** Nupe Barter 1047! Zungeru (fr. Aug.) Dalz. 100! Bauchi Plateau (fr. July) Lely P. 400! Yola (fl. & fr. June) Dalz. 153! **S. Nig.:** Lagos Millen 58! Okomu F.R. (Feb.) Brenan 9171! Agulu Thomas 223! **Br. Cam.:** Rio del Rey Johnston!

Widespread in tropical Africa, in **Arabia** and in India; also in **Cape Verde Islands**,

11. **Acalypha sp. B.** *APD acc*

Possibly new, or else perhaps introduced. A weed up to 21/2 ft. high, well-branched and straggly.

S. L.: Tower Hill, Freetown (fl. & fr. June) Deighton 2988! Mano railway station (fl. & fr. Nov.) Deighton 3280!

12. **Acalypha crenata Hochst. ex A. Rich.** — F.T.A. 6, 1: 903; Pax & K. Hoffm. l.c. 16: 97. *APD acc*

An annual herb, 1–11/2 ft. high.

N. Nig.: Lokoja (fl. & fr. Nov.) Ansell! Barter! Dalz. 163! Aguji, Ilorin Thornton!

Also in **French Cameroons**, **A.-E. Sudan**, **Somaliland**, **Abyssinia** and **Uganda**.

13. **Acalypha segetalis Müll. Arg.** — F.T.A. 6, 1: 904; Pax & K. Hoffm. l.c. 18: 36; Berhaut l.c. 168. *APD acc*

Acalypha crenata of F.W.T.A., ed. 1, 1: 303, partly.

An annual herb, to 11/2 ft. high; flowers reddish; a weed.

Sen.: fide Berhaut l.c. **S. L.:** Musaia (fl. & fr. July) Deighton 4807! **Togo:** Misahöhe Baumann 227. **Dah.:** Le Testu 95. **N. Nig.:** Nupe Barter 1490! 1495! Zaria (fl. & fr. Aug.) Keay FHI 28014! Kyana, Nassarawa (fl. & fr. July) Hepburn 28! Nabardo (fl. & fr. May) Lely 214! Bauchi Plateau (fl. & fr. June) Lely P. 335. Vom Dent Young 225! **S. Nig.:** Lagos Millen 37! **Br. Cam.:** Bamenda Prov. (May) Maitland 1761! Mamfe (fl. & fr. Apr.) Ejiofor FHI 29374!

Widespread in tropical Africa.

14. **Acalypha neptunica Müll. Arg.** — F.T.A. 6, 1: 907; Pax & K. Hoffm. l.c. 16: 109. *APD acc*

A forest shrub. The only specimen from our area has one twig with long spreading hairs on the stem and leaves, while the other twigs have a short curly indumentum; two varieties may be represented here.

G. C.: Akatui (Oct.) Vigne FH 4029!

Also widespread in central and eastern Africa.

Acalypha hispida Burm.

A native of tropical Asia, it is cultivated.

Acalypha wilkesiana Müll. Arg.

A native of tropical Asia, it is cultivated.

Acalypha sp.

Herb, about 1 ft. high, in [montane forest](#); leaves reddish below. Female flowers and fruits apparently solitary and sessile in the leaf-axils. More material required.

S. Nig.: Ikwette Plateau, Obudu, 5,200 ft. (fr. Dec.) Keay & Savory FHI 25264!

Imperfectly known species.

49. RICINUS

Linn. — F.T.A. 6, 1: 945; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 11: 119 (1919).

- 1** Leaves alternate, long-petiolate, orbicular in outline, peltate, up to 60 cm. broad, deeply palmately lobed; lobes 7 or more, glandular-toothed, glaucous, glabrous, green or reddish; stipules large, ovate, connate into a sheath and enclosing the bud; flowers in large panicles, the males below, the females above; capsule smooth or prickly, about 2.5 cm. diam.; seeds mottled[communis](#)

Ricinus communis *Linn.* — F.T.A. 6, 1: 945; Pax & K. Hoffm. l.c. 11: 119, fig. 29, q.v. for varieties and forms.

The common castor-oil plant, widely cultivated and very variable; several varieties are distinguished with variously prickly fruits.

50. TETRACARPIDIUM

Pax in Engl. Bot. Jahrb. 26: 329 (1899).

Angostylidium (*Müll. Arg.*) *Pax & K. Hoffm.* in Engl. Pflanzenr. Euph. 9: 17 (1919).

- 1** Leaves ovate, abruptly acuminate, rounded at base, about 10 cm. long, 4.5–5 cm. broad, crenulate, 3-nerved at base, glabrous; petiole up to 5 cm. long; male flowers in narrow raceme-like panicles about as long as the leaves, with 1–2 females near the base; pedicels jointed above the base; sepals glabrous; stamens about 40; style very stout, at length quadrangular, with 4 spreading stigmas; ovary 4-lobed; capsule about 7 cm. across, 4-winged, ridged between the wings[conophorum](#)

Tetracarpidium conophorum (*Müll. Arg.*) *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 307 (1928); Kew Bull. 1928: 300 (q.v. for full synonymy). *APD acc*

Plukenetia conophora *Müll. Arg.* (1864) — F.T.A. 6, 1: 949; Chev. Bot. 582.

Angostylidium conophorum (*Müll. Arg.*) *Pax & K. Hoffm.* l.c. 9: 17, fig. 5 (1919).

Cleidion preussii (*Pax*) *Bak.* (1910) — F.T.A. 6, 1: 931.

A climbing shrub 10–20 ft. long, glabrous; male flowers deciduous, leaving the females at the base of the raceme. Cultivated for its oil-rich fruits. Apparently not indigenous in Sierra Leoné.

S. L.: Sc. Elliot 4118! Alien Town (Dec.) Deighton 3304! Port Loko (Jan.) Deighlon 4041! Njala (Jan) Deighton 5018!

Kennedy 1731! Ibuzo (Nov.) Thomas 1997! Aguku Thomas 888! Oban Talbot 615! 1371! 1384! 2307! **Br. Cam.:** R.

Cameroon (Jan.) Mann 2202! Victoria (Feb.) Maitland 184! 375! Barombi Preuss 420! **F. Po:** Mildbr. 6968.

Also in [French Cameroons](#), [Spanish Guinea](#), [Gabon](#) and [Belgian Congo](#).

51. TRAGIA

Linn. — F.T.A. 6, 1: 964; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 9: 32 (1919).

- 1** Female flower on a long slender pedicel as long as the male raceme; female calyx hardly accrescent in fruit; leaves ovate-oblong, rounded or subcordate at the base, acute at the apex, 5–7.5 cm. long, 2–4 cm. broad, serrate, slightly bristly; fruits deeply 3-lobed, 7 mm. broad, bristly-pilose[I. volubilis](#)
- Female flowers on very short pedicels (sometimes extending in fruit); female calyx usually accrescent in fruit: **2**
- 2** Leaves linear or linear-lanceolate, sessile or subsessile; inflorescence long and slender, 15 cm. or more:**3**

- Leaves lanceolate to ovate-elliptic, distinctly petiolate; inflorescence usually rather short:.....4
- 3 Racemes unisexual; leaves 4–5 cm. long, 1 cm. broad, nearly glabrous, slightly serrulate near the apex; stems glabrescent[2. akwapimensis](#)
- Racemes bisexual; leaves acute, 4–5 cm. long, 1 cm. broad, softly pubescent on both sides and with stinging hairs, sharply serrate; stems pilose; female calyx-segments 3, pectinately toothed[3. wildemanii](#)
- 4 Female calyx-lobes 3 (rarely 4–5) in a single series, orbicular-ovate, pectinate all round, densely setose:.....5
- Female calyx-lobes 6, usually more or less distinctly 2-seriate:.....6
- 5 Leaves ovate, deeply cordate at base, long-caudate-acuminate, up to 12 cm. long and 6.5 cm. broad, margins rather coarsely serrate, densely setose-pilose on both surfaces; petioles up to 5 cm. long[4. senegalensis](#)
- Leaves triangular-lanceolate, widely cordate at base, acute but scarcely acuminate at apex, 6–14.5 cm. long, 1–4.2 cm. broad, margins serrate, often only denticulate in the upper part of the leaves, setose-pubescent, very shortly so above, more or less glabrescent; petioles up to 2.5 cm. long[5. vogelii](#)
- 6 Calyx-lobes of female flowers without a foliaceous apex, deeply pectinate:7
- Calyx-lobes of female flowers with a foliaceous undivided apex, entire or variously lobed or pectinate below: .8
- 7 Leaves sharply serrate; stem, petioles and leaves with pungent setose hairs; leaves ovate, cordate at base, acutely acuminate, 5–14 cm. long, 2.5–9 cm. broad; petioles 2–10 cm. long[6. benthami](#)
- Leaves subentire; stem, petioles and leaves without pungent setose hairs, minutely puberulous or glabrescent; leaves oblong-lanceolate or ovate-elliptic, cordate or subhastate at base, acutely acuminate, 8–20 cm. long, 2.5–8 cm. broad; petioles 2.5–6 cm. long[7. preussii](#)
- 8 Female calyx-lobes pectinately divided on each side into 4–6 teeth below the foliaceous apical portion:.....9
- Female calyx-lobes with 0–1 (–2) teeth on each side below the foliaceous apical portion: 10
- 9 Lateral teeth of female calyx-lobes bristly with numerous white stinging hairs; leaves ovate-oblong, widely cordate, acutely acuminate, slightly toothed, 6–13 cm. long, 2.5–6 cm. broad, bristly pubescent mainly on the nerves[8. tenuifolia](#)
- Lateral teeth of female calyx-lobes setose but not bristly; leaves ovate-lanceolate, cordate at base, acute at apex, entire or undulate, 6–10 cm. long, 2–4.5 cm. broad, bristly pilose on both surfaces[9. chevalieri](#)
- 10 Claw of female calyx-lobes at least twice as long as the terminal 1 mm. diam. foliaceous apical portion which is entire or with 1 tooth on each side at base, the calyx-lobes 2.5–3.5 mm. long in fruit; leaves oblong-oblongate to ovate, cordate or truncate at base, rather long-acuminate, margin coarsely and irregularly toothed or subentire, 4–12 cm. long, 1.5–5.3 cm. broad, bristly pilose on both surfaces[10. laminularis](#)
- Claw of female calyx-lobes less than twice as long as the 3–4 (–6) mm. broad terminal foliaceous apical portion, the calyx-lobes 6–10 (–13) mm. long in fruit: 11
- 11 Leaves glabrous except for a few appressed hairs on the nerves above and very sparingly pubescent nerves beneath; ovate-elliptic, deeply cordate, obtusely acuminate, entire, 6–10 cm. long, 2–3.5 cm. broad; female calyx-lobes obovate, entire, sparingly hirsute[11. polygonoides](#)
- Leaves pilose or pubescent on both surfaces: 12
- 12 Female calyx-lobes densely bristly but without teeth below the broad foliaceous apical portion; leaves ovate-elliptic, to obovate-elliptic, rather shallowly cordate at base, acutely acuminate, margin shortly crenate or serrate, 4.5–8 cm. long, 1.8–4.8 cm. broad, shortly bristly-pilose above, rather densely pubescent beneath [12. spathulata](#)
- Female calyx-lobes setose but not bristly, with a tooth (or rarely 2) each side below the broad foliaceous apical portion; leaves elliptic to obovate-elliptic or oblong-elliptic, more or less narrowed to the obtuse or narrowly cordate base, acuminate, margin usually serrate in the upper half, 6.5–16 cm. long, 2.5–9.5 cm. broad, rather densely bristly-pilose on both surfaces[13. sp. A](#)

1. **Tragia volubilis** Linn. — F.T.A. 6, 1: 969; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 9: 47–50 (as var genuina), fig. 14; Chev. Bot, 583. *APD acc*

A slender twiner armed with stinging hairs.

S. L.: Kuru (Apr.) Sc. Elliot 5514! Rowala (July) Thomas 1156! Sewa River ferry, Nganyama (fl. & fr. Nov.) Deighton 4660! **IV. C.:** Soubre Chev. 19134. Zagoué to Soucourala Chev. 21577. **S. Nig.:** Chama6 Beauvois. Awka Thomas 1325; 1332. **F. Po:** (Dec.) Mann 75!

Extends to **Belgian Congo** and **Angola**; also widespread in tropical America from whence it has probably been introduced to Africa.

2. **Tragia akwapimensis** Prain — F.T.A. 6, 1: 992; Pax & K. Hoffm. l.c. 9; 87. *APD acc*

Stems suberect from a woody base, 1 1/2–2 ft. high, branched, sparingly armed with stinging hairs; dioecious.

G. C.: A buri Andersen 54!

3. **Tragia wildemanii** Beille — F.T.A. 6, 1: 993; Pax & K. Hoffm. l.c. 9: 92; Chev. Bot. 588. *APD acc*

Erect from a woody base, 1–1 1/2 ft. high, sparingly branched, softly pubescent and armed with stinging hairs.

Fr. Sud.: Katou (Mar.) Chev. 539. **Fr. G.:** Timbo to Farana Chev. 13307.

4. **Tragia senegalensis** Müll. Arg. — F.T.A. 6, 1: 999, partly; Pax & K. Hoffm. l.c. 9: 92, partly; Chev. Bot. 583; F.W.T.A., ed. 1, 1: 308, partly. *APD acc*

Tragia angustifolia of Chev. Bot. 583.

A twiner, in **savannah regions**; flowers yellow-green with stinging hairs on inflorescence.

Gam.: Albreda, in ricefields Leprieur! **Fr. G.:** Timbo Maclaud 30! **S. L.:** Musaia (Mar. July, Aug., Dec.) Deighton 4482! 4798! 5395! Jordan 497! **G. 5. **Tragia vogelii** Keay in Kew Bull. 1955: 139. *APD acc*

Tragia angustifolia Benth. (1849) — F.T.A. 6, 1: 999; Pax & K. Hoffm. l.c. 9: 93; F.W.T.A., ed. 1, 1: 308; not of Nutt. (1837).

Tragia senegalensis of F.T.A. 6, 1: 909, partly; of Pax & K. Hoffm. l.c. 9: 92, partly; of Chev. Bot. 583; of F.W.T.A., ed. 1, 1: 308, partly; not of Müll. Arg.

Erect, then scrambling or twining stems from a perennial stock; in **savannah, especially on rocky hillsides**.

N. Nig.: Nupe Barter 1732! Kontagora (Jan.) Meikle 1080! Addaenda, R. Niger (Sept.) T. Vogel 108! Lokoja (fl. & fr. Sept.) Parsons 45! Jones FHI 5000! Yola (fl. & fr. Apr.) Dalz. 157! **S. Nig.:** Lagos Dawodu 205!

Also in **French Camerouns**.

6. **Tragia benthami** Bak. — F.T.A. 6, 1: 984. *APD acc*

Tragia cordifolia of Benth. (1849) — Pax & K. Hoffm. l.c. 9: 76; not of Vahl (1790).

Tragia kassiliensis Beille (1910) — Chev. Bot. 583.

Herbaceous climber or trailer, with stinging hairs.

Iv. C.: Gotoro to Diahbo (July) Chev. 22037! Kassilé (Jan.) Chev. 17050! **G. C.:** Cape Coast (July) T. Vogel 53! Aburi (July–Aug.) Deighton 3383! Irvine 845! Owabi (fl. & fr. May) Andoh FH 4202! **Togo:** Misahöhe Baumann 283. **Dah.:** Adja Onéré Le Testu 11; 12. **S. Nig.:** Abeokuta Millen 80! Isijere, Ibadan (fl. & fr. Nov.) Keay FHI 28140! Oban Talbot 613! **Br. Cam.:** Cam. Mt., 1,000 ft. (fl. & fr. Dec.) Mann 1255! Buea (fr. Nov.–Jan.) Maitland 238! Migeod 104! **F. Po:** Clarence (fr. Oct.) T. Vogel 26!

Also in **French Camerouns** and extends to A.-E. **Sudan, Uganda, Belgian Congo, Angola** and E. Africa.

7. **Tragia preussii** Pax — F.T.A. 6, 1: 989; Pax & K. Hoffm. l.c. 9: 75. *APD acc*

Stems twining; apparently without stinging hairs.

S. Nig.: Oban Talbot 624! **Br. Cam.:** Victoria Winkler 343. Barombi Preuss 467!

Also in **Belgian Congo**.

8. **Tragia tenuifolia** Benth. — F.T.A. 6, 1: 973; Pax & K. Hoffm. l.c. 9: 96. *APD acc*

Stems twining; flowers greenish, the female calyx-lobes with white stinging hairs.

Fr. G.: Dyeke (fl. & fr. Oct.) Baldwin 9652! **S. L.:** Bagroo R. (fl. & fr. Apr.) Mann 834! Kambia (Jan.) Sc. Elliot 4371! Yonibana (Nov.) Thomas 4731! 4838! Gola Forest, Gaura (fl. & fr. Dec.) King 93b! Gegbwema — Gorahun road, Tunkia (fl. & fr. Dec.) Deighton 3826! **Lib.:** Nékabozu, Vonjama (Oct.) Baldwin 9970! Pallilah, Gbanga (fl. & fr. Sept.) Baldwin 13227! **G. Also in **French Cameroons**, **Gabon**, **Belgian Congo**, **Uganda** and **S. Tomé**.

9. **Tragia chevalieri** *Beille* — F.T.A. 6, 1: 972; Pax & K. Hoffm. l.c. 9: 95; Chev. Bot. 583. *APD acc*

A slender twiner armed with stinging hairs.

Iv. C.: Guidéko (June) Chev. 16471! **S. Nig.:** Ajilite Millen 172! Oban Talbot 1494!

[The type specimen is extremely poor, and the other two specimens cited above which were originally identified by Prain for the F.T.A. are little better. Better material is needed to decide whether this is really a good species.]

10. **Tragia laminularis** *Müll. Arg.* — F.T.A. 6, 1: 971; Pax & K. Hoffm. l.c. 99. *APD acc*

Stem slender, woody and erect below, twining above, armed with stinging hairs.

S. L.: Afzelius; Smeathmann! Hill Station, Freetown (fl. & fr. May) Deighton 1126! Sugar Loaf Mt. (fl. & fr. Nov.) Deighton 5622!

11. **Tragia polygonoides** *Prain* — F.T.A. 6, 1: 970; Chev. Bot. 583; Pax & K. Hoffm. l.c. 9: 98. *APD acc*

A slender twiner without stinging hairs.

Iv. C.: Bouroukrou (Dec., Jan.) Chev. 16860.

12. **Tragia spathulata** *Benth.* — F.T.A. 6, 2: 971; Pax & K. Hoffm. l.c. 9: 98, fig. 22, A–B. *APD acc*

A slender pubescent twiner armed with stinging hairs; capsule densely bristly.

S. L.: Njala (Nov.) Deighton 2548! **Lib.:** Gbanga (fl. & fr. Sept.) Linder 702! **G. C.:** Cape Coast (July) T. Vogel 8! Odumase, Krobo Plains (fl. & fr. Aug.) Johnson 1089! Aburi (fl. & fr. Aug.) Deighton 3396! Ananekurum (fl. & fr. Jan.) Irvine 634! Gida Abdulker Krause! **Togo:** Misahöhe Baumann 450 (partly). **S. Nig.:** Abeokuta Irving 72! Olokemeji (fl. & fr. Apr., Aug.) Foster 278! Symington FHI 5065!

13. **Tragia sp. A.**

Possibly this is *T. mildbraediana* Pax & K. Hoffm. l.c. 96, fig. 22, C–E (1919), but the type has presumably been destroyed and the female calyx-lobes in our material do not match the figure in the *Pflanzenreich* very well. A twiner with bristly-pilose stems and leaves, stinging: **in forest vegetation**.

S. L.: Bumbuna (fl. & fr. Oct.) Thomas 3174! Mabonto (Oct.) Thomas 3570! Bobobu, Giewahun (fl. & fr. Dec.) Deighton 3808! Peri, Gaura (fl. & fr. Oct.) Deighton 5199! 5200! **Lib.:** Soplima, Vonjama (fl. & fr. Nov.) Baldwin 10019! Yahun, Kolahun (fl. & fr. Nov.) Baldwin 10213! **S. Nig.:** Akure F.R. (fl. & fr. Oct.) Keay FHI 25478! Owam F.R., Benin (fl. & fr. Nov.) Meikle 515! Okomu F.R., Benin (fl. & fr. Jan.) Brenan 8853!

Imperfectly known species.

Tragia monadelpha *Schum. & Thonn.* *Beskr. Guin. Pl.* 404 (1827); Pax & K. Hoffm. l.c. 9: 100. *APD acc*

The type specimen could not be traced at Copenhagen in 1954.

G. C.: Aquapim Thonning.

Imperfectly known species.

52. DALECHAMPIA

Linn. — F.T.A. 6, 1: 952; Pax & K. Hoffm. in *Engl. Pflanzenr. Euph.* 12; 3 (1919).

- 1 Involucral bracts ovate, entire; leaves ovate and not lobed or deeply 3-lobed; stipules subulate-lanceolate; female sepals accrescent, pinnatifid *1. ipomoeifolia*
 Involucral bracts 3-lobed and serrulate; stipules ovate-lanceolate; female sepals as above *2. scandens*

1. **Dalechampia ipomoeifolia** *Benth.* — F.T.A. 6, 1: 953; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 12: 39; Chev. Bot. 584. *APD acc*

APD: Synonym of Dalechampia parvifolia Lam. var. parvifolia

A slender twiner with pubescent stems and flowers in close clusters within two leafy bracts.

S. L.: Bumbuna (Oct.) Thomas 3752! Njala (fr. Jan.) Deighton 2965! Segbwema (Dec.) Deighton 3463! **Lib.:** Monrovia (fl. & fr. July) Linder 23! Yratoke, Webo (July) Baldwin 6252! **Iv. C.:** Bouroukrou Chev. 16783. Zaranou Chev. 17637. **G. C.:** Princes (fr. Jan.) Akpabla 764! Sutah, Ashanti Cummins 48! Achimota (fr. Aug.) Irvine 861! **Togo:** Kpandu Robertson 69! **S. Nig.:** Lagos (Dec.) Dalz. 1270! Hagerup 836! Lower Niger T. Vogel 9! Degema Talbot 3802! Eket Talbot 3365! Oban Talbot 683!

Also in **French Cameroons**, **Spanish Guinea**, **Gabon** and **Belgian Congo**.

2. **Dalechampia scandens** *var. cordofana* (*Hochst. ex Webb*) *Müll. Arg.* in DC. Prod. 15, 2: 1245 (1866); F.T.A. 6, 1: 954 (incl. *var. parvifolia*); Pax & K. Hoffm. l.c. 10: 34; F. W. Andr. Fl. Pl. A.-E. Sud. 2: 61, fig. 22.

APD: Synonym of Dalechampia parvifolia Lam. var. parvifolia

Dalechampia cordofana *Hochst. ex Webb* (1849).

Like the last but with leaves always deeply 3–5-partite.

Sen.: Dakar Adanson. Dagana Perrottet 740. Richard Tol Lelièvre.

Also in **Cape Verde Islands**, **Chad area** and widespread in north-eastern, central and southern tropical Africa and in **Arabia**.

53. MANIHOT

Mill. — F.T.A. 6, 1: 839; Pax & K. Hoffm. in E. & P. Pflanzenfam. 19C: 174 (1931).

- | | | |
|---|---|--|
| 1 | Leaves peltate; fruits without wings or ridges; bracts small | <i>1. glaziovii</i> |
| | Leaves not peltate; fruits with 6 distinct wings or ridges: | 2 |
| 2 | Bracts large and leafy, at first concealing the flowers: | 3 |
| | Bracts small, not longer than the pedicels: | 4 |
| 3 | Fruits dehiscent | <i>2. piahyensis</i> |
| | Fruits indehiscent | <i>3. teissonnieri</i> |
| 4 | Lobes of the leaves sometimes more or less lobulate, the middle lobe the longest with the midrib continued to the top, abruptly acuminate; rubber plant | <i>4. dichotoma</i> |
| | Lobes of the leaves entire; food plants | <i>5. esculenta</i> |

1. **Manihot glaziovii** *Müll. Arg.* — F.T.A. 6, 1: 839; Holl. 4: 598; Chev. Bot. 574.

The Ceara rubber tree, native of Brazil, cultivated for rubber and planted as an ornamental tree.

2. **Manihot piahyensis** *Ule* — F.T.A. 6, 1: 840; Holl. 4: 600.

A shrub or small tree, Piahy rubber, native of Brazil; cultivated.

3. **Manihot teissonnieri** *A. Chev.* — F.T.A. 6, 1: 841; Chev. Bot. 574.

Similar to the last; cultivated in French West Africa.

4. **Manihot dichotoma** *Ule* — F.T.A. 6, 1: 841; Holl. 4: 597.

The Jequié rubber tree, native of Brazil, cultivated as a rubber plant.

5. **Manihot esculenta** *Crantz* *Inst. Rei Herb.* 1: 167 (1766).

Manihot utilissima *Pohl* (1828) — F.T.A. 6, 1: 842 (incl. vars.); Holl. 4: 600; Chev. Bot. 574; F.W.T.A., ed. 1, 1: 300 (incl. var.).

A shrub 6–10 ft. high, glabrous, with digitate leaves glaucous beneath, and tuberous roots; very variable in colour of bark, tint of foliage, etc. Cassava, a cultivated food-plant; native of Brazil.

54. KLAINETHUS

Pierre ex Prain — F.T.A. 6, 1: 963; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 408 (1914).

- 1 Tree; branchlets pubescent when young, at length glabrous; leaves oblong or obovate, obtuse to cuneate at base, shortly acuminate, entire, 10–32 cm. long, 4–12 cm. broad, glabrous; petiole 2.5–5 cm. long, distinctly pulvinate and geniculate at apex; panicles axillary and terminal, puberulous and often with long spreading hairs as well; flowers about 2 mm. long; sepals strongly imbricate; petals absent; male flower with 8 or 10 stamens in two series, surrounded by a ring of 4 or 5 extrastaminal glands alternate with the outer stamens and opposite the sepals, rudimentary ovary usually 3-lobed; female flowers with cupular, denticulate and 4–5-lobed disk, staminodes often present, ovary 3-celled, style 3, deeply 2-partite; capsule trigonous-sub-orbicular about 1.5 cm. long and broad, glabrous and shining outside, dehiscent; seeds solitary in each cell, clothed with a yellow fleshy aril [gaboniae](#)

Klaineanthus gaboniae *Pierre ex Prain* — F.T.A. 6, 1: 963; Hook. Ic. Pl. t. 2985; Pax & K. Hoffm. l.c.

APD: Synonym of Klaineanthus gabonii Pierre

A forest tree, 30–90 ft. high, with rough, fluted bole; flowers white; fruits bright red.

S. Nig.: Sapoba Kennedy 2268! 2280! 2312! Oban (fr. May) Ujor FHI 31800! Uwet Odot F.R., Itu (fr. May) Onochie FHI 33223! Obudu Dist. (May) Latilo FHI 30922! Ikom Dist. (fr. May, June) Latilo FHI 30998! 31827! **Br. Cam.:** S. Bakundu F.R. (fr. Aug.) Olorunfemi FHI 30711! Near Mungo R., Kumba Dist. (Apr.) Olorunfemi FHI 30532!

Also in **French Cameroons**, **Gabon** and **S. Tomé**.

55. GELONIUM

Roxb. — F.T.A. 6, 1: 947; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 4: 14 (1912).

- 1 A glabrous shrub or treelet with flexuous branchlets, angular when young; leaves sessile or very shortly petiolate, oblanceolate, obovate or oblong-elliptic, rounded to subcordate at base, shortly acuminate to subcaudate-acuminate, acumen itself obtuse, 10–18 cm. long, 3.5–8 cm. broad; flowers dioecious, subsessile, in small, leaf-opposed fascicles; male flowers 3–6 per fascicle, sepals 5–6, imbricate, the outer 3 suborbicular and about 3 mm. diam.; stamens 20–30, with short filaments; female flowers apparently 1–2 per fascicle; ovary glabrous, 3-celled, ovules solitary in each cell; capsule depressed 3-lobed, about 1.4 cm. diam., seeds suborbicular [occidentale](#)

Gelonium occidentale *Hoyle* in Kew Bull. 1935: 258.

APD: Synonym of Suregada occidentalis (Hoyle) Croizat

A forest shrub or treelet, to 10 ft. high; outer sepals green, inner sepals and stamens creamy-white.

G. C.: Mampong Scarp (fl. & fr. Feb., Dec.) Vigne FH 2754! 2755! 4092! 4093! Ofin Headwaters F.R. (Oct.) Vigne FH 3124! **N. Nig.:** Kurmin Damisa, Jemaa (Nov.) Keay & Onochie FHI 21725! **S. Nig.:** Etemi Odo, Ijebu Ode Prov. (Nov.) Tamajong FHI 20992! Akure F.R. (Nov.) Keay & Trochain FHI 25605! Owo (May) Jones FHI 3567!

56. HAMILCOA

Prain — F.T.A. 6, 1: 1000; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 419 (1914).

- 1 A glabrous shrub; leaves nearly sessile or long-petiolate on the same branch, entire or slightly 3-lobed; lamina elliptic- or ovate-oblong to lanceolate, rounded to subacute at base, caudate-acuminate, 10–26 cm. long, 3.5–10 cm. broad; petiole up to 6 cm. long; racemes axillary, 6–8-flowered, up to 4 cm. long; male sepals imbricate, about 3 mm. long, petals and rudimentary ovary absent; stamens 18–30, subsessile; female sepals 1 mm. long, disk urceolate, ovary 3-celled, glabrous, style thick, with 3 free stout stigmas; capsule deeply 3-lobed, about 1.2 cm. long and 2.2 cm. broad; seeds solitary in each cell, large, with smooth mottled testa [zenkeri](#)

Hamilcoa zenkeri (*Pax*) *Prain* — F.T.A. 6, 1: 1000; Hook. Ic. Pl. t. 3009; Pax & K. Hoffm. l.c. *APD acc*

Plukenetia zenkeri Pax (1909).

A scandent forest shrub, stems 20–30 ft. high, or tree to 45 ft. high (fide Brenan), with white latex.

Br. Cam.: S. Bakundu F.R., Kumba (fl. Mar., fr. Mar., Aug.) Brenan 9430! Olorunfemi FHI 30705!

Also in **French Cameroons**.

57. TETRORCHIDIUM

Poepp. & Endl. Nov. Gen. & Sp. 3; 23 (1842); Pax in Engl. Pflanzenr. Euph. 4: 29 (1912); Pax & K. Hoffm. l.c. 14: 53 (1919).

Hasskarlia Baill. (1860) — F.T.A. 6, 1: 846; Pax l.c. 7: 416 (1914).

- 1 Plants entirely glabrous; leaves of the upper branchlets alternate, lower leaves sometimes opposite, leaf-base cuneate; inflorescences leaf-opposed: 2

Plants pubescent on branchlets, petioles and inflorescences; leaves mostly opposite, elongate-oblong-elliptic to oblong-elliptic, cuneate to obtuse at base, long-acuminate, 8–19 cm. long, 2.5–8 cm. broad, margin irregularly serrate or undulate; male inflorescences 4.5–11 cm. long, interpetiolar, the spike interrupted; female flowers not known; shrub, to 2.5 m. high 3. *oppositifolium*

- 2 Male inflorescences 3.5–9.5 cm. long, flowers crowded; leaves oblong-elliptic to obovate, cuspidate-acuminate, 8–22 cm. long, 4–11 cm. broad, margin entire or denticulate; female flowers solitary or few; shrub, or a tree to 25 m. high 1. *didymostemon*

Male inflorescences up to 6 mm. long, flowers crowded; leaves obovate to oblanceolate, long-acuminate, 3–8 cm. long, 1–3 cm. broad, markedly serrate in the upper half; female flowers not known; shrub, or a tree to 6 m. high 2. *minus*

1. *Tetrorchidium didymostemon* (Baill.) Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 14: 53 (1919); Aubrév. Fl. For. C. Iv. 2: 77, t. 155. *APD acc*

Hasskarlia didymostemon Baill. (1860) — F.T.A. 6, 1: 846; Chev. Bot. 575.

A shrub or a tree up to 80 ft. high with zigzag branchlets, pale yellowish-green foliage and slender yellow male flower-spikes; in secondary forest regrowth.

Fr. G.: Fouta Djallon (Apr., May) Heudelot 835! **S. L.:** Berria, Falaba (Mar.) Sc. Elliot 5430! Freetown (Mar.) Dalz. 960! Zimmi (Nov.) Deighton 383! Rokupr (fl. & young fr. Also in **French Cameroons**, **Gabon**, **Belgian Congo**, **Uganda**, **Tanganyika**, **Angola** and **S. Tomé**.

2. *Tetrorchidium minus* (Prain) Pax & K. Hoffm. l.c. (1919).

APD: *Synonym of Tetrorchidium didymostemon* (Baill.) Pax & K. Hoffm.

Hasskarlia minor Prain (1912) — F.T.A. 6, 1: 1055.

A glabrous shrub or small tree, to 20 ft. high, with very slender branchlets.

There are no collectors' notes to support Prain's statement that this plant is a herb.

S. L.: near Pendembu (Apr.) Sc. Elliot 5680! **S. Nig.:** Okeigbo, Ondo Prov. (Feb.) Jones & Onochie FHI 14714! Benin (Feb.) Onochie FHI 31172! Degema Talbot 3795!

3. *Tetrorchidium oppositifolium* (Pax) Pax & K. Hoffm. l.c. (1919). *APD acc*

Hasskarlia oppositifolia Pax (1909) — F.T.A. 6, 1: 847; Chev. Bot. 576.

A forest shrub, to 9 ft. high; flowers cream.

Lib.: Sinoe Basin Whyte! Monrovia Dinklage 2213. Jaurazon (Mar.) Baldwin 11450! Nyaake, Webo (June) Baldwin 6108!
IV. C.: Mt. Copé, Grabo (July) Chev. 19695. **S. Nig.:** Oban Talbot 617! 640! 664! Kwa Falls, Calabar (Mar.) Brenan 9233!
Br. Cam.: Kembong F.R., Mamfe (Mar.) Onochie FHI 32051!

Also in **Gabon**.

58. PLAGIOSTYLES

Pierre — F.T.A. 6, 1: 170 & 1001; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 7: 420 (1914).

- 1 Branchlets glabrous; leaves oblong-elliptic, abruptly acuminate, slightly cuneate or rounded at base, 15–20 cm. long, 5–7 cm. broad, obscurely toothed, thinly coriaceous, markedly reticulate; lateral nerves 5 pairs; petiole 1–1.5 cm. long, pulvinate at base and apex; flowers dioecious; male racemes about 5 cm. long; pedicels up to 8 mm. long; stamens 15–21, anthers papillous; fruit transversely oblong, 2 cm. across, with a lateral stigma [africana](#)

Plagiostyles africana (Müll. Arg.) Prain in Kew Bull. 1912: 107; Pax & K. Hoffm. l.c. 7: 421. *APD acc*

Daphniphyllum africanum Müll. Arg. (1864).

Plagiostyles klaineana *Pierre* (1897) — F.T.A. 6, 1: 171 & 1001.

A forest tree, 30–50 ft. high, with pale yellow-green viscid sap.

S. Nig.: Oban Talbot! **Br. Cam.:** S. Bakundu F.R. (Mar.) Brenan 9330! Barombi Preuss 421! Johann-Albrechtshöhe Staudt 496.

Also in **French Cameroons**, **Spanish Guinea**, **Gabon**, **French** and **Belgian Congo**.

59. SEBASTIANIA

Spreng. — F.T.A. 6, 1: 1007; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 5: 88 (1912).

- 1 Shrub; leaves oblong-lanceolate, caudate-acuminate, rounded at base, 6–13 cm. long, 3–5 cm. broad, minutely denticulate with glandular teeth; male spikes branched, axillary, about 1/4 as long as the leaves, female inflorescences mixed with the male; stamens 2–4; ovary smooth [1. inopinata](#)
- Herb; leaves linear, not acuminate, narrowed at base, 3–6 cm. long, up to 0.8 cm. broad, closely serrulate and cartilaginous on the margin; spikes simple, terminal or leaf-opposed, short; stamens 3; ovary and fruit muricate with 2 rows of bristles on each cell [2. chamaelea](#)

1. **Sebastiania inopinata** Prain — F.T.A. 6, 1: 1007; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 5: 120, fig. 23.

APD: Synonym of Duvigneaudia inopinata (Prain) J. Léonard

A glabrous forest shrub, 8–15 ft. high.

Br. Cam.: R. Cameroon (Jan.) Mann 755! 2225!

Also in **French Cameroons**.

2. **Sebastiania chamaelea** (Linn.) Müll. Arg. — F.T.A. 6, 1: 1008; Pax & K. Hoffm. l.c. 5: 116 (as var. *africana*); Chev. Bot. 584. *APD acc*

Tragia chamaelea Linn. (1753).

A more or less woody herb, glabrous, branched, 1–2 ft. high.

G. C.: Achimota (June) Irvine 569! **Togo:** Lome Warnecke 186! Agome Schlechter 14965! **Dah.:** Ouidah to Adjounja Chev. 23461. Agouagon Chev. 23519. **N. Nig.:** Nupe Barter 1492! Thomas 711! 1064!

Also in **French Cameroons** and **Ubangi-Shari**; widely spread throughout S.E. Asia to N. Australia.

60. SAPIUM

Browne — F.T.A. 6, 1: 1009; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 5: 199 (1912).

- 1 Ovary and fruit normally 2-celled, rarely 3- or 1-celled; fruits tardily dehiscent or indehiscent; trees 7–35 m. high:2
- Ovary and fruit normally 3-celled, dehiscent; glabrous shrubs and suffrutices:3
- 2 Fruits 2-lobed, about 8–10 mm. broad, on pedicels up to 3.3 cm. long; female flowers on pedicels 3–5 mm. long at the base of the more or less puberulous 5–12 cm. long spikes; leaves elliptic or oblong-elliptic, obtuse to rounded at base, acute or shortly acuminate at apex, 4–15 cm. long, 1.6–7.2 cm. broad, margin crenate, with 1 or 2 pairs of sessile glands near the base; petioles up to 1 cm. long [1. ellipticum](#)
- Fruits not 2-lobed, ovoid to subglobose, 15–18 mm. broad, on short pedicels; female flowers subsessile or very shortly pedicellate at the base of puberulous 6–9 cm. long spikes; leaves oblong-elliptic, obtuse to rounded at base, subacuminate, 7.5–15 cm. long, 4–6.5 cm. broad, margin crenate, with a pair of sessile glands near the base; petioles 1–3 cm. long [2. aubrevillei](#)
- 3 Leaves long-acuminate; forest shrubs:4
- Leaves not or only slightly acuminate; savannah suffrutices; male flowers solitary in each bract; fruits not horned:5
- 4 Valves of the fruits each with a projecting dorsal wing or horn; male flowers several to each bract; leaves elongate-elliptic to oblanceolate-elliptic, rounded at base, 6.5–21 cm. long, 2.5–5.5 cm. broad, margin entire or subentire; petioles 0.5–12 cm. long; fruits about 1.2 cm. diam [3. cornutum](#)
- Valves of the fruits without dorsal wings or horns; male flowers solitary in each bract; leaves oblanceolate rounded to cuneate at base, caudate-acuminate, 5–22 cm. long, 4–7 cm. broad, margin crenulate or subentire; petioles 1–1.6 cm. long; fruits about 1 cm. diam. [4. guineense](#)
- 5 Leaves elliptic to obovate-elliptic:6
- Leaves linear or oblong-linear, acute, 2–4.5 cm. long, up to 1 cm. broad, nerves scarcely visible, margin cartilaginous and undulate with a pair of glands on each side at the base; spikes slender, up to 10 cm. long; fruits 7–8 mm. diam. [7. dalzielii](#)
- 6 Lateral nerves about 12 on each side of midrib; leaves 4–13 cm. long, 3–5 cm. broad, margin denticulate, biglandular at the base; spikes 1–5 cm. long; fruits about 2 cm. diam. [5. grahamii](#)
- Lateral nerves 3–5 on each side of midrib, obscure; leaves 2.5–3 cm. long, 1.5–2 cm. broad, margin minutely denticulate, not glandular at the base; spikes 4–6 cm. long [6. faradianense](#)

1. **Sapium ellipticum** (Hochst.) Pax in Engl. Pflanzenr. Euph. 5: 253, fig. 49 (1912); Chev. Bot. 584, partly; Aubrév. Fl. For. C. Iv. 2: 80, t. 157; Aubrév. Pl. For. Soud.-Guin. 196, t. 38, 5–8.

APD: *Synonym of Shirakiopsis elliptica* (Hochst.) Esser

Sclerocroton ellipticus Hochst. (1845).

Excoecaria manniana Müll. Arg. (1864).

Sapium mannianum (Müll. Arg.) Benth. ex Pax (1893) — F.T.A. 6, 1: 1016.

A tree, 25–120 ft. high with drooping branches; flowers yellow-green; fruits orange-green, tardily dehiscent; in savannah and in streamside forest in both savannah and forest regions.

Fr. G.: Farana (fl. Jan., fr. Mar.) Chev. 20441! Sc. Elliot 5342! Pita Pobéguin 864. **S. L.:** Kabala (Jan.) King 187b! Kurusu (fr. Apr.) Sc. Elliot 5508! Musaia (fr. Apr.) Deighton 5476! **IV. Maitland 116! 459! **F. Po:** Mildbr. 6783.

Widespread in tropical Africa and in Natal.

2. **Sapium aubrevillei** Léandri in Bull. Soc. Bot. Fr. 81: 449 (1934); Aubrév. Fl. For. C. Iv. 2: 80, t. 158.

APD: *Synonym of Shirakiopsis aubrevillei* (Leandri) Esser

Sapium ellipticum of Chev. Bot. 584, partly (Chev. 16190).

A forest tree of medium to large size, bole up to 4 ft. diam.; fruit a drupe.

Iv. C.: Mbago, Agnéby valley (fr. Feb.) Chev. 16190! Mt. Tonkoui Aubrév. 1004! Mt. Momy Aubrév 1184. Taï Aubrév. 1210.

3. *Sapium cornutum* Pax — F.T.A. 6, 1: 1013; Pax l.c. 5: 246.

APD: *Synonym of Sclerocroton cornutus (Pax) Kruijt & Roebers*

A forest shrub, to 10 ft. high; spikes pendulous red; fruits reddish.

S. L.: Njala (fl. Feb., May, fr. Feb.) Deighton 635! 4700! Nganyama Tikonko (fr. Nov.) Deighton 5262! **Lib.:** Gbanga (fr. Sept.) Linder 563! Mecca, Boporo (fr. Nov.) Baldwin 10433! 10439!

Also in **French Cameroons**, **Spanish Guinea**, **French Congo** and **Belgian Congo** and **Angola**.

4. *Sapium guineense* (Benth.) O. Ktze. — F.T.A. 6, 1: 1011.

APD: *Synonym of Excoecaria guineensis (Benth.) Müll. Arg.*

Stillingia guineensis Benth. (1849).

Excoecaria guineensis (Benth.) Müll. Arg. (1863) — Pax l.c. 5: 164; Chev. Bot. 585.

E. comoensis (Beille) A. Chev. Bot. 584.

A forest shrub, usually 2–5 ft. high.

S. L.: Smeathmann! Freetown (Dec.) Sc. Elliot! Dalz. 975 (partly)! Sugar Loaf Mt. (fl. & fr. Nov.) Deighton 5643! **Lib.:** Monrovia Dinklage 2418. **Iv. C.:** Bettié (Mar.) Chev. 17577! Also in **French Cameroons**, **French** and **Belgian Congo** and **Principe**.

5. *Sapium grahamii* (Stapf) Prain in F.T.A. 6, 1: 1012 (1913); Chev. Bot. 584.

APD: *Synonym of Excoecaria grahamii Stapf*

Excoecaria grahamii Stapf (1906) — Pax l.c. 5: 164; Chev. Bot. 585.

A savannah suffrutex sending up half-woody stems to 2 ft. high from a creeping rootstock, with milky juice; capsule pale, crustaceous, breaking up into three 2-valved cocci.

Fr. Sud.: Pénia (May) Chev. 823. **Fr. G.:** Kollangui Chev. 12200. **Iv. C.:** Gampela to Ouagadougou Chev. 24661. **G. C.:** Gambaga (fl. & fr. Apr.) Graham! Kintampo (Mar.) Dalz. 37! Tumu (fl. & fr. Apr.) Vigne FH 3783! **Togo:** Gabotawe Kersting 276. Basari Kersting 605. **Dah.:** Djougou Chev. 23895!

6. *Sapium faradianense* (Beille) Pax in Engl. Pflanzenr. Euph. 5: 247 (1912); F.T.A. 6, 1: 1012.

APD: *Synonym of Microstachys faradianensis (Beille) Esser*

Excoecaria faradianense Beille (1910) — Chev. Bot. 585.

A small savannah suffrutex with slender woody stems.

Sen.: Karakoro to Niana, Casamance (Feb.) Chev. 2611. **Fr. G.:** Faradiana (Mar.) Chev. 640!

7. *Sapium dalzielii* Hutch. in Kew Bull. 1917: 234; Pax l.c. 17: 204 (1924).

APD: *Synonym of Microstachys dalzielii (Hutch.) Esser*

A savannah suffrutex with slender, slightly branched 1–2 ft. high, erect stems, leafy from base to apex.

G. C.: Tamale (fl. & fr. Dec.) Adams & Akpabla GC 4157! **N. Nig.:** Katsina Ala (June) Dalz. 749!

61. MAPROUNEA

Aubl. — F.T.A. 6, 1: 1002; Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 5: 174 (1912).

- 1 Leaves membranous, laxly reticulate, ovate or ovate-elliptic to lanceolate, 3.5–9.5 cm. long, 1.7–4 cm. broad, glaucous beneath; petiole 7–10 mm. long, slender; male inflorescences ovoid, 5 mm. long, shortly pedicellate, usually with 2 or more pedicellate female flowers below; stamens 2; capsule globose, 3-lobed; seeds rugulose, scarcely 4 mm. long, with a caruncle as large as the body of the seed; tree of forest or savannah [1. membranacea](#)

Leaves thinly coriaceous, closely and conspicuously reticulate, ovate, oblong-ovate, lanceolate or orbicular-ovate, 1.5–5.5 cm. long, 1.5–3 cm. broad, glaucous beneath; petiole 7–15 mm. long, slender; male inflorescences oblong, 3–12 mm. long, with 1–3 pedicellate female flowers below; stamens 2–3; capsule globose, 3-lobed; seeds smooth, 6–8 mm. long, with a caruncle less than 1/4 the size of the body of the seed; savannah tree [2. africana](#)

1. **Maprounea membranacea** Pax & K. Hoffm. in Engl. Pflanzenr. Euph. 5: 178, fig. 33 (1912); F.T.A. 6, 1: 1002; Kennedy For. Fl. S. Nig. 82. *APD acc*

A tree, up to 50 ft. high, **usually in forest, but sometimes in savannah**; inflorescence and fruit red.

S. Nig.: Ajebandele, Omo F.R. (Apr.) Onochie FHI 15536! Sapoba Kennedy 2301! Udi Plateau (Feb., Mar.) Ainslie! Cons. of For. 102! Eket Talbot 3253! Akparabong to Adijinkpon, Ikom (young fr. June) Latilo FHI 31821!

Also in **French Cameroons**, **Spanish Guinea**, **Gabon** and **Belgian Congo**.

2. **Maprounea africana** Müll. Arg. — F.T.A. 6, 1: 1004; Pax & K. Hoffm. l.c. 5: 178 (incl. vars); Aubrév. Fl. For. Soud.-Guin. 198, t. 38, 2–4. *APD acc*

A **savannah** tree, up to 20 ft. high, rarely more.

N. Nig.: Tambari Hill, Birnin Gwari Keay FHI 28053! Anara F.R., Zaria fide Keay. **Br. Cam.:** Mai Idoanu, Gashaka Dist. (Feb.) Latilo & Daramola FHI 34474!

Also in **French Cameroons**, **Ubangi-Shari** and widespread in central and east Africa.

62. ANTHOSTEMA

- A. Juss.** — F.T.A. 6, 1: 607; Pax & K. Hoffm. in E. & P. Pflanzenfam. 19C: 207 (1931). *APD acc*

- 1 Leaves cuneate at base, elliptic with rounded margins, obtusely acuminate, 7.5–13 cm. long, 3–4.5 cm. broad, with numerous lateral nerves spreading at right angles; flowers cymose; cymes subsessile, axillary, rather densely flowered; fruits deeply 3-lobed, nearly 2.5 cm. broad [1. senegalense](#)

Leaves rounded or very broadly cuneate at base, oblong with more or less straight margins, 8–15 cm. long, 2.5–4.5 cm. broad; cymes rather densely flowered; fruits up to 3 cm. broad [2. aubryanum](#)

1. **Anthostema senegalense** A. Juss. — F.T.A. 6, 1: 607; Chev. Bot. 553; Aubrév. Fl. For. C. Iv. 2: 20–22. *APD acc*

A **forest** tree with glabrous branchlets and rather leathery leaves; juice milky.

Sen.: Leprieur! Sangalkans (young fr. Oct.) Berhaut 996! **Gam.:** Abuko (Jan.) Dalz. 8057! **Fr. Sud.:** Fangala Kouta (fl. Nov., fr. Dec.–Jan.) Dubois 218! Moussaia Chev. 406. Nono Chev. 429. **Fr. G.:** Heudelot 592! Tristao Isl. Paroisse 1! **S. L.:** Kessewe F.R. (fr. Feb.) Macdonald 6! Njala (Oct.) Deighton 1342! Ronietta (Nov.) Thomas 5416! Newton (Nov.) T. S. Jones 290! **Lib.:** Monrovia (Nov.) Linder 1409! Grand Bassa Dinklage 1769! Duport (Oct.) Barker 1442! **Iv. C.:** fide Chev. l.c.

2. **Anthostema aubryanum** Baill. — F.T.A. 6, 1: 608; Aubrév. l.c. 2: 20–22, t. 127 (?). *APD acc*

A **forest** tree, 30–40 ft. high or more, with glabrous branchlets; leaves shining above; juice milky; **in swamp forest**.

Iv. C.: fide Aubrév. l.c. **G. C.:** W. Apollonia (Aug.) Chipp 324! Abosso (Aug.) Vigne FH 3027! **S. Nig.:** Ajilite to Addo Millen 178! Sapoba (Aug., Sept.) Kennedy 1737! Ajayi FHI 26923!

Also in **Gabon**, **Cabinda** and **Principe**.

63. DICHOSTEMMA

Pierre — F.T.A. 6, 1: 605; Pax & K. Hoffm. in E. & P. Pflanzenfam. 19C: 207 (1931).

- 1 A small tree or climber; branchlets glabrous; leaves obliquely oblong-lanceolate, shortly cuneate at base, acuminate, 7–16 cm. long, 2.5–6 cm. broad, entire, glabrous, glaucous beneath; lateral nerves 6–8 pairs, looped; panicles terminal, up to 40 cm. long, puberulous; involucre cup-like, obtusely 4-angled, up to 5 mm. broad; male flowers reduced to a single stamen; fruits depressed-quadrangular, 4-lobed, 3 cm. broad, rusty-tomentellous [glaucescens](#)

Dichostemma glaucescens *Pierre* — F.T.A. 6, 1: 606. *APD acc*

A forest tree, to 40 ft. high, or said sometimes to be climbing; with abundant milky juice; flowers yellow.

S. Nig.: Oban (young fr. May) Talbot 2328! Ujor FHI 31792! New Ndebiji, Calabar (May) Ejiofor FHI 21890! **Br. Cam.:** Victoria to Kumba (fr. Aug.) Dundas FHI 8403!

Also in **French Cameroons**, **Spanish Guinea**, **Gabon**, **Cabinda** and **Belgian Congo**.

64. EUPHORBIA

Linn. — F.T.A. 6, 1: 470.

- 1 Herbs, annual or perennial, or suffrutices; rarely fleshy, but never prickly: 2
Shrubs or trees, with fleshy glabrous stems, often prickly (except Nos. 22–24): 22
- 2 Inflorescences appearing directly from the apices of fleshy underground or partially exposed stems 1–1.5 cm. thick; peduncles 2–4 cm. long, involucre glabrous, 2–3 mm. diam.; leaves appearing later, few, oblanceolate, up to 14 cm. long and 4 cm. broad [21. бага](#)
Inflorescences not as above: 3
- 3 Leaves all strictly opposite, usually markedly unequal at base, up to 5 cm. long and 2 cm. broad; stipules present, mostly conspicuous; mostly erect or prostrate annual herbs, but some perennial (see Nos. 1 and 13): 4
Leaves alternate below, but opposite or whorled above where they subtend inflorescences, usually exceeding 5 cm. long and 1 cm. broad; stipules absent or glandular; mostly erect perennial herbs: 16
- 4 Ovary and capsule hairy: 5
Ovary and capsule glabrous: 10
- 5 Involucre borne in dense, rather long-pedunculate, axillary and terminal leafless glomerules; stems rather coarsely spreading-pilose with yellowish hairs over a shorter indumentum; leaves obliquely ovate to lanceolate, rounded on one side, cuneate on the other at base, acute at apex, up to 5 cm. long and 2 cm. broad, serrate [2. hirta](#)
Involucre solitary or on short leafy lateral branches: 6
- 6 Capsules pubescent only on the angles; stems subglabrous except for a line of short curly hairs on the upper side; seeds with minute sharp transverse ridges; leaves broadly elliptic to elliptic-oblong, obtuse or rounded at apex, mostly 4–8 mm. long [12. prostrata](#)
Capsules with the hairs not confined to the margins; stems pubescent or tomentose: 7
- 7 Stems erect, sparingly branched; leaves lanceolate, very unequal at base, 20–40 mm. long and 6–13 mm. broad, serrulate or subentire; stems and inflorescences, at least when young, densely woolly-tomentose; capsules, 2–2.5 mm. broad, densely tomentose [9. convulvuloides](#)
Stems more or less prostrate, or ascending, well-branched; leaves more or less oblong-elliptic, 2.5–14 mm. long, 3–8 mm. broad; 8
- 8 Capsules all exserted from the involucre on well-developed pedicels; capsules 1.5–2 mm. long and broad; seeds usually with a whitish waxy coat; stems pubescent or pilose all round; 9
Capsules mostly included at the base in the involucre which is thus distended at maturity, pedicels very short; capsules about 1 mm. long and broad; stems pilose mainly on the upper side; stipules lanceolate, conspicuous; leaves conspicuously serrulate, rounded to obtuse at apex, 2.5–10 mm. long, 1–6 mm. broad [11. thymifolia](#)
- 9 Glands on the involucre with broad petal-like appendages; stems, leaves and inflorescences very densely long spreading-pilose; stipules minute; leaves conspicuously serrulate, rounded at apex, 7–14 mm. long, 3–8 mm. broad [8. scordifolia](#)
Glands on the involucre without broad appendages; stems, leaves and inflorescences with curly pubescence; stipules well-developed; leaves subentire or minutely serrulate, 3–12 mm. long, 1.5–8 mm. broad [7. aegyptiaca](#)

- 10** Leaves suborbicular, 3–5 mm. long and broad, subcordate at base, emarginate at apex; stipules united into a white, glabrous, membranous scale; glabrous annual with prostrate branches; involucre solitary at the ends of the shoots [6. *serpens*](#)
- Leaves not suborbicular: **11**
- 11** Stems arising annually after fires from a woody rootstock, flowering when only a few centimetres high but eventually attaining up to 16 cm. long, sparingly puberulous; lower leaves more or less oblong, 3–9 mm. long, 2–5 mm. broad, upper leaves linear-lanceolate, 12–24 (–30) mm. long, 2.5–4 mm. broad, entire except at the very tip; involucre solitary, axillary, with peduncles elongating to 13 mm. long [13. *kerstingii*](#)
- Stems not as above: **12**
- 12** Leaves not or very obscurely nerved at the base, linear-lanceolate, cordate on one side at base, toothed towards apex, 3–21 mm. long, 1–4 mm. broad; involucre solitary, peduncles short; erect glabrous annual [10. *polycnemoides*](#)
- Leaves with distinct lateral nerves at the base; involucre in cymes: **13**
- 13** Perennial glabrous herb of seashore; stems dark purplish, prostrate, with short internodes (usually 1–2.5 cm. long); leaves glaucous, oblong-elliptic, cordate on one side at base, rounded and mucronate at apex, 5–20 mm. long, 3.5–10 mm. broad, entire; stipules deeply dentate; involucre several together [1. *glaucophylla*](#)
- Annual herbs; main stems erect, with internodes 2–5 cm. long, or if procumbent with shorter internodes then puberulous: **14**
- 14** Involucre few in lax slender dichotomously branched cymes accompanied by leafy bracts; stipules short, ciliate, broad in outline; stem and leaves often pubescent when young, glabrescent, leaves obliquely obovate-oblong or oblong, rounded on one side, acute on the other at base, rounded to subacute at apex, up to 2.8 (–4) cm. long, and 1.3 (–1.8) cm. broad, distinctly serrulate; capsules about 2 mm. broad [4. *hyssopifolia*](#)
- Involucre in several- to many-flowered rather close cymes: **15**
- 15** Stems erect, like the leaves quite glabrous; stipules ovate to lanceolate, about 1 mm. long; leaves obliquely lanceolate-elliptic, unequally rounded and obtuse at base, obtuse or subacute at apex, up to 3.5 cm. long and 1.2 cm. broad, serrulate; capsules about 1.3–1.4 mm. broad [3. *glomerifera*](#)
- Stems decumbent, like the undersurface of leaves rather densely pubescent; stipules ovate, scarcely 1 mm. long; leaves obliquely oblong-elliptic, unequally rounded and cuneate at base, obtuse or subacute at apex, up to 12 mm. long and 5 mm. broad, serrulate; capsules about 1.4 mm. broad [5. *sp. A*](#)
- 16** Involucre solitary, 6–9 mm. diam., with 5 broad flap-like glands transversely elliptic with crenulate margins; perennial herbs in savannah, sending up annual shoots to 30 cm. long from a woody stock; stem and leaves glabrous, subsucculent; leaves rounded or subacute at apex, usually mucronulate, lateral nerves inconspicuous beneath: **17**
- Involucre in terminal cymes or umbels; involucral glands mostly not as above, but see No. 16; habit of plant not as above: **18**
- 17** Peduncles 2–6 mm. long; leaves broadly linear to elongate-elliptic, narrowed to an obtuse subsessile base, 5–14 cm. long, 1–2 cm. broad [14. *ledermanniana*](#)
- Peduncles 8–26 mm. long; leaves obovate to obovate-oblongate, long-cuneate at base, 4–8 cm. long, 2.5–3.5 cm. broad [15. *kouandenensis*](#)
- 18** Involucre in lax several- to many-rayed umbels or cymes; each involucre normally with 4–5 glands: **19**
- Involucre in close terminal cymes; each involucre with only a single large fleshy substipitate gland; introduced annual weeds; leaves variable in shape and size, upper leaves sometimes panduriform; often with whitish or red blotches at the base of the upper leaves and bracts; stipules glandular [18. *heterophylla*](#)
- 19** Ovary not tuberculate: **20**
- Ovary densely and conspicuously tuberculate; leaves numerous, varying from linear-lanceolate to elliptic or subsessile, those of the whorl below the inflorescence usually shorter and broader than the stem leaves; bracts broadly ovate, about 1 cm. long and broad; capsule far-exserted, about 6 mm. broad [20. *depauperata*](#)
- 20** Leaves obovate or broadly oblanceolate; few; glands of the involucre not crescent-shaped or 2-horned: **21**
- Leaves lanceolate or narrowly oblanceolate, numerous; 4–10 cm. long, 1–2.5 cm. broad; leafy bracts ovate, up to 4 cm. long; glands of the involucre crescent-shaped or 2-horned; capsule 3–4 mm. broad [19. *schimperiana*](#)
- 21** Bracts subtending the involucre about 3 cm. long, rounded-ovate, subcoriaceous; glands of the involucre flap-like, denticulate on the margin; leaves subcoriaceous, apiculate, 7–15 cm. long, 3–5.5 cm. broad, with rather obscure lateral nerves; capsule 1.5 cm. broad [16. *macrophylla*](#)
- Bracts subtending the involucre about 1 cm. long, broadly obovate, mucronate at apex; glands of the involucre with 2–5 filiform forked processes; leaves slightly acuminate, 10–15 cm. long, 4–6 cm. broad, with several pairs of distinct lateral nerves [17. *cervicornu*](#)
- 22** Inflorescences and leaves and spines when present, arranged spirally, or inflorescences terminal; stems more or less terete; leaves present, often well-developed (except No. 23), crowded towards the ends of the branches, normally deciduous: **23**

- Inflorescences and spines, and leaves when present, arranged along 3–6 angles or wings of the branchlets which are not terete (note however that old branches may become more or less terete); spine-shields with a pair of well-developed or vestigial spines: **28**
- 23** Spines absent, or sometimes (No. 24) with solitary spines rudimentary or present only on young plants: **24**
- Spines present, well-developed: **26**
- 24** Flowering branchlets 0.25–0.6 cm. diam.; leaves linear up to 0.7 cm. broad, with a single main nerve: **25**
- Flowering branchlets 2.5–4 cm. diam. with leaves in 8–10 spiral ranks; leaves obovate-spathulate, long-cuneate at base, usually widely emarginate at apex, 5–14 cm. long, 3–7 cm. broad, pinnately nerved; involucre shortly pedunculate, usually paired, axillary, numerous at the ends of the shoots; fruits deeply 3-lobed, about 5–6 mm. diam., glabrous, each coccus subglobose; fruiting pedicels about 5–12 mm. long [24. *poissoni*](#)
- 25** Involucres unisexual, with stout peduncles up to 2 mm. long, solitary in upper leaf-axils; ovary and fruit pubescent; leaves numerous, usually deciduous, up to 10 cm. long and 7 mm. broad [22. *balsamifera*](#)
- Involucres bisexual, with slender peduncles 6–20 mm. long, arranged in terminal umbels; ovary and fruit glabrous; leaves rather sparse and early deciduous, up to 3 cm. long and 2.5 mm. broad [23. *lateriflora*](#)
- 26** Spines solitary, subulate from a very broad shield-like base, about 1 cm. long, glaucous grey; stems 1–2 cm. diam., with leaves (as far as can be judged from available material) in 4–5 spiral ranks; leaves oblong-spathulate, sometimes 2-lobed at apex, or mucronate, subentire or fringed, 5–11.5 cm. long, 1.5–5 cm. broad; involucre and fruits apparently as in No. 24 but more scattered [25. *unispina*](#)
- Spines paired: **27**
- 27** Flowering branchlets 2–5 cm. diam.; fruits subglobose or ovoid about 15 mm. long and 12 mm. broad, on rather short pedicels; seeds oblong, about 8 mm. long and 3 mm. broad; leaves triangular-obovate to spathulate, rounded or truncate at the apex and mucronate or emarginate, up to 7 cm. long and 6 cm. broad [26. *paganorum*](#)
- Flowering branchlets 1–1.5 cm. diam.; fruits deeply 3-lobed, about 3 mm. long and 5 mm. broad, on pedicels 5–7 mm. long; seeds subglobose about 1.5 mm. diam.; leaves spathulate to triangular-obovate, dentate to lacerate at apex, 2–5 cm. long, 1.5–2 cm. broad [27. *sudanica*](#)
- 28** Leaves present, deciduous, fleshy-coriaceous, spathulate-obcordate, up to 17 cm. long and 12 cm. broad; branchlets 3–5-angled, not or scarcely winged, not segmented; involucre solitary or paired, protogynous, on a common peduncle 2–4.5 cm. long; fruits trigonous, about 1 cm. long, with sides about 1.4 cm. wide; fruiting pedicels up to 1.3 cm. long, recurved [28. *desmondi*](#)
- Leaves absent, or very rudimentary and caducous; branchlets 3–4 (–6)-winged, segmented; involucre protandrous, on common peduncles up to only 1 cm. long, even in fruit: **29**
- 29** Calyx of female flower truncate; fruits sharply 3-angled, about 5 mm. long, with sides about 1 cm. wide, slightly concave, without subsidiary lobes; fruiting pedicels about 4 mm. long [29. *deightonii*](#)
- Calyx of female flower lacinate; fruits 3-angled, about 7 mm. long, with sides about 1.2 cm. wide each with fleshy subsidiary lobes while ripening; fruiting pedicels about 3 mm. long [30. *kamerunica*](#)

1. *Euphorbia glaucophylla* Poir. — F.T.A. 6, 2: 499.

APD: *Synonym of Euphorbia trinervia Schumach. & Thonn.*

Perennial herb with prostrate branches; woody stems dark purplish, leaves pale green; [just above high-water-mark on sandy seashores.](#)

Brenan 8741! Ogwashi (fl. & fr. Dec.) Thomas 2062! Calabar (fl. & fr. May) Holland 123! **F. Po:** Mann 213!

A native of tropical America; widespread as a weed in the tropics.

13. *Euphorbia kerstingii* *Pax* — F.T.A. 6, 1: 500. *APD acc*

Euphorbia polycnemoides of F.W.T.A., ed. 1, 1: 312, partly (Dalz. 33).

A perennial, with short annual stems arising from the woody rootstock after grass fires in savannah.

G. C.: Kintampo (fl. & fr. Nov.) Dalz. 33! **Togo:** Trogoode, Königsdorf (Jan.) Kersting 35. Kete Krachi Zech 45. **S. Nig.:** between Iggetti and Kishi, Oyo Prov. (Feb.) Collier FHI 16272!

14. *Euphorbia ledermanniana* *Pax & K. Hoffm.* in Engl. Bot. Jahrb. 45: 241 (1910); F.T.A. 6, 1: 524. *APD acc*

Euphorbia calva *N.E. Br.* in F.T.A. 6, 1: 522 (1911); F.W.T.A., ed. 1, 1: 312.

Perennial herb in *savannah*, sending up rather fleshy shoots from a woody stock after grass fires.

N. Nig.: Mando, Birnin Gwari (fr. Aug.) Keay FHI 28001! Kyana, Nassarawa (fl. & fr. Mar.) Hepburn! Bauchi Plateau (Mar.) Lely P. 190! Katsina Ala (June) Dalz. 754!

Also in *French Cameroons*.

16. *Euphorbia kouandenensis* *Beille* in Bull. Soc. Bot. Fr. 61, Mém. 8: 296 (1917); Chev. Bot. 552. *APD acc*

Perennial *savannah* herb, like the preceding.

G. C.: Bahare, Gambaga (June) Akpabla 668! **Togo:** Yendi (fr. May) Akpabla 518! **Dah.:** Kouandé (June) Chev. 24248!

16. *Euphorbia macrophylla* *Pax* — F.T.A. 6, 1: 529. *APD acc*

Erect perennial, 11/2 ft. or more high, with a whorl of 3–5 leaves below the umbel of bracteate involucre; lower leaves alternate.

Sen.: Tambacounda Berhaut 1656; 2954; 3267. **G. C.:** Gambaga, N.T. (fr. Aug.) Norman!

Also in *A.-E. Sudan* and *Tanganyika*.

17. *Euphorbia cervicornu* *Baill.* — F.T.A. 6, 2: 528. *APD acc*

Erect, perennial, 2–3 ft. high, with rather soft half-woody branches, glabrous.

S. Nig.: Calabar R. (Feb.) Mann 2315!

Also in *Belgian Congo* and *S. Tomé*.

18. *Euphorbia heterophylla* *Linn.* Sp. Pl. 1: 453 (1753); Berhaut Fl. Sen. 196. *APD acc*

Euphorbia geniculata *Orteg.* (1797) — Milne-Redhead in Kew Bull. 1948: 457.

A rather lax erect annual weed, to 3 ft. high; locally abundant. In most specimens from our area the upper leaves and bracts are either entirely green, or with whitish blotches at the base, or tinged purplish on the petiole, nerves and margins; Deighton 4505 and Meikle 877 are specimens of the form with red or orange blotches which is sometimes cultivated.

Sen.: cult. fide Berhaut l.c. **S. L.:** Njala, cult. (fl. & fr. Oct.) Deighton 4505! **Lib.:** Monrovia (fl. & fr. May) Barker 1320!

G. C.: Amanase, Suhum (fl. & fr. Apr.) Hughes 80! **N. Nig.:** Jebba (fl. & fr. Dec.) Hagerup 715! Zaria (fl. & fr. Aug.) Keay FHI 28024! Kafanchan (fl. & fr. Apr.) Jones FHI 6425! **S. Nig.:** Ibadan (fl. & fr. Nov., Dec.) Meikle 655! 877! 878!

A native of tropical and subtropical America, now widespread in the tropics.

19. *Euphorbia schimperiana* *Scheele* in Linnaea 17: 344 (1843); F.T.A. 6, 1: 533. *APD acc*

Euphorbia ampla *Hook. f.* (1862) — F.T.A. 6, 1: 532; F.W.T.A., ed. 1, 1: 312.

Stems 2–4 ft. high, probably perennial; leaves alternate with a whorl of 4–10 below the umbel; in *montane vegetation*.

Br. Cam.: Cam. Mt., 5,000–9,000 ft. (fl. & fr. Nov.–Mar.) Mann 1265! 2006! Maitland 197! Mildbr. 10829! Manenguba Mt. Thornbecke. Bafut-Ngemba F.R., Bamenda, 5,500–7,000 ft. (fl. & fr. Jan.) Keay FHI 28348! Tiku FHI 22243! Banso Ledermann 2017.

Widespread in tropical Africa, from Abyssinia to S. Rhodesia, also in *Arabia*.

20. *Euphorbia depauperata* *Hochst. ex A. Rich.* — F.T.A. 6, 1: 537. *APD acc*

Rootstock perennial, woody; stems 2 to several, herbaceous, or, if not burnt by fires, enduring for 2 or more years and becoming woody and leafless below simple or branched, 4 to 36 in. high; in *montane grassland*.

S. L.: Bintumane Peak, 5,500 ft. (Jan.) Glanville 469! **Iv. C.:** Nimba Mt., 4,500 ft. Schnell 3535! **Br. Cam.:** Bamenda Prov.: Banso, 6,000 ft. Ledermann 2006. Lakom, 6,000 ft. (June) Maitland 1502! Bambili (fr. Aug.) Ujor FHI 29979!

Widespread in tropical Africa.

21. **Euphorbia бага** *A. Chev.* in Rev. Bot. Appliq. 13: 569, fig. 18 (1933). *APD acc*

A perennial herb with stout rootstock and short erect underground or partially exposed stems; inflorescences appearing when leafless; flowers red. The association of Lely P. 63 (a specimen with flowers but no leaves) with Chev. 935 (the type specimen which has leaves but no flowers) is only tentative; specimens showing both leaves and flowers from the same plant are needed to confirm this.

iv. C.: Banankolidoro to Bama, Bobo Dioulasso Chev. 935! **N. Nig.:** on flat-topped lateritic hills, Bauchi Plateau (Jan.) Lely P. 63!

22. **Euphorbia balsamifera** *Ait.* Hort. Kew., ed. 1, 2: 137 (1789); Chev. Bot. 550; Chev. in Rev. Bot. Appliq. 13: 545; Aubrév. Fl. For. Soud.-Guin. 177; Schnell in Ic. Pl. Afr. t. 28. *APD acc*

Euphorbia sepium *N.E. Br.* in F.T.A. 6, 1: 551, 1040 (1911).

Euphorbia rogeri *N.E. Br.* l.c. 551 (1911); F.W.T.A., ed. 1, 1: 313.

A low shrub with glabrous succulent branches; **commonly grown in hedges in dry regions**; leaves deciduous, or evergreen on plants growing in especially favourable situations.

Maur.: fide Chev. l.c. **Sen.:** Farmar 54! Sor Isl. Brunner 21. Lampsor and Maka (Dec.–Jan.) Roger! Cayor & Dakar Paroisse 43. **Fr. Sud.:** Danga Chev. 1315. Gao (Feb.) De Wailly 4673! **G. C.:** Yendi (fr. May) Akpabla 541! **Togo:** Kersting 739. **Dah.:** Dassa-Zoumé Chev. 23620! **Fr. Nig.:** fide Aubrév. l.c. **N. Nig.:** Sokoto Dalz. 528! Katsina to Daura Sampson 8! Katagum Dalz. 320!

Also in the **Canary Islands** and **Rio de Oro**; apparently not known east of L. Chad.

[The record from Lagos in the first edition is based on a sterile leafless specimen which may well be *E. lateriflora*.]

23. **Euphorbia lateriflora** *Schum. & Thonn.* — F.T.A. 6, 1: 552; Chev. in Rev. Bot. Appliq. 13: 546; Aubrév. l.c.; Monod in Mém. I.F.A.N. 18: 19. *APD acc*

A low shrub with smooth-glaucous more or less erect branches; flowers yellow; **commonly grown in hedges**; leaves usually deciduous.

S. L.: Newton Deighton 1958! **G. C.:** Chama (Apr.) Chipp 188! Achimota Irvine 1010! **N. Nig.:** Sokoto Dalz. 392! Katsina (Feb.) Meikle! Kano (Mar., Oct.) Bally! Keay FHI 21139! Katagum Dalz. 327! Jos (Mar.) Hill 21! Pedong, Jos (fl. & fr. Dec.) Monad 9705! **S. Nig.:** Epe Barter 3309! Ibadan fide Keay. **Br. Cam.:** Gwoza, Dikwa Div. (fr. Dec.) McClintock 58!

[The record from Kratschi, Togoland, given in the first edition seems to be based on a mistranslation of the Danish phrase “I Krati” which means “In thickets”; Thonning does not cite an exact locality. This species is close to the common and variable S. African species known as *E. mauritanica* Linn.; comparison of living specimens would be desirable in determining the taxonomic status of the W. African plant; *E. nubica* N.E. Br. of north-eastern Africa is also close.]

24. **Euphorbia poissoni** *Pax* — F.T.A. 6, 1: 560; Chev. Bot. 552; Chev. in Rev. Bot. Appliq. 13: 549; Aubrév. l.c. 177. *APD acc*

An erect shrub to 6 ft. high, with candelabriform branching; branches silvery-grey, stout; leaves pale green, deciduous; flowers pale greenish with red stamens; **on rocky hills in savannah and planted; sometimes with rudimentary spines, or with spines present only on young plants.**

Fr. G.: Pobéguin. **iv. C.:** Mossi fide Chev. l.c. **G. C.:** Anderson! Tamale Bally 5192! **Togo:** various localities Kersting 88; 91; 414; 574. **Dah.:** Poisson. [The forms with rudimentary spines may be distinguished from *E. unispina* by the stouter flowering branchlets which have the leaves in 8–10 spiral ranks instead of about 5, by the smaller spines, and by the more numerous inflorescences densely clustered at the ends of the shoots.]

25. **Euphorbia unispina** *N.E. Br.* in F.T.A. 6, 1: 561 (1911); Chev. in Rev. Bot. Appliq. 13: 550; Aubrév. l.c. 178. *E. “venenifica”* of Chev. l.c. 549, partly; of Aubrév. l.c. 178, partly. *APD acc*

An erect shrub to 10 ft. high with candelabriform branching; **on rocky hills in savannah.**

Fr. Sud.: Sikasso to Bobo Dioulasso (June) Chev. **Iv. C.:** Soucourala to Sanrou Chev. 21583! **G. C.:** Navrongo (fr. Oct.) Vigne FH 4616! **Togo:** Loso Kersting 569. Difale (fr. Dec.–Feb.) Kersting A. 573! **N. Nig.:** Katagum Dalz. 329! **Br. Cam.:** Gwoza, Dikwa Div. (Jan.) McClintock 142!

[Certain forms of *E. poissoni* may be confused with this species; see note under *E. poissoni*.]

26. **Euphorbia paganorum** A. Chev. in Rev. Bot. Appliq. 13: 556, fig. 16 (1933); op. cit. 28: 351, t. 8; Aubrév. l.c. 178. *APD acc*

A low fleshy shrub, with pale green stems and brown spines.

Fr. Sud.: Souloula, Bougouni (Mar.) Chev. 672! Sindou rocks, Sikasso (fr. Jan.) Chev. **N. Nig.:** Zaria (fl. buds Feb.) Milne-Redhead 5039! Ibeto, Kontagora (fl. buds Jan.) Meikle 1049!

27. **Euphorbia sudanica** A. Chev. in Bull. Mus. Hist. Nat. sér. 2, 4: 589, fig. 2 (1932); Rev. Bot. Appliq. 13: 554, t. 9 & fig. 15; Aubrév. l.c. 178; Berhaut Fl. Sen. 3,122. *APD acc*

APD: *Synonym of Euphorbia paganorum* A. Chev.

Euphorbia trapaefolia A. Chev. l.c. 556, t. 10 (1933); Aubrév. l.c.

Euphorbia tellieri A. Chev. l.c. 555 (1933); Aubrév. l.c. 178.

A fleshy shrub, to 6 ft. high; on rocky hills in dry savannah.

Sen.: Berhaut 258; 4270. Bakel Trochain 1097. **Fr. Sud.:** Koulikoro (fl. & fr. Mar.) Chev. 26023! 44039! Koulouba Chev. 45093! Gao to Ansongo Chev. 43180 bis! **Fr. Nig.:** Kodjar rocks, Gourma Chev. 24417! Niamey (cult. in Paris, fls. June) Tellier!

28. **Euphorbia desmondi** Keay & Milne-Redhead in Kew Bull. 1955: 139. *APD acc*

A shrub or tree, with erect rather stiff branching and large deciduous leaves; inflorescences reddish; involucrel-glands dull crimson; ovary pale green with bright red stigmas.

N. Nig.: about 33 miles from Katsina on Kano road (fl. & fr. Dec.) Meikle 813! Jos Batten-Poole FHI 12893! Barges, Plateau Prov. (fl. & fr. Dec.) Monod! Pedong, Plateau Prov. (Dec.) Monod 9709! **Br. Cam.:** Gwoza, Dikwa Div. (fr. Dec.) McClintock 68!

29. **Euphorbia deightonii** Croizat in Kew Bull. 1938: 58. *APD acc*

A shrub forming large clumps, apparently without a distinct trunk; bracts tinged reddish, involucrel-glands green; fruits dull red; often planted.

S. L.: Njala (Nov., Jan.) Deighton 2609! 3109! 3985! **G. C.:** Achimota (fl. & fr. July) Milne-Redhead 5118! **S. Nig.:** Ikare (fl. & fr. Oct.) G. Burton!

30. **Euphorbia kamerunica** Pax — F.T.A. 6, 1: 586; Chev. in Rev. Bot. Appliq. 13: 565; Croizat in Kew Bull. 1938: 53–56; Aubrév. l.c. 177. *APD acc*

Euphorbia barteri N.E. Br. in F.T.A. 6, 1: 597 (1912); Croizat l.c.

Euphorbia kamerunica var. **barteri** (N.E. Br.) A. Chev. in op. cit. 28: 348 (1948), as to name.

Euphorbia garuana N.E. Br. (1912).

A shrub or tree with candelabriform branching, to 25 ft. high or more, normally with a distinct trunk; often planted in towns and villages.

N. Nig.: Ketsa Rock, Jebba (shrivelled fls. & frts. Mar.) Barter 1012! Meikle 1314! **Br. Cam.:** Barombi (Sept.) Preuss 511! Mamfe (fr. Jan.) Keay FHI 28323!

Also in French Cameroons.

- Euphorbia pulcherrima** Willd. ex Klotzsch

An introduced species, it is cultivated.

- Euphorbia milii** Des Moul.

Euphorbia splendens Boj. ex Hook.

An introduced species, it is cultivated.

- Euphorbia tirucalli** Linn.

An introduced species, it is cultivated.

1. **Euphorbia purpurascens** *Schum. & Thonn.* Beskr. Guin. Pl. 252 (1827); Boissier in DC. Prod. 15, 2: 22, cites this as *E. indica* Lam. (1786); this is probably correct, but the Thonning specimen, which I have seen, is too poor for certainty. No comparable material has been collected in our area since Thonning's specimen (1799–1802).

APD: *Synonym of Euphorbia indica* Lam.

G. C.: Thonning!

Imperfectly known species.

2. **Euphorbia** sp. *APD acc*

Near to *E. ledermanniana* and *E. kouandenensis* but probably new; further material desired.

Fr. G.: Kandika (Apr.) Roberty 17578!

Imperfectly known species.

65. ELAEOPHORBIA

Stapf — F.T.A. 6, 1: 604; Croizat in Bull. Jard. Bot. Brux. 15: 109 (1938).

- 1 Peduncles forked, with a sessile involucre in the fork, sometimes with the lateral branches forked again; common peduncles 2.5–4.5 cm. long, axillary, in threes, lateral branches of inflorescence 1–2 cm. long; fruits ellipsoid, with a very short stipe, usually about 2–3 cm. long and 1.5–1.8 cm. broad; involucre with 5 transversely oblong, denticulate lobes and 5 fleshy similar-shaped glands; male flowers numerous; female solitary, subsessile; branchlets fleshy, armed with pairs of broad-based prickles about 5 mm. long; leaves oblanceolate to obovate, sometimes widely emarginate at apex, up to 25 cm. long and 9 cm. broad, fleshy, entire *1. drupifera*

Peduncles not forked, each with a solitary involucre, axillary, in threes, up to 5.8 cm. long in fruit; fruits ellipsoid or obovoid-ellipsoid, 3.5–4 cm. long, 2.8–3.5 cm. diam., with a stipe 4–7 mm. (or rarely 12–20 mm.) long; leaves up to 30 cm. long and 7.5 cm. broad; otherwise similar to above *2. grandifolia*

1. **Elaeophorbia drupifera** (*Thonn.*) *Stapf* in Hook. Ic. Pl. t. 2823 (1906); F.T.A. 6, 1: 604, partly; Croizat in Bull. Jard. Bot. Brux. 15: 113. *APD acc*

Euphorbia drupifera *Thonn.* (1827) — Chev. in Rev. Bot. Appliq. 13: 560, partly.

Elaeophorbia neriifolia of Chev. in op. cit. 28: 348, partly, not of (Linn.) Chev.

A tree with woody stem and fleshy branches containing abundant, very caustic, white latex; branched low down in *open situations* but with a long clear bole in *forest*; 10–50 ft. or more high; ripe fruits yellow.

G. C.: Eady! Accra Plains (fl. & fr. Feb.) Johnson 605! 1053! Achimota (fr. Mar.) Milne-Redhead 5051! Newtown (fr. July) Chipp 279! Also in **Ubangi-Shari**.

ROSACEAE

Trees, shrubs or herbs. Leaves various, simple or compound, alternate or rarely opposite; stipules mostly present and paired, sometimes adnate to the petiole. Flowers actinomorphic or subzygomorphic, usually hermaphrodite. Calyx free or adnate to the ovary; lobes imbricate. Petals present, rarely absent, imbricate. Stamens usually numerous; filaments free or connate; anthers small, 2-celled. Carpels 1 or more, free or connate, superior or inferior; styles free or rarely connate. Ovules 2 or more in each carpel, superposed. Fruit superior or inferior, drupaceous, pomaceous, follicular or achenial. Seeds without endosperm.

A cosmopolitan family rather poorly represented in the tropics.

Distinguished from Ranunculaceae by the perigynous type of flower and absence of endosperm. The tribe Chrysobalanaceae closely connects with the Caesalpiniaceae.

- 1 Herbs with prostrate, not prickly, stems; carpels more than 1:2
 Scrambling shrubs with prickly stems and compound leaves; ovary apocarpous, carpels numerous on a subglobose torus[3. Rubus](#)
 Trees or shrubs; carpels usually solitary:3
- 2 Leaves digitately lobed; calyx without setiform bracts; petals 0; stamens usually 4; carpels 5, free, not all fertile[1. Alchemilla](#)
 Leaves pinnately lobulate; calyx-tube surrounded with setiform bracteoles; petals 5, small; stamens about 10; carpels 5–10, more or less consolidated with the calyx-tube[2. Neurada](#)
- 3 Style or stigma terminal; flowers in simple racemes[4. Pygeum](#)
 Style basal or gynobasic:4
- 4 Flowers actinomorphic; ovary at the base and in the centre of the receptacle (calyx-tube); stamens inserted all round the receptacle:5
 Flowers zygomorphic; ovary inserted laterally near the mouth of the receptacle (calyx-tube):6
- 5 Petals present; flowers hermaphrodite, in short cymes[5. Chrysobalanus](#)
 Petals absent; flowers polygamous, in panicles[6. Afrolicania](#)
- 6 Carpels 2-celled[7. Parinari](#)
 Carpels 1-celled:7
- 7 Stamens free or united only at the base[8. Hirtella](#)
 Stamens united into a long unilateral strap-shaped bundle[9. Acioa](#)

Eriobotrya japonica (Thunb.) Lindl.

A native of China and Japan, it is sometimes cultivated in our area.

Prunus persica (Linn.) Batsch

A native of China and Japan, it is sometimes cultivated in our area.

1. ALCHEMILLA

Linn. — **F.T.A. 2: 377. APD acc**

- 1 Leaves usually with 5 short lobes rounded and dentate at apex, the sinuses not reaching half the radius of the leaf; petioles of radical leaves 2.5–7.5 cm. long; petioles of cauline leaves 1–3 cm. long; inflorescences up to 15 cm. long, but normal inflorescences often absent; subsessile flowers hidden under the stipules of the stolons very frequent[1. cryptantha](#)
 Leaves usually with 7 elliptic-lanceolate lobes, the sinuses reaching more than half the radius of the leaf, margin dentate almost to the base of the lobes; petioles of radical leaves 4–18 cm. long; petioles of cauline leaves 3–5 cm. long; inflorescences in axillary many-flowered cymes 10–15 cm. long, or in a panicle up to 35 cm. long; subsessile flowers under the stipules absent or very rare[2. kiwuensis](#)

1. *Alchemilla cryptantha* Steud. ex A Rich. — F.T.A. 2: 377; Hauman in Fl. Congo Beige 3: 7 (1952).
APD acc

Alchemilla tenuicaulis Hook. f. — F.T.A. 2: 378; F.W.T.A., ed. 1, 1: 314.

Low creeping herb; flowers greenish-yellow.

Br. Cam.: Cam. Mt., 5,000–12,000 ft. (Dec.–Mar.) Mann 1984! Maitland 485! 842! 1294! Brenan 9391a! Bamenda, 6,000 ft. (Jan.) Migeod 448! Belo, Bamenda (Apr.) Maitland 1760! L. Oku, Bamenda, 7,700 ft. (Jan.) Keay FHI 28467! **F. Po:** 7,500 ft. Mann 1447! Moka (Jan.) Guinea 1967!

Widespread on the mountains of eastern and central Africa from Abyssinia to Transvaal, of S. Tomé and of Madagascar.

2. *Alchemilla kiwuensis* Engl. Bot. Jahrb. 46: 129 (1911); Hauman l.c. 6, t. 1. *APD acc*

Herb with trailing stems; flowers pale green.

Br. Cam.: below Liwonge, Cam. Mt., 6,600 ft. (Mar.) Brenan 9549!

Also on the mountains of **Belgian Congo**, **Uganda**, **Kenya**, **Tanganyika** and S. Rhodesia.

2. NEURADA

Linn. — F.T.A. 2: 381.

- 1 A woody tomentose annual with short spreading prostrate branches, the fruit persisting around the base of the stem; leaves pinnately lobulate or deeply toothed, rather long-petiolate, about 1·5 cm. long, densely white-woolly-tomentose; flowers axillary, solitary, roundish, surrounded with setiform bracteoles; fruit woody, orbicular, about 1·5 cm. diam., spinose *procumbens*

Neurada procumbens Linn. — F.T.A. 2: 382; Chev. Bot. 253. *APD acc*

Fr. Sud.: Timbuktu (June–Aug.) Hagerup 126! 240! Chev. 1343!

Common in desert regions from Mauritania, across N. Africa to India.

3. RUBUS

Linn. — F.T.A. 2: 374; Gustafsson in Arkiv. för Bot. 26A, 7: 1–68 (1934); Bull. Jard. Bot. Brux. 13: 267–276 (1935); Kew Bull. 1938: 177–187.

Most of the West African Rubi bear their inflorescences on leafy branches arising from axils of the leaves of a primary or main stem (turion). This main stem appears to be usually suberect or scandent. In order that this difficult genus may be better understood and to facilitate accurate determination, collectors should be careful not only to preserve an inflorescence but also a piece of the main stem bearing at least one leaf. Care should be taken to ensure that the main stem and inflorescence belong to the same plant. Notes on the fruits are much desired (e.g. colour and whether separating from receptacle as in the raspberry or adhering to it as in the blackberry).

- 1 Carpels at least 100, forming an elongate-ovoid fruit 1·5–2 cm. long; flowers solitary or few together; petals suborbicular, about 1 cm. long, showy; branchlets laxly villous, prickles few, recurved; leaves pinnate, those of main stems usually with 5–7 (rarely 9–11) leaflets, those of branches usually with 5 leaflets (uppermost with 3, or simple); leaflets ovate- or oblong-lanceolate, rounded at base, coarsely biserrate, hairy and green beneath *1. rosifolius*
- Carpels much fewer; panicles many-flowered, prickly; petals small, often caducous, or absent: **2**
- 2 Lower surface of leaves obscured by a dense pilose-tomentum or by a dense tomentellous felt, the leaves consequently white beneath: **3**
- Lower surface of leaves clearly visible between the hairs, the leaves consequently green beneath; branchlets shortly tomentose, with recurved prickles; leaves pinnate, mostly with 5–7 (rarely 9) leaflets; leaflets narrowly ovate, rounded at base, biserrate, pilose mainly on the nerves beneath, usually glabrous (rarely pilose) above; carpels pubescent *5. pinnatus* var. *afrotropicus*
- 3 Lower surface of leaves densely pilose-tomentose; leaves mostly trifoliate; leaflets ovate-rotundate, cordate at base, coarsely biserrate, pilose above; branchlets pilose, prickles recurved; panicles stout with prickles extending on to base of sepals; carpels glabrous *2. apetalus*

Lower surface of leaves densely and closely white-tomentellous with longer pilose hairs as well; leaves mostly pinnate, 5-foliolate, upper leaves sometimes trifoliolate:4

- 4 Branchlets, leaf-rachides and inflorescence densely villous; upper surface of leaflets pilose; leaflets ovate-elliptic, rounded or subcordate at base, coarsely biserrate; upper pair of lateral leaflets very shortly petiolulate; branchlets with numerous large recurved prickles; prickles extending on to base of sepals; carpels glabrous .3. [*exsuccus*](#)

Branchlets, leaf-rachides and inflorescence tomentellous and shortly pilose; upper surface of leaflets almost glabrous except for the nerves; leaflets ovate-elliptic, obtuse or rounded at base, coarsely biserrate; upper pair of leaflets distinctly petiolulate; branchlets with recurved prickles; carpels pubescent4. [*fellatae*](#)

1. **Rubus rosifolius** Sm. Pl. Ic. Hact. Ined. 3, t. 60 (1791); Gustafsson in Arkiv. för Bot. 26A, 7: 11. *APD acc*

Flowers white; fruit red, edible but rather insipid. Cultivated and often naturalized in certain localities within our area.

Br. Cam.: Buea Dundas FHI 15232! Bamenda (fl. & fr. Dec.) Egbuta FHI 3764! **F. Po:** Moka (fl. & fr. Dec.) Boughey 112!

A native of Asia (? also of Mascarene Isls. and the Cape).

2. **Rubus apetalus** Poir. var. (?) — F.T.A. 2: 374. *APD acc*

Petals usually absent; fruit edible.

N. Nig.: Bauchi Plateau Lely 731!

[This specimen cited and illustrated in F.W.T.A., ed. 1 as *R. apetalus* Poir. is not identical with the other specimens of the species at Kew, but may well be a variety of this widespread species. — R.W.J.K.]

3. **Rubus excsuccus** Steud. ex A. Rich. Tent. Fl. Abyss. 1: 256 (1848); Gustafsson l.c. 36.

APD: *Synonym of Rubus apetalus Poir. var. apetalus*

Low scrambling bramble; sepals green; petals caducous; stamens crimson; fruit black when ripe.

Br. Cam.: Bambui, Bamenda (Jan.) Keay FHI 28338!

Also in [Uganda](#), [Kenya](#), [Abyssinia](#), [Nyasaland](#) and [S. Rhodesia](#).

4. **Rubus fellatae** A. Chev. in Bull. Soc. Bot. Fr. 54, Mém. 8: 18 (1907); Chev. Bot. 253. *APD acc*

Rubus interjungens of Gustafsson in Bull. Jard. Bot. Brux. 13: 269, partly.

Fruits red when ripe, edible.

Fr. G.: Ditinn to Diaguissa (fr. Apr.) Chev. 12905! Macenta (fl. & fr. Oct.) Baldwin 9850! **S. L.:** Bintumane, 5,400 ft. (fl. & fr. Jan.) Nichols 1! **Lib.:** Mt. Wolagwisi, Pandamai, 4,500 ft. (fl. & fr. Mar.) Beguaert 115! Nekabozu, Vonjama (fl. & fr. Oct.) Baldwin 9965! **Iv. C.:** Mt. Dou, 4,000 ft. (May) Chev. 21481!

[This species is not mentioned in the papers by Gustafsson cited above, but a specimen (Chev. 12908) from French Guinea is cited as *R. interjungens* Gust. (1934). The two species may prove to be identical. — R.W.J.K.]

5. **Rubus pinnatus** Willd. — F.T.A. 2: 374; Gustafsson in Arkiv. för Bot. 26A, 7: 45. *APD acc*

Rubus pinnatus var. afrotropicus (Engl.) C. E. Gust. l.c. 46 (1934).

APD: *Synonym of Rubus pinnatus Willd.*

Rubus pinnatus subsp. afrotropicus Engl. Pflanzenw. Afr. 3, 1: 292 (1915).

Scandent shrub, to 15 ft. high; sepals grey-green; petals small, mauve-pink; stamens deep red-mauve; fruits red when ripe, edible.

Fr. G.: Cabara, near Liberian border Baldwin 9855! **Lib.:** Vonjama (fr. Oct.) Baldwin 9952! **Br. Cam.:** Cam. Mt., 4,000–9,000 ft. (fl. & fr. Nov.–Apr.) Mann 1221! 2026! Brenan 9578! Bali, Bamenda (May) Ujor FHI 30393! **F. Po:** 7,000 ft. Mann 295! Mioka (Dec.) Boughey 155!

Widespread on the mountains of tropical Africa, also on S. Tomé and Annobon; the species also occurs in S. Africa, Ascension and St. Helena.

4. PYGEUM

APD: Synonym of Prunus L.

Gaertn. — F.T.A. 2: 373.

- 1 Tree to 25 m. or more, with dark longitudinally fissured bark; leaves elliptic or oblong, shortly acuminate, 8–13 cm. long, 3–5 cm. broad, crenate, glabrous, thinly coriaceous; lateral nerves 7–8 pairs; petiole 1–2 cm. long; flowers small in simple racemes shorter than the leaves arising from the lower part of the branchlets; pedicels spreading, up to 5 mm. long; petals woolly on the margin; fruit dry, depressed-globose, 1–1.5 cm. diam., glabrous, with a short style [africanum](#)

Pygeum africanum *Hook. f.* — F.T.A. 2: 373.

APD: Synonym of Prunus africana (Hook. f.) Kalkman

Flowers white; petioles red.

Br. Cam.: Cam. Mt., 7,000–7,500 ft. (Dec., Jan.) Mann 1207! 2165! L. Bambulue, Bamenda, 7,000 ft. (Jan.) Keay FHI 28377! **F. Po:** Mildbr. 7151.

Widely distributed in the mountainous parts of tropical Africa, extending south to [Angola](#) and Transkei (Cape Prov.).

5. CHRYSOBALANUS

Linn. — F.T.A. 2: 365.

- 1 Leaves orbicular to obovate-orbicular, usually widely emarginate at the apex, never acuminate, rounded or slightly cuneate at base, 5–9 cm. long, 3.5–6 cm. broad, thick and leathery, glabrous, reticulate on both surfaces; petiole about 3 mm. long; flowers very few in axillary cymes, appressed-tomentose; bracts ovate; petals obovate, glabrous; filaments pilose; fruit indehiscent, obovoid, glabrous, about 2.5 cm. long [1. orbicularis](#)

Leaves more or less acuminate, obovate to oblong, conspicuously narrowed to the base: [2](#)

- 2 Leaves broadly obovate, shortly and obtusely acuminate, 5–10 cm. long, 3–5 cm. broad, closely reticulate and often shining, glabrous; flowers more numerous and smaller than above, often becoming galled; fruit obovoid, dehiscent from the base, ribbed, crustaceous [2. ellipticus](#)

Leaves oblong or oblong-elliptic, conspicuously acuminate, cuneate at the base, 7–12 cm. long, 3.5–5 cm. broad, obscurely reticulate, glabrous; flowers few and small, similar to those of *C. ellipticus*; fruit obovoid, more or less 5-ribbed, pubescent when young [3. atacorensis](#)

1. **Chrysobalanus orbicularis** *Schum.* *Beskr. Guin. Pl.* 232 (1827); *Aubrév. Fl. For. C. Iv.* 1: 137, t. 48 B; *Hauman in Bull. Jard. Bot. Brux.* 21: 172 (1951); *Fl. Congo Beige* 3: 34.

APD: Synonym of Chrysobalanus icaco L. subsp. icaco

Chrysobalanus icaco of F.T.A. 2: 365; not of Linn.; *Chev. Bot.* 250.

A shrub or small tree of the coastal areas; flowers white or pinkish; fruit plum-like, deep red-purple; [always near the sea.](#)

Sen.: Sieber 31! **Gam.:** Dawe 77! Sukuto (Jan.) Dalz. 8042! **Port. G.:** Esp. Santo 707! **Fr. G.:** Los Isl. (May) Pobéguin 1211! **S. L.:** Lumley Beach (Aug.) Deighton 18! Yele, Turtle Isl. Victoria (Jan.) Kalbreyer 30! **F. Po:** San Carlos (Jan.) Guinea 800!

Extends along the coast to **Belgian Congo** and (?) **Angola**.

3. *Chrysobalanus atacorensis* A. Chev. in Bull. Soc. Bot. Fr. 58, Mém. 8: 169 (1912); Aubrév. Fl. For. Soud.-Guin. 199, t. 38, 1; Hauman l.c. 36.

APD: *Synonym of Chrysobalanus icaco* subsp. *atacorensis* (A. Chev.) F. White

A shrub or tree, up to 40 ft. high, branching low down; in galley forests and fresh-water swamp forest.

Dah.: Atacora Mts. (June) Chev. 24175! **S. Nig.:** Jamieson R., Sapoba (Nov.–Jan.) Kennedy 1729! Brenan 8935!

Also in **Ubangi-Shari** and **Belgian Congo**.

For the purposes of this edition I have followed Hauman's treatment in Fl. Congo Beige 3: 34 (1952). Further investigation, especially in the field, is, however, needed to determine just how far the above species are really distinct and whether or not they should be regarded as subspecies or varieties of the American *C. icaco* Linn.

6. AFROLICANIA

Mildbr. in Notizbl. Bot. Gart. Berl. 7: 483 (1921). *APD acc*

- 1 A medium-sized tree; branchlets soon glabrous and purplish; leaves elliptic, cuneate at base, acutely acuminate, 7–14 cm. long, 3–6 cm. broad, glabrous, laxly reticulate; petiole 5 mm. long; stipules subulate, persistent, 5–7 mm. long; inflorescence a slender terminal panicle; flowers very small, in small cymes on the main branches, softly tomentose; stamens about 20; fruit ovoid, 3–4 cm. long, warty[elaeosperma](#)

Afrolicania elaeosperma Mildbr. in Notizbl. Bot. Gart. Berl. 7: 483 (1921); Aubrév. Fl. For. C. Iv. 1: 138, t. 49, 1–5.

APD: *Synonym of Licania elaeosperma* (Mildbr.) Prance & F. White

Homalium zenkeri Gilg ex Mildbr. l.c. 484, name only.

Parinarium glabrum of F.W.T.A., ed. 1, 1: 317, partly.

A tree with drooping branches and foliage, and greenish-white flowers; young leaves densely white-tomentellous, older leaves glabrous.

S. L.: Yoni and Walai, Bonthe Isl. (fr. Mar., June) Deighton 1971! 2465a–f! Njala (Nov.) Deighton 1508! **Lib.:** Grand Bassa (fl. Aug., fr. Feb.) Dinklage 1969! 2761! **Iv. C.:** (fl. Nov., fr. Aug.) Aubrév. 1494; 1651. **G. C.:** Half Assinie (fr. July) Chipp 299! Ankasa F.R. (Dec.) Vigne FH 3176! **S. Nig.:** Eba Isl. (Jan.) Thornevill 195! 201! Eket Talbot 3098!

Also in **French Cameroons** and **Gabon**.

7. PARINARI

Aubl. — F.T.A. 2: 366; Hauman in Bull. Jard. Bot. Brux. 21: 184–198 (1951).

- 1 Sepals rounded; flower buds not enclosed by a pair of bracts as long as themselves; stamens 15–20, or more: ...2

- Sepals acute; flower-buds 2–3 together, enclosed by a pair of bracts as long as themselves; inflorescence and flowers densely tomentose; fertile stamens 7–8; leaves with 12 or more pairs of lateral nerves prominent beneath; undersurface white tomentose with prominent close reticulation: **10**
- 2** Flowers in much-branched cymes; fertile stamens at least 20; leaves glabrous or more or less densely hairy beneath, and not strongly and closely reticulate; lateral nerves few (less than 13) and rather distant: **3**
- Flowers in terminal, subspiciform few-branched panicles; inflorescence and flowers densely tomentose; fertile stamens 15; leaves ovate or elliptic, cordate at base, rounded or subacute at apex, 10–25 cm. long, 5–15 cm. broad, densely white-tomentellous and conspicuously reticulate beneath with 15–20 pairs of prominent lateral nerves; fruit ellipsoid, about 5 cm. long, finely warted [8. *macrophylla*](#)
- 3** Receptacle (calyx-tube) 3–15 mm. long: **4**
- Receptacle (calyx-tube) 3–4 cm. long, strongly curved; inflorescence and exposed parts of flower glabrous; leaves elliptic or obovate-elliptic, obtuse and slightly decurrent at base, abruptly acuminate, 12–34 cm. long, 4.5–11 cm. broad, glabrous [7. *gabunensis*](#)
- 4** Undersurface of leaf green or grey, glabrous or hairy: **5**
- Undersurface of leaves, even when mature, covered with a dense reddish-brown tomentellous felt; leaves rather broadly oblong-elliptic, rounded or subcordate at base, shortly acuminate, 10–23 cm. long, 4.5–12 cm. broad; inflorescence and outside of flowers densely reddish-brown tomentose; receptacle conical, 12–15 mm. long [6. *chrysophylla*](#)
- 5** Leaves obtuse at apex, or very shortly and obtusely acuminate, rounded or obtuse at base, oblong or elliptic, 8–16 cm. long, 5–9 cm. broad; basal glands conspicuous; inflorescence and outside of flowers densely tomentose; receptacle about 8 mm. long, sepals about 4 mm. long; fruits broadly ovoid-ellipsoid, 2–2.5 cm. long, puberulous; savannah trees: **6**
- Leaves distinctly acuminate: **7**
- 6** Mature leaves glabrous or sparingly pilose beneath [1. *polyandra* var. *polyandra*](#)
- Mature leaves with a cottony white felt beneath [1a. *polyandra* var. *cinerea*](#)
- 7** Leaves not denticulate towards the apex, cuneate to rounded at base; without a bracteole at the base of the receptacle: **8**
- Leaves denticulate towards the apex, cordate at base; receptacle densely tomentose, 3–5 mm. long, accompanied by a more or less persistent bracteole; leaves elliptic, 7–16 cm. long, 4–7 cm. broad, lower surface with a thin cottony felt when young [5. *aubrevillei*](#)
- 8** Receptacle elongate-turbinate, at least 5 mm. long, glabrous; exposed outer surfaces of sepals glabrous: **9**
- Receptacle very shortly turbinate, about 3 mm. long; inflorescence branches and outside of flowers densely pubescent or tomentose; leaves more or less mealy-puberulous all over the lower surface, elliptic, 7–12 cm. long, 3.5–6 cm. broad; basal glands conspicuous [4. *robusta*](#)
- 9** Receptacle 6–7 mm. long; branches of inflorescence puberulous; carpels solitary; leaves elliptic, cuneate at base, 6–11 cm. long, 3–4.5 cm. broad; basal glands obscure [2. *glabra*](#)
- Receptacle about 1 cm. long; branches of inflorescence glabrous; carpels 2–3; leaves ovate-elliptic, cuneate to rounded at base, 8–13 cm. long, 3.5–8.5 cm. broad; basal glands more or less conspicuous [3. *kerstingii*](#)
- 10** Receptacle (calyx-tube) 2–5 mm. long; lateral nerves 15–25 pairs; inflorescence and flowers silky-tomentose: **11**
- Receptacle (calyx-tube) about 8 mm. long; lateral nerves about 12 pairs; inflorescence a terminal corymbose, much-branched cyme, shorter than the leaves, like the flowers shortly tomentose; leaves broadly elliptic, cuneate to cordate at base, rounded at apex, 6–10 cm. long, 5–7 cm. broad; young fruits ovoid, about 2 cm. long, slightly pubescent [12. *benna*](#)
- 11** Leaves rounded at apex, rounded or slightly cuneate at base (sometimes cordate on coppice shoots), oblong-elliptic, 5–17 cm. long, 3–8 cm. broad; inflorescence a lax open many-flowered panicle; fruit ovoid, up to 3.5 cm. long; a savannah tree or shrub [9. *curatellifolia*](#)
- Leaves conspicuously acuminate, narrowed at base, elliptic or ovate-elliptic to lanceolate, 5–12 cm. long, 2–5 cm. broad; flowers in a leafy terminal panicle; fruit obliquely ellipsoid, 3–4 cm. long; a forest tree [10. *excelsa*](#)
- Leaves shortly acuminate, cordate at base, ovate-oblong, 5–10 cm. long, 2.5–5 cm. broad; flowers in a leafy terminal panicle; fruit ellipsoid, about 3 cm. long; a forest tree [11. *congensis*](#)

1. *Parinari polyandra* Benth. var. *polyandra* — F.T.A. 2: 370; Aubrév. Fl. For. Soud.-Guin. 207, t. 40, 6–7, incl. var. *villosa* Aubrév.; Hauman in Bull. Jard. Bot. Brox. 21: 187.

*APD: Synonym of *Maranthes polyandra* (Benth.) Prance*

Savannah tree, to 25 ft. high; leaves coriaceous, dark green and glossy above; flowers white or pink in flattened corymbs; fruits deep red to blackish purple.

G. C.: Ejura (fr. Aug.) Chipp 724! Masera (Apr.) Thompson 69! Yegi (July) Pomeroy FH 1243! Bujan to Sekaii (Apr.) Kitson 561! Yendi (fl. & fr. Feb.) McLeod 814! **Togo:** Sokode (fl. Apr., fr. Oct.) Also in **French Cameroons**, **Ubangi-Shari** and **A.-E. Sudan**.

1a. **Parinari polyandra var. cinerea** Engl. Bot. Jahrb. 17: 87 (1893); Hauman l.c. 188.

APD: Synonym of Maranthes polyandra (Benth.) Prance

Parinari polyandra var. argentea Aubrév. l.c. 207 (1950).

Togo: Gleibusse 3565. **S. Nig.:** Lagos Foster 23! Ibode Bere Road (fr. May) Denton 8!

Also in **A.-E. Sudan**.

2. **Parinari glabra** Oliv. F.T.A. 2: 370 (1871); Hauman l.c. 186; Fl. Congo Beige 3: 54.

APD: Synonym of Maranthes glabra (Oliv.) Prance

Parinari vassonii A. Chev. Bot. 250, name only.

Parinari kerstingii of Aubrév. Fl. For. C. Iv. 1: 148, t. 51 and of F.W.T.A., ed. 1, 1: 317, partly.

A forest tree, up to 100 ft. high and 12 ft. girth; calyx green; petals white; fruit ovoid, somewhat flattened, about 1 1/2 in. long.

S. L.: Bobobu (June) Aylmer 577! Yoni, Bonthe Isl. (Mar.) Deighton 2482! **Lib.:** Gbanga (Sept.) Linder 538! Dukwia R. (May) Cooper 454! Harbel, Montserrado (July) Baldwin 6661! **IV. Sapoba Kennedy 2129! Awka Thomas 108!

Also in **French Cameroons**, **Ubangi-Shari**, **Spanish Guinea** and **Belgian Congo**.

[The specimens cited above, other than those from Nigeria, differ from the type by having the young branchlets covered with shortly puberulous and long-pilose hairs; they may represent a distinct variety.]

3. **Parinari kerstingii** Engl. Bot. Jahrb. 46: 140, t. 3 (1911); Hauman in Bull. Jard. Bot. Brux. 21: 186; Fl. Congo Beige 3: 56; F.W.T.A., ed. 1, 1: 317, partly (excl. syn.).

APD: Synonym of Maranthes kerstingii (Engl.) Prance

Tree to 60 ft. high, in **fringing forests in the savannah regions**; flowers white.

Togo: Sokode-Basari (fl. & fr. Jan., Feb.) Kersting A. 320! A. 547! Atakpame (Feb.) Doering 297. **N. Nig.:** Bauchi Plateau (Jan.) Lely 737! P. 119! Batten-Poole 106! **S. Nig.:** Nsukka (fl. & fr. Feb.) Cousens FHI 7456! Udi (Feb.) Chesters 193!

Also in **French Cameroons**, **Ubangi-Shari** and **Belgian Congo**.

4. **Parinari robusta** Oliv. F.T.A. 2: 370 (1871); Aubrév. Fl. For. C. Iv. 1: 150, t. 52, 1-5; Hauman in Bull. Jard. Bot. Brux. 21: 186 (N.B. — var. glabrifolia Hauman is var. robusta).

APD: Synonym of Maranthes robusta (Oliv.) Prance

Tree, to 40 ft. high, or more; **in coastal areas and swamp forest**.

IV. C.: Sassandra, Abidjan, Bingerville, etc., fide Aubrév. l.c. **G. C.:** Abbontiakoon (July) Brown 1! **S. Nig.:** Badagri (Nov.) A. F. Rose 171! Lagos (Feb.) Dalz. 1338! Nun R. (fl. & fr. Sept.) Mann 481! Okeluseh (Nov.) Farquhar 42! Onitsha Unwin 72! Abokam (Jan.) Holland 200!

5. **Parinari aubrevillei** Pellegr. in Bull. Soc. Bot. Fr. 78: 140 (1931); Aubrév. l.c. 1: 150, t. 53; Hauman l.c. 187.

APD: Synonym of Maranthes aubrevillei (Pellegr.) Prance

Parinari polyandra of F.W.T.A., ed. 1, 1: 317, partly.

Parinari robusta of F.W.T.A., ed. 1, 1: 317, partly.

A large forest tree.

S. L.: Kambui (Oct.) King 283! Aylmer 252! **IV. C.:** Azaguié (Sept.) Chev. 22355! Dakpadou (Oct.) Aubrév. 847!

6. *Parinari chrysophylla* Oliv. F.T.A. 2: 369 (1871); Aubrév. l.c. 152, t. 54 B; Hauman l.c. 187.

APD: Synonym of Maranthes chrysophylla (Oliv.) Prance subsp. chrysophylla

Forest tree, to 75 ft. high, with very characteristic rusty-brown indumentum on lower surface of leaves.

Lib.: Dukwia R. (Mar.–May) Cooper 297! 446! Sangwin (Mar.) Baldwin 11331! **IV. C.:** Tabou Aubrév. 1678! **G. C.:** Prestea Vigne FH 3081! **S. Nig.:** Oban Talbot! Afi River F.R. Jones FHI 14147! Keay!

Also in French Cameroons and Gabon.

7. *Parinari gabunensis* Engl. Bot. Jahrb. 27: 87 (1893); Hauman l.c. 187; Fl. Congo Beige 3: 58.

APD: Synonym of Maranthes gabunensis (Engl.) Prance

A glabrous forest tree, to 60 ft. high.

Br. Cam.: Kumba to Banga (Mar.) Brenan 9470!

Also in French Cameroons, Gabon and Mayumbe.

8. *Parinari macrophylla* Sabine — F.T.A. 2: 369; Aubrév. Fl. For. Soud.-Guin. 206, t. 39, 1–3; Hauman in Bull. Jard. Bot. Brux. 21: 189.

APD: Synonym of Neocarya macrophylla (Sabine) Prance

Shrub or tree to 30 ft. high, with stout densely tomentose branchlets, and gnarled bole; flowers crowded, white or pinkish; fruit rough-skinned edible; on sandy beaches and also inland in the driest savannah regions.

Sen.: Sieber 24! Döllinger 30! Panie-Foul Perrottet! St. Louis Roger! **Gam.:** Brown-Lester 219! Genieri Fox 82! **Port. G.:** Pussubé, Bissau (Mar.) Esp. Santo 1154! **Fr. G.:** Farmar 303! **S. ***Parinari* sp.**

Rain forest tree to 95 ft. high; near *P. congensis* F. Didr., but leaves larger and stipules foliaceous, up to 3 in. long; flowers and fruits not known.

Br. Cam.: S. Bakundu F.R. Ejiofor FHI 15253! Olorunfemi FHI 30502!

Imperfectly known species.

8. HIRTELLA

Linn. Sp. Pl. 1: 34 (1753); A. Chev. in Bull. Mus. Hist. Nat. Sér. 2, 3: 192–195 (1931).

- 1 Stipules large, ovate, 2–4 cm. long, 1.5–2 cm. broad; leaves oblong, obtuse at base, acuminate at apex, 15–20 cm. long, about 10 cm. broad, petiole 1–1.2 cm. long; panicles glabrous; receptacle 5–6 mm. long; staminodes united into a narrow tongue, denticulate at apex [1. conrauana](#)
- Stipules small, linear-oblong, up to 1 cm. long and 2 mm. broad; inflorescences rusty-pubescent: **2**
- 2 Leaves large, oblong-ovate, cordate at base, rounded and abruptly apiculate at apex, 18–40 cm. long, 8–18 cm. broad, subsessile or petiole up to 5 mm. long; inflorescence a panicle of long racemes, up to 40 cm. long; receptacle about 12 mm. long; staminodes united into a narrow tongue, denticulate at apex [2. fleuryana](#)
- Leaves smaller, up to 20 cm. long and 8 cm. broad; receptacle 3–5 mm. long; staminodes in the form of a comb: **3**
- 3 Leaves rounded or subcordate at base, broadly oblong-lanceolate, acute or rounded at apex, 10–20 cm. long, 4–8 cm. broad; inflorescence a terminal many-flowered ample panicle, up to 20 cm. long; receptacle about 3 mm. long [3. butavei](#)
- Leaves cuneate at base, narrowly obovate-elliptic, gradually acuminate, 8–18 cm. long, 3–5 cm. broad; flowers in axillary, lax, few-flowered racemes, up to 8 cm. long; receptacle about 5 mm. long [4. cupheiflora](#)

1. *Hirtella conrauana* (Engl.) A. Chev. in Bull. Mus. Hist. Nat. Sér. 2, 3: 194 (1931).

APD: *Synonym of Magnistipula conrauana* Engl.

Magnistipula conrauana Engl. Bot. Jahrb. 36: 226 (1905); Hauman in Bull. Jard. Bot. Brox. 21: 174.

A glabrous shrub.

Br. Cam.: Bangwe (Mar.) Conrau 65.

2. *Hirtella fleuryana* A. Chev. l.c. 192 (1931).

APD: *Synonym of Magnistipula zenkeri* Engl.

Parinari fleuryana (A. Chev.) Aubrév. Fl. For. C. Iv. 1: 153 (1936).

Magnistipula fleuryana (A. Chev.) Hauman l.c. 175 (1951).

Forest tree, to 45 ft. high; in swampy places; flowers white, fragrant; inhabited by ants.

Lib.: Zwedru, Tchien (Aug.) Baldwin 7017! Sarbo, Webo (July) Baldwin 12522! IV. C.: Gagnoa to Issia, Sassandra (fl. & fr, Oct.) Chev.

3. *Hirtella butayei* (De Wild.) Brenan in Trop. Woods 86: 4 (1946); Hauman in Fl. Congo Belge 3: 41, t. 2.

APD: *Synonym of Magnistipula butayei subsp. sargosii* (Pellegr.) F. White

APD: *Synonym of Magnistipula butayei* De Wild. subsp. *butayei*

Magnistipula butayei De Wild. (1908).

Parinari sargosii Pellegr. (1920) — Aubrév. Fl. For. C. Iv. 1: 152, t. 54 A.

P. tisserantii Aubrév. & Pellegr. (1950) — Aubrev. Fl. For. Soud.-Guin. 208, t. 39, 7–14.

Forest tree, to 100 ft. high.

IV. C.: Guiglo to Toulépleu Aubrév. 1231!

Also in Ubangi-Shari, Gabon and Belgian Congo.

4. *Hirtella cupheiflora* (Mildbr.) Mildbr. ex A. Chev. l.c. 195 (1931); Hauman in Bull. Jard. Bot. Bros. 21: 184.

APD: *Synonym of Magnistipula cupheiflora* Mildbr. subsp. *cupheiflora*

Magnistipula cupheiflora Mildbr. in Notizbl. Bot. Gart. Berl. 7: 57 (1921).

A medium-sized forest tree, with irregular bark and rough bole.

S. L.: Gola East F.R. (Oct.) D. G. Thomas 118! King 172!

Also in French Cameroons.

9. ACIOA

Aubl. Pl. Gui. 2: 698 (1775); De Wild. in Bull. Jard. Bot. Brux. 7: 188 (1920). APD acc

Griffonia Hook. f. (1865) — F.T.A. 2: 371.

- | | | |
|---|--|----|
| 1 | Calyx-tube glabrous or very shortly and thinly pubescent outside: | 2 |

| 2 | Bracteoles on the pedicels more or less ovate, entire, not or rarely slightly gland-toothed: | 3 |
| | Bracteoles on the pedicels deeply gland-toothed or palmatisect: | 6 |
| 3 | Inflorescence a simple raceme, rarely the racemes more than 1 in the leaf-axils; the bracts usually much larger than the bracteoles: | 4 |

- Inflorescence a panicle; the bracts scarcely larger than the bracteoles; leaves broadly elliptic, slightly cuneate at base, 12–16 cm. long, 5–8 cm. broad, glabrous; lateral nerves 7 pairs; stipules obliquely ovate, nervose; calyx-tube (receptacle) up to 1.5–2 cm. long, puberulous; staminal column 2–5 cm. long [4. mannii](#)
- 4 Calyx-tube (receptacle) distinctly puberulous outside, 1–5 cm. long; branchlets glabrescent; leaves elliptic, cuneate at base, 6–10 cm. long, 3.5–5 cm. broad, glabrous; lateral nerves 4–5 pairs; stipules subulate, entire; flowers numerous, small; staminal column 1.5–2 cm. long [1. barteri](#)
- Calyx-tube (receptacle) quite glabrous outside; leaves more or less scabrid above: **5**
- 5 Leaves cuneate at base; characters otherwise much as in *A. barteri* [2. scabrifolia](#)
- Leaves rounded at base, ovate-lanceolate or oblong-lanceolate, gradually acuminate, 6–15 cm. long, 2.5–6 cm. broad, more or less hispid on the nerves; lateral nerves 5–6 pairs; stipules ovate-lanceolate, toothed at base; axis of inflorescence up to 3 cm. long; flowers crowded; calyx-tube (receptacle) 1.5–2 cm. long; fruit broadly ovoid, 3 cm. long, tomentose [3. whytei](#)
- 6 Lateral nerves up to 8 pairs; leaves ovate or shortly elliptic: **7**
- Lateral nerves 10–16 pairs; leaves elongate-oblong, cordate at base, up to 30 cm. long and 10 cm. broad, glabrous or hirsute on nerves beneath; stipules ovate or ovate-lanceolate, foliaceous; branchlets with long spreading hairs; bracteoles deeply palmatisect with gland-tipped segments; calyx-tube (receptacle) 2.5–3.5 cm. long, glabrous; staminal column 4 cm. long; fruit ovoid, 6–7 cm. long, tomentose and bristly [9. klaineana](#)
- 7 Bracteoles divided to the base, gland-tipped; leaves ovate, rounded at the base, acutely acuminate, 6–11 cm. long, 4–5.5 cm. broad, long-pilose on the nerves beneath; lateral nerves 6 pairs; branchlets bristly hairy; stipules very small; axis of inflorescence 4 cm. long; bracteoles lacinate nearly to the base, gland-tipped; calyx-tube (receptacle) glabrous, 1.5 cm. long, falling away and leaving long peg-like persistent pedicels; staminal column 1.5 cm. long [5. unwinii](#)
- Bracteoles divided up to the middle: **8**
- 8 Calyx-tube (receptacle) glabrous outside; bracts not glandular; stipules entire: **9**
- Calyx-tube (receptacle) setose-pilose outside; bracts as well as the bracteoles with glandular teeth; stipules with glandular teeth; leaves ovate-elliptic to lanceolate, rounded to broadly cuneate at base, gradually acutely acuminate, 5.5–11.5 cm. long, 1.7–4 cm. broad; branchlets and undersurface of leaves setose-pilose; fruit ovoid, 2–3.5 cm. long, 2–3 cm. broad, densely tomentellous and with longer hairs. [8. johnstonei](#)
- 9 Leaves rounded or subcuneate at base, more or less elliptic, shortly acuminate, 7–13 cm. long, 4–6 cm. broad, pubescent on the nerves; lateral nerves about 7 pairs; bracteoles ovate, with short glandular teeth; stipules linear-subulate; branchlets with short hairs; calyx-tube glabrous, 2.5 cm. long; staminal column 2 cm. long [6. rudatisii](#)
- Leaves subcordate at base, oblong, abruptly acuminate, 6–10 cm. long, 3–4 cm. broad, the midrib with long spreading hairs; bracteoles with long gland-tipped teeth; branchlets spreadingly pilose; calyx-tube glabrous, 2 cm. long; staminal column 3 cm. long [7. hirsuta](#)
- 10 Leaves cordate at base: **11**
- Leaves rounded or slightly cuneate at base; hairs on the calyx-tube fairly long: **12**
- 11 Midrib rather densely pubescent beneath; hairs on the calyx-tube very short; bracts and bracteoles conspicuous; leaf-blades oblong-elliptic, abruptly acuminate, 10–15 cm. long, 5–7 cm. broad; lateral nerves about 7 pairs; stipules subulate; calyx-tube 2–2.5 cm. long; staminal column about 3.5 cm. long; fruits ellipsoid, about 4 cm. long, tomentose with short hairs and also sparsely pilose with long hairs [10. pallescens](#)
- Midrib glabrous beneath; leaves broadly oblong-elliptic, shortly acuminate, about 15 cm. long, 8–9 cm. broad, with about 7 pairs of lateral nerves; inflorescence paniculate; calyx-tube 1 cm. long; staminal column 2.5 cm. long, shortly pubescent [11. eketensis](#)
- 12 Inflorescence racemose: **13**
- Inflorescence dichotomously cymose; leaves broadly elliptic, rounded at base, shortly acuminate, up to 15 cm. long and 9 cm. broad, glabrous, with about 8 pairs of lateral nerves; branchlets lenticellate; calyx 1.5 cm. long, softly pubescent; staminal column 2 cm. long [14. dichotoma](#)
- 13 Inflorescence lax-flowered, the axis about 10 cm. long; bracts ovate-lanceolate, 5–6 mm. long, glabrous inside; bracteoles ovate-lanceolate, conspicuous; leaf-blades oblong-elliptic, 8–15 cm. long, 5–6.5 cm. broad; midrib glabrescent; lateral nerves 8 pairs; stigmas ovate, long-acuminate; calyx-tube 3 cm. long; staminal column 3 cm. long [12. dinklagei](#)
- Inflorescence rather close-flowered, the axis 3–4 cm. long; bracts subulate; about 2 mm. long, hairy all over; bracteoles minute; leaf-blades elliptic, acutely acuminate, 9–14 cm. long, 4–7 cm. broad; midrib tomentose beneath; lateral nerves about 10 pairs; stipules lanceolate, short; calyx-tube 2 cm. long; staminal column 3 cm. long [13. talbotii](#)

1. *Acioa barteri* (*Hook. f. ex Oliv.*) *Engl. Bot. Jahrb.* 28: 382 (1899); *De Wild. in Bull. Jard. Bot. Brux.* 7: 210. *Griffonia. barteri* *Hook. f. ex Oliv. F.T.A.* 2: 373 (1871).

APD: Synonym of Dactyladenia barteri (Hook. f. ex Oliv.) Prance & F. White

Acioa tenuiflora Dinkl. & Engl. (1899).

Acioa eketensis of F.W.T.A., ed. 1, 1: 320, partly (Kitson s.n.).

A shrub or small tree, with slender branches more or less climbing; leaves dark glossy green, reddish-brown when dry; flowers greenish-white, fragrant; fruit 1 1/2 in. long, green, turgid, tubercled, more or less pear-shaped and pointed; **sometimes planted**.

11. **Acioa eketensis** *De Wild.* l.c. 214 (1920).

APD: Synonym of Dactyladenia eketensis (De Wild.) Prance & F. White

Branchlets glabrous.

S. Nig.: Eket Talbot 3239!

12. **Acioa dinklagei** *Engl.* Bot. Jahrb. 26: 381 (1899); De Wild. l.c. 211.

APD: Synonym of Dactyladenia dinklagei (Engl.) Prance & F. White

A tall shrub or tree, with drooping tomentose branchlets and hoary racemes of white flowers.

Lib.: Grand Bassa (Sept.) Dinklage 2023! Tchien Dist. (Aug.) Baldwin 6980! 7078! **G. C.:** Sa, Bonsa R., Tarkwa (Aug.–Sept.) Vigne FH 156! 973!

13. **Acioa talbotii** *Bak. f.* in Cat. Talb. 29 (1913); De Wild. l.c. 206.

APD: Synonym of Dactyladenia staudtii (Engl.) Prance & F. White

A small tree, about 20 ft. high, with pale tomentose branchlets and brownish-velvety inflorescence.

S. Nig.: Oban Talbot 1533!

14. **Acioa dichotoma** *De Wild.* l.c. 216 (1920).

APD: Synonym of Dactyladenia dichotoma (De Wild.) Prance & F. White

Branchlets tomentose.

S. Nig.: Eket, along the rivers Talbot 3048!

Acioa parvifolia *Engl.* Bot. Jahrb. 26: 380 (1899); De Wild. l.c. 198.

S. L.: Afzelius.

[I have been unable to study the type of this species, but from the description it does not seem to be the same as *A. unwinii* De Wild. as stated in F.W.T.A., ed. 1. — R.W.J.K.]

Imperfectly known species.

CHAILLETIACEAE

Small trees or shrubs, sometimes climbing. Leaves alternate, simple; stipules present. Flowers small, mostly hermaphrodite, actinomorphic or slightly zygomorphic. Sepals 5, free or partially connate, imbricate. Petals mostly 2-lobed or 2-partite, free or united with the stamens into a tube. Stamens 5, alternate with the petals, free or united; anthers 2-celled, opening lengthwise, the connective often dorsally thickened. Hypogynous glands opposite to the petals, free or connate. Ovary superior to quite inferior, 2–3-celled; style mostly simple, 2–3-fid at the apex; ovules 2 in each cell, pendulous. Fruit a drupe, dry or rarely fleshy, sometimes the epicarp splitting. Seeds without endosperm; embryo large, straight.

A small tropical family.

With the aspect of some Rosaceae; recognized by the usually bilobed petals; peduncles sometimes adnate to the petiole.

- 1 Petals equal, free, or rarely united; fertile stamens 5; peduncle free, or sometimes adnate to the petiole [1. Dichapetalum](#)

Petals unequal, 1 or 2 of them larger than the others, united into a tube; fertile stamens 2 or 3; peduncle always adnate to the petiole [2. Tapura](#)

1. DICHAPETALUM

Thouars Nov. Gen. Madag. 23 (1806).

Chailletia *DC.* (1811) — F.T.A. 1: 339.

Icacinopsis *Roberty* (1953).

Sepals sparingly puberulous; petals about as long as the sepals; cymes short; branchlets and leaves glabrous or nearly so; leaves more or less oblong-elliptic, acute to rounded at base, gradually long-acuminate, 9–15 cm. long, 3–5–6 cm. broad, lateral nerves 5–6 pairs, prominently looped well within the margin [27. nitidulum](#)

Sepals densely white-tomentellous:

Branchlets puberulous; lower inflorescences often borne on short axillary lateral shoots with small leaves, hence appearing free from the petioles; leaves oblong or elliptic, cuneate at base, obtusely acuminate, 10–15 cm. long, 4–6 cm. broad, glabrous; axils of main lateral nerves beneath often with small glands and tufts of hair; fruits ellipsoid, 3–4 cm. long, hoary, not beaked and not ridged [29. toxicarium](#)

- Branchlets densely rusty-tomentose; flowers all subfasciculate at the apex of the petiole of well-developed leaves; leaves oblong-elliptic, obtuse to cuneate at base, obliquely acuminate, 9–15 cm. long, 4–8 cm. broad, glabrous; fruits ellipsoid, about 3 cm. long, tomentellous, long-beaked, longitudinally ridged [30. rudatisii](#)
- Branchlets rusty-pilose; leaves rounded to subcordate at base, oblong-lanceolate, gradually long-acuminate, 7–14 cm. long, 3–7 cm. broad; cymes rather few-flowered; petals bilobed; fruits ellipsoid rusty pilose [31. longitubulosum](#)
- Branchlets finely puberulous; leaves cuneate at base, narrowly elliptic, long-caudate-acuminate, 5.5–12 cm. long, 1.7–4 cm. broad; cymes many-flowered; petals entire [32. sp. A.](#)
- 1** Petals free: **2**
- Petals united into a tube with the stamens; cymes subsessile:
- 2** Stipules pinnatisect, about 1 cm. long; branchlets densely tomentose; sepals reflexed; petals deeply lobed; inflorescences lax, well-branched: **3**
- Stipules entire: **4**
- 3** Peduncle never adnate to the petiole; inflorescence a large terminal paniculate cyme about 15 cm. long; leaves with a close-felted indumentum beneath, elliptic-obovate, cordate at base, shortly acuminate, 10–15 cm. long, 5–8 cm. broad [1. petersianum](#)
- Peduncle adnate to the petiole; inflorescence a lax, divaricate paniculate cyme; leaves densely pubescent beneath, but with the surface visible between the hairs; oblong-elliptic, rounded or subcordate at base, gradually acuminate, 9–17 cm. long, 4–9 cm. broad [2. angolense](#)
- Cymes lax, with the free portion of the peduncle at least 4 mm. long, lower peduncles free from the petioles; flowers apparently very small (but not known at maturity); branchlets nearly glabrous; leaves oblong-elliptic or obovate-oblong, shortly cuneate, abruptly and shortly acuminate, 4–8 cm. long, 2–4 cm. broad, glabrous and shining [28. chrysobalanoides](#)
- Cymes short and dense, peduncle less than 4 mm. long; flowers at least 4 mm. long:
- 4** Leaves with a close-felted whitish indumentum beneath, the hairs entirely covering the lower surface: **5**
- Leaves glabrous, or laxly pilose or pubescent beneath: **6**
- 5** Midrib and lateral nerves beneath covered with long spreading hairs quite different from the whitish wool of the surface; leaves elliptic or oblong, unequally rounded at base, shortly acuminate, 5–12 cm. long, 3–5 cm. broad; cymes short, crowded, pedunculate [3. argenteum](#)
- Midrib and lateral nerves beneath covered with the same close-felted whitish indumentum as the lower surface; leaves oblong-elliptic to oblong-oblongeolate or obovate, obtuse at base, acutely acuminate, 6–17 cm. long, 3–7 cm. broad, lateral nerves 6–9 pairs, prominent beneath; cymes crowded, with a peduncle 0.5–3 cm. long [4. pallidum](#)
- 6** Peduncle never adnate to the petiole: **7**
- Peduncle (or at least the upper ones) actuate to the petiole:
- 7** Petals entire (or shortly bifid), about as long as the 6–7 mm. long erect sepals; leaves elliptic or slightly obovate-oblong, rounded to cuneate at base, bluntly acuminate, 7–12 cm. long, 4–7 cm. broad, glabrous, coriaceous; branchlets rusty-tomentellous; cymes lax, pedunculate, sometimes borne on leafless shoots [5. barkeri](#)
- Petals more or less deeply bilobed, usually longer than the sepals (but see No. 12); sepals erect or reflexed, usually less than 5 mm. long: **8**
- 8** Inflorescences pedunculate and more or less laxly cymose: **9**
- Inflorescences sessile, or densely subcapitate and pedunculate: **14**
- 9** Leaves cordate to subcordate at base; branchlets glabrous or nearly so; leaves very broadly elliptic, obtuse to acute at apex, 7–15 cm. long, 5–10 cm. broad, slightly pubescent on the nerves beneath; cymes few-flowered, about 1.5 cm. long, bracteate [6. subcordatum](#)
- Leaves not cordate at base: **10**
- 10** Sepals reflexed; cymes very slender; branchlets and leaves glabrous or nearly so; leaves shining, with about 6 pairs of lateral nerves prominently looped beneath: **11**
- Sepals not reflexed: **12**
- 11** Petals about 2 mm. long; pedicels very short; leaves oblong-elliptic, subacute at base, acutely acuminate, 7–12 cm. long, 3–5 cm. broad; cymes many-flowered [7. zenkeri](#)
- Petals 3–4 mm. long; pedicels about 5 mm. long; leaves oblong-oblongeolate or obovate-oblong, acutely acuminate, 6–12 cm. long, 2–5 cm. broad; cymes rather few-flowered [8. cymulosum](#)
- 12** Pedicels scarcely 1 mm. long; sepals broadly oblong; petals about 3 mm. long, shortly bilobed; cymes relatively short and densely flowered; sometimes subcapitate, more usually branched and often borne on leafless shoots thus appearing paniculate; leaves obovate-elliptic to oblongeolate, obtuse to rounded or sometimes cuneate at base, shortly obtusely acuminate, 8–16 cm. long, 3–7 cm. broad, pubescent beneath (rarely nearly glabrous); stigma deeply 3-lobed; fruit ellipsoid, 1–1.5 cm. long [9. guineense](#)
- Pedicels 2–3 mm. long; sepals narrowly oblong; petals about 4 mm. long, deeply bilobed and much narrowed

- below; cymes lax, well-branched and usually at least 3 cm. long; stigma shortly or deeply 3-lobed:..... **13**
- 13** Cymes few-flowered, slender; leaves oblong-elliptic, 6–14 cm. long, 2.5–6 cm. broad, with 5–6 lateral nerves prominent beneath and conspicuously looped well within the margin, usually drying green [10. oblongum](#)
- Cymes many-flowered, large and lax; leaves broadly elliptic or obovate, 10–22 cm. long, 5–11 cm. broad, with 6–7 lateral nerves more or less prominent beneath and looped near the margin, usually drying brownish [11. floribundum](#)
- 14** Inflorescences subcapitate and pedunculate: **15**
- Inflorescences sessile, or very nearly so: **19**
- 15** Petals equal to or shorter than the sepals; pedicels longer than the flowers; peduncle stout, up to 2 cm. long and 2 mm. broad; branchlets, inflorescences, flowers and petioles densely tomentose; leaves broadly oblong-elliptic to oblong-obovate, acute to cordate at base, acuminate, 8–18 cm. long, 5–10 cm. broad, strongly and rather closely reticulate beneath; stigma very shortly 3-fid [12. reticulatum](#)
- Petals longer than the sepals; pedicels shorter than the flowers; stigma 3-lobed:..... **16**
- 16** Leaves cordate at base: **17**
- Leaves not cordate at base: **18**
- 17** Leaves spreadingly pilose on the nerves of both surfaces even when mature, obovate-elliptic, 6–10 cm. long, 4–5 cm. broad; peduncle 0.5–2 cm. long; cymes rather few-flowered; stamens and style much longer than the petals [13. umbellatum](#)
- Leaves almost glabrous on both surfaces when mature, rather strongly reticulate beneath; cymes many-flowered, usually sessile, but sometimes with a peduncle up to 1 cm. long; stamens and style about as long as the petals; for other characters see below [17. johnstonii](#)
- 18** Stamens and style much longer than the petals; peduncles always branched, but sometimes appearing subcapitate; for other characters see above [9. guineense](#)
- Stamens and style about as long as the petals; peduncles 2–5 cm. long, usually unbranched; leaves obovate-elliptic, rounded to obtuse at base; acutely acuminate, 8–13 cm. long, 3.5–5.5 cm. broad [14. tomentosum](#)
- 19** Leaves cordate and often glandular at the base: **20**
- Leaves not cordate at base: **24**
- 20** Flowers sessile or subsessile; petals only a little longer than the sepals; for other characters see below [22. heudelotii](#)
- Flowers distinctly pedicellate: **21**
- 21** Young stems, midrib and main lateral nerves beneath very long spreading-pilose; petals only a little longer than the sepals; leaves oblong, unequally cordate at base, obtuse or shortly acuminate at apex, 8–20 cm. long, 3.5–7.5 cm. broad, with 6–10 pairs of looped main lateral nerves; fruits densely velutinous, up to 3 cm. diam. and 2 cm. long [15. martinequi](#)
- Young stems, midrib and main lateral nerves beneath not long spreading-pilose; petals considerably longer than the sepals: **22**
- 22** Leaves oblong-obovate, long-acuminate, 8–15 cm. long, 3.5–6 cm. broad, main lateral nerves 4–5 pairs, setulose on the nerves beneath [16. linderi](#)
- Leaves oblong-elliptic, shortly acuminate or obtuse, 5–15 cm. long, 2.5–6 cm. broad, main lateral nerves about 7 pairs, almost glabrous beneath when mature; for other characters see above [17. johnstonii](#) **23**
- [@](#)
- 23** Leaves obovate-elliptic, long-acuminate, 10–25 cm. long, 5–10 cm. broad, main lateral nerves 6–10 pairs, almost glabrous beneath [18. subauriculatum](#)
- Flowers pedicellate: **26**
- 24** Sepals reflexed; petals only shortly bilobed; branchlets and leaves sparsely puberulous; leaves oblong-elliptic, cuneate at base, shortly acuminate, 6–10 cm. long, 2.5–4 cm. broad, main lateral nerves 4–5 pairs; flowers pedicellate in sessile clusters [19. staudtii](#)
- Sepals not reflexed; petals deeply bilobed; branchlets mostly hispid or tomentose, or if sparsely pubescent or glabrous then leaves much larger than above: **25**
- 25** Branchlets very hispid with spreading, rather long hairs, or densely tomentose:
- Branchlets glabrous or shortly appressed-pubescent; leaves glabrous or very nearly so:
- 26** Branchlets softly tomentose; leaves more or less elliptic, shortly acuminate, 5–14 cm. long, 2.5–5.5 cm. broad, sparingly puberulous on the 5–6 pairs of lateral nerves beneath [20. kumasiense](#)
- Branchlets and undersurface of leaves hispid with long spreading hairs; leaves oblong-elliptic, acutely acuminate, 6–8 cm. long, 2–3 cm. broad; lateral nerves about 6 pairs conspicuously looped and prominent beneath **21**.
- acutisepalum **27**
- [@](#)

- 27** Flowers sessile; **28**
 Leaves elongate-oblong, very shortly cuneate, acuminate at apex, 18 cm. long, 6–7 cm. broad; lateral nerves 6–7 pairs; flowers few, crowded, distinctly pedicellate; petals bilobed to the middle **25. thomsonii** **30**
 **@**
- 28** Leaves rounded at base: **29**
 Leaves cuneate and unequal-sided at base, oblong, gradually acuminate, 11–15 cm. long, 4–5 cm. broad, loosely pubescent beneath; lateral nerves about 8 pairs **24. ferrugineum**
- 29** Lateral nerves 5–6 pairs; leaves oblong, rather narrow and subauriculate at base, acuminate and mucronate at apex, 7–14 cm. long, 2.5–4.5 cm. broad, glabrous beneath except on the nerves; branchlets loosely tomentose **22. heudelotii**
 Lateral nerves about 10 pairs; leaves as above; branchlets very densely tomentose **23. scabrum**
- 30** Leaves elliptic, rounded at base, obtusely acuminate, 12–15 cm. long, 6–7.5 cm. broad, leathery; lateral nerves 5–6 pairs; flowers numerous, clustered, with rather slender pedicels; petals bilobed 1/3 their length **26. obanense**

1. *Dichapetalum petersianum* Dinkl. & Engl. in Engl. Bot. Jahrb. 46: 572 (1912).

*APD: Synonym of *Dichapetalum angolense* Chodat*

An erect shrub with more or less pendulous branchlets, softly tomentose.

Lib.: Grand Bassa (Aug.) Dinklage 1970! Monrovia (July) Dinklage 2231. Sarbo, Webbo (young fr. July) Baldwin 6392!

2. *Dichapetalum angolense* Chodat in Bull. Herb. Boiss. 3: 672 (1895). *APD acc*

Dichapetalum ferrugineo-tomentosum Engl. (1896); Chev. Bot. 120.

Shrub, up to 12 ft.

IV. C.: Dabou Chev. 15560 bis! **S. Nig.:** Oban (May) Ujor FHI 31795! **Br. Cam.:** Buea (fr. Apr.) Dunlap 157! Maitland 1173!

Also in **French Cameroons**, **Gabon** and **Angola**.

3. *Dichapetalum argenteum* Engl. Bot. Jahrb. 33: 82 (1902).

*APD: Synonym of *Dichapetalum bangii* (Didr.) Engl.*

Chailletia rufipilis of F.T.A. 1: 342, partly, not of Turcz.

A climbing shrub, up to 15–20 ft. long; calyx green; petals white.

Br. Cam.: Cameroons R. (Jan.) Mann 747!

Also in **French Cameroons**, **Gabon** and **Cabinda**.

4. *Dichapetalum pallidum* (Oliv.) Engl. in E. & P. Pflanzenfam. 3, 4: 249 (1896); Chev. Bot. 121. *APD acc*

Chailletia pallida Oliv. F.T.A. 1: 343 (1868).

Dichapetalum liberiae Engl. & Dinkl. in Engl. Bot. Jahrb. 33: 84 (1902); Chev. Bot. 120; F.W.T.A., ed. 1, 1: 324.

Dichapetalum warneckeii Engl. l.c. 83.

Dichapetalum cinereum Engl. l.c. 85; Chev. Bot. 119.

Dichapetalum whytei Stapf in Johnston Lib. 2: 586 (1906).

Dichapetalum bussei Engl. Bot. Jahrb. 46: 574, fig. 1 (1912).

Dichapetalum albidum A. Chev. Bot. 119, name only.

A shrub, erect or scandent; branchlets pale yellowish tomentose.

Fr. G.: R. Konkouré, Kouria (July) Chev. 15086! Konanké country (Feb.) Chev. 20826. Kindia (Mar.) Chev. 13368. **S. L.:** Mabum (fr. Aug.) Thomas 1604! Mayoso (Aug.) Thomas 1431! Mabonto (young fr. Also in **French Cameroons** and **Gabon**.

The following specimens seem to represent a distinct variety with tuberculate fruits: S. L.: Gbesebu, Njala (fr. Sept.) Deighton 3792! Gola Forest (fr. Apr.) Deighton 3639! Taiama (fr. Oct.) Deighton 4504! Lib.: Peahtah (fr. Oct.) Linder 897! Mecca, Boporo (fr. Nov.) Baldwin 10420! Kolahun Dist. (fr. Nov.) Baldwin 10163! 10206! G. C.: Kumasi (July) Vigne 3290!

5. *Dichapetalum barteri* Engl. Bot. Jahrb. 23: 134 (1896). *APD acc*

Icacinopsis annonoides Roberty in Bull. I.F.A.N. 15: 1420, fig. 6 (1953).

A tree, to 35 ft. high, with dense bushy crown; flowers cream; fruit apparently tuberculate.

G. C.: Cape Coast Castle (Nov.) Roberty 12829! Komenda (fr. Jan.) Andoh FH 5597! **S. Nig.:** Onitsha Barter 1781! Orlu (Dec.) Jones FHI 6202! Agulu (Nov.) Keay FHI 25593! Udi (Nov.–Feb.) Jones FHI 7431! Keay FHI 22280!

Also in **French Cameroons**.

6. *Dichapetalum subcordatum* (Hook. f.) Engl. in E. & P. Pflanzenfam. 3, 4: 349 (1896).

APD: *Synonym of Dichapetalum madagascariense Poir. var. madagascariense*

Chailletia subcordata Hook. f. — F.T.A. 1: 341.

A shrub about 15 ft. high, with puberulous branchlets and fairly large leaves.

F. Po: (June, Nov.) T. Vogel 207! Mann 432!

7. *Dichapetalum zenkeri* Engl. Bot. Jahrb. 23: 138 (1896). *APD acc*

A climbing shrub; branchlets yellowish-tomentellous becoming glabrous; flowers small, white, fragrant.

S. Nig.: Oban Talbot 1360! 1631!

Also in **French Cameroons**, **Gabon** and **Belgian Congo**.

8. *Dichapetalum cymulosum* (Oliv.) Engl. in E. & P. Pflanzenfam. 3, 4: 349 (1896); Chev. Bot. 120. *APD acc*

Chailletia cymulosa Oliv. F.T.A. 1: 340 (1868).

A shrub, sometimes climbing; branchlets pubescent, becoming glabrous; fruit plum-like, 1–1½ in. long, glabrous.

IV. C.: Dabou (Feb.) Chev. 17165! **Br. Cam.:** Cameroons R. (Jan.) Mann 2200!

Also in **French Cameroons** and **Gabon**.

9. *Dichapetalum guineense* (DC.) Keay in Kew Bull. 1955: 137 (q.v. for full synonymy).

APD: *Synonym of Dichapetalum madagascariense Poir. var. madagascariense*

Ceanothus? guineensis DC. (1825).

Rhamnus paniculatus Thonn. (1827).

Chailletia flexuosa Oliv. F.T.A. 1: 340 (1869).

C. floribunda var. *β.* Oliv. F.T.A. 1: 341.

Dichapetalum flexuosum (Oliv.) Engl. (1896) — F.W.T.A., ed. 1, 1: 324; Aubrév. Fl. For. C. Iv. 2: 4, t. 125, A.

Dichapetalum paniculatum (Thonn.) De Wild. (1919).

Dichapetalum rowlandii Hutch. & Dalz. F.W.T.A., ed. 1, 1: 324 (1928).

Dichapetalum bocageanum of Chev. Bot. 119.

A shrub or small tree; flowers cream, fragrant; fruits bright orange, tomentose.

S. L.: Kafogo (Apr.) Sc. Elliot 5601b! Rowala (July) Thomas 1017! **IV. C.:** Aubrév. 1129! Dyolas (fr. May) Chev. 21549!

Scandent shrub with densely tomentose branchlets and inflorescences and rather large leaves.

S. Nig.: Ibadan South F.R. (Mar.) Chizea FHI 24485! Akure Foster 192! Udo, Ubijaja (young fr. May) Umana FHI 29104!

Also in **French Cameroons**.

13. *Dichapetalum umbellatum* Chodat in Bull. *APD acc*

Herb. Boiss. 3: 671 (1895).

A woody climber with short branchlets spreading at right angles; flowers creamy-white.

S. Nig.: Ajilite Millen 167! Okomu F.R. (Feb.) Brenan 9140! Akpabla 1087!

Also in **Angola**.

14. *Dichapetalum tomentosum* Engl. Bot. Jahrb. 23: 138 (1896). *APD acc**Dichapetalum acutifolium* Engl. l.c. 136 (1896); F.W.T.A., ed. 1, 1: 325.

Scandent shrub or woody climber, rusty-pilose; calyx pale green; petals cream, turning yellow; fruit obliquely ovoid, about 1 in. long, rusty-tomentose.

S. Nig.: Abontakon, Ikom (Dec.) Keay FHI 28172! **Br. Cam.:** Victoria (Apr., May) Preuss 1103! Maitland 663! Barombi (Apr.) Preuss 55!

Also in **Gabon**.

15. *Dichapetalum martineau* Aubrév. & Pellegr. in Aubrév. Fl. For. C. Iv. 2: 4, t. 124, 7-10 (1936), French descr. only.*APD: Synonym of *Dichapetalum heudelotii* var. *ndongense* (Engl.) Breteler*

A small tree in the understorey of rain forest; fruits orange.

IV. C.: Banco (fl. June, fr. Aug.) Martineau 290! Serv. For. 483!

16. **Dichapetalum linderi** Hutch. & Dalz. F.W.T.A., ed. 1, 1: 324 (1928); Kew Bull. 1928: 380.

APD: Synonym of Dichapetalum heudelotii (Planch. ex Oliv.) Baill. var. heudelotii

Low bush; flowers yellowish.

Lib.: Suen (Nov.) Linder 1407!

17. **Dichapetalum johnstonii** Engl. l.c. 23: 14! (1896).

APD: Synonym of Dichapetalum heudelotii (Planch. ex Oliv.) Baill. var. heudelotii

A shrub, sometimes climbing; young branchlets densely rusty-tomentose, becoming glabrous; inflorescence close-clustered.

G. C.: Axim (Feb.) Irvine 2260! **S. Nig.:** Ebute Metta (Nov.) Millen 22! Cross R. (Apr.) Johnston! Oban Talbot 1763! Eket Talbot!

18. **Dichapetalum subauriculatum** (Oliv.) Engl. in E. & P. Pflanzenfam. 3, 4: 349 (1896).

APD: Synonym of Dichapetalum heudelotii (Planch. ex Oliv.) Baill. var. heudelotii

Chaillertia subauriculatum Oliv. F.T.A. 1: 344 (1868).

A shrub 6–8 ft. high; branchlets slightly puberulous, becoming soon glabrous.

S. Nig.: Calabar (Feb.) Mann 2260! **Br. Cam.:** Bimbia (Feb.) Maitland 394! Buea (Mar.) Maitland 573!

19. **Dichapetalum staudtii** Engl. Bot. Jahrb. 23: 139 (1896). *APD acc*

Scrambling shrub; petals greenish-cream.

S. Nig.: Omo F.R. (Mar.) Jones & Onochie FHI 17037!

Also in **French Cameroons**.

20. **Dichapetalum kumasiense** Hoyle in Kew Bull. 1932: 260. Straggling shrub.

APD: Synonym of Dichapetalum heudelotii (Planch. ex Oliv.) Baill. var. heudelotii

G. C.: Kumasi (Mar.) Vigne 1635! **Togo:** Okrabi, Hohoe Dist. (Nov.) St. C. Thompson FH 3700! **S. Nig.:** Shasha F.R. (young fr. Apr.) Tamajong FHI 16848!

21. **Dichapetalum acutisepalum** Engl. l.c. 23: 140 (1896).

APD: Synonym of Dichapetalum heudelotii (Planch. ex Oliv.) Baill. var. heudelotii

A rusty hairy shrub.

S. L.: near Kurusu (Apr.) Sc. Elliot 5526!

22. **Dichapetalum heudelotii** (Planch. ex Oliv.) Baill. Hist. des Pl. 5: 140 (1874); Chev. Bot. 120. *APD acc*

Chaillertia heudelotii Planch. ex Oliv. F.T.A. 1: 344 (1868).

A shrub, branchlets and young leaves rusty-hairy.

Fr. G.: Heudelot 770! Fouta Djallon (Mar.) Chev. 12599. **S. L.:** Bagroo R. (Apr.) Mann 800! Njala (Mar.–May) Deighton 1580! 2999! Dodo (Apr.) Deighton 3918! Gima, Valunia (Apr.) Deighton 5859!

23. **Dichapetalum scabrum** Engl. Bot. Jahrb. 33: 86 (1902).

APD: Synonym of Dichapetalum heudelotii var. longitubulosum (Engl.) Breteler

A climbing shrub; branchlets yellow-tomentose.

Br. Cam.: Johann-Albrechtshöhe (Jan.) Staudt 542.

24. *Dichapetalum ferrugineum* Engl. Bot. Jahrb. 23: 139 (1896).

*APD: Synonym of *Dichapetalum heudelotii* (Planch. ex Oliv.) Baill. var. heudelotii*

A shrub with densely rusty-tomentose branchlets.

Br. Cam.: Victoria (May) Preuss 1275!

25. *Dichapetalum thomsonii* (Oliv.) Engl. in E. & P. Pflanzenfam. 3, 4: 349 (1896).

*APD: Synonym of *Dichapetalum madagascariense* Poir. var. madagascariense*

Chailletia thomsonii Oliv. F.T.A. 1: 342 (1868).

A small tree.

S. Nig.: Calabar Thomson 79!

26. *Dichapetalum obanense* (Bak. f.) Hutch. & Dalz. F.W.T.A., ed. 1, 1: 324 (1928). *APD acc*

Dichapetalum thomsonii var. *obanense* Bak. f. in Cat. Talb. 19 (1913).

A shrub or small tree; petals orange.

S. Nig.: Oban Talbot 1627!

27. *Dichapetalum nitidulum* Engl. & Ruhl. in Engl. Bot. Jahrb. 33: 77 (1902).

*APD: Synonym of *Dichapetalum gabonense* Engl.*

Small tree.

S. Nig.: Oban Talbot **Br. Cam.:** Missellele, Tiko (Jan.) Box 3552!

Also in **French Cameroons**.

28. *Dichapetalum chrysobalanoides* Hutch. & Dalz. F.W.T.A., ed 1, 1: 325 (1928); Kew Bull. 1928: 380.

30. *Dichapetalum rudatisii* Engl. Bot. Jahrb. 46: 582 (1912). *APD acc*

A shrub, erect or climbing.

S. Nig.: Degema Talbot! Oban Talbot 19! 482! **Br. Cam.:** Abonando, Mamfe (Mar.) Rudatis 16!

Also in **French Cameroons**.

31. *Dichapetalum longitubulosum* Engl. Bot. Jahrb. 33: 90 (1902).

*APD: Synonym of *Dichapetalum heudelotii* var. *longitubulosum* (Engl.) Breteler*

Scandent shrub, to 12 ft. high; branchlets rusty-hirsute; calyx pale green; petals cream, becoming yellow at tips; fruit bright orange with white hairs.

S. Nig.: Bendiga Ayuk, Ikom (fl. & fr. Dec.) Keay FHI 28165!

Also in **French Cameroons**.

32. *Dichapetalum* sp. A. *APD acc*

Near to *D. integripetalum* Engl., but probably new. Understorey tree, to 15 ft. high. Better specimens required.

S. Nig.: Okwango F.R., Obudu (May) Latilo FHI 30960!

1. *Dichapetalum affinis* Planch. ex Benth. in Fl. Nigrit. 276 (1849). *APD acc*

Included in *D. toxicarium* (G. Don) Baill. by Oliver (F.T.A. 1: 341), but probably distinct. Perfect flowers and mature fruits not known.

F. Po: T. Vogel 149!

Imperfectly known species.

2. *Dichapetalum* sp. B. *APD acc*

Liane; flowers white. Near *D. umbellatum* Chodat.

S. Nig.: Shasha F.R. (May) Richards 3461! Ross 91!

Imperfectly known species.

3. *Dichapetalum* sp. C. *APD acc*

“Straggling climbing shrub in forest.”

G. C.: Abosso (Aug.) Vigne FH 3033!

Imperfectly known species.

4. *Dichapetalum* sp. D. *APD acc*

Shrub 10 ft. high; flowers white. Probably near *D. heudelotii*.

Port. G.: Catió (June, July) Esp. Santo 2092! 2101!

Note. A number of specimens of this difficult genus have come to hand since the above key was sent to the printer and it is evident that there is still a lot more work to be done before the genus is satisfactorily understood in our area.

2. TAPURA

Aubl. — F.T.A. 1: 344.

Leaves 2.5–10 cm. long, 1.2–4 cm. broad, main lateral nerves 4–6 on each side of the midrib, lamina elliptic to elliptic-lanceolate, shortly cuneate at base, gradually sub-acuminate, pubescent to glabrescent beneath; flowers on pedicels about 2 mm. long; peduncle more or less free from the petiole in its upper part; corolla with 1 or 2 larger bilobed petals, and 3 or 2 smaller bilobed petals, and a single lanceolate or bifid petal; fertile stamens 2; fruit 3-lobed, about 4 mm. long [*2. fischeri*](#)

Leaves 10–22 cm. long, 4–11 cm. broad, main lateral nerves 3–4 on each side of the midrib, lamina obovate-elliptic, shortly cuneate at base, abruptly acuminate, puberulous only on the nerves beneath, laxly reticulate; flowers shortly pedicellate, clustered; peduncle completely adnate to the petiole; corolla with 2 large bilobed petals and 3 small lanceolate petals; fertile stamens 3; fruit ellipsoid, about 3 cm. long [*1. africana*](#)

1. *Tapura africana* Oliv. F.T.A. 1: 344 (1868). *APD acc*

A forest tree, to 80 ft. high; flowers yellow.

S. Nig.: Aboabam, Ikom (fl. & fr. May) Latilo FHI 30978! Cross River North F.R., Ikom (fl. & fr. June) Latilo FHI 31829!

Br. Cam.: Bimbiam Road, Victoria (Apr.) Maitland 611! 614! **F. Po:** Mann 1161!

2. *Tapura fischeri* Engl. Pflanzenw. Ost-Afr. C. 423 (1895). *APD acc*

***Tapura africana* Engl.** l.c. 235 (1895), not of Oliv.

Small much-branched tree, to 40 ft. high; flowers white.

Also in **A.–E. Sudan, Belgian Congo, Kenya, Uganda** and **Tanganyika**.

\$/eflora

CAESALPINIACEAE

Trees, shrubs or very rarely herbs or scramblers. Leaves pinnate or bipinnate, rarely simple or 1-foliolate; stipels mostly absent. Flowers mostly showy, racemose, spicate or rarely cymose, zygomorphic, rarely subactinomorphic; bracteoles sometimes large and enclosing the flower in bud. Sepals 5, or the two upper connate, mostly free, imbricate or valvate, sometimes much reduced and then replaced by the large bracteoles. Petals 5 or fewer or absent, the adaxial (upper) one inside in bud, the others variously imbricate. Stamens mostly 10, rarely numerous, free or variously connate; anthers various, sometimes opening by terminal pores. Ovary superior, 1-celled, of 1 carpel. Seeds with or without endosperm and large embryo.

Mainly tropical and subtropical.

Recognized amongst its allies by the adaxial petal being inside the others in bud. A large number of the African genera have a much-reduced calyx, a condition then compensated for by the large pair of opposite valvate bracteoles which completely envelop the flower in bud. These bracteoles may easily be mistaken for a true calyx.

- 1 Leaves simple or unifoliolate:2
- Leaves compound; 2 or more foliolate:9
- 2 Leaves more or less deeply bilobed:3
- Leaves not bilobed:4
- 3 Plants monoecious, flowers hermaphrodite; ovules and seeds in 1 series [1. Bauhinia](#)
- Plants dioecious, flowers unisexual; ovules in several series; seeds scattered in the pulp of the subwoody indehiscent fruits [2. Piliostigma](#)
- 4 Petals present:5
- Petals absent or if present then sepals absent or much reduced:7
- 5 Calyx with 4–5 distinct lobes in bud; petals 5; stamens 10:6
- Calyx in one piece and closed in bud, splitting irregularly; petals 6; stamens 14–41; flowers in short racemes or umbels [4. Baphiopsis](#)
- 6 Fruits inflated, bladder-like; flowers numerous in pyramidal racemes, at length reflexed; calyx with 5 lobes, united at the base into a long tube [3. Griffonia](#)
- Fruits not bladder-like; flowers in very short few-flowered racemes; sepals 4, free, imbricate [22. Zenkerella](#)
- 7 Bracteoles not valvate, early caducous; sepals 4, well-developed; see also below [30. Guibourtia](#)
- Bracteoles valvate completely enclosing the bud, persistent; sepals absent or much-reduced:8
- 8 Flowers in racemes; petal 1 (or 2–3), well-developed, or absent; fertile stamens 3–6 (–7–8); ovary stipitate; fruits without longitudinal ridges [49. Cryptosepalum](#)
- Flowers in narrow panicles; petals (4–) 5, filiform; fertile stamens (4–) 5; ovary subsessile; fruits with 1–2 longitudinal ridges [60. Didelotia](#)
- 9 Leaves once pinnate:10
- Leaves bipinnate:55
- 10 Bracteoles not valvate, usually early caducous; leaflets alternate or opposite:11
- Bracteoles valvate, well-developed, completely enclosing the bud, persistent (except in *Tamarindus*); leaflets opposite, mostly without translucent dots; flowers arranged in more than 2 ranks:41
- 11 Calyx in one piece and closed in bud, splitting irregularly; stamens 16 to very numerous; petals 0 or 1, rarely 3; ovary stipitate; fruits indehiscent; leaves with an odd terminal leaflet (imparipinnate):12
- Calyx with the sepals, lobes or teeth distinct in bud, splitting regularly; stamens mostly 10 or less, rarely more: 14
- 12 Flowers with a single large posterior petal, rarely with a pair of minute lateral petals; fruits cylindrical with numerous seeds; ovary shortly stipitate; stamens numerous, anthers basifixed; leaflets 5–19, without translucent glands [5. Swartzia](#)
- Flowers without petals; fruits subglobose or ovoid; ovary long-stipitate; anthers dorsifixed; leaflets 18–38, with translucent glands:13
- 13 Stamens very numerous, inserted halfway up the campanulate calyx-tube; racemes (in our species) arising on the woody shoots before the leaves; savannah trees [6. Cordyla](#)
- Stamens 12–18, inserted round the edge of the disk at the base of the open calyx; racemes arising on young shoots with the leaves; rain forest tree [7. Mildbraediodendron](#)
- 14 Petals all deeply bilobed to below the middle, the lobes narrow or ligulate; fruit flat, elliptic, indehiscent, winged

- all round, 1–2-seeded; leaves with an odd terminal leaflet (imparipinnate), stipels well-developed [8. *Amphimas*](#)
- Petals present or absent, not as above; stipels absent: **15**
- 15** Anthers attached at or near the base, often opening by terminal pores, sometimes dorsifixed in which case 2–3 of the filaments are bent into the form of a hook and the fruits are cylindrical with transverse partitions (certain species of *Cassia*): **16**
- Anthers attached at the middle, never opening by pores; filaments never bent into the form of a hook: **19**
- 16** Leaves with an odd terminal leaflet (imparipinnate): **17**
- Leaves without an odd terminal leaflet (paripinnate): **18**
- 17** Fruit an elongate, woody, dehiscent pod with a ridge near each margin of the valves; inflorescence a stout simple raceme, or panicle of racemes; sepals 4, the largest one encircling the others in bud; stamens 4 (–5), with the adaxial pair more or less connate [9. *Duparquetia*](#)
- Fruit drupaceous, indehiscent, orbicular or ovoid; inflorescence a panicle of cymes; sepals 5, subequal; stamens 2, or 4–5, free [10. *Dialium*](#)
- 18** Petals 3; fertile stamens 2; fruit thin, flat, elliptic, indehiscent, several-seeded [11. *Distemonanthus*](#)
- Petals 5; stamens 10, fertile or partly abortive; fruits various [12. *Cassia*](#)
- 19** Sepals subvalvate in bud (i.e. valvate, but with very narrow membranous, slightly imbricate margins), or sepals reduced to short teeth; flowers often arranged distichously: **20**
- Sepals imbricate in bud; flowers usually arranged in more than 2 ranks: **27**
- 20** Petals 5, well-developed, subequal in length: **21**
- Petals absent; sepals 4; stamens 10, free: **25**
- 21** Sepals 4, well-developed: **22**
- Sepals 5, teeth-like or up to 1 mm. long, calyx-tube campanulate; petals up to 7 mm. long; leaflets opposite: . **24**
- 22** Flowers relatively small; receptacle very short; sepals up to 1.5 cm. long; leaflets with translucent dots, alternate: **23**
- Flowers large; receptacle elongate; sepals at least 7 cm. long; stamens 10, of which 9 are connate into a tube at the base; leaflets without translucent dots, opposite or alternate [15. *Baikiaea*](#)
- 23** Stamens 10, free; lateral nerves mostly joined to a marginal nerve; leaflets not, or very obscurely, emarginate at apex [13. *Gilletiodendron*](#)
- Stamens 10, of which 9 are connate into a tube at the base; lateral nerves looping before the margin; leaflets usually emarginate at apex [14. *Tessmannia*](#)
- 24** Flowers in long narrow panicles; disk fleshy, campanulate, bearing the petals and 10 equal stamens; seeds up to 15 [16. *Chidlowia*](#)
- Flowers in spike-like racemes; disk absent; 5 stamens long, 5 stamens short; seeds 1–2 [17. *Kaoue*](#)
- 25** Young shoots with long, rolled, stipule-like scales opposite the leaves, leaving an almost annular scar on the stem after falling; leaflets alternate; disk absent; ovules 10–12; fruits indehiscent, with a proximal wing [18. *Hyiodendron*](#)
- Young shoots without long, stipule-like leaf-opposed scales; ovules 2 (rarely 4–7); fruits not winged: **26**
- 26** Disk absent; fruits indehiscent, drupaceous, with fibrous mesocarp; leaflets alternate [19. *Detarium*](#)
- Disk present; fruits dehiscent; seeds arillate; leaflets opposite to alternate [20. *Copaifera*](#)
- 27** Petals present; leaflets opposite: **28**
- Petals absent; leaflets alternate or opposite: **35**
- 28** Corolla of 5 petals subequal in length: **29**
- Corolla of 1–5 petals very unequal in length: **30**
- 29** Stipe of the ovary free, inserted at the base of the shallow receptacle; sepals 4–5 [21. *Cynometra*](#)
- Stipe of the ovary completely adnate to one side of the tubular receptacle; sepals 4 [23. *Schotia*](#)
- 30** Fertile stamens 7 (–8); 1 petal well-developed with a long claw, the other 4 minute or absent; fruit thick, woody; seeds black, with red, orange or yellow arils; petiolules twisted [24. *Afzelia*](#)
- Fertile stamens 10 (rarely 16–26): **31**
- 31** Bracteoles not petaloid; leaflets not emarginate at apex: **32**
- Bracteoles petaloid, coloured, ovate or lanceolate: **34**
- 32** Leaflets 3 or more pairs; flowers in well-developed racemes or panicles; bracteoles sepal-like, imbricate, surrounding the buds: **33**
- Leaflets 1 pair; 1 petal well-developed, not clawed, the other 4 minute; flowers in very short racemes; buds

- obovoid, not surrounded by the minute bracteoles [27. *Eurypetalum*](#)
- 33** Petiolules twisted; 3 petals well-developed, clawed, the other 2 (or rarely 1) small or minute; fruit woody [25. *Loesenera*](#)
- Petiolules not twisted; petals not clawed; 1 petal well-developed and the other 4 minute, or 3 petals well-developed and the other 2 minute; fruit with coriaceous valves, 1-seeded [26. *Daniellia*](#)
- 34** Leaflets emarginate; flowers distichous; disk present as a swelling prominent at the base of the receptacle; stipe of ovary completely adnate to one side of the receptacle; petals 5, 3 large and 2 smaller (in our species) [28. *Plagiosiphon*](#)
- Leaflets not emarginate (except in *H. aubrevillei*); flowers not arranged distichously; disk absent or very obscure; stipe of ovary adnate to one side of the receptacle only in the lower part; petals 3–5, unequal, or absent; see also below [29. *Hymenostegia*](#)
- 35** Leaflets with translucent dots; ovary sessile, or with stipe not fused to the side of the receptacle; stamens 4, or (8–) 10 (–12); fruits mostly indehiscent: **36**
- Leaflets without translucent dots; ovary stipitate, with the stipe adnate in its lower part to the side of the receptacle; sepals 4 (rarely 5); fruits dehiscent: **39**
- 36** Stamens (8–) 10 (–12), free: **37**
- Stamens 4, united below; sepals 4; disk present; ovary shortly stipitate; fruits indehiscent, flat, papery, 1–2-seeded; leaflets 4–10, alternate [33. *Stemonocoleus*](#)
- 37** Disk present, fleshy: **38**
- Disk absent; sepals 4 (–5); ovary stipitate; fruits indehiscent, with a proximal wing; leaflets 6–10, alternate .. [32. *Gossweilerodendron*](#)
- 38** Sepals 4; ovary sessile or stipitate; fruits thin and indehiscent, or thick and dehiscent with arillate seeds; leaflets always 1 pair, opposite; see also above [30. *Guibourtia*](#)
- Sepals 5 (–6); ovary sessile; fruits indehiscent, sometimes with a proximal wing; leaflets 1 pair, or leaflets up to 9, subopposite or alternate [31. *Oxystigma*](#)
- 39** Leaflets alternate, petiolules twisted; disk present; stamens 8–10; bracteoles not petaloid [34. *Crudia*](#)
- Leaflets opposite; disk absent or very obscure; stamens 8–10, or 16–26; bracteoles linear to linear-oblong, petaloid: **40**
- 40** Stamens 8–10; leaflets 5–20 pairs [35. *Talbotiella*](#)
- Stamens 16–26; leaflets 3–4 pairs; petals apparently absent in *H. talbotii*, for other species see above [29. *Hymenostegia*](#)
- 41** Stamens very numerous; anthers deeply sagittate; bracteoles with a gland-like knob at the apex; sepals 4; petals 5, subequal [36. *Polystemonanthus*](#)
- Stamens up to 15: **42**
- 42** Sepals well-developed: **43**
- Sepals absent or much reduced: **52**
- 43** Androecium of 10 (–13) stamens, all fertile, exserted and subequal in length: **44**
- Androecium of 3 large, fertile, exserted stamens, the others reduced, included, staminodal or absent, rarely of 9 large fertile stamens (*Gilbertiodendron splendidum*): **48**
- 44** Receptacle elongated into a tube 2.5–18 mm. long; sepals not ciliate, petals 5: **45**
- Receptacle flat or only slightly concave; sepals 5, free, densely ciliate; stamens 10, of which 9 are connate at the base; flowers up to 2 cm. long: **47**
- 45** Sepals 5, free; leaflets up to 5 pairs, at least 6 cm. long, rhachis not winged: **46**
- Sepals 3, free and 2 united; stamens 10, of which 9 are connate at the base; petals 5, subequal in length; flowers less than 1 cm. long; leaflets 12–18 pairs, up to 3.5 cm. long, rhachis narrowly winged between the leaflets [39. *Microberlinia*](#)
- 46** Stamens 10 (–13), free to the base; petals scarcely exceeding the bracteoles, subequal in length (in our species); flowers not exceeding 2 cm. in length [37. *Isobерlinia*](#)
- Stamens 10, of which 9 are connate at the base; petals much exceeding the bracteoles, subequal in length or the lateral ones smaller than the posterior; flowers 4 cm. or more long [38. *Berlinia*](#)
- 47** Leaflets with conspicuous translucent dots, 2–5 pairs; posterior petal well-developed, clawed, lateral petals minute [40. *Julbernardia*](#)
- Leaflets without conspicuous translucent dots, 1 pair; all petals minute [41. *Paraberlinia*](#)
- 48** Leaflets more than 3 cm. long; fruits dehiscent; large stamens not unilateral, free or shortly united: **49**
- Leaflets up to 3 cm. long; fruits indehiscent; the 3 large stamens unilateral and united up to the middle [46. *Tamarindus*](#)

- 49** Intrastaminal tube absent; leaflets without marginal glands; fruits without longitudinal ridges: **50**
 Intrastaminal tube present (see fig. 152), bearing staminodes some of which may be reduced to mere protuberances or absent; leaflets with glands on or near the margin: **51**
- 50** Petals not blue; stipe of ovary up to 1 mm. long; bracteoles up to 1.5 cm. long, tomentellous to puberulous outside; fruits with more or less prominent transverse ridges; petiolules not twisted [42. *Anthonothea*](#)
 Petals blue; stipe of ovary 10–12 mm. long; bracteoles 2.5 cm. or more long, glabrous; fruits without transverse ridges; petiolules twisted [43. *Paramacrolobium*](#)
- 51** Fruits without longitudinal ridges; leaflets 1 pair; stipels present; glands near the margin of the leaflets [44. *Pellegriniodendron*](#)
 Fruits with longitudinal ridges; leaflets 2 or more pairs; stipels absent; glands actually on the margins of the leaflets [45. *Gilbertiodendron*](#)
- 52** Fertile stamens (8–) 10 (–18), almost free, or connate at base, or 9 connate and 1 free: **53**
 Fertile stamens 3–6 (–7–8), free: **54**
- 53** Sepals 0–5; petal 1, well-developed (in our species), the other 4 minute [47. *Monopetalanthus*](#)
 Sepals and petals not differentiated; tepals 0–10 [48. *Brachystegia*](#)
- 54** Flowers in racemes; petal 1 (–2–3), well-developed, or absent; fertile stamens 3–6 (–7–8); ovary stipitate; fruits without longitudinal ridges [49. *Cryptosepalum*](#)
 Flowers in narrow panicles; petals (4–) 5, filiform; fertile stamens (4–) 5; ovary subsessile; fruits with 1–2 longitudinal ridges [50. *Didelotia*](#)
- 55** Sepals free to the base or nearly so; leaflets opposite or alternate: **56**
 Sepals connate into a campanulate tube; leaflets alternate: **60**
- 56** Common petiole normally developed, not ending in a spine; rhachis not leaf-like: **57**
 Common petiole very short, ending in a sharp spine; rhachis of pinnae flat and leaf-like, leaflets very small .. [55. *Parkinsonia*](#)
- 57** Branchlets and often the leaf-rhachis prickly; sepals imbricate: **58**
 Branchlets and leaf-rhachis not prickly: **59**
- 58** Fruits indehiscent, flat and thin, with an intramarginal nerve, not prickly; stipules small and inconspicuous .. [51. *Mezoneuron*](#)
 Fruits (in our species) dehiscent, not flat, prickly; stipules leafy, bilobed, usually persistent [52. *Caesalpinia*](#)
- 59** Sepals valvate; petals red, with long claws; fruits many-seeded; leaflets small, opposite, very numerous [53. *Delonix*](#)
 Sepals imbricate; petals yellow, shortly clawed; fruits 1–2-seeded; leaflets relatively large, alternate .. [54. *Bussea*](#)
- 60** Fruits 1-seeded, indehiscent, flat and thin; ovules 1–2 [56. *Burkea*](#)
 Fruits 2–18-seeded; ovules 6–20: **61**
- 61** Fruits dehiscent, valves subcoriaceous to woody-leathery, with projecting sutures; seeds 2–10 [57. *Erythrophleum*](#)
 Fruits indehiscent, valves thickly woody with thick projecting sutures; seeds 10–18 [58. *Pachyelasma*](#)

Brownea spp.

From tropical America is represented.

Haematoxylum campechianum Linn.

The “Logwood,” from tropical America is represented.

Peltophorum pterocarpum (DC.) Backer

P. ferrugineum (Decne.) Benth.

A native of tropical Asia and Australia, this species is represented.

P. dasyrrhachis (Miq.) Kurz ex Bak.

A native of the East Indies is represented.

Trachylobium verrucosum (Gaertn.) Oliv.

A “Copal tree” from East Africa is represented.

1. BAUHINIA

Linn. — F.T.A. 2: 285. *APD acc*

- 1 Leaves very small, bilobed almost to the base, rarely over 2 cm. long, lobes semicircular, glaucous, glabrous; petiole about 1/3 as long as the leaf; racemes few-flowered; calyx spathaceous, the limb twice as long as the tube, finely puberulous; petals spathulate; stamens 10, all perfect, filaments hairy at the base; anthers thinly pilose; ovary long-stipitate, glabrous; fruit linear, curved, obliquely constricted, 6–9 cm. long, glabrous[rufescens](#)

Bauhinia rufescens Lam. — F.T.A. 2: 289; Aubrév. Fl. For. Soud.-Guin. 214, t. 41, 6–9. *APD acc*

Bauhinia adansoniana of Guill. & Perr. 1: 265, partly (notes only), see Pellegrin in Bull. Soc. Bot. Fr. 74: 622 (1927).

Piliostigma rufescens (Lam.) Benth. (1852).

A much-branched shrub or small tree, up to 25 ft. high, with white flowers and blackish, often twisted, several-seeded pods which persist on the plants a long time; branchlets often armed with pointed short lateral shoots; [in the drier savannahs especially on river banks, and sometimes planted in villages.](#)

Widespread in tropical Africa from Abyssinia to Transvaal.

The areas occupied by these two species are well-marked, *P. reticulatum* occurring in the drier and *P. thonningii* in the moister savannah regions. At Zaria in N. Nigeria where the areas overlap Milne-Redhead (l.c.) noted a mixed population with strong indications of hybridity.

3. GRIFFONIA

Baill. in Adansonia 6: 188 (7 Oct., 1865); Taub. in E. & P. Pflanzenfam. 3, 3: 147 (1892).

Bandeiraea Welw. ex Benth. in Benth. & Hook. f. Gen. Pl. 1: 577 (1865, about 19 Oct.); F.T.A. 2: 284; F.W.T.A., ed. 1, 1: 328.

- 1 Calyx-tube softly tomentose outside, about 1 cm. long; leaves more or less ovate, rounded or widely cordate at base, rounded or shortly obtusely acuminate at apex, 6–12 cm. long, 3–6 cm. broad, glabrous and shining, prominently 3-nerved at base; inflorescence softly tomentose, with a curled hook-like branch at base; fruits obliquely oblong, inflated, up to 4–5 cm. long, blackish and reticulate; stipe slender, 1–1.5 cm. long, pubescent *1. simplicifolia*

Calyx-tube glabrous outside, about 3 cm. long; leaves oblong-elliptic, a little cuneate at base, slightly acuminate at apex, 6–14 cm. long, 3–6 cm. broad, glabrous, less prominently 3-nerved at base; inflorescence glabrous, without a modified branch at base; fruits probably smaller than above, but otherwise similar *2. physocarpa*

1. *Griffonia simplicifolia* (Vahl ex DC.) Baill. in Adansonia 6: 197 (1866). *APD acc*

Schotia simplicifolia Vahl ex DC. (1825).

Bandeiraea simplicifolia (Vahl ex DC.) Benth. in Trans. Linn. Soc. 25: 306 (1865); F.T.A. 2: 285; F.W.T.A., ed. 1, 1: 328; Chev. Bot. 228; Pellegr. Lég. Gab. 135.

A hard-wooded shrub, usually climbing, with greenish flowers and inflated black pods.

Lib.: Ganta (Oct.) Harley! Tchien Dist. (Aug.) Baldwin 9023! 9024! **IV. C.:** San Pedro Thoiré 318! Bouroukrou (fr. Dec.) Chev. 16543. Sassandra Port Chev. 17939. **G. 4. BAPHIOPSIS

Benth. ex Bak. — F.T.A. 2: 256. *APD acc*

- 1 A tree; leaves unifoliate, broadly elliptic or ovate-elliptic, obtusely acuminate, 9–20 cm. long, 4–10 cm. broad, closely reticulate on both surfaces, glabrous; lateral nerves 5–6 pairs; petiolule 1–4 cm. long, pulvinate and transversely rugose at each end; flowers in very short axillary racemes; axis of inflorescence up to 2.5 cm. long, slender, shortly pubescent; pedicels up to 1 cm. long, slightly pubescent; buds broadly ellipsoid, hairy at the tip, about 3.5 mm. long; calyx closed in bud, at length splitting irregularly; petals 6, about as long as the

calyx, subequal; stamens 16–18, short, free; ovary sessile, 2-ovuled; fruits not known[parviflora](#)

Baphiopsis parviflora *Benth. ex Bak.* in F.T.A. 2: 256 (1871); Bak. f. Leg. Trop. Afr. 2: 590; Gilbert & Boutique in Fl. Congo Belge 3: 554. *APD acc*

An understorey forest tree, 20–50 ft. high; flowers white, with an unpleasant smell.

Br. Cam.: Amba Bay (Jan.) Mann 715! Likomba (Oct.) Mildbr. 10561!

Also in **Gabon**, **Belgian Congo**, **Uganda** and **Tanganyika**.

5. SWARTZIA

Schreb. — F.T.A. 2: 256.

- 1 Leaflets obtuse or emarginate, not apiculate, alternate or opposite, lanceolate to elliptic, 3–7 cm. long, 1.5–4.5 cm. broad, closely reticulate above, thinly pubescent beneath; flowers few in short racemes; pedicels up to 4 cm. long, tomentose; calyx globose in bud, finally splitting to the base and spreading or reflexed; petal normally 1, orbicular, about 2.5 cm. broad, shortly clawed, densely villous outside; stamens numerous, free; anthers unequal, oblong; ovary shortly stipitate; fruit up to 30 cm. long, cylindrical, glabrous, black; seeds numerous; savannah species [1. madagascariensis](#)

Leaflets apiculate, alternate, lanceolate, 5–9 cm. long, 3–4.5 cm. broad, glabrous; flowers in lax axillary racemes, peduncles about 20 cm. long, pedicels 1–2 cm. long, shortly appressed-pubescent; flowers and fruits similar to the last species; rain forest species [2. fistuloides](#)

1. **Swartzia madagascariensis** *Desv.* — F.T.A. 2: 257; Bak. f. Leg. Trop. Afr. 2: 605; Aubrév. in Fl. For. Soud.-Guin. 302, t. 60, 5–8; Gilbert & Boutique in Fl. Congo Belge 3: 551; Berhaut Fl. Sen. 42.

APD: Synonym of Bobgunnia madagascariensis (Desv.) J.H. Kirkbr. & Wiersema

A tree, 20–30 ft. high with conspicuous white sweetly-scented flowers, and pods a foot long rather like those of *Cassia sieberiana*.

Sen.: fide Berhaut l.c. **Gam.:** Sounders 45! **Fr. Sud.:** Bougouni (Apr.) Chev. 675! **Port. G.:** Gabu (June) Esp. Santo 2506! **Fr. G.:** Kouroussa (Apr.) Pobéguin 185! **iv. Nig.:** Nupe Barter 1649! Sokoto (June) Dalz. 531! Katsina (May) MacElderry FHI 16468! L. Chad (May) E. Vogel 95!

Widespread in tropical Africa and the Mascarene Islands.

2. **Swartzia fistuloides** *Harms* in Engl. Bot. Jahrb. 45: 305 (1910); Bak. f. l.c. 605; Aubrév. Fl. For. C. Iv. 1: 280, t. 110; Gilbert & Boutique l.c.

APD: Synonym of Bobgunnia fistuloides (Harms) J.H. Kirkbr. & Wiersema

A forest tree to 80 ft. high; the one petal of each flower white or pale pink.

iv. C.: Abengourou to Bondoukou Aubrév. 709! Agboville Aubrév. 1497! 1913! **S. Nig.:** Sapoba Kennedy 1696! **Br. Cam.:** Abonando, Mamfe (May) Rudatis 65!

Also in **French Cameroons**, **Spanish Guinea**, **Gabon**, **Cabinda** and **Belgian Congo**.

6. CORDYLA

APD: Synonym of Dupuya J.H. Kirkbr.

Lour. — F.T.A. 2: 257; Milne-Redhead in Fedde Rep. 41: 227 (1937).

- 1 A tree; leaflets opposite or subopposite, about 9–10 pairs, ovate, obtuse, 5–6 cm. long, 2–2.5 cm. broad, glabrous or slightly pubescent, often glaucous; rachis and petiolules pubescent; flowers in rather dense softly woolly-tomentose racemes up to about 8 cm. long; pedicels about 1 cm. long; calyx closed in bud, at length splitting

7. MILDBRAEDIODENDRON Flora of West Tropical Africa CAESALPINIACEAE

into 4–5 lobes; petals none; stamens numerous, nearly free; ovary long-stipitate, glabrous, multiovulate; fruit stipitate, ellipsoid, about 5 cm. long, 2–3-seeded [pinnata](#)

Cordyla pinnata (*Lepr. ex A. Rich.*) *Milne-Redhead* c89f3 l.c. 232 (1937); Aubrév. Fl. For. Soud.-Guin. 304, t. 61, 1–3. *APD acc*

Calycandra pinnata *Lepr. ex A. Rich.* (1831).

Cordyla africana of F.T.A. 2: 257, partly; of Chev. Bot. 219; of F.W.T.A., ed. 1, 1: 370, partly; of Bak. f. Leg. Trop. Afr. 2: 606, partly; not of Lour.

A tree 40–50 ft. high, with corky bark, grey pubescent branchlets, pale foliage and white or yellow flowers (stamens, not petals) appearing on one-year-old shoots before the leaves; [in savannah](#).

Sen.: Heudelot 367! Sedhiou (Feb.) Chev. 3537! Trochain 1403. Kaolack Kaichinger 63. **Gam.:** Brown-Lester 70! Dawe 41! Pirie 37! Gounat Perrottet 32. Georgetown (Jan.) Dalz. 8029! **Fr. Sud.:** Ségou to Barouéli Chev. 44017. Diondiou Chev. 1006.

1. **Cordyla sp. A.** See *Milne-Redhead* l.c. 228.

Leaves minutely pubescent beneath; fruit poisonous.

Togo: Basari Kersting A. 517!

Imperfectly known species.

2. **Cordyla sp. B.** See *Milne-Redhead* l.c.

Leaves minutely pubescent beneath.

N. Nig.: Abinsi. Dalz. 705!

Imperfectly known species.

3. **Cordyla sp. C.**

Leaves with a few long curled hairs beneath.

Iv. C.: Batié (fl. & fr. Feb.) Serv. For. 2837!

[Aubrév. in Fl. For. Soud.-Guin. 306, cites this as *C. richardii* Planch, ex *Milne-Redhead*, but it appears to me to be an undescribed species. Further material of this and of the other imperfectly known species is much needed. — F.N.H.]

7. MILDBRAEDIODENDRON

Harms in *Mildbr. Wiss. Ergebn.* 1907–08, 2: 241 (1911).

- 1 A large tree; leaflets alternate or opposite, 12 — 19 on each side of rachis, lanceolate to oblong, 2.5–5 cm. long, nearly 1 cm. broad, pellucid-punctate and minutely pubescent on both surfaces; flowers few in short racemes about 3 cm. long; rachis and calyx on both sides covered with bright yellow appressed pubescence; calyx subglobose in bud, splitting into usually 3 broad, deltoid lobes, subequal, more or less reflexed; about 4 mm. long; petals absent; stamens 12–18 in a ring on the margin of the disk, filaments about 12 mm. long, anthers small, ovate, dorsifixed; ovary stipitate, oblong, 1–8-ovuled, glabrous; fruit stipitate, obliquely ellipsoid, up to 10 cm. diam., coriaceous outside, fleshy inside, with 4–5 transversely arranged seeds [excelsum](#)

Mildbraedi dendron excelsum *Harms* l.c., t. 27 (1911); Bak. f. Leg. Trop. Afr. 2: 607. *APD acc*

A tall [forest](#) tree with buttresses, a straight trunk and spreading crown; leaves deciduous, reappearing with the flowers.

G. C.: Bosumkese, Sunyani Dist. (Dec.) Lawton FH 5769! **Br. Cam.:** Issongo (Nov.) Mildbr. 10643!

Also in **French Cameroons**, **A.-E. Sudan** and **Belgian Congo**.

8. AMPHIMAS

Pierre ex Harms in Nat. Pflanzenfam. Nachtr. 3: 157 (1906). *APD acc*

- 1 Branchlets stout, rusty-tomentellous; leaflets 5–6 pairs, opposite or subopposite, lanceolate to narrowly obovate, rounded or broadly acuminate and mucronate, 6–12 cm. long, 2–3.5 cm. broad, glabrous, with rather numerous slender lateral nerves; stipels filiform, about 7 mm. long; panicles bracteate; bracts ovate, acuminate, about 7 mm. long, tomentellous; fruits flat, oblong-elliptic, 15–18 cm. long, 4–6 cm. broad, the body lanceolate and reticulate, surrounded by a smooth wing about 2 cm. broad; seed solitary, reniform, about 2 cm. broad

.....[pterocarpoides](#)

Amphimas pterocarpoides *Harms* in Fedde Rep. 12: 12 (1913); Bak. f. Leg. Trop. Afr. 3: 609; Aubrév. Fl. For. C. Iv. 1: 280, t. 111; Wilczek in Fl. Congo Belge 3: 548, t. 40. *APD acc*

A forest tree, to 150 ft. high, with cylindrical stem and spreading crown; slash with a red exudate; flowers white, fragrant; fruits papery.

Fr. G.: Kissidougou (fr. Feb.) Chev. 20716! **S. L.:** Colony F.R. Formah 27! Njala (fl. Oct., Nov., fr. Feb.) Deighton 4914! 4952! 5351! **Lib.:** Banga (Oct.) Linder 1227! 10. DIALIUM

Linn. — F.T.A. 2: 282; Steyaert in Bull. Soc. Roy. Bot. Belg. 84: 29–45 (1951).

- 1 Leaflets usually 5, rarely 3 or 7, usually alternate, sometimes subopposite:2
Leaflets 11–17 (rarely up to 21), opposite or subopposite; lateral leaflets oblong rounded at base, acute or obtuse at apex, 1.5–5 cm. long, 0.6–2.5 cm. broad, terminal leaflet elliptic more or less acute at each end, 3–6 cm. long, 1.3–2 cm. broad; rachis 7–13 cm. long, together with petiolules and undersurface of leaflets rusty pubescent; petals absent; stamens 2, filaments straight; fruits subglobose, 1.5–2 cm. diam., densely tomentellous, brown[5. dinklagei](#)

- 2 Reticulation of leaflets lax, lateral nerves about 4 pairs; leaflets 2–7 cm. long, 2–4 cm. broad, rhachis 3.5–5 cm. long; lateral leaflets ovate, obtuse to rounded or subcordate at base, obtusely acuminate at apex, terminal leaflet elliptic, acute at base; rhachis, petioles and undersurface of leaflets pubescent; petals absent; stamens 4–5, filaments straight; fruits subglobose, 1.2–1.5 cm. diam., densely tomentellous, brown [1. pobeguinii](#)
- Reticulation of leaflets close, lateral nerves 8–15 pairs; petals 1 (rarely 2), caducous; stamens 2, rarely 3: **3**
- 3 Stamens with straight filaments; fruits suborbicular, flattened, 2–2.5 cm. diam., densely velvety-tomentellous, black; leaflets elliptic to lanceolate, 3–12 cm. long, 1.5–5 cm. broad, rounded or obtuse at base, obtuse or shortly and obtusely acuminate at apex, often puberulous beneath; rhachis 4–12 cm. long [2. guineense](#)
- Stamens with bent filaments; leaflets glabrous and shining: **4**
- 4 Fruits glabrous, suborbicular, flattened, 1.7–2 cm. diam.; leaflets elliptic to oblong- or ovate-elliptic, cuneate at base, rather long-acuminate, 7–13 cm. long, 2–5 cm. broad; rhachis 4–7 cm. long [3. aubrevillei](#)
- Fruits densely tomentellous, obovoid to subglobose, slightly flattened, about 2.5 cm. long and 1.5 cm. broad; leaflets oblong-elliptic or sometimes obovate, cuneate at base, acuminate at apex, 8–23 cm. long, 3.5–8 cm. broad; rhachis 8–17 cm. long [4. pachyphyllum](#)

1. **Dialium pobeguinii** *Pellegr.* in Bull. Soc. Bot. Fr. 88: 449 (1941); Aubrév. Fl. For. Soud.-Guin. 217, t. 46, 7–8; Steyaert in Bull. Soc. Roy. Bot. Belg. 84: 37. *APD acc*

Dialium ovatum *Hutch. & Dalz.* in Dalz. Us. Pl. W.T.A. 190 (1937), name only.

Tree, to 45 ft. high, on river banks close to water; flowers white.

Fr. G.: R. Koumi (June) Pobéguin 1629. Labé Chev. 12383. **S. L.:** Njala (fl. June, fr. Mar.) Deighton 1752! 1823! Batkanu (fr. Jan.) Deighton 2849!

12. CASSIA

Linn. — F.T.A. 2: 268; *Benth.* in Trans. Linn. Soc. 27: 503–591 (1871).

- 1 Leaflets 1 pair, sessile, obovate, very unequal at base, 7–22 mm. long, 5–14 mm. broad; petiole up to 5 mm. long, eglandular; stems prostrate, like the leaves long-spreading-pilose; stipules foliaceous, obliquely ovate, persistent, 5–12 mm. long; flowers axillary, solitary or paired; pedicels longer than the leaves, up to 3.5 cm. long in fruit; fruits flat, linear-oblong, slightly curved, 1.8–3.5 cm. long, 2.5–4 mm. broad, valves thin, pubescent, the septae clearly visible from the outside, curling on dehiscence; seeds 8–16 [1. rotundifolia](#)
- Leaflets 2 or more pairs: [2](#)
- 2 Leaflets sessile; petioles with at least one gland towards the top but below the lowest pair of leaflets; leaflets up to 2.6 cm. long and 6 mm. broad; flowers solitary, or in few-flowered racemes, usually supra-axillary (the peduncle adnate to the stem); fruits flat, linear-oblong, slightly curved, valves thin, curling on dehiscence; seeds in 1 series: [3](#)
- Leaflets petiolulate; petiole and rhachis with or without glands; leaflets less than 15 pairs, more than 1.5 cm. long and 1 cm. broad, never linear, at most lanceolate; flowers axillary or terminal; fruits indehiscent or dehiscent, valves not curling on dehiscence (except in *C. absus*): [6](#)
- 3 Leaflets (3–) 4–6 (–12), narrowly and obliquely oblong, midrib nearly central, unequal at base, rounded and mucronate at apex, 7–18 (–25) mm. long, 2.5–6 mm. broad, petiole and rhachis 1.8–3.5 (–7.8) cm. long, petiole with a stipitate gland about 1 mm. long just below the lowest pair of leaflets; flowers solitary, supra-axillary; pedicels up to 3.8 cm. long in fruit; fruits about 3.5 cm. long and 4 mm. broad, pubescent; seeds about 12 [2. jaegeri](#)

- Leaflets 10–70 pairs:4
- 4 Rhachis of leaf channelled above between each pair of leaflets:5
- Rhachis of leaf with a serrated ridge along the top, having a tooth between each pair of leaflets; leaflets asymmetrical, 30–70 pairs, linear, obliquely acute and mucronate at apex, 2–8 mm. long, 0.7–2 mm. broad; rhachis and petiole 4–9 cm. long, petiole with a sessile gland just below the lowest pair of leaflets; flowers solitary, or 2–3 together, supra-axillary; pedicels 1–2 cm. long; fruits 3–5 cm. long; seeds 13–24 [5. mimosoides](#)
- 5 Midrib central, leaflets symmetrical or nearly so, 10–18 pairs, oblong-elliptic, rounded and apiculate at apex, 15–26 mm. long, 5–6 mm. broad; rhachis and petiole about 7 cm. long, petiole with an ellipsoidal gland about 2 mm. long; racemes very short, 5–6-flowered, solitary, or paired with one raceme axillary and the other supra-axillary; pedicels 1–3 mm. long; fruits 2.5–4 cm. long; seeds about 10[3. nigricans](#)
- Midrib lateral, leaflets asymmetrical, 25–30 pairs, oblong-linear, obliquely acute and mucronate at apex, 9–17 mm. long, 1.5–4 mm. broad; rhachis and petiole 7–14 cm. long, petiole with a sessile gland just below the lowest pair of leaflets; flowers solitary or 2–3 together, supra-axillary, pedicels about 1 cm. long; fruits 6–7.5 cm. long; seeds 14–20[4. kirkii](#)
- 6 Petiole and rhachis without glands:7
- Petiole and rhachis with conspicuous glands:16
- 7 Stems not viscid-glandular; leaflets 3 pairs, or more; valves of fruit not curling on dehiscence, or fruit indehiscent:8
- Stems and leaves viscid-glandular-pubescent; leaflets 2 pairs, close together at the end of a 3–5 cm. long petiole; lamina obliquely obovate or elliptic, 1.5–3 cm. long, 1–1.5 cm. broad; flowers in terminal or leaf-opposed racemes; fruits oblong, 2.5–4 cm. long, 7–8 mm. broad, strigose, valves curling on dehiscence[15. absus](#)
- 8 Filaments of 2–3 lower stamens much longer than the petals, bent into the shape of a hook; anthers dorsifixed; fruits more or less terete, with numerous transverse septae:9
- Filaments of all stamens straight and shorter than the petals; fruits flat or winged:12
- 9 Petals pink or white; bracts caducous; inflorescences terminating short axillary branches, racemose or subcorymbose, 5–12 cm. long, with about 20 flowers; pedicels about 4.5 cm. long; fruits indehiscent, straight, subterete or slightly compressed dorsally, up to 90 cm. long and 2–3 cm. diam., with a longitudinal septum, the seeds thus in 2 series; leaflets 7–10 pairs, elliptic to elliptic-ovate, acute or shortly acuminate at apex, 6–8 cm. long, 2.5–3.5 cm. broad; petiole and rhachis up to about 30 cm. long[6. mannii](#)
- Petals yellow; bracts more or less persistent:10
- 10 Flowers in racemes up to 40 cm. long, pedicels up to 5 cm. long; fruits indehiscent:11
- Flowers in terminal bracteate corymbs, the lower pedicels the longest and up to 10 cm. long; fruits dehiscent along one suture, seeds in 1 series; leaflets 5–9 pairs, ovate-elliptic, cuneate at base and long petiolulate, acute or slightly acuminate at apex, 3–4.5 cm. long, 1–2.5 cm. broad; petiole and rhachis up to 26 cm. long [9. arereh](#)
- 11 Fruits with a longitudinal septum, the seeds thus in 2 series; fruit straight, subterete or slightly compressed dorsally, 60–70 cm. long, 2.5–3 cm. broad, 2–2.5 cm. thick; bracts obliquely lanceolate, about 1 cm. long, densely velutinous; pedicels velutinous; leaflets 6–12 pairs, oblong-lanceolate, obtuse at apex, 3–10 cm. long, 1–4 cm. broad; petiole and rhachis up to 35 cm. long[7. aubrevillei](#)
- Fruits without a longitudinal septum, the seeds thus in 1 series; fruits seldom straight, terete, 50–80 cm. long, about 1.5 cm. diam.; bracts linear-lanceolate, 1–2 cm. long, pubescent; pedicels pubescent; leaflets 5–8 pairs, elliptic or oblong, shortly subacute or emarginate at apex, 5–10 cm. long, 2.5–5 cm. broad; petiole and rhachis up to 20 cm. long[8. sieberiana](#)
- 12 Rhachis narrowly winged, with a transverse ridge connecting the leaflets; leaflets 8–14 pairs, oblong to obovate, rounded at each end, 5–15 cm. long, 3–8 cm. broad; petiole and rhachis up to 60 cm. long; flowers in erect dense, terminal racemes, with large enveloping bracts; fruits straight, oblong, 15–25 cm. long, about 1.8 cm. broad, each valve with a prominent broad crenate wing along the middle[10. alata](#)
- Rhachis not winged; fruits flat not winged:13
- 13 Fruits 10 cm. long or more, up to 1.5 cm. broad, straight, attached centrally; leaflets at least 5 cm. long; petiole and rhachis up to about 30 cm. long:14
- Fruits up to 6 cm. long, 1.8–2.5 cm. broad, broadly oblong, attached towards the ventral suture; leaflets up to 4 cm. long; petiole and rhachis up to about 16 cm. long; flowers in simple racemes:15
- 14 Flowers in dense, erect, spike-like terminal racemes; leaflets 4–5 pairs, elliptic, more or less narrowed at each end, 6–12 cm. long, 3.5–6 cm. broad; fruits about 10–12 cm. long and 1.5 cm. broad, with transverse ridges, indehiscent[11. podocarpa](#)
- Flowers in panicles of axillary or terminal corymbs, numerous at the ends of the shoots; leaflets 8–12 pairs, oblong-elliptic, more or less rounded at each end, usually emarginate and mucronate at apex, 5–6 cm. long, 2–2.5 cm. broad; fruits 15–30 cm. long, about 1 cm. broad, dehiscent[12. siamea](#)
- 15 Fruits with an undulate crest up the middle of each valve, curved, 3.5–5.5 cm. long, about 2 cm. broad; leaflets 5–6 pairs, obliquely oblong-obovate, rounded and mucronate at apex, 1.5–4 cm. long, 0.8–2.5 cm. broad[13. italica](#)

Fruits without an undulate crest, more or less straight, 4–6 cm. long, 1.8–2.5 cm. broad; leaflets 3–9 pairs, elliptic-lanceolate or lanceolate, 1.5–3.5 cm. long, 0.5–1.2 cm. broad [14. *senna*](#)

16 Glands on the rachis at the insertion of 1 or several pairs of leaflets: **17**

Glands towards the base of the petiole only; leaflets acuminate; seeds in 1 series; racemes few-flowered: **20**

17 Leaflets 5–8 pairs, elliptic, rounded at each end, emarginate and mucronate at apex, 2–5 cm. long, 1–3 cm. broad; petiole and rachis to 20 cm. with a slender club-shaped gland between each pair of leaflets; flowers in corymbose racemes, clustered towards the end of the branches; fruits subtergird and subtorulose at maturity, beaked at apex, 10–15 cm. long, 5–8 mm. diam.; seeds in 1 series [16. *singueana*](#)

Leaflets 3–5 pairs, or if more then seeds in 2 series and fruits not subtorulose: **18**

18 Fruits subcylindrical, 1–1.5 cm. diam., 7–10 cm. long; seeds in 2 series, transversely arranged; inflorescences 4–10-flowered axillary or terminal racemes; leaflets 3–6 pairs: **19**

Fruits more or less compressed, 3–6 mm. broad, 15–25 cm. long, curved, valves longitudinally ridged; seeds in 1 series, arranged longitudinally; inflorescences 2-flowered, axillary, or flowers solitary; leaflets 3 pairs, obovate, mucronate at apex, up to 6 cm. long and 3 cm. broad; petiole and rachis up to 15 cm. long, with a gland at the insertion of the lowest pair, or 2 lowest pairs, of leaflets [19. *tora*](#)

19 Leaflets acutely acuminate at apex, ovate-elliptic to lanceolate, 4–9 cm. long, 2–5 cm. broad; petiole and rachis 10–20 cm. long, with a gland between each pair of leaflets [17. *laevigata*](#)

Leaflets rounded and often mucronate at apex, obovate, 1.5–3 cm. long, 1–2 cm. broad; petiole and rachis 3–7 cm. long, with a gland at the insertion of the lowest pair of leaflets only [18. *bicapsularis*](#)

20 Leaflets and fruits glabrous, or shortly pubescent: **21**

Leaves, stem and fruits long-pilose or hirsute; leaflets 4 pairs, lanceolate or ovate-lanceolate, 4–7 cm. long, 1.5–2.5 cm. broad; fruits flattish, about 12 cm. long and 5 mm. broad, very densely long-hirsute [22. *hirsuta*](#)

21 Leaflets 5–9 pairs, the top pair not the largest, narrowly lanceolate, very acute, 4–7 cm. long, 1.5–2 cm. broad; fruits subtergird with prominent sutures, 7–8 cm. long, about 1 cm. broad, shortly beaked [20. *sophera*](#)

Leaflets 4–5 pairs, the top pair the largest, broadly lanceolate or ovate, 3.5–10 cm. long, 2–4 cm. broad; fruits flattish, up to 14 cm. long, abruptly beaked [21. *occidentalis*](#)

1. *Cassia rotundifolia* Pers. Syn. 1: 456 (1805); Benth. in Trans. Linn. Soc. 27: 570. *APD acc*

Subwoody herb, with prostrate branches up to 18 in. long radiating from the rootstock; flowers yellow; fruits blackish-brown when ripe; **a weed locally common, introduced into our area.**

G. C.: Afringba, Keta (fl. & fr. Sept.) Akpabla 335! **N. Nig.:** Zaria (fl. & fr. Dec.) Daggash FHI 31406! 51 miles SE of Ilorin Clarke 24! **S. Nig.:** Lagos (fl. & fr. Aug.) Rowland! Abeokuta (fl. & fr. Feb.) Burt B. 32! Ibadan (fl. & fr. Aug.) Chizea FHI 20021! A native of tropical America.

2. *Cassia jaegeri* Keay in Bull. I.F.A.N. 18: 375 (1956). *APD acc*

Cassia grantii* var. *pilosula of Berhaut Fl. Sen. 33, not of Oliv.

Slender subwoody herb, erect, to 3 ft. high.

Sen.: without precise locality Berhaut 1232. **Fr. Sud.:** Kita (fl. & fr. Oct.) Jaeger! **S. L.:** Musaia (fr. Dec.) Deighton 4424!

3. *Cassia nigricans* Vahl — F.T.A. 2: 280; Benth. l.c. 577; Chev. Bot. 223; Steyaert in Fl. Congo Belge 3: 518.

APD: Synonym of Chamaecrista nigricans (Vahl) Greene

A woody herb or undershrub, up to 4 or 5 ft. high, with small yellow flowers.

Sen.: Heudelot 256! **Gam.:** Park! Pirie 326! **Fr. Sud.:** Bilma (fl. & fr. Dec.) E. Vogel! Toukoto (fl. & fr. Dec.) Chev. 71! Gao (Sept.) Hagerup 361! **Port. G.:** Sama, Bafata (fl. & fr. Jan.) Esp. Santo 437! **G. C.:** Ahinsa, Kumasi (fi. & fr. Oct.) Darko 415! Gambaga (fl. & fr. Sept.–Dec.) Vigne FH 4586! Adams & Akpabla GC 4219! 4242! **Dah.:** Atacora Mts. Chev. 24119. **N. Widespread in tropical Africa, also in **Arabia** and India.

[Barter 534 cited as this species in F.W.T.A., ed. 1, 1: 335, is a species of *Aeschynomene*.]

4. *Cassia kirkii* Oliv. F.T.A. 2: 281 (1871); Benth. l.c. 580; Steyaert l.c. 525, t. 38. *APD acc*

Erect shrub, to 5 ft. high; flowers yellow. Steyaert (l.c.) distinguishes 3 varieties: var. *kirkii* — stems with long, spreading, woolly hairs mixed with the shorter appressed hairs; var. *guineensis* Steyaert — stems with appressed hairs only; var. *glabra* Steyaert — plant quite glabrous. The first two varieties occur in our area, but several specimens are intermediate.

Widespread in the tropics.

22. *Cassia hirsuta* Linn. Sp. Pl. 1: 378 (1753); Benth. l.c. 534; Steyaert l.c. 513.

APD: Synonym of Senna hirsuta (L.) H.S. Irwin & Barneby

Undershrub, to 7 ft. high; flowers yellow; **introduced and found mainly near habitation.**

Fr. G.: Macenta (fl. & fr. Oct.) Baldwin 9848! **Lib.:** Diebla, Webo (fl. & fr. July) Baldwin 6346! **G. C.:** Offinso (fl. & fr. Nov.) Darko 640! **S. Nig.:** Ibadan (July) Tamajong FHI 16761! A native of tropical America, introduced into Africa.

Cassia auriculata Linn.

A species with yellow flowers, it is cultivated in gardens in our area.

Cassia fistula Linn.

A species with yellow flowers, it is cultivated in gardens in our area.

Cassia fruticosa Mill.

Cassia bacillaris Linn. f.

A species with yellow flowers, it is cultivated in gardens in our area.

Cassia ligustrina Linn.

A species with yellow flowers, it is cultivated in gardens in our area.

Cassia multijuga Linn.

A species with yellow flowers, it is cultivated in gardens in our area.

Cassia spectabilis DC.

A species with yellow flowers, it is cultivated in gardens in our area.

Cassia surattensis Burm. f.

Cassia glauca Lam.

A species with yellow flowers, it is cultivated in gardens in our area.

Cassia grandis Linn. f.

A species with pink flowers, it is cultivated in gardens in our area.

Cassia javanica Linn.

A species with pink flowers, it is cultivated in gardens in our area.

Cassia roxburghii DC.

A species with pink flowers, it is cultivated in gardens in our area.

Cassia nodosa Buch.-Ham. ex Roxb.

A species with pink flowers, it is cultivated in gardens in our area.

13. GILLETIODENDRON

Vermoesen Man. Ess. For. Congo Belge 85 (1923); Léonard in Bull. Jard. Bot. Brux. 21: 402 (1951).

Cymometra *Roberty* (1954).

- 1 Leaflets 9–20 on each side of the rhachis, linear, 0.7–1.8 cm. long, 0.2–0.5 cm. broad; fruits 3.5–5 cm. long, 2–2.5 cm. broad, valves woody [1. glandulosum](#)
- Leaflets 4–6 (rarely 3 or 7) on each side of the rhachis, rhombic-elliptic, often obliquely so, 1.5–7.2 cm. long, 0.6–3.5 cm. broad; fruits 2.5–4 cm. long, 1.5–2.5 cm. broad, valves coriaceous [2. kisantuense](#)

1. *Gilletiodendron glandulosum* (*Portères*) *J. Léonard* in Bull. Jard. Bot. Brux. 21: 404, t. 4 (1951).

APD acc

Cynometra glandulosa *Portères* in Rev. Bot. Appliq. 19: 785, t. 5 (1939); Aubrév. Fl. For. Soud.-Guin. 227, t. 46.

Cynometra glandulosa (*Portères*) *Roberty* (1954).

Evergreen tree, to 65 ft. high; fruits with prominent glands.

Fr. Sud.: Kita Massif (fl. July, fr. Oct.) Dubois 105; Chev. 28934; Jaeger 14!

2. *Gilletiodendron kisantuense* (Vermoesen ex De Wild.) J. Léonard l.c. 405, t. 109 (1951). *APD acc*

Cynometra kisantuense Vermoesen ex De Wild. Pl. Bequaert 3: 99 (1925).

C. pierreana of Aubrév. Fl. For. C. Iv. 1: 244 & 246, t. 93 C, not of Harms.

Forest tree, to 50 ft. high.

Iv. C.: Morénou, Daoukrou Chev. 22492. Also in Gabon and Belgian Congo.

14. TESSMANNIA

Harms in Engl. Bot. Jahrb. 45: 295 (1910); Léonard in Publ. I.N.É.A.C., Sér. Sci. 45: 35–55 (1950).

- 1 Outside of sepals, and usually the pedicels and rhachis of inflorescence, covered with glandular excrescences as well as with hairs; pedicels 0.5–1.2 cm. long; the 4 larger petals 1.7–2.5 cm. long; leaflets 7–12, alternate, elliptic or oblong-elliptic, obtuse or acuminate and slightly emarginate at apex, 3.5–9.5 cm. long, 1.5–4.5 cm. broad; fruits obliquely suborbicular or oblong, 4.5–6 cm. long, 3.5–5 cm. broad, flattened, glabrescent, studded with large spinescent warts *L. africana*

Outside of sepals, pedicels and rhachis of inflorescence densely pubescent, but without glandular excrescences; pedicels 1.5–2 cm. long; the 4 larger petals 2.5–3 cm. long; leaflets 4–6, alternate, obliquely obovate-oblongate to narrowly elliptic, 4–10 cm. long, 1.8–4 cm. broad; fruits obliquely oblong-elliptic, 5–7 cm. long, 3–3.5 cm. broad, flattened, densely tomentose; studded with small glandular warts *2. baikiaeoides*

1. *Tessmannia africana* *Harms* in Engl. Bot. Jahrb. 45: 295, t. 2 (1910); Léonard in Publ. I.N.É.A.C., Sér. Sci. 45: 41; Fl. Congo Belge 3: 288. *APD acc*

Large forest tree, to 160 ft. high with tall straight cylindrical bole; calyx green; petals and filaments white.

Br. Cam.: S. Bakundu F.R. (fl. Apr., fr. Jan.) Ejiofor FHI 29316! Keay!

Also in **Spanish Guinea**, **Gabon**, **French Congo** and **Belgian Congo**.

2. *Tessmannia baikiaeoides* *Hutch. & Dalz.* F.W.T.A., ed. 1, 1: 336 (1928); Kew Bull. 1928: 382; Aubrév. Fl. For. C. Iv. 1: 252, t. 96, 1–2. *APD acc*

Forest tree, to 7 ft. in girth; with slight buttresses and smooth, round straight bole.

S. L.: York Pass (Dec.) Aylmer 137! For. Dept.! Dodo Hills F.R. (fr. Jan.) Sawyerr FHK 13576! **Iv. C.:** Mt. Dou Aubrév. 1046.

15. BAIKIAEA

Benth. — F.T.A. 2: 309. *APD acc*

- 1 Leaflets 2–5, alternate or subopposite, obliquely oblong-elliptic, gradually acuminate and rather blunt, base rounded and umbonately thickened on one side, 12–30 cm. long, 4.5–8 cm. broad, entire, leathery, glabrous, with indistinct nerves; petiolules 1 cm. long, transversely wrinkled; stipules small, scale-like; flowers few, nodding, clustered at the tips of the twigs, densely velvety in bud; pedicels stout, 2 cm. long, velvety; calyx-tube turbinate; lobes broadly linear, up to 11 cm. long, velvety outside, at length recurved; petals up to 20 cm. long, obovate, hairy down the middle, the upper petal yellow inside, the others white, veiny; stamens 10, upper one free, the others unequally connate and pubescent below; anthers 1.3 cm. long; ovary long-stipitate, densely villous; fruit flat, curved, large, wrinkled and finely velvety *insignis*

Baikiaea insignis *Benth.* — F.T.A. 2: 309; Bot. Mag. t. 8819; Léonard in Fl. Congo Belge 3: 298, t. 23. *APD acc*

A tree, up to 80 ft. high, in rain forest, with very large flowers.

S. Nig.: Lagos Colony (Feb.) Moloney 6! Punch! Oban Talbot 1749! R. Imo Kennedy 2556! Afi River F.R. Keay FHI 28684! **Br. Cam.:** Victoria (Jan.) Maitland 1307! **F. Po.:** (Mar.) Mann 2342!

Also in **French Cameroons**, **Gabon**, **French Congo** and **Belgian Congo**, **Uganda** and **Angola**.

16. CHIDLOWIA

Hoyle in *Kew Bull.* 1932: 101 (1932).

- 1** A tree, wholly glabrous; leaves paripinnate, leaflets 4–6 pairs, opposite or subopposite, the lowest ovate, the middle pairs oblong-elliptic, the distal pair obovate-elliptic, 4–12 cm. long, 2–5 cm. broad, cuneate to rounded and oblique at base, rather abruptly long-acuminate, main lateral nerves 5–7 on each side of midrib, lower surface dull; panicles very slender, pendulous, 1–2 together on the old wood or occasionally terminal on young branchlets, to 40 cm. long, lateral branchlets numerous, up to 4 mm. long, 5–7-flowered; pedicels 3–3.5 mm. long; calyx campanulate, 2 mm. long, with 5 short rounded teeth; disk fleshy, campanulate, bearing 5 subequal petals and 10 stamens; fruit oblong-linear, acute at both ends, up to 60 cm. long and 6 cm. broad, valves coriaceous-woody and very elastic, dehiscing along both sutures; seeds up to 15, suborbicular, flat [.sanguinea](#)

Chidlowia sanguinea *Hoyle* l.c. 101, t. 1 (1932); Aubrév. *Fl. For. C. Iv.* 1: 98. *APD acc*

Forest tree, to 80 ft. high, locally abundant; flowers wine-red in very slender, long, pendulous panicles.

S. L.: York Pass (Feb.) Aylmer 102! Lane-Pools 447! Kenema (Apr.) Aylmer 225! Kambui (May) Lane-Poole 198! Gola Forest (young fr. Mar.) Small 558! **IV. C.:** Aubrév. 929! Also in **French Cameroons** and **Gabon**.

20. COPAIFERA

Linn. Sp. Pl., ed. 2, 1: 557 (1762); Léonard in Bull. Jard. Bot. Brux. 19: 391–398 (1949).

- 1 Leaflets 10–14 (rarely to 18), opposite, or subopposite, oblong or elliptic, rounded and emarginate and very slightly apiculate at apex, 1·8–4·3 cm. long, 1·1–2·6 cm. broad, rhachis 6–13 cm. long; mature leaflets without translucent dots; inflorescence 3–12 cm. long; fruit obliquely oblong, 3·2–3·8 (–4·5) cm. long, 2·4–3 cm. broad, with a single large seed covered by a waxy red aril [1. salikounda](#)

Leaflets 20–40, alternate or subopposite, oblong, rounded and emarginate and very slightly apiculate at apex, 1·5–4 (–6) cm. long, 1–1·8 (2·3) cm. broad, rhachis 13–25 cm. long; mature leaflets with translucent dots; inflorescence 8–30 cm. long; fruit and seed similar to above [2. mildbraedii](#)

1. **Copaifera salikounda** *Heckel* in Ann. Fac. Sci. Marseille 3, 4: 4, t. 16 (1893); Aubrév. Fl. For. C. Iv. 1: 262, t. 102; Léonard in Publ. I.N.É.A.C., Sér. Sci. 45: 58. *APD acc*

APD: Synonym of Copaifera religiosa J. Léonard

Detarium chevalieri *Harms* (1909).

A large forest tree, often more or less gregarious, with rugose bark; pods brown, woody.

Fr. G.: Lower Koukouré Paroisse. Sombouya Maclaud. **S. L.:** Sherbro Poisson! Baiima, Gbo (fr. May) Deighton 5768! **Iv. C.:** Bingerville (Feb.) Chev.! Abidjan Aubrév. 499! **G. C.:** Evans 15! Owabi (fr. Nov.) Vigne FH 2592! Amentia (fr. Dec.) Vigne FH 1491!

2. **Copaifera mildbraedii** *Harms* in Notizbl. Bot. Gart. Berl. 8: 147 (1922); Léonard l.c. 65, with photo; Fl. Congo Belge 3: 307. *APD acc*

Copaifera salikounda of Kennedy For. Fl. S. Nig. 95, not of Heckel.

Large forest tree, to 200 ft. high, with clean cylindrical bole.

S. Nig.: Sapoba (fr. Feb.) Kennedy 2093! 2306! Urhuehue Keay FHI 21591! **Br. Cam.:** Likomba Mildbr. 10572! S. Bakundu F.R. (fr. Feb.) Ngalamé FHI 24807!

Also in **Ubangi-Shari**, **French Cameroons**, **Gabon** and **Belgian Congo**.

21. CYNOMETRA

Linn. — F.T.A. 2: 316.

- 1 Leaflets 6–10 pairs, more or less truncate or emarginate, oblong, up to 3 cm. long and 1·5 cm. broad: **2**
 Leaflets 4–1 pairs: **3**
- 2 Leaflets about 10 pairs, shortly pubescent on the midrib beneath; flowers very small, in panicles shorter than the leaves; pedicels 5–8 mm. long, shortly pubescent; bracts ovate, long-acuminate, about 6 mm. long .. [1. hankei](#)
 Leaflets about 6 pairs, glabrous beneath, otherwise more or less as in the preceding [2. leonensis](#)
- 3 Leaflets 3–4 pairs, acuminate: **4**
 Leaflets 1 pair (very rarely 2 pairs): **5**
- 4 Acumen very short and abrupt; bracts shortly pubescent; leaflets very obliquely oblanceolate, the uppermost pair the longest, up to 12 cm. long and 3·5 cm. broad, leathery, stiff, reticulate, nerves equally prominent on both sides; inflorescence short and dense; fruits about 4–6 cm. diam. [3. megalophylla](#)
 Acumen rather long and gradual, deeply emarginate; bracts glabrous and closely striate; leaflets obliquely obovate-oblanceolate, the uppermost pair the largest, up to 6 cm. long and 2·5 cm. broad, glabrous; inflorescence very short and densely bracteate; pedicels rather densely pubescent; fruits elliptic, about 4 cm. long, very rugose [4. mannii](#)

- 5 Leaflets deeply emarginate, not acuminate, obovate-elliptic, up to 9 cm. long and 4 cm. broad, glabrous and shining; flowers subfasciculate; pedicels up to 1.5 cm. long, softly pubescent; bracts small, strongly striate; fruits shortly falcate, 3.5 cm. long, 2 cm. broad, wrinkled [5. vogelii](#)

Leaflets acuminate, broadly sickle-shaped, 6–10 cm. long, 2–4 cm. broad, glabrous; flowers small and rather crowded in short cymes; pedicels very short, rusty-pubescent; bracts small; fruits broadly oblong, about 9 cm. long and 5 cm. broad, slightly nervose [6. ananta](#)

1. **Cynometra hankei** Harms in Notizbl. Bot. Gart. Berl. App. 21: 39 (1911); Pellegr. Lég. Gab. 106; Léonard in Bull. Jard. Bot. Brux. 21: 392, t. 106; Fl. Congo Belge 3: 318, t. 20 & photo. **APD acc**

Forest tree, to 150 ft. high; rhachis of leaves slightly winged between the leaflets; flowers white.

S. Nig.: Eket Talbot 3279! Oban Talbot 1639! **Br. Cam.:** Banga, Kumba Keay! Ejiofor FHI 29361!

Also in **French Camerouns** and **Belgian Congo**.

2. **Cynometra leonensis** Hutch. & Dalz. F.W.T.A., ed. 1, 1: 331 (1928); Kew Bull. 1928: 381; Léonard in Bull. Jard. Bot. Brux. 21: 392. **APD acc**

A large forest tree, near water; flowers small, white.

S. L.: Yandahun (Jan.) Unwin & Smythe 52! Bandama (Mar.) Aylmer 576! Kenema (fl. Mar., fr. Apr.) Aylmer 136! King 10! Njala (Dec., Mar.) Deighton 1106! 1861! **Lib.:** Dobli Isl., St. Paul. R. Bequaert 25!

3. **Cynometra megalophylla** Harms in Engl. Bot. Jahrb. 26: 262 (1899); Aubrév. Fl. For. C. Iv. 1: 244, 246, t. 93 A; Pellegr. l.c. 110; Léonard l.c. 385, t. 102, 103. **APD acc**

A large riverside and forest tree, the trunk sometimes divided near the base; young foliage drooping, often wine-red; flowers white; fruits warted.

S. L.: Afzelius. **Iv. C.:** Bettié, Lower Comoé (fr. Mar.) Chev. 17259! Groumania Aubrév. 784! **G. C.:** Anamabou Hove! Cape Coast (Dec.) Taylor FH 5448! Pra R. (fl. Dec., fr. Apr.) Johnson 926! A tall **forest** tree, the crown covered with light grey flowers; often gregarious.

Lib.: Dukwia R. (fr. July) Cooper 411! **Iv. C.:** Abidjan Aubrév. 189! **G. C.:** Ancobra River Basin (Nov.) Chipp 11! Dunkwa (fr. June) Vigne 875!

Cynometra trinitensis *Oliv.*

A native of the W. Indies, it has been cultivated in our area.

22. ZENKERELLA

Taub. in E. & P. Pflanzenfam. 3, 3: 386 (1894); Léonard in Bull. Jard. Bot. Brux. 21: 408 (1951).

- 1 Leaves 1-foliolate; leaflet very shortly petiolulate, elliptic, shortly acuminate, rounded at base, 7–14 cm. long, 4–7 cm. broad, glabrous; racemes very short and glomerule-like, few-flowered; pedicels 1.5–3 mm. long; sepals 4–5 mm. long, glabrous; petals 5 [citrina](#)

Zenkerella citrina **Taub.** l.c. 386 (1894); Léonard l.c. 410, t. 110. **APD** *acc*

Cynometra citrina (**Taub.**) **Harms** (1915) — Bak. f. Leg. Trop. Afr. 3: 757; Pellegr. Lég. Gab. 112.

C. leptoclada **Harms** (1915) — F.W.T.A., ed. 1, 1: 331, fide Bak. f. l.c. and fide Pellegr. l.c.; type specimen destroyed, see Léonard l.c. 412.

A shrub or small tree with white flowers.

S. Nig.: Oban Talbot 1303! **F. Po:** Clarence Peak (Aug.) Mildbr. 6346.

Also in **French Cameroons** and **Gabon**.

23. SCHOTIA

Jacq. — F.T.A. 2: 309.

- 1 A tree 8–10 m. high; branchlets often swollen and hollow under each node (occupied by ants); leaves paripinnate, 2–4 pairs, opposite, the lowest pair at the base of the petiole, obliquely oblong-elliptic, obtusely caudate-acuminate, unequal-sided at base, 10–18 cm. long, 4.5–7 cm. broad, with about 8 pairs of prominently looped lateral nerves, glabrous; racemes lateral, solitary or 2–3 together, very short, densely flowered; pedicels 2–3 mm. long, bracteolate; calyx-tube 7–8 mm. long, puberulous; lobes 4, nearly as long as the tube, ovate-elliptic; petals 5, subequal; stamens 10, shortly coherent at the base; filaments glabrous; ovary and gynophore pilose; ovules 4–5 [africana](#)

Schotia africana (**Baill.**) **Keay** in Kew Bull. 1953: 490 (1954).

APD: *Synonym of Leonardoxa africana* (**Baill.**) **Aubrév.**

Humboldtia africana **Baill.** (1870).

Schotia humboldtioides *Oliv.* F.T.A. 2: 310 (1871); **Harms** in Notizbl. Bot. Gart. Berl. App. 20: 50 & fig.; F.W.T.A., ed. 1, 1: 331; Bak. f. Leg. Trop. Afr. 3: 710.

Theodora africana (**Baill.**) **Taub.** (1892).

Calyx green, petals purple.

S. Nig.: Oban Talbot 1440! **Br. Cam.:** Cameroons R. (Jan.) Mann 726! R. Bombe, Kumba Obiorah FHI 29511! Iwasa, Kumba (Mar.) Sangama 12/38!

Also in **French Cameroons**, **Spanish Guinea** and **Gabon**.

24. AFZELIA

Sm. — F.T.A. 2: 301; Léonard in Reinwardtia 1: 61–66 (1950). **APD** *acc*

- 1 Receptacle 5–7 mm. long; petal 13–15 mm. long; flowers numerous in spreading panicles; fruits oblong, straight or only slightly curved, 12–17 cm. long, 5–8 cm. broad, valves not curling after dehiscence, seeds arranged in a more or less straight row down the middle of the valves so that points of attachment are some way from the

upper suture; seeds 2–2.3 cm. long, with a cupular aril covering 1/4 to 1/3 of the seed; leaflets 3–5 pairs, broadly elliptic, acuminate or obtuse to rounded at apex, 5–15 cm. long, 3.5–8.5 cm. broad, glabrous, conspicuously reticulate on both surfaces; rhachis 10–30 cm. long, petiolules 4–10 mm. long [1. africana](#)

Receptacle 1–3.5 cm. long; petal 2.5–6.5 cm. long; valves of fruit curling after dehiscence: **2**

- 2** Leaflets pubescent beneath, 5–10 pairs, oblong or oblong-lanceolate, rounded or emarginate or rarely subacute at apex, 2–6.2 cm. long, 0.9–2.5 cm. broad, reticulate on both surfaces, shining above, matt beneath; rhachis 6–20 cm. long; petiolules 2–3 mm. long; receptacle 1.5–2 cm. long; petal 2.5–4 cm. long, with the claw rather densely pubescent; fruits pale brown, matt, obliquely elliptic, reniform, 13–20 cm. long, 9–13 cm. broad, valves 1.5–2 cm. thick, curling after dehiscence; seeds 3–4.5 (–5.5) cm. long, with a cupular, slightly 4-lobed aril not covering more than 1/4 of the seed [2. pachyloba](#)

Leaflets glabrous beneath; petiolules 3–7 mm. long; fruits black and shining, oblong, curved; seeds attached close to the upper suture; arils 2-lobed, covering about 1/2 one side of seed and 3/4 to 4/5 of the other side: ... **3**

- 3** Bracts large, up to 1 cm. long, persistent up to the time of flowering or longer, soon reflexed; receptacle 1–1.5 cm.; petal 3–4 cm. long, red; leaflets 3–5 pairs, oblong, slightly curved, obtuse or rounded at apex, 6–11 cm. long, 3–4 cm. broad, shining above, matt beneath, rather faintly reticulate; rhachis 5.5–15 cm. long; fruits 7–10 cm. long, 4–4.5 cm. broad; seeds 1.5–2 cm. long [3. bracteata](#)

Bracts caducous before flowering, usually very small and inconspicuous; receptacle 1.5–4 cm. long; leaflets conspicuously reticulate on both surfaces: **4**

- 4** Tall tree; leaflets 5–8 pairs (rarely 4), oblong, acuminate to obtuse or rounded at apex, 5–13 (–20) cm. long, 2.5–5.7 (–7) cm. broad; rhachis 14–27 cm. long; receptacle 1.5–4 cm. long; petal 3.4–5 cm. long, 2–3.5 cm. broad, with a pubescent claw; fruits 8–19.5 cm. long, 5.5–8 cm. broad; seeds 2.5–4.5 cm. long [4. bipindensis](#)

Small tree or shrub; leaflets 3–5 pairs (rarely 6), elliptic or elliptic-lanceolate or elliptic-obovate, generally rather oblique, acuminate at apex, 4.5–16 cm. long, 2.2–7.3 cm. broad; rhachis 6–18 cm. long; receptacle 1–2 cm. long; petal (3.8–) 4–6.5 cm. long, (2.2–) 2.5–4 cm. broad, with a glabrous or slightly pubescent claw; fruits 6–15 cm. long, 3–6 cm. broad; seeds 2–3.1 cm. long [5. bella var. bella](#)

Tall tree; leaflets 4–6 pairs, obliquely oblong-elliptic, obtusely acuminate, 4–9 cm. long, 1.5–3.8 cm. broad; rhachis 10–15 cm. long; petal (2.3–) 3.4–3.8 (–4.3) cm. long, (1.2–) 1.9–2.1 cm. broad, with a pubescent claw; fruits up to 12 cm. long and 5 cm. broad, often smaller and only 1–3-seeded [5a. bella var. gracilior](#)

1. Afzelia africana Sm. — F.T.A. 2: 302; Kennedy For. Fl. S. Nig. 100; Aubrév. Pl. For. C. Iv. 1: 214; For. *APD acc*

Trees & Timbers Brit. Emp. 2: 15, fig. 2; Léonard in Fl. Congo Belge 3: 355, fig. 27 C.

A tree, to 100 ft. high, **in savannah, in fringing forest and in the drier parts of the forest regions**; flowers very fragrant, green, except for the petal which is white with reddish markings; fruits and seeds black, shining; aril orange.
